The young man who sang the comic songs immediately discovered that he had not the bean; the ladies'-

maids found out as much; Madame Miroiton declared she had not got it; all her children echoed the words; M. Bichonnet did not speak, not thinking it dignified; and M. Miroiton, because his mouth was full.

'I suppose Mademoiselle Ursule is queen?' ironically observed Mademoiselle Ursule.

'I am not queen,' sharply answered the staymaker, with a tone and look which seemed to say she might have been if she would.

Mademoiselle Miroiton coloured, and in a softened tone said to Antoine, 'Are you king, Monsieur Tourneur?'

Antoine started, and turning his eyes from Rosine, for the first time opened his portion of the cake. No sooner had he done so, than the dark bean appeared, enshrined in the yellow crust. Immediately a loud cry of 'Tourneyer is king! Long live the king!' resounded in the lodge. Antoine laughed, and bowing, intimated his wish of speaking; but the loyalty of his new subjects was not thus easily checked, and the Miroiton part of the company especially showed their delight by making an unusual noise. When he was at last allowed to speak, he returned thanks in a short speech, and concluded by drinking the health of all present. No sooner had he raised his glass to his lips, than the cries of 'The king drinks! Long live the king!' again echoed round. But when this first excitement had somewhat subsided, Antoine was requested by Madame Bichonnet to use his privilege, and name a queen for the evening. On hearing this, Mademoiselle Miroiton looked modestly on her plate, whilst Mademoiselle Ursule applied her scent-bottle to her nose. 'Ho, ho!' continued Madame Bichonnet, with a knowing wink, and glancing towards the spot where Mademoiselle Miroiton and the staymaker were both seated, so that it could not be known precisely to which of the two she meant to allude, 'I think I know who will be queen.' She paused, struck aghast with astonishment and dismay—for Antoine had, with a low bow, placed the bean in the glass of Rosine, thus proclaiming her queen for the evening.

A deep ominous silence followed this daring act. Madame Miroiton gazed on Madame Bichonnet with an indignant glance, as much as to say, 'You see it!' and Madame Bichonnet turned up her eyes, and clasped her hands in amazement. M. Miroiton did not seem to know what to make of it; and M. Bichonnet solemnly shook his head two or three times, like one whom nothing could astonish. On perceiving Antoine's meaning, Rosine had coloured deeply, and, by the timid deprecating look she cast around, seemed to implore indulgence for her involuntary fault. But the singer of comic songs was staring point-blank at the wall; the two ladies'-maids, who readily took their cue, seemed, by the glances they exchanged, to say, 'What a shocking creature!' the looks of the Miroitons and the Bichonnets were equally stern and forbidding. Mademoiselle Miroiton was too desperately incensed to strive to hide her feelings; and though Mademoiselle Ursule partly triumphed in the mortification suffered by her younger and more attractive rival, her whole attitude showed the consciousness of injured dignity. Antoine alone looked kindly on her, and seemed to resent very much the manner in which the object of his choice was treated. The truth was, that, having perceived the drift of Madame Bichonnet's hints and allusions, he had felt piqued at being disposed of without his consent, and would have asked either of the ladies'-maids to be queen sooner than Mademoiselle Miroiton or Mademoiselle Ursule. Wishing to relieve Rosine from her embarrassment, he drank her health with studied politeness; but when he cried out, 'Long live the queen!' no voice save M. Bichonnet's, who felt himself bound in honour to reply, echoed his. Poor Rosine grew pale, and laid down her untasted glass, whilst Antoine frowned on the silent and rigid Miroitons. Willing, however, to make an effort towards conciliation, the young shoemaker said with a smile addressing the

company, 'Ladies and gentlemen, let me hope you will drink the health of your queen.'

The melancholy-looking young man who sang the comic songs immediately drank a glass of wine, first muttering something which might sound as an assent to or a protest against the toast, just as the parties were inclined; but no one else pledged Antoine. Mademoiselle Miroiton, indeed, eyed him with great contempt, yawned audibly, and looking at her mother, carelessly observed it was late enough to go home. To this Madame Miroiton assented, and rising immediately, helped her daughter to put on her cloak and bonnet—for Mademoiselle Miroiton had lately assumed this badge of distinction. It was in vain that Madame Bichonnet begged of them to stay a little longer; they smiled scornfully in reply to all her intreaties; whilst, heedless of his wife's indignant glance, M. Miroiton, determined to make the best of the little time left, hastily gulped down two or three glasses of champagne.

'Pray, do stay,' urged Madame Bichonnet.

'No, ma'am, thank you,' dryly answered Mademoiselle Miroiton. 'I can assure you, ma'am, we are not blind; we can see very well through your schemes, and those of other people.'

'Yes indeed we can,' echoed her mother, with a scornful toss of the head; whilst even M. Miroiton, roused at last, and having now quite done with the champagne, repeated, 'Ay, sir, we can,' addressing M. Bichonnet; and with his wife on one side, and his daughter on the other, stalked out of the lodge, followed by his children, and closed the street door behind him with a thundering slam.

When they were gone—she would have scorned to do it before—Mademoiselle Ursule rose; and though she only opened her lips to say 'good-night,' the manner in which she uttered the words spoke volumes. The singer of comic songs, perceiving that his services were no longer necessary, departed, under pretence of seeing her home—she lived in the house opposite; and the two ladies'-maids took the same opportunity of saying something about their mistresses—who were both out—wanting them, and left the lodge, where only Antoine, Rosine, with the porter and his wife, now remained. After their departure, Antoine made several ineffectual attempts to create a little mirth: the Bichonnets were both dismally solemn; and Rosine, who began to fear she had been the occasion of a vast deal of mischief, was too ill at ease to enjoy herself any longer. Seeing the uselessness of his efforts, Antoine at length took leave of his hosts, without taking any particular notice of Rosine.

When he was gone, M. Bichonnet turned towards the young milliner, and in a solemn tone began, 'Mademoiselle, I feel it is a duty I owe to my fellow-men—' But there was something in Rosine's mild appealing glance which seemed to reprove him: he paused, looked embarrassed, and observed in a gentler tone, 'Well, well, I see you understand me; and so—good-night.' Rosine made no reply; but rising somewhat proudly, she retired, bitterly regretting having accepted the unlucky invitation, which had so disturbed the harmony of the evening.

Several days elapsed, during which nothing of importance seemingly occurred. Mademoiselle Ursule, who, since the Evening of the Day of the Kings, had taken upon herself the office of observing whatever was going on in the street, nevertheless found the opportunity of making several curious and interesting remarks. Thus she noticed that, on the Friday which followed that memorable evening, Madame Bichonnet, notwithstanding the delicate state of her health, and the severe cold, actually left her lodge, and ventured to cross the street, in order to enter the abode of the Miroitons; that she remained there upwards of an hour; and that, when she left at last, her features wore the expression of one highly satisfied with the success of a momentous enterprise. Mademoiselle Ursule, moreover, perceived that a very unusual agitation prevailed in the porter's lodge: through some mysterious means she even learned that,

during the course of the day, several secret conferences took place between Madame Bichonnet and the cook of the first-floor lodgers. M. Bichonnet himself seemed more solemn and dignified than ever. At last the important truth came out: the Bichonnets were, on the next Sunday, to give a dinner, to which the Miroitons and Antoine Tournour were invited. The mystery was, however, kept up until the Saturday afternoon. It then happened that the portress let out an inkling of the fact to one of her neighbours, the consequence of which was, that, in less than five minutes, Mademoiselle Ursule entered the shoemaker's shop.

'Sir,' said she, addressing Antoine Tournour, who stood behind the counter, 'I am in want of a pair of shoes; will you take my measure?' The young man bowed, and very politely led the way to a little back parlour, where the staymaker took a seat, and in a very slow and stately manner gave him numberless recommendations concerning the size, colour, and shape of her chausseure. Although Antoine heard her patiently to the end, Mademoiselle Ursule seemed to mistake the nature of his feelings, for she observed, 'I see you are in a hurry, and I am sorry to detain you; but as I shall be very busy next week, and as I shall not see you until the shoes are made—'

'What!' interrupted Antoine, 'do we not meet to-morrow evening?'

'Where should we meet, sir?' asked the staymaker with much seeming surprise.

'At Madame Bichonnet's of course,' said the young man.

Mademoiselle Ursule seemed to endeavour to recollect who the Bichonnets were; then, as though suddenly remembering, she loftily observed, 'Oh, bless me, no! I shall spend to-morrow at home, sir, with poor dear Rosine.'

'And is not Mademoiselle Rosine to be there either?' eagerly asked Antoine, whose features expressed some disappointment.

'Really, Monsieur Tournour,' sharply observed the spinster staymaker, 'you must have an extraordinary opinion of myself and Rosine, to imagine that, after the insults we have there endured, we could ever be induced to cross again the threshold of Madame Bichonnet's lodge.'

'I beg your pardon,' confusedly answered Antoine; 'but when Madame Bichonnet spoke of my meeting pleasant company to-morrow, I really thought she meant you.'

Though somewhat soothed by the compliment, Mademoiselle Ursule smiled with unutterable scorn. 'Sir,' she loftily said, 'I will not speak of myself; I will speak of Rosine, whom Mademoiselle Miroiton has maliciously slandered, for what motive I know not'—Mademoiselle Ursule uttered the words in so significant a tone, as to leave no doubt but she was perfectly aware of it—'and whom, but for me, she would have deprived of the means of earning her bread.' Antoine looked up with astonishment: the staymaker continued—'Rosine works for a great milliner, who resides in the house where Mademoiselle Miroiton's parents are porters. Since the Evening of the Kings, this creature has so contrived her vile insinuations, that Rosine has been refused any more work. Seeing her pass by the day before yesterday all in tears, I called her in, and, as she can fortunately stitch very neatly, engaged her to work for me on the instant, so that she shall have work in spite of the whole Miroiton brood.'

'And has everything really happened as you relate it?' very gravely asked Antoine.

'Exactly so, sir,' dryly replied Mademoiselle Ursule. 'Pray do not forget my shoes. Good-day to you. I suppose,' she carelessly added, 'you go to the Bichonnets to-morrow?'

Antoine bowed in token of assent; and without seeming to notice the smile and glance of contempt which she cast upon him, he ceremoniously conducted Mademoiselle Ursule to the door. The staymaker went home,

so sorely puzzled to make out the shoemaker's real intentions, and quite disposed to quarrel with him for taking no heed of poor neglected Rosine, and dining with those odious Miroitons and Bichonnets; but though in such ill-humour, that her first act on entering the workroom was to scold Rosine for some imaginary fault, she had enough of self-control not to say a word about Antoine Tournour, or the step she had taken. Perhaps the reader will feel surprised to see the staymaker now taking part for the young girl whom she treated with such contempt on the Evening of the Kings; but Mademoiselle Ursule did not pique herself in the least of acting upon logical principles: she boasted that she had 'strong feelings and lively sensibilities—that she was the creature of impulse,' &c.—which of course explained everything. The truth was, that although, as she herself truly asserted, she had never experienced the passion of love, she had, however—partly through Madame Bichonnet's hints—begun to think lately that her young neighbour, M. Tournour, might prove an acceptable partner for life. His politeness she construed into a deeper feeling, veiled by profound respect; and although she felt no strong affection for him, yet there is no knowing to what pity might have led even her rather unsusceptible heart, when the rivalry of Mademoiselle Miroiton awoke all her jealous feelings, and for the present stifled tenderer emotions.

When Rosine entered the porter's lodge on the evening of the festival, she immediately looked upon her as on another rival, and found her artful, designing, &c. It is very likely this impression might never have been effaced, if Mademoiselle Miroiton had not chanced to take precisely the same view of the subject; which Mademoiselle Ursule no sooner saw, than she immediately perceived she must have been in the wrong. There could be no possible sympathy between her and her rival. When she learned the unworthy treatment the young milliner had met with from the porter's daughter, she felt highly indignant; and, as much from a feeling of justice, as from the wish of annoying Mademoiselle Miroiton, she took her into her employment. As she was naturally kind-hearted, the simplicity and gentleness of Rosine soon charmed her; and reflecting—for, from his conduct on the Evening of the Kings' festival, she began to suspect she might have been deceived in Antoine's feelings—that she had lived too long single to resign herself to the many tribulations of wedded life, and that it would be highly imprudent in her to trust herself to the fickleness of man, she prudently resolved to discard Antoine altogether: a task which she found the easier, that her heart had never been in the least affected. But though she might be quite willing to give him up for herself, she was anything but desirous that Mademoiselle Miroiton should enjoy the triumph of supplanting her; indeed, as she had a shocking temper, she felt it quite a charity to prevent their union. In short, she resolved that it should not be her fault if her rival ever became Madame Tournour. It is true Antoine did not seem very deeply smitten; but then there was no knowing what arts might be employed. Ah! if he only knew what a dear good creature Rosine was; and much prettier than Mademoiselle Miroiton too! There could be no doubt about that! Indeed it was no difficult task; a shockingly vulgar creature! She herself, though not quite so fresh perhaps, might venture to compare. But even in her thoughts Mademoiselle Ursule was modest: she hated to speak of her personal advantages!

Such being her feelings on this subject, it is no matter of wonder that Mademoiselle Ursule should be exceedingly cross, when, on the Sunday afternoon, she perceived the Miroitons proceeding to the Bichonnets; but when she actually saw Antoine taking the arm of Mademoiselle Miroiton, dressed out in all her finery, and who, as she averred, cast a glance of ironical triumph on her as she passed by, her anger broke out in vehement denunciations against the faithlessness of men in general, and Antoine Tournour's want of spirit in

particular. Rosine gently endeavoured to say a few words for the culprit, but she was immediately silenced by the indignant staymaker.

Several days elapsed, and notwithstanding her anxiety on this subject, Mademoiselle Ursule could not ascertain how the dinner of the Bichonnets had passed. The cook of the first-floor lodgers indeed informed her of the number of dishes served on the table, but farther than this her knowledge did not extend, and the triumphant bearing of Mademoiselle Miroiton alone left her room to conjecture the issue of this important event. Towards the middle of the week, Antoine Tournour brought home Mademoiselle Ursule's shoes himself. The staymaker received him very stiffly in the presence of Rosine, whose eyes seemed rivetted on her work, and sharply observed that the shoes did not fit. Contrary to her expectation perhaps, Antoine, far from disputing the fact, readily admitted it, and instantly offered to make her another pair. Mademoiselle Ursule, who was taken by surprise, and felt somewhat conscience-stricken—for the shoes were, in reality, an excellent fit—abruptly replied, that as she wanted them for the following Sunday, she must keep them such as they were.

'You can have the other pair by Saturday morning,' calmly replied Antoine.

Still Mademoiselle Ursule objected; but taking up the shoes, the young man showed her so plainly they did not fit, that she at length gave up the point, and consented to have the other pair made. This being decided, Antoine, who seemed in no great hurry to depart, entered into a very animated conversation with Mademoiselle Ursule, and after exchanging a few words with Rosine, at length took his leave.

'Well,' said the staymaker, now greatly mollified, 'I must confess that, with all his faults, Monsieur Tournour is really a nice young man. And you see, Rosine, what might happen, if I only wished for it.' Rosine started, and looked somewhat surprised. Misunderstanding her feelings, Mademoiselle Ursule complacently continued, 'Yes, my dear, did I not prefer leading a single life, I might be Madame Tournour; but though I may give up this prospect, it is not in order to see that odious Mademoiselle Miroiton marry him; and really, child, I wonder you did not take more notice of him just now; who knows what may happen?' She paused, and nodded very significantly. But Rosine coloured, and looked unusually grave.

On the following Saturday Antoine called with the shoes, which were this time an admirable fit; so at least Mademoiselle Ursule said, and Antoine did not contradict her, although he made a longer stay than the last time, and was still more lively and pleasant. But notwithstanding his indirect attempts to enter into a conversation with her, Rosine was so silent and reserved, in spite of Mademoiselle Ursule's encouraging nods and winks, that the staymaker gave her a good scolding when the young man was gone—upbraiding her for her prudery, stiffness, and so forth. To her reproaches Rosine mildly but firmly answered, 'I will not feign to misunderstand you; but, with the exception of a very simple mark of politeness, what reason has Monsieur Tournour given me to think that he looks upon me otherwise than as a stranger? And he being rich, and I poor, what would his opinion be of me if I seemed to think differently?'

'Very well, my dear,' bitterly replied her friend; 'see him married to Mademoiselle Miroiton, and live and die an old maid, if such is your choice.'

Rosine made no reply, and here the subject was dropped. Although the shoes which Antoine had made for Mademoiselle Ursule were perhaps the best shoes that had ever been made (so she said at least), they were worn out in an incredibly short space of time; the consequence of which was, that she had to order another pair. She next discovered that she sadly wanted winter boots; then, as spring was coming on, a pair of summer ones. She even asserted that Rosine had nothing fit to put on her feet; that her shoes were too narrow; that

they hurt her; and, in short, that M. Antoine Tournour must take her measure. It was in vain for Rosine to protest against this; she was compelled to submit. The consequence of this was, that Antoine, who always made it a point—doubtless out of pure politeness—to take the measure and bring home the shoes and boots himself to his customers, was seldom less than two or three times a-week at Mademoiselle Ursule's house.

We must now return to M. and Madame Bichonnet, whom we have neglected too long. On the evening of the second Sunday which followed that on which they gave the dinner to the Miroitons, they were seated as usual in their lodge, Madame Bichonnet dozing in her arm-chair, and her husband looking on the fire, and thinking of nothing, or, as he more elegantly expressed it, 'wrapped in profound meditation,' when they were suddenly startled by a loud knock at the street-door. M. Bichonnet pulled the string placed near him for this purpose, the door opened, and Mademoiselle Ursule showed her thin and prim countenance at the other side of the glass casement which divided the lodge from the passage, and through means of which M. Bichonnet could reconnoitre every one who entered or left the house.

'Is Mademoiselle Rosine at home?' she hastily inquired. 'Bless me, what shall I do?' she continued in a tone of deep disappointment on being answered in the negative.

'I believe,' politely answered M. Bichonnet, 'Mademoiselle Rosine is gone to vespers.'

'Oh dear no,' smilingly replied Mademoiselle Ursule; 'she is gone to take a walk with her betrothed!'

'Her betrothed!' echoed the astonished porters.

'Yes,' carelessly rejoined the staymaker; 'she is to be married to Monsieur Antoine Tournour next Sunday-week. I wanted to see her, in order to know whether she would have her wedding-dress of white tulle or muslin. But I daresay the muslin will look best. But bless me, now I think of it, she must be at home by this time, and I to stand talking here! Good-night, Monsieur; good-night, Madame Bichonnet.' And Mademoiselle Ursule hastened away, with a look of the greatest consequence, leaving the porters so astonished, that it was several minutes before they recovered from the surprise into which she had thrown them.

'Poor Mademoiselle Miroiton!' exclaimed Madame Bichonnet, clasping her hands, and turning up her eyes, 'I thought to have drunk her health at her marriage-dinner before I died; but it is all over now!'

'My dear,' solemnly said M. Bichonnet, 'this is what comes of mingling with people beneath you; this is—'

'Nay, Bichonnet,' mildly interrupted his wife, 'Rosine is a sweet-tempered girl, and she will really do better for Antoine than Mademoiselle Miroiton, with her high spirit. I daresay if I were to give her something, just a bit of lace, on the occasion of her marriage, it would not be thrown away; and I should like to see Antoine happily settled before I die. I am afraid the ceremony might affect my nerves; though I believe I should go, if they were to ask us to the dinner.'

'But, my dear, think of Mademoiselle Miroiton,' gravely observed her husband.

'Really I don't care about Mademoiselle Miroiton,' sharply replied Madame Bichonnet; 'her airs are insupportable; whereas I always liked dear little Rosine.'

'I believe, my dear,' solemnly said M. Bichonnet, 'that you are in the right. If they ask us, we will go to the dinner. To be friendly with them, is our greatest duty towards our fellow-men.'

In short, it required very few arguments to convince this worthy couple that Antoine Tournour could not have made a better choice than in the person of the modest little milliner, whom they henceforth treated with the most flattering distinction. On the next Sunday-week Rosine and Antoine were married, to the triumph of Mademoiselle Ursule, and the despair of Mademoiselle Miroiton. M. and Madame Bichonnet,

who were amongst the guests, were delighted with the whole affair; which, indeed, they asserted, they had wished for and foreseen from the beginning. But though the bride and bridegroom were polite to them, there was not in their behaviour the warmth and cordiality which marked their intercourse with Mademoiselle Ursule. This difference became still more marked after their marriage; for whereas the stay-maker was almost constantly their guest, the porters received no further invitations. Madame Bichonnet now began to think poor Mademoiselle Miroiton had been sadly used, and she called on her for the purpose of condoling with her misfortune; but the young lady, who had a high spirit, shut the door in her face, and informed M. Bichonnet's landlord of the code of regulations he had set up in his house; the consequence of which was, that the porters were discharged, and left the neighbourhood, 'with the consciousness,' as M. Bichonnet said, 'of having vainly endeavoured to serve his fellow-men.'

About a year after his marriage—need we say it proved a happy one?—Antoine met M. Bichonnet in a remote neighbourhood. He inquired after the health of Madame Bichonnet, and learned that it had greatly improved since they had opened a commercial establishment. Antoine looked surprised. 'Yes,' continued the former porter with his usual dignity, 'we sell fried potatoes on the Pont-Neuf.'

Antoine smiled, and wishing him every success, bade him farewell. Six months later, he met him again. He was more thin and dignified than ever. Antoine hoped his affairs were in a flourishing state.

'No, sir, they are not,' loftily replied M. Bichonnet; 'the year has been dreadful for trade, and we have suffered like everybody. I suppose you have suffered too?'

'No, indeed; I was never better off.'

'That is strange; all the tradespeople we know failed. But we have not, mind you. No, no, sir: we have given up the potato concern, it is true, but our honour is unsullied.'

'And where are you now?' asked Antoine.

'We have a porter's lodge in the Faubourg Saint-Antoine. A poor place, sir. Ah! times are changed since we ate the Kings' cake with you in our comfortable lodge.'

Merely inquiring for his direction, Antoine took leave of M. Bichonnet. The same evening he held a long and private conference with his wife. Mademoiselle Ursule saw that something was going to take place; and though too proud to question them, she used her eyes and ears without scruple. The next morning she learned that Antoine was to call on his landlord, who resided in the house where Rosine had formerly lived, and which he had lately bought from its original possessor. What could Antoine want with him? For several days she could learn nothing, but the truth at last became apparent. On a fine morning, a small cart-load of furniture, led by M. Bichonnet, and with Madame Bichonnet perched on the top of a very high bedstead, stopped at the door of the house opposite. As Madame Bichonnet nodded and smiled very benignantly to her, there could be no doubt about it. On learning that Antoine had recommended the Bichonnets to his landlord, who was in want of porters, Mademoiselle Ursule was at first highly indignant. Rosine, however, succeeded in pacifying her, by mentioning their unhappy state, and reminding her that if Madame Bichonnet had not entertained a wholesome apprehension of sitting down to a table when there were thirteen persons present, they would never have become acquainted. As for Mademoiselle Miroiton, she entered into a desperate rage on perceiving her ancient enemies once more in possession of their stronghold. She even sought out every opportunity of injuring them; but the porters had been taught by misfortune. They still occasionally gave parties, but avoided notoriety, and condescended to behave more politely to their lodgers.

Ill-disposed persons asserted, however, that the new landlord's presence alone prevented M. Bichonnet from carrying on matters with as high a hand as formerly.

As for Madame Bichonnet, she was marvellously improved in health, and went about the house quite briskly, considering her delicate state—for she still spoke occasionally of her ailments, and indulged in dismal forebodings of not living beyond the spring; but, as Mademoiselle Ursule charitably observed, this was 'through habit.' Misfortune had not, however, soured Madame Bichonnet's placid temper. She spoke kindly of every one, and never said anything worse of Mademoiselle Miroiton than that, 'Poor thing! so, notwithstanding every effort she made, she could not get married after all. It grieves me to the heart; but indeed I always thought her too high-spirited for matrimony!'

We have dwelt somewhat lightly on the married life of Antoine and Rosine; but it is happy, and what more could be said? Mademoiselle Ursule, whose somewhat irritable temper they bear with the most praiseworthy patience, is still their best and most constant friend: they are thoroughly happy and prosperous, in the moral and worldly sense of the words.

The Bichonnets are still in their old lodge: they have left off a good deal of their selfish worldliness—would we might say all!—and are quite cured of the temptation of match-making. For indeed, as M. Bichonnet loftily observes, it hardly becomes the dignity of a French porter to meddle in such affairs; and he very much doubts whether his duty to his fellow-men does not forbid it entirely. The last tidings we had of the Bichonnets declare that, on the 6th of January last, an enormous twelfth-cake was cut up in their lodge; the persons present were, besides the hosts, Antoine Tournear, with his wife and two children, Mademoiselle Ursule, and the melancholy young man who sings the comic songs, and who declared, that though they were not yet thirteen, there was no knowing what might happen in time, winking as he spoke towards Madame Tournear and the children; a joke which obtained much success, and is not yet forgotten in the neighbourhood. The same young man is said to have paid great attention to Mademoiselle Ursule. As she is resolved to remain single, this must be a calumny; and yet it may be true enough, for Mademoiselle Ursule herself was the person who originated the report. On the same evening M. Bichonnet also confidentially informed one of his guests—which, it is not known—that Louis-Philippe had only a very short time to remain on the throne. He prudently refrained from saying how long, for fear the police might seek to involve him in some political conspiracy.

BELIEF AND CONVICTION.

BETWEEN these two there is all the difference in the world. Perhaps there are scarcely ten thieves or dishonest tradesmen in England who do not believe that 'honesty is the best policy;' but the actual conduct of each shows clearly enough that they are not convinced of this truth. Men scarcely ever act from opinions to which they have given merely theoretical assent. Unless the mind has been compelled into conviction by the reasons and grounds of assent having been repeated over and over again, brought before their eyes, and forced into their attention by instances and examples constantly renewed and impressed indelibly by the frequency with which they are presented—unless, I say, this be the way in which opinions are formed, they have not the slightest influence over men's actions. Just as in the material world the unceasing operation of some force, such as gravitation, is necessary to carry on and keep up with constancy the movement of the universe, where no mere casual impulse would suffice to produce aught beyond a momentary start, so in the world of thought

and moral action, it is no bare and momentary sight of the truth which can effect anything practical. The wisdom of age and experience is precisely this—*conviction from long familiarity with the proofs* of those truths which the young and inexperienced have merely read in books or heard from others. If you tell a young and vigorous man that he will injure his health by this or that practice, he will probably give his verbal assent; but no *impression* is made on the mind, and he proceeds to do that which the older man has so strongly associated with the feelings of pain and disease consequent on it, that even if he were as young and healthy, he would not, and could not neglect the danger. The statements of science are *believed* by the great mass of people of course on trust. If you tell one who is totally ignorant of astronomy, that on such a day a hundred years to come there will be an eclipse, he will believe it; but if any great stake depended upon it, such as his fortune or his life, he would immediately become restless and unsatisfied, showing clearly that his *belief* was not *conviction*, whilst the astronomer, who had gone carefully through every step of the investigation, would be perfectly at ease.

No one can ever become a man of decided character, whose opinions are not thus founded on 'conviction,' as opposed to mere 'belief.' For some excellent remarks on this point, the reader is referred to that admirable work, 'Foster's Essays.' For, without firm grounds for his 'belief,' he will 'waver about with every wind of doctrine.' If we examine the daily conduct of all classes of society, we see in every one this want of 'conviction.' If a set of propositions were drawn up, on which half a million of people agreed, by nine-tenths of them would the greater portion be violated in their conduct. Take, for instance, a set of such assertions as those relating to the preservation of health. 'Fresh air is necessary,' 'Exercise is necessary,' 'Moderation in eating and drinking,' &c. &c. Now, if people really were *convinced* of these facts, their conduct would show it. But they are *not* convinced, or anything like it. Nothing is so difficult as to *convince* people of the most obvious and generally admitted truths, especially if their own welfare depends upon acting on these truths. You may easily enough find persons to support aërial machines, impossible railways, or any other absurdity; but directly you try to make them *act* in accordance with principles, the truth of which they have admitted all their lives, you find you are talking to empty air. If one ten-thousandth part of the money, time, and energy were employed in putting into practice the most simple and evident truths, which are now squandered in useless vagaries, the comfort, health, wealth, and happiness of all classes throughout Europe would be more advanced in two years than in the last two hundred years. What is wanted is not a crusade to preach new opinions, but to get everybody to act up to those he already has. The object to be aimed at is the substitution of that thorough, clear-sighted, determined 'conviction' which impels a man on as effectually as if the pains and punishment of neglect were staring him in the face, and about to fall on him immediately—the substitution of this for that lazy 'belief,' which gives assent because it is no more trouble than to dissent. Money won easily is lost again easily: opinions taken up without much care are either changed in the same way, or at anyrate remain barren, lifeless, useless things. It is only by going carefully through every reason on which they are founded, and by thus having the mind deeply and frequently impressed with the reality of the truth, that these profitless and empty 'beliefs' can be converted into practical principles. The difference between one man and another will be found to depend very greatly on the attention he has given to the *proofs* and *reasons* of things. The creed of one man is his own property, for he has made it himself; that

of another is made up of odds and ends borrowed from all sources, often disagreeing with each other, and having no firm foundation whatever. Such a man is 'unstable as water, and shall not prevail.'

THE INSTALLATION ODE.

We had thought that the days of ceremonial verse by poets-laureate were past with Mr Pye; but we were mistaken. Mr Wordsworth, it appears, does not enjoy the situation on the understanding of its being a sinecure. He has produced an ode on the occasion of Prince Albert's installation as chancellor of Cambridge university. And such an ode! No one can read it without pitying the poor old man who, for some paltry hundred a-year, has either felt it as his duty, or been reminded thereof, to cudgel his brains in order to make something that will sing on an occasion to the Muse indifferent. Finding, apparently, no idea of the present day to start with, he has been forced to go back to some of Mr Pye's compositions for material, and accordingly we have a commencement made with the following allusions to that favourite aversion of our youth, Napoleon:—

INTRODUCTION AND CHORUS.

For thirst of power that Heaven disowns,
For temples, towers, and thrones,
Too long insulted by the spoiler's shock,
Indignant Europe cast
Her stormy foe at last
To reap the whirlwind on a Libyan rock.

SOLO-TENOR.

War is passion's basest game
Madly played to win a name;
Up starts some tyrant, earth and heaven to dare,
The servile million bow;
But will the lightning glance aside to spare
The despot's laurelled brow?

CHORUS.

War is mercy, glory, fame,
Waged in freedom's holy cause—
Freedom such as man may claim
Under God's restraining laws.
Such is Albion's fame and glory;
Let rescued Europe tell the story.

So much being done—and most thankful must the poet have been when he had done so much—a new effort has to be made. One can imagine the writer running distractedly over the whole field of his thoughts in quest of something more, and at length, after desperate exertions, making out a reference to another matter that excited public feeling in our youth, but one not bearing the slightest connection with the preceding.

RECIT. (ACCOMPANIED)—CONTRALTO.

But, lo! what sudden cloud has darkened all
The land, as with a funeral pall?
The Rose of England suffers blight,
The flower has drooped, the Isle's delight;
Flower and bud together fall—
A nation's hopes lie crushed in Claremont's desolate hall.

Here another awful pause of thought. The poet, however, is now approaching ground which has some sort of connection with the occasion. Hear him—

AIR—SOPRANO.

Time a chequered mantle wears;
Earth awakes from wintry sleep;
Again the tree a blossom bears—
Cease, Britannia, cease to weep.
Hark to the peals on this bright May morn!
They tell that your future Queen is born.

SOPRANO SOLO AND CHORUS.

A guardian angel flattered
Above the babe, unseen;
One word he softly uttered—
It named the future Queen:
And a joyful cry through the island rang,
As clear and bold as the trumpet's clang,
As bland as the reed of peace—
'Victoria be her name!'—
For righteous triumphs are the base
Whereon Britannia rests her peaceful fame.

QUARTET.

Time, in his mantle's sunniest fold,
Uplifted in his arms the child;
And, while the fearless infant smiled,
Her happier destiny foretold:—
'Infancy, by wisdom mild,
Trained to health and artless beauty.
Youth, by pleasure unbeguiled
From the lore of lofty duty.
Womanhood, in pure renown,
Seated on her lineal throne,
Leaves of myrtle in her crown,
Fresh with lustre all their own.
Love, the treasure worth possessing,
More than all the world beside:
This shall be her choicest blessing,
Oft to royal hearts denied.'

This designed for lyric poetry! All of it, too, untrue in fact, seeing that Queen Victoria was not born to a certain expectation of the throne, and that therefore no joyful cry whatever ran through the land on account of her advent into the world. Criticism on the quartet part is forbidden by decorum; but we hope that the Queen knows how to estimate expressions which would be equally bestowed by a court poet on any person whatever occupying her place. The best, however, is now to come. We are next called upon either to believe as fact, or to regard as a pleasant poetical fancy, that at some indefinite time in the Queen's infancy, called 'that eve,' the following supernatural occurrences took place:—

RECIT. (ACCOMPANIED)—BASS.

That eve the star of Brunswick shone
With steadfast ray benign
On Gotha's ducal roof, and on
The softly flowing Leine:
Nor failed to gild the spires of Bonn,
And glittered on the Rhine.
Old Camus, too, on that prophetic night,
Was conscious of the ray;
And his willows whispered in its light,
Not to the zephyr's sway,
But with a Delphic life, in sight
Of this auspicious day.

CHORUS.

This day, when Granta hails her chosen lord,
And proud of her award,
Confiding in the star serene,
Welcomes the consort of a happy queen.

From some recollections of Milton's *Lycidas*, we presume that Old Camus is the genius of the river Cam, a gentleman who speaks by his willows; thus, like the duke, finding tongues in trees, though, it would appear, not very truthful ones, since Granta could scarcely be considered as proud of an award in which her mind was very nearly as much for no as yes. Could some power but give us a correct return of the various motives which went to make up the majority that chose the Prince, oh William Wordsworth! what a comment we should have upon Granta's confidence in the 'star serene.' Let us hear, however, what farther these willows of Old Camus have to say—

AIR—CONTRALTO.

Prince, to these collegiate bowers,
Where science, leagued with holier truth,
Guards the sacred heart of youth,
Solemn monitors are ours.
These reverend aisles, these hallowed towers,
Raised by many a hand august,
Are haunted by majestic powers,
The memories of the wise and just,
Who, faithful to a pious trust,
Here, in the founder's spirit sought
To mould and stamp the ore of thought,
In that bold form and impress high
That best betoken patriot loyalty.
Not in vain those sages taught—
True disciples, good as great,
Have pondered here their country's weal,
Weighed the future by the past,
Learned how social frames may last,
And how a land may rule its fate,
By constancy inviolate,
Though worlds to their foundations reel,
The sport of factious hate or godless zeal.

For comment on this we are content to wait for the university commission, that cannot be much longer delayed. Now for a crash of sentiment to bring out all the musical powers of the affair—

AIR—BASS.

Albert, in thy race we cherish
A nation's strength that will not perish
While England's sceptered line
True to the King of Kings is found;
Like that wise* ancestor of thine
Who threw the Saxon shield o'er Luther's life,
When first above the yells of bigot strife
The trumpet of the Living Word
Assumed a voice of deep portentous sound,
From gladdened Elbe to startled Tiber heard.

CHORUS.

What shield more sublime
E'er was blazoned or sung?
And the Prince whom we greet
From its hero is sprung.
Resound, resound the strains,
That hail him for our own!
Again, again, and yet again,
For the Church, the State, the Throne!
And that presence fair and bright,
Ever blest wherever seen,
Who deigns to grace our festive rite,
The Pride of the Islands, Victoria the Queen!

And so it closes, without one poetical thought or happy expression from beginning to end, much less with a single gleam of healthy, natural, sincere sentiment—the whole a piece of the merest crambo, scarcely worthy of hoarse Fitzgerald, and certainly much less likely to have met with success in a tavern hall, had it been there spouted, than were the ordinary creaking couplets of that hero. What on earth can have induced the poet of the lakes to consent to the degradation of writing such a poem!

ASCENT OF THE BUET.

If the Alpine tourist be possessed of tolerable activity, and be desirous to obtain an unequalled mountain view—and, more particularly, a view of the monarch of mountains, Mont Blanc, sublimely seated in his awful state—let him, the tourist, if he be within any moderate distance of the mountain, by no means omit to ascend the Buet; for many years, until English perseverance and activity proved the contrary, supposed to be the highest accessible point of the Alps.

It was on the 24th of July 1844 that I left Chamouny, with my guide, Ferdinand Tissay, each mounted on a mule, at half-past three in the morning, on our way to the Buet. At half-past four we reached Argentiere; and here I could not help stopping for several minutes to admire, though I had many times seen it before, the wonderful ice-battlemented glacier of Argentiere, and the sublime granite spire of the Aiguille Verte, now tinged with the earliest beams of the sun, which, for peaks of such stupendous elevation, had already risen. At half-past five, we stopped for a short time at the Chalets of Poyat; after which we took the direction of the Col du Bérard. Our way at first lay over a stony and rather boggy ascent; and afterwards up an exceedingly wild and picturesque valley, with a loud torrent foaming as usual through it. Here the path became so exceedingly rough and steep, that I confess I was not sorry to leave the mules before we came to the Pierre de Bérard, which we were obliged to do, in consequence of our finding so much yet unmelted winter's snow. We left our mules with a youth who had preceded us on foot from Chamouny, and began our own journey on foot at half-past six, passing over a bed of snow, with a torrent audibly running underneath, for half an hour or more. At a quarter past seven we reached the Pierre de Bérard, a point beyond which mules never pass. Travellers have frequently made the Pierre de Bérard their halting-place for the night; and indeed there is a hollow under this rock large enough

* Frederic the Wise, Elector of Saxony.

to shelter several people; and an additional poor protection is afforded by a rough wall of stones to keep out the wind. But it is needless to add that bivouacs in such places, though no doubt highly romantic, should for obvious reasons be avoided, unless in cases of extreme necessity. For, after all, even 'for beggars or thieves,' a worse lodging could scarcely be found. I am always, I confess, for a good night's rest; and am apt to suspect the energy and perseverance of those who affect to despise convenience. The hovel, formed in this desolate spot almost wholly by nature, was very damp and dirty, and contained a large patch of snow, yet remaining from the blasts and drifts of the winter. At this spot we first obtained a sight of the Oberland Alps, and from hence our way, though steep, was for a time free from snow. The weather was quite perfect; not a cloud was visible; the sky was clear of haze, and the air mild, yet not close. This pass of Bérard is one of those better known to shepherds and smugglers than to any other description of travellers.

At a quarter past eight we had of course gained somewhat in height; but we nevertheless saw cattle passing the snow, one by one, at a great height above us, and in a few minutes more we again entered on the snow. At a quarter before nine we caught sight of Mont Blanc appearing over the range of the Aiguilles Rouges. At twenty minutes past nine we attained a rough slaty ridge, quite free from snow; in fact the ridge of the pass. From hence we had a wonderful view of mountain-tops in all directions. It was not cold, but the sky now put on the appearance of the weather being about to change for the worse. Every peak, however, even the most distant, was quite clear; nor was there the slightest cloud or haze upon any part of Mont Blanc. From this pass we might have descended directly to Servoz; but our purpose was of a much more aspiring nature. After pausing a few minutes, we commenced and completed a fatiguing ascent of the now eternal snow, which was succeeded by a heart-breaking slope of bare slaty débris, occupying us together till forty minutes after ten o'clock. Again another slope of snow succeeded, and again another ascent of slaty fragments, which brought us, at a quarter past eleven, to the remains of the stone hovel of the philosopher Pictet, in which he used to take shelter when overtaken by bad weather in this elevated desert. One more short slaty ridge, and a steep slope of soft snow, brought us to the summit of the Buet, 10,154 English feet, according to De Saussure, above the level of the sea, at half-past eleven, after a fatiguing walk of five hours from the place where we left the mules, and eight hours exactly from Chamouny. The sun at half-past eleven was exactly over the Aiguille du Midi, as seen from hence. From this fine mountain-summit we looked clear away over the summit of the Brever, and of the Aiguilles Rouges (which we had so often looked up to from Chamouny), to Mont Blanc, and his attendant Aiguilles in all their glory. Mont Blanc, seen from this height, and at this distance, towered in kingly state over all his vassals. There were some clouds about, but none to impede the view; nor was there a breath of wind. The air, too, was quite mild; but my feet now became excessively cold, from my having been so long walking in the soft snow. The mountain summits visible from hence are so numerous, that to mention them all would be to make a catalogue of a considerable portion of the Alps. Beyond the range of Mont Blanc, towards the west, far in the Tarentaise, I saw very many undulating snowy summits, with a light thrown over them that gave them the appearance of the coloured waves seen in a surface of mother-of-pearl; in another direction, through a mountain gap, we got a peep of the Lake of Geneva. The Jura range, on the other side of the lake, was very distinct; so were the summits of the Oberland Alps, and all the heights quite round towards the Simplon. We were here, although the air was perfectly calm, at a height to which the voice of the torrent did not reach; and the

impression of stillness I shall never forget. Close on the edge of the highest point of the mountain, where the precipice suddenly sinks down with frightful rapidity, and to which we scarcely dared approach, for fear of dislodging a mass of the soft snow, we saw the track of a chamois, that must have very lately passed. I observed several insects half dead lying on the snow during our ascent; and whilst we stood on the summit—oh, satire on human ambition!—several common butterflies flew over our heads.

The view from the summit of the Buet reminds one forcibly of one of the old-fashioned maps of all the mountains in the world at one view. In a word, it is the most unpicturesque thing possible, but possessing a grandeur and sublimity peculiar to itself, which, once seen, is never through life forgotten.

We could not remain on the actual summit for any length of time, for the snow was so soft, that we could not sit down, and no dry rock was visible, and my feet were aching excessively with the cold of the wet snow; so we descended to some dry rocks a little way down, where we changed our stockings, and got quite warm, and enjoyed the luncheon we brought with us very much. We remained here until one o'clock. Neither on the summit, nor during the ascent, did either I or my guide experience any inconvenience from the rarity of the air. During the ascent, I twice heard that peculiar solemn noise, difficult to describe, something between a deep sigh and a *lourd*, heavy, sullen, subdued sound of an explosion, which no doubt is frequently to be heard in these upper regions. It is probably occasioned by some slip or giving way of the snow under the influence of the mid-day sun. Beneath the snow-cliffs, my guide pointed out to me a place which, he told me, was that in which, in the year 1800, Mr Eschen, a Dane, lost his life. In the spot which he pointed out, the snow appeared deeply crevassed; and to the most unpractised eye, it was evidently not the way up the mountain. It was hard to believe that any one would have ventured into such a place.

I have already mentioned the stone hovel on the summit of the Buet, erected for the accommodation of the philosopher Pictet. I believe he made on this spot many observations with the barometer, as well as experiments on heat and radiation; the Buet is also alluded to by name, in a paper by him in the English 'Philosophical Transactions,' concerning the measurement of an arch of the meridian, dated 1791.

The steep and fatiguing slopes of slaty débris which I have mentioned before, are enriched with some of the rarest of the Alpine plants.

In descending, we glissaded the greater part of the slopes of snow; but where we kept the track of our ascent, I was surprised to find that our footsteps, though very deeply impressed, were almost entirely effaced by the action of the sun. Our descent was very rapid, and varied with frequent falls; the ensuing *glissading* of which may, without care, be carried far beyond a joke. So overpowering was the glare from the snow on the Buet, that I did not find a large goggling pair of green spectacles, together with a thick black crape veil, more protection to the eyes than was necessary.

We finally reached the spot where we had left our mules, below the Pierre de Bérard, at a quarter before three o'clock; that is, in an hour and three-quarters from the summit of the mountain, it having taken us five hours to ascend the same distance. I continued my way on foot, leaving the guide and mules to follow all the way down, and had now ample leisure to admire the scenery of the valley we had ridden up in the morning, which presents one of the wildest and most thoroughly picturesque scenes I ever beheld. Some of the rock and water scenes are scarcely to be exceeded for beauty and grandeur. No one should omit, if possible, during a séjour at Chamouny, an excursion as far at least as the Pierre de Bérard.

We arrived at the Chalets de Poyat at four o'clock, and I got back to Chamouny on my mule at a quarter

before six. Thus the expedition from Chamouny to the summit of the Buet, and back, occupies just about fifteen hours.

THE GENIUS AND WRITINGS OF LEIGH HUNT.

[From the 'Manchester Examiner.']

Of all living English writers, there is not one towards whom there exists a more general feeling of kindness and gratitude than Leigh Hunt. This friendly gratitude has arisen from the peculiar characteristics of his writings—from their sympathy and genuine cordiality—their cheerful, hopeful tone—in short, their fulness to overflowing with that spirit which is best expressed by the beautiful but neglected old English word 'loving-kindness.' We know of no writer who has done more to make hearths and homes happy by peopling them with pleasant thoughts; for he quickens us into a livelier consciousness of our blessings, and communicates to our ordinary duties, and the simple objects of our daily wayside walk, a freshness and interest which it becomes a kind of grateful duty to him to acknowledge.

The tendency of all that Leigh Hunt has written is to *cheerfulise* existence. He reconciles us to ourselves, draws off our minds from remote visions of some future possible good, or painful remembrances of the past, and fixes our attention upon the actual blessings and privileges about us. He is one of the best teachers we know of that kind of contentment and gratitude which arises from a thankful recognition of those minor joys by which all of us are more or less surrounded, and to the value of which most of us are by far too insensible. And then with what a delicate and fine touch he pierces our selfishness! In what a kindly way he convinces us of our uncharitableness, and puts to rout our self-indulgent fallacies! With what a jovial hilarity he banters us out of our moroseness, and laughs at our ill-humour, until at last we are ashamed of our weakness, and determine to be wiser and better for the future! We never rose from a few hours' perusal of any of his charming books, without a sense of obligation to him for stimulating to a desire of generous activity those sympathies which habit and daily contact too often render languid and inert. Everything that comes from his pen is refreshing, and full of good-will to all the world. A belief in good, the recognition of universal beauty, and 'a brotherly consideration for mistake and circumstance,' will be found pervading every essay he has written. To minds disturbed, or set on edge by crosses and disappointments, we know of no more effectual soother than 'a course' of Leigh Hunt. His own buoyant spirit is a fine example of the impossibility of crushing the heart of a true man, be his misfortunes and hardships ever so severe; and no man has suffered the rubs of fortune more bravely than he has done. A popular writer once spoke of him as 'the gray-headed boy whose heart can never grow old.' Those who are familiar with his writings will recognise the truthfulness of this remark, and remember how this perpetual youthfulness of feeling shows itself, in a thousand different ways, throughout all his works.

Another winning peculiarity of Leigh Hunt's writings is their frank, friendly, conversational tone—the pleasantly-egotistical and almost confidential manner in which he tells us every now and then of his own private notions and sentiments—so that we begin to fancy he is addressing *ourselves* in particular, and not his readers in general. There is such an easy, fireside-way about him, that it is like talking with an old intimate friend. He runs on from one theme to another with the most sprightly exuberance—now discussing with hearty sympathy the merits of Chaucer or Spenser, or some other old poet, and pointing out to us the beauty and true meaning of a favourite passage—now bringing out the sentiment of an ancient classical story, or dwelling upon his first impressions of the Arabian Nights' Entertainments—then, perhaps, entering into a curious speculation regarding 'persons one would wish to have seen,' Shakespeare, for instance, or Petrarch, or Mahomet, or Cromwell, or Sir Philip Sydney—or, in a more gossiping vein, relating some characteristic anecdote of Cowley, or Pope, or Lady Mary Wortley Montagu, or Colley Cibber, or Mrs Centlivre; or reporting matches of racy court scandal from the diary of Samuel Pepys. Then he will get into a philosophical humour, and discourse 'of the slow rise of the most rational opinions,' and quote wise and stately sentences from Lord Bacon's 'Essays' or Milton's 'Areopagitica.' On another occasion he comes to us when he is running over with news of the fields

and the woods, and can speak of nothing but May-day, and May-poles, and the young spring flowers. He will give an hour's description of the pleasures of breakfasting in the country on a fine summer morning, with open window looking out upon a bright green lawn, with the air breathing in fresh and balmy, the sunlight streaming through the foliage, and casting its chequering shadows upon the favourite books and pictures with which the parlour walls are adorned; upon the table a few pansies freshly plucked, contrasting well with the snow-white cloth; and a bee humming about from cup to cup, seeking to partake of the honey which she herself probably assisted to furnish. At another time, perhaps, when some calamity has overtaken you, and affliction lies heavy upon a household, he comes in the guise of an old and tried friend of the family, with all a friend's privileges; and sits by your hearth, and suggests many a tender and solemn thought about death and immortality. His manner has more than its usual kindness; his voice sounds gravely, yet there is almost cheerfulness in its tone when he says that 'the best part of what you loved still remains, an indestructible possession—that although the visible form be taken away, yet that was only lent for a season, whereas the love itself is immortal, and the consciousness of it will ever abide to strengthen your faith, and soothe you amid the stir and fever of life.' Or it may be that he speaks of 'The Deaths of Little Children,' and then he almost makes you feel as if his true friend's hand were pressing your own, as he goes on to tell you that 'those who have lost an infant are never, as it were, without an infant child—that the other children grow up to manhood and womanhood, and suffer all the changes of mortality; but this one alone is rendered an immortal child; for death has arrested it with his kindly harshness, and blessed it into an eternal image of youth and innocence.' In the rough winter time again, 'when wind and rain beat dark December,' he will tell you of 'A Day by the Fire' which he had not long since—with all its home comforts and accompaniments—the pleasant hour before the candles are lighted—the gazing meditatively into the fire—the kettle 'whispering its faint under-song,' and the cheerful tea-table with its joyous faces, and the pleasant hours between tea-time and bed-time spent in the free utterance of thought as it comes, with a little music perhaps, or the reading of some favourite passages to stimulate the conversational powers of the circle; while every now and then the rain rattled against the windows, and the wind howled in such a way as to make everybody think of the sea and the poor sailors, and people who have to be out of doors in such weather; and last of all, the quiet half-hour after every one had retired but himself—when all around was silent, the cares of the day gone to sleep, and the fading embers reminding him where he should be: all these, and a thousand things else, in-doors and out of doors, in books, in nature, and in men, he talks about in a way so natural, easy, and colloquial—so marked by a pervading kindness of feeling—entering so heartily into all our tastes and thoughts, and enlisting all the while so thoroughly our sympathies, that we cannot but class him in the foremost rank of our most genial essayists, and place his writings among our choicest 'parlour window-seat books,' to be taken up in the brief intervals of active and social life, sure to find in them something which appeals to our most cherished tastes, and meets with our immediate appreciation.

IMPORTANCE OF HEALTH TO THE LABOURING CLASSES.

Of all the members of society, the labouring man is the most dependent. Health is his only wealth, his capital, his stock in trade. When disease attacks him, the very source of his subsistence is dried up. He must earn his daily bread by daily toil; and, unlike many who occupy a higher position in society, he cannot do his work by deputy, nor postpone the doing of it till his health is re-established. Day by day the expense of sickness is added to the loss of income; and too often he recovers only to find his place occupied by another, and the first hours of convalescence spent in an anxious, and too often a fruitless, search after employment.—*Dr Guy.*

THE PROTECTOR.

THE fate of Cromwell, as a man of history, is singular. After a lapse of time which seems more than sufficient to have dissipated prejudice, and silenced the outcries of party—after his character had long found what seemed to be its true level—a new agitation arises, and a revolution is called for in public opinion regarding him. 'The Protector, a Vindication,' is the title of a volume by Dr Merle D'Aubigné of Geneva, written in defence and praise of this remarkable individual.* It was originally intended as an article for a review, but grew into a book. We have in it no new facts regarding the Protector, but a considerable amount of fresh eloquence in showing him up as a great man. Dr Merle D'Aubigné, being satisfied that Cromwell was a sincere lover of evangelical Christianity, and anxious to promote the welfare of England on that principle, follows up the general line lately assumed by Mr Carlyle; so that the judgment of the last two centuries may on this point be said to be undergoing a very serious challenge. There is something interesting in thus seeing a new light attempted to be thrown upon a character which has so long stood among the shades of history.

Mr Carlyle's love for Cromwell seems mainly to spring from the admiration which this author bears for the earnest. Oliver was a man of strong views and profound convictions, who went resolutely through his work. This is enough for the eccentric philosopher of Chelsea. The present author is led by a different passion; he sees in Cromwell the arch opponent of the Roman church in the seventeenth century, and for this cause venerates him. To make all square to this point, we fear he scarcely gives a fair account of the religious principles of the two first Stuarts. These he makes out as the friends of the papal system; a somewhat odd position, in the first place, for the almost victim of the Gunpowder Conspiracy; and in the second, for him who had his head cut off because he never could exactly give up the Church of England. Even in the case of Charles II., one would say it was a somewhat unalarming friendship for Romanism, which never could confess itself till the deathbed scene had arrived. We should rather think that the Stuarts simply chanced to live at a time when the popular spirit was working strongly towards more liberal forms of policy, as well as to more zealous views of religion; and that placing themselves, as is very natural for the possessors of power, in opposition to this spirit, they unavoidably fell a sacrifice. As for there being anything peculiarly bad in the spirit of this family, it seems a vulgar way of accounting for the events, and, moreover, a somewhat equivocal vindication of their dethronement, seeing that,

in adopting monarchy at all as a form of government, a people necessarily expresses its willingness to bear the risks which families run in the course of nature, of presenting imbecile or evil-spirited representatives. A much honest way of describing the Revolution were to say that the people came to lose all patience with the king's infatuation, and frightened him away without ever considering the constitutional bearing of the act. One-half of the errors of history are after-thoughts—philosophical accounts of things that proceeded from instinctive impulses, or took their main character from accidents small and great.

The outline of Cromwell's life given in this book is meagre; but it is enough, with the arguments accompanying it, to complete the extinction of the hypocrisy theory regarding the Protector. The profound cunning so long attributed to him now vanishes like darkness before light. There cannot, we think, be any longer a doubt that Cromwell was not only a man of vast capacity and energy—a thoroughly great man in the ordinary meaning of the term—but an entirely well-meaning man towards his country, aiming primarily at the establishment of the religious and civil liberties of the people, and only obliged to take power upon himself, because there was no other ready way of accomplishing that end. There was even a true humanity in Cromwell, albeit obscured and often set entirely aside by his religious delusions and his views of policy. In all these respects it is profound injustice to the Protector to compare him with Bonaparte. They take analogous places in their several chapters of history; but there was one simple but decisive difference in their characters—the one was a wholly selfish man, the other not so. Beyond this, however, we suspect that the vindication of Cromwell cannot be justly carried.

For one thing, it appears in glaring colours throughout Cromwell's life—and no eloquence of Mr Carlyle or Dr Merle D'Aubigné can extenuate the matter—that he would do any amount of evil that good might come. The execution of the king was an example. His practice with the Irish was to the same effect. When he landed there to restore order, he had to consider the plan that ought to be followed for the purpose. 'Should he employ a few weeks,' says our Genevan doctor, 'with the sacrifice of 5000 men, or several years, with the loss of perhaps 20,000? Having weighed everything, he decided for the hand of iron. That hand is never amiable; but yet there are cases in which it is salutary.' This is the way in which an evangelical minister of our day commences an apology for the most horrible butcheries on record in our history during the last five centuries. The page cannot, he admits, be read without emotion and pain, 'but it presents this great man to us as following the most skilful course to arrive at a prompt and universal pacification.' Can Dr Merle D'Aubigné

* Oliver and Boyd, Edinburgh. 1847.

be forgetful of the strong condemnation put upon this policy by one whom he must venerate—Paul? Can he be ignorant that the very same excuse would serve for the Duke of Alva, for Graham of Claverhouse, or for Judge Jeffries? Our author admits that his hero acted too much on the Old Testament. We deny, however, that such actions could flow from anything but the man's own nature. He was a bold, rough, decisive man, and his plans partook of this character. Further speculation on the subject is apt to become mere refining.

For another thing, we demur very much to the pretensions now made for Cromwell as a statesman. He did undoubtedly place himself in a position of great authority, and, as far as his authority went, he acted generally well. We must ever, for example, admire his energetic interferences in behalf of the oppressed Protestants of France and the Canton Vaud. No English heart but must beat high and proudly at the respect he secured for our country amongst foreign states. But Cromwell was merely a successful despot. We have it in his own words, that he believed it to be 'lawful for the lesser party, *when in the right*, to force the majority.' This is quite enough. He could do nothing to generate a system that would work apart from his own vast personal energies. The parliaments he called about him were all failures. We do not hear of a single minister or coadjutor possessing the slightest share of ability evoked by him. He was like some over-active men in private life, who prevent their servants and children from coming into any efficiency, by doing everything too well themselves. Hence, at his death, there was no arrangement for conducting the state without him. His family and whole system, as far as he had one, vanished away in a few months into an insignificance most surprising, considering what the Protector had himself so recently been. And it cannot but appear to us as saying wonderfully little for his government, that in little more than a year after its cessation, not a voice was heard praising it; but, on the contrary, the nation, like one man, was shouting with joy at the re-establishment of that which Cromwell had spent himself to suppress. The people of England were then confessedly a great and a reflecting people. If so, they could not have failed to appreciate Cromwell and his government, if either had been, on the whole, entitled to their esteem. How is Dr Merle D'Aubigné to reconcile the facts, that the people had both sense and good feeling, and yet saw Cromwell's body, within two years of his death, exposed on a gibbet without a word or act of remonstrance? The plain reading of the events, to our apprehension, is, that Cromwell, however in his own heart a well-intending man, was practically a grievance to his country. We can easily conceive him to have been so, if not from his own positive acts, at least from his preventing the establishment of such a constitutional system as would work peaceably, and give assurance of future peace. Even, perhaps, in that very misrepresentation to which Mr Carlyle and Dr D'Aubigné show he has been exposed for two hundred years, there is something condemnatory—for how should he have been from the beginning so totally misunderstood, unless under a sense of his having been somehow a source of suffering to his country? The very recklessness and debauchery of the ensuing age, as in some measure a reaction from the Commonwealth rigours, is a kind of impeachment of Cromwell, as much as it is of Charles Stuart. From a truly wise and just rule no such consequences could have proceeded.

The secret of the whole matter we suspect to be this—that Cromwell both started from a false point, and laboured under false views, in his particular

actions. Though greatly in advance of his age in his ideas of religious toleration or non-interference, he was nevertheless one who set up a religious policy as something indispensable for the good of mankind, and something which he, as governor, was bound to see established. 'The supreme magistrate,' he said, 'should exercise his conscience in erecting what form of church government he is satisfied should be set up;' a maxim which would entirely justify James II. in his efforts to restore Catholicism. He did not offend much in this particular direction; he rather went the other way; but he still sought to apply to human affairs a Scriptural rule which, under an arbitrary interpretation, is quite inapplicable to them. With this radical error in his conduct, his state affairs could never go quite right. Perhaps it was only by reason of his natural good sense that they answered at all. Then, for a particular course of action, Cromwell did not look for a guidance in the Bible; he prayed fervently, and took his next ensuing emotions for the direction of God within him—a practice which of course must have led to the most dreadful mistakes. It meets ample condemnation from our author, and we fully concur in the judgment. Liable to such fallacies, borne away by impulses so irrelative to the common wisdom of the world, it is easy to understand how Cromwell—majestically great and good man as he, after all, was—ultimately failed in his aims, and drew things to a precisely contrary point. He was one of the many of God's own who have been ruined and lost by false though well-meaning faith; seeking to carry religion beyond its own only proper sphere—the silent temple of the individual heart; fastening it to the wheels of every vehicle of human affairs, only to have it spattered with dirt and made a mockery to the reckless. When will men see it in its true character, and abstain from profaning it by their injudicious zeal?

THE DANCING-GIRL OF INDIA.

THE rajah of Hussunpoor gave a splendid *nauch* or dance, and supper, to the officers of a detachment of East India Company's troops, then on their way to the seat of war in the Ghoorka mountains. The festivity was conducted on a scale of profuse magnificence, such as the princes of Hindoostan are fond of displaying on state occasions, and which forms a remarkable contrast to their ordinary simple and even frugal style of living. The spot selected for the occasion was outside the town, at no great distance from the British camp. The enormous tent of the rajah was composed entirely of blue and white velvet, in alternate stripes, with a deep border of cloth of gold. The cords were made of twisted strands of silk and gold, with tassels of the same precious metal. The gilded tent-poles had spear-heads of solid gold. The canvas floor-cloth on which the tent was pitched was covered with a carpet of crimson velvet, with a deep fringe of gold bullion. On this, in the centre, was spread a snow-white cloth for the dancers. Attendants, in surcoats and trousers of blue velvet, with crimson shawls about the waist, and turbans of brocade, stood round the sides of the tent, some with silver maces, others bearing large fans, which they waved over the heads of the guests, and others with torches composed of strips of muslin steeped in oil and wrapped around iron spindles. These cast a wild and flaring light over this scene of truly Oriental splendour, in which the Cashmere shawls, jewelled turbans, and loose graceful garments of the native nobles were contrasted with the scarlet uniforms and glittering side-arms of the European officers. The latter were mostly 'old hands,' who had been long enough in India to be perfectly versed in the customs of the people. The guests reclined at their ease on cushions and couches, eating sweetmeats, or drinking the wines which were served in profusion by the attendants.

At length, at a signal given by the rajah, the *nauchees* or dancers made their appearance. There were two of them, young Hindoostanee girls, with fine re-

gular features, and dusty bronze-like skins. Their large dark eyes appeared yet larger and more languishing from the circle of black pigment, called *sorma* (a preparation of antimony), which was drawn around the inner edges of the eyelids. The tips of their fingers and the soles of their bare feet were stained of a rosy hue with the juice of the henna plant. They wore full trousers, and skirts of gay-coloured mualins embroidered with gold, with a muslin chuddur or scarf over the neck, and a figured shawl about the waist—the dress of these females being far more modest than that of European opera-dancers. Silver anklets, hung with little bells, jingled to the slow movements of their feet. The large hanging sleeves of their vests showed the bracelets of gold and gems on their slender rounded arms. In their ears they had rings, of which the golden setting was hardly visible for the brilliancy of the jewels which flashed and glittered in the torchlight. These were presents from their admirers; for the dancers of the semi-barbarous East are almost as much petted, and as widely celebrated, as those of the civilised West—which is saying a great deal.

The musicians now struck up their monotonous scraping and thumping, and the nauchnees commenced their song and dance. The Oriental style of dancing, it is well known, differs greatly from that to which we are accustomed. It consists principally in movements of the body and arms: the feet, though in constant motion, remaining nearly in the same place. Our dances are addressed wholly to the eye, and are intended chiefly to gratify that taste for regular and graceful motion which seems as natural as the love of music. The eastern dance is decidedly of a more intellectual character. It is accompanied by a song, or rather the singing is considered the principal part of the entertainment, to which the dance is subsidiary. Its motions are intended to illustrate the sentiments conveyed in the words. To this end every movement, attitude, and look is made to contribute with wonderful skill. Most of the songs express the passion of love, with all its vicissitudes of gaiety, sadness, hope, suspicion, transport, jealousy, fury, despair. In these cases the acting is sometimes exquisite, and such as would excite admiration in any theatre. Sometimes a martial air is introduced, or a pastoral carol, or a song descriptive of the chase, or other incidents of daily life in the East. Many of these compositions are as famous as the favourite operas and ballets of our boards, and particular dances are called for by the guests of the nauch at their pleasure. The exertions of the dancers are so great, that their excitement soon exhausts them, and several sets are usually ready, who succeed one another, and vary the performances.

The rajah of Hussunpoor had been at some expense and trouble to procure the most celebrated dancers of the country; and many of them were greatly applauded, especially by the foreigners, who, strange as it may appear, almost invariably learn, after a while, to prefer this kind of exhibition to the graces of the ballet by which Taglioni and Elssler have acquired their fame. One of the nauchnees in particular attracted their attention, from her youth and modest appearance. She came forward at first with great diffidence, almost trembling, and sang a pastoral song somewhat similar to the 'Ranz des Vaches,' with a voice so plaintively sweet, and a manner so graceful and winning, that the call for its repetition was universal. She excited as much curiosity as an actress making her first appearance on the stage. Her complexion was fairer than that of the other nauchnees, and it appeared still more so from the contrast with the chuddur or mantilla which she wore, falling from her head over her shoulders, and which was of black stuff, after the fashion of those worn by the mountaineers of the north. The rajah, a fat old Mussulman, who prided himself on being a connoisseur in the art, was much taken with the new performer. He called to him the sirdar or director of the entertainment, and inquired her name and origin.

'Light of the world,' answered the sirdar, 'the girl's name is Lonee; and she comes from the province of Kemaon, in the neighbourhood of Almora.'

'She is not a Ghoorka?' said the rajah.

'The maharajah is right. She is a Vaisya, and was taken captive by the Ghoorkas, who sold her to some merchants, of whom your slave purchased her at the fair of Hurdwar. She has been but two months in training, and promises to make an excellent nauchnee, but for her excessive desire to return to her native land.'

'I think,' observed the rajah with an air of great wisdom, 'that all these mountaineers are mad on that head.'

'True, Khodawund, servant of God,' replied the sirdar. 'They fall sick with longing for their barren hills and rocks, where the goats starve to death in winter, as I tell Lonee. I have been compelled, in order to keep up the girl's spirits, to promise her that, when she shall have earned a certain sum to repay me for what I have expended on her, she shall be free to return to Kemaon. Perhaps the maharajah would like to hear the girl relate her own history in a song which Zalim Singh, the bard, has composed for her?'

'By all means,' said the rajah, and the rest of the company eagerly joined in the call. Lonee, who had been standing with folded hands and downcast eyes during this conversation, now came forward, and sang with expressive action some verses, of which the following is a free translation:—

LONEE'S SONG.

Where shines the god-mountain*
Sublime o'er the earth;
Where leaps the god-river
From ice into birth;
Where great Nundidevi†
Soars white to the moon—
There, there is my country,
Beloved Kemaon!

The bright stars of midnight
Their dews o'er us wept;
In the valley of Deenah
All peaceful we slept;
And fearless the nightingale
Warbled his song—
He heard but the streamlet
Soft rippling along.

What voices of terror
Ring wild through the night?
Up!—up! 'tis the Ghoorka!
Arm, arm for the fight!
Bring buckler and broadsword!
Bring matchlock and bow!
From the hill-sides all round us
Down thunders the foe!

Too late was the warning,
The struggle was vain;
Beside their own threshold
My brethren were slain;
Afar from her kindred
Poor Lonee was torn;
A slave to the stranger,
She wanders forlorn.

Oh, noble Bahadur,‡
No more let me roam—
Redeem a poor maiden
Who sighs for her home.
Think, gentle Feringhees,§
What fond hearts and true,
Beyond the Black Water,¶
Are pining for you!

* *Gangotri*, the peak of the Himalayas, from which the Ganges takes its rise, is considered by the Hindoos to be the embodied form of Mahadeo, or Shiva, the destroying power. *Gunga*, the deified river, is his daughter.

† *Nundidevi*, before the altitude of Dhawalagari was known, was considered the highest summit of the Himalayan chain. It rises 25,669 feet above the level of the sea.

‡ *Bahadur*, great personage, nobleman.

§ *Feringhee*, or Frank, is the usual term applied to Europeans by the natives of India.

¶ *Kala Páni*, the Black Water, is the Hindoo name for the ocean, of which their ideas and descriptions are of the most terrific kind—something like those which were common in Europe previous to the voyage of Columbus.

This appeal, chanted in earnest, moving tones, was answered not only by general applause, but by the more satisfactory response of a shower of jewels and gold pieces—the former coming from the native nobles, and the latter from the British officers. Lonee, 'with a smile on her lip and a tear in her eye,' hastened to gather up these contributions to her ransom, and was about to withdraw, when the rajah, who had been charmed by the novel and peculiar style of beauty of the young nauchnee, as well as by her character, so different from that of the class to which she belonged, bade her remain, and announced his intention of rewarding her deserts by promoting her into his zenannah. It was plainly his expectation that the damsel would receive this intelligence with transport, as indeed it was an unexampled honour for one of her profession. Poor Lonee, however, seemed to be otherwise affected. She stood for a moment as if thunderstruck; and then sinking at the rajah's feet, with joined hands, in the attitude of supplication, she exclaimed, 'Mighty rajah, asylum of the earth, your slave is unworthy to enter your zenannah!'

'Tush!' returned the old Mussulman; 'if I say you are worthy, that is enough. Only conduct yourself well, and you shall be favoured.'

'Light of the universe,' replied the nauchnee, trembling and wringing her hands, 'what shall your slave say? She has bargained with the sirdar to pay him a thousand rupees, and then she will be free to return to her home and her kindred.'

'Well, well,' answered the rajah impatiently, 'I will pay the money. Have I not said it? You shall remain with me, to entertain me and my zenannah. You shall dress in brocade and shawls of Cashmere, and shall feast on pilans and sugar-plums. What more would you have? *Bus!* (enough!) you can go.'

But in spite of this permission, intended for a command, poor Lonee remained kneeling, with every sign of confusion and dismay. 'Oh maharajah,' she said, 'pardon your wretched slave, but her heart is in her native land, among the hills of dear Kemaon.'

'Wallah!' exclaimed the fat old chieftain, puffing and fuming with anger at this unexpected opposition. 'What fool's nonsense is this? Native hills! Dear Kemaon! Stuff! What is it to me where her heart is? Take her away!'

The attendants, in great haste, were about to obey this imperious order, when they were interrupted by the interposition of a third party. The English officers had listened to this conversation with attention, exchanging remarks now and then among themselves, and evidently sympathising with the dancing-girl. At this moment one of the youngest of them, whose uniform showed him to be a lieutenant, spoke hastily.

'This proceeding,' he said, 'appears to me unjust. If the girl has made a contract with her master, it is right that she should have an opportunity of fulfilling it.'

'Well; what then?' inquired the rajah angrily. 'Have I not twice said that I would pay the money?'

'But,' returned the lieutenant, 'it was a part of the agreement that Lonee should have permission to return to her native land.'

'Bah!' retorted the Mussulman, his round eyes gleaming with anger; 'what do I care for the agreement? What fuss is this about a nauchnee? Is she not a slave? Is not this my land? Can I not do what I please?'

'No!' replied the young Englishman quickly; 'not if you were the padshah himself. You shall not perpetrate this injustice in the presence of British officers.'

The rajah turned almost white with rage, and some very unpleasant scene would have ensued, but for the interference of Colonel G—, a tall, thin, gray-headed officer, with a yellow complexion, and an air of invincible coolness. 'Mr R—,' he said in English, 'you are too hasty; you forget yourself.' Then turning to the rajah, he continued in Hindoostanee—'It would be truly un-

worthy of our wisdom if we should allow a dispute about a dancing-girl to create ill-blood between us and our esteemed ally, the rajah of Hussunpoor. All this business may be easily settled. The noble rajah, with that generosity for which he is famous throughout the world (here the old chief stroked his beard), has condescended to notice a poor nauchnee, who is a slave, and to offer to pay her ransom, and to provide for her most liberally. Assuredly such munificence is not to be surpassed. But it seems that the girl is anxious to return to the country in which she was born; certainly a natural feeling, and one in which we all partake who are in like manner condemned to spend our lives at a distance from our native land. But she must understand that it is very doubtful whether she would find the home of her childhood, if she should be allowed to seek it. The ravages of the Ghoorkas have been dreadfully destructive throughout that unhappy land. Many villages have been swept away, and their inhabitants exterminated.'

Here poor Lonee, sobbing bitterly, covered her face with her hands, vainly attempting to hide her tears. The colonel continued, apparently unmoved, 'It is my opinion, therefore, that she cannot do better than accept the liberal and condescending kindness of our esteemed friend the rajah. But if she should obstinately persist in her resolution to return to Kemaon, we must endeavour, among us, to make up the sum necessary to satisfy her master, to which I will willingly contribute; and I doubt not that the generosity of the rajah, and of these other princes, will be displayed with its customary magnificence.'

There is no virtue on which Oriental magnates so much pride themselves as on their liberality. The colonel was thoroughly acquainted with the character of those with whom he had to deal, and his speech was received with exclamations of '*Ucha! bhote khood!*' ('Good! well-said!')—in which the old rajah joined, though rather sulkily. But he was well aware that his 'esteemed allies' were, in fact, his masters, and he had an especial dread of the shrewd imperturbable old colonel.

'Well, Lonee,' said the latter, 'tell us your final determination. Will you remain in the zenannah of his highness, or will you take the risk of wandering homeless and homeless over the hills of Kemaon?'

'Protector of the poor,' replied the nauchnee without hesitation, 'how can your slave answer? She is a poor foolish girl, but her heart is in her native land, and if she does not see it again she will die.'

'Well, gentlemen,' said the colonel, 'I think we can make up a purse among us to ransom the poor girl.' Here he was interrupted by his khitmutgar, or personal attendant—a Mussulman, clad in a showy surcoat of yellow muslin, with yellow trousers, and a blue shawl-girdle and turban, who came forward with joined hands, in the attitude of one asking a favour. 'Will the Colonel Sahib listen to the petition of his servant?' he said. 'What is it?' inquired the colonel, somewhat surprised.

'I have served the Colonel Sahib fifteen years, and he has found no fault with me.'

'True, Sahaduk,' replied his master, 'and you once saved me from a tiger. Well, what now?'

'Gurreebpurwar, protector of the poor,' answered Sahaduk, 'I want a wife. My wife died two years ago in Malwa, and I have a little child, and no one to take care of it when I am waiting on your highness. The Colonel Sahib's kindness has made me rich. The Vaisya women have the report of being excellent wives. Let your servant pay the girl's ransom, and marry her.'

'With all my heart,' replied the colonel laughing, 'provided you can get her consent. I am not her father, and cannot give her to you. What do you say, Lonee? Will you be the wife of my khitmutgar? He is a worthy fellow, and will take good care of you.'

The young girl looked earnestly at Sahaduk, who was a handsome man of about thirty, with a counte-

nance expressive of courage and good-nature. 'Will he take me to Kemaon?' she asked.

'Certainly,' replied the colonel; 'we are on our way there at this moment.'

Lonee's countenance brightened up. 'And will he never beat me? We Vaisya women do not like to be beaten, like the wives in this lowland country.'

'My servant must answer for himself,' replied the colonel. 'I think I have heard of his beating his former wife; hey, Sahaduk?'

'Never but once, Gurreebpurwar,' answered the khitmutgar, 'when she neglected our first child, and it died.'

'Ah, then she deserved it!' said Lonee. 'I will be your wife, for I think you will treat me well; and I shall see Kemaon again.'

'Well, off with you both,' said the colonel; 'get married at once, for we start to-morrow morning for Almora.'

The couple, so unexpectedly mated, retired; and the party, whose good-humour had been restored by this little scene, applied themselves heartily to the supper which was now brought in. The rajah washed away the remains of his sulkiness in a bowl of brandy punch, which Lieutenant R— concocted by way of a peace-offering, and which the sinful old Mussulman drank without regard to the interdiction of his religion. The entertainment was not long protracted, as the officers were compelled to withdraw early, having to set off before the dawn on the following morning.

In ten days, Colonel G—, with the troops under his command, had passed the Terrai, or belt of forest-land and marsh, noted for its deadly climate, which separates the plain of Hindoostan from the hill-country at the base of the Himalayas. The province of Kemaon is composed entirely of rocky mountain ridges, intersected by narrow valleys or glens, like the most rugged districts in the Scottish Highlands. Though nearly under the tropic, the vegetation bears the character proper to the northern limits of the temperate zone. Oaks, pines, firs, the pear, the raspberry, the blackberry, and other trees and fruits to which they had long been unaccustomed, reminded the British invaders of their native land. The original inhabitants and proper owners of the country were the Vaisyas, a fine race of mountaineers, who, in their manner of life, and their simple, honest, industrious character, have many points of resemblance to the Swiss. They build good houses of limestone and slate, and cultivate not only their valleys, but even the terraced sides of their rugged hills, wherever this is possible. They have herds of small cattle, which they keep for their milk, but never kill them, that being forbidden by their religion. Although a brave and high-spirited people, they had the ill luck to be conquered by the Ghoorkas, or natives of Nepaul, to the east of Kemaon, who took advantage of some civil dissensions among the Vaisyas to assail them when disunited, and unprepared for a contest. The Ghoorkas, who are a race partaking of the Tartar physiognomy and character, treated the conquered Vaisyas with great cruelty, ravaging their villages, murdering all who resisted, and selling their wives and children into slavery. Fortunately, in the course of their maraudings, they came in collision with the British authorities; and the result was the war of 1815, in which the Ghoorkas were expelled from the conquered territory. In this contest our troops were greatly indebted to the assistance of the Vaisyas, who, regarding them as deliverers, did all in their power to aid them, acting as guides and messengers, dragging their cannon up the declivities, and fighting bravely when they came to close quarters with the enemy.

Colonel G—, with the forces under his command, had been ordered to make a detour in the mountains near Almora, for the purpose of dislodging the enemy from a strong position which they held in front of the British main body. Unfortunately, the guide who had been furnished him was not well acquainted with the

country; and after wandering about for three or four days in the wildest recesses of the hills, the colonel found himself one evening in a rugged defile between two precipices, with no outlet in front but by a narrow and perilous ascent. Determined not to bivouac in this dangerous position, he pushed forward until he was checked by the alarming intelligence that the passage was barricaded, and occupied by a strong body of Ghoorkas. It would have been madness to attack them in the steep path where three men could not advance abreast, and Colonel G— at once gave orders to retreat from the defile by the way in which they had entered. But at this moment word was brought from the rearguard that the enemy had appeared in great force at that end of the pass. It was plain to the colonel and his officers that they were caught in a trap, from which it would be impossible to extricate themselves by fighting, without heavy loss. A hurried consultation was held. Lieutenant R— proposed to scale the side of the ravine with a small party, and surprise the enemy by an attack in the rear. The guide was sent for, and interrogated respecting the feasibility of this movement; but he declared his utter ignorance and perplexity. He was a Vaisya, but from a different part of the province, and had only travelled this road on one occasion many years before. While they were still engaged in the discussion, Sahaduk, the khitmutgar, made his appearance, begging to be heard. His wife, he said, was well acquainted with the country, and might be of service, if they would be pleased to listen to her.

'By all means; bring her here, Sahaduk,' said the colonel. 'Why did we not think of this before? Let us hear what she has to say.'

Lonee now came forward, no longer in the garb of a nauchnee, but apparelled as a Vaisya damsel, in a frock of gray camlet, with a black mantle of woollen cloth over her head. She was perfectly familiar, she said, with the place in which they were, having frequently visited it in search of bilberries and other wild fruit. She knew of a path by which not merely a small party, but, if they chose, the whole force, might ascend the side of the ravine, and regain the main road to Almora without difficulty.

'Show us that, my good girl,' said the colonel, 'and you will do us a service for which you shall be well rewarded.'

'No, Sahib,' said Lonee eagerly; 'not that. Is it not to free my country from these robbers? And did you not save me from the rajah, and bring me to Kemaon?'

'Well, my daughter,' said the colonel, 'show us the path, and we will dispute about the recompense hereafter.'

Lonee was as good as her word. The track up which she led was steep and rugged, but practicable for infantry not burdened with heavy arms or baggage. A dozen men could have defended it with ease; but the Ghoorkas were probably ignorant of its existence. By midnight the whole detachment had made its way out of the defile in which it had been blockaded, and was encamped in a valley of some extent, offering a good field for action in case of an attack. Many houses were scattered through the valley, but they were tenantless, and appeared to have been lately shattered and spoiled by ruthless hands. 'The Ghoorkas have been at work here,' said Lieutenant R—. 'Do you know this place, Lonee?'

'Do I know it, Sahib?' she said. 'Ah, wo is me! it is Deenah! It is the valley where I was born. They are all gone. There is not one left. It is as the Colonel Sahib said. Oh, my father!—my mother! I shall see you no more!'

'Perhaps they have only fled, and will return as soon as the Ghoorkas are driven away,' observed Lieutenant R—. The remark appeared to inspire Lonee with new hope. She darted up the side of the hill which overhung the valley, and reached at length a lofty crag

which jutted out from the declivity. Standing there, she uttered a shrill, piercing cry, in the tone in which natives of mountainous countries are wont to call to each other. Three times she repeated this call, listening anxiously in the intervals. At length a response of the same kind was heard, but evidently from a great distance, and Lonee slowly descended the hill. There were, she said, some of her people in the neighbourhood, but they were afraid to approach. It would be necessary to wait till the morning, when she would be able to learn more.

When the morning dawned, the British officers perceived that their escape from the ravine had been discovered by the Ghoorkas, who had shifted their ground, and were now drawn up in great force in the road to Almora. Immediate preparations were made for an attack. The struggle which ensued was desperate, the British troops being superior in arms and discipline, and their opponents in numbers, with the advantage of the ground. The battle, however, was suddenly decided by an unexpected event. A furious attack was made by some fresh assailants upon the rear of the Ghoorkas, who, surprised and panic-stricken, broke and fled in every direction. The English officers, unwilling that their men should be scattered, soon recalled them from the pursuit. The auxiliaries who had so unexpectedly come to their aid were less forbearing. They were no other than the Vaisyas of the neighbourhood, who, warned by the cries of Lonee, had suddenly collected and assailed their enemies when they found them engaged with the English. They now pursued and cut them down without mercy, thus avenging the many outrages which they had endured at their hands.

When the pursuit was over, the Vaisyas assembled in a body, and came forward to greet their allies. They were headed by a noble-looking old man, whose stalwart form betokened great strength, and who bore in his hand a heavy wooden mace shod with iron, which had evidently been wielded with unsparing vigour. His looks, however, betrayed no exultation, but were composed, and even melancholy. He was heartily welcomed by Colonel G— and his officers, who acknowledged the assistance which they had received from his well-timed attack. The old man received their compliments and congratulations very calmly. He said that he and his people should always be grateful to the English for taking so much trouble to deliver them from the tyrannical Ghoorkas. For his own part, he had not much cause for rejoicing: the Ghoorkas had spoiled his homestead, slain his two sons, and carried his daughter into captivity. His house could be repaired, and his fields stocked anew; but of what avail would it be to one who had no children to share in his good fortune, or to succeed him when he died?

Poor Lonee could endure no more. Casting off the black mantle which concealed her face, she threw her arms around her father's neck, laughing and weeping at the same time in the excitement of her joy. The astonishment and delight of the old man at thus unexpectedly recovering his lost child may be readily conceived. It appeared that Lonee's mother was still alive, and there were others of her kindred among the neighbours who were now coming in from all directions. The officers, as may be supposed, were much pleased at witnessing the happiness of their pretty protégée, to whom they themselves had been not a little indebted for their extraction from the embarrassment of the preceding night. As it was impossible to delay their march, Sahaduk was directed to remain at Deenah with his wife until the war was over—an order which, without disparagement to his courage, he was very willing to obey.

In a few weeks the Ghoorkas were compelled to evacuate the country, and a permanent military station was formed at Almora. Sahaduk resided there with his master, until the latter was ordered to another part of India. He then rewarded the faithful services of his attendant, and discharged also his debt of obligation to

Lonee, by fitting up a handsome shop in Almora, which he made over in fee-simple to his ex-khitmutgar. Should any of our friends hereafter chance to visit the capital of Kemaon, we recommend them to make their purchases in the linen-draperies of the worthy Sahaduk Bhae, now one of the principal mahajans or merchants of Almora. Lonee is his faithful helpmate, the careful mother of half-a-dozen fine young mountaineers; and from all that we can learn, we have no doubt that he has honourably fulfilled his promise—never to beat her unless she deserved it.

THE FREE BATHS AND WASH-HOUSES AT EAST SMITHFIELD.

ON one of the sultry days in July of the present year, the writer of this paper was induced to visit the free baths and wash-houses in East Smithfield, for the purpose of inspecting the establishment, of which he had read a good deal in the newspapers.

The baths are obscurely situated in Glasshouse Yard, East Smithfield, immediately contiguous to the western entrance of the London docks, and in the midst of a densely-populated district, composed for the greater part of the very poorest class, and embracing a great portion of Whitechapel, Wapping, Shadwell, Radcliffe, Commercial Road, the Minories, and Tower Hill. The place is somewhat difficult to be found, and the access to it is rather repulsive, by reason of the adjacent indications of squalor and poverty; but of course these circumstances only render it the more appropriate. The building, which is composed almost entirely of wood, seems originally to have been employed for a different purpose from that to which it is now devoted; and the operations are wholly conducted on the ground floor. The institution, which has been in operation about two years, was set on foot by a few private and wealthy persons, actuated by no expectations of private gain or personal motives of any kind, but solely with the benevolent view of mitigating some of the hardships pertaining to the lot of the poor inhabitants in the vicinity, and of all who chose to avail themselves of its privileges; and this not by donations of money or food, but by means less palpable and appreciable perhaps, but scarcely less essential—namely, by affording them facilities for cleansing their persons, their clothes, and their homes. Its original promoters still exercise an active superintendence over its affairs; and it is maintained almost wholly by voluntary contributions, the exception being, that a charge of one penny is made for a warm bath to persons of a class above those whom the institution was more especially designed to benefit. The individual by whom we believe the baths and wash-houses were originated—at all events, under whose management they have been conducted since their commencement—is a person of a benevolent turn of mind and unassuming manners, Mr Robert Bowie, who practises as a surgeon in the immediate vicinity. To him all the arrangements, so simple, unpretending, and economical, yet so efficient, are owing.

The institution is divided into two departments—namely, one for washing, and one for bathing. Poor people who choose to bring their clothes to be washed, are provided, free of expense, with suitable accommodation in a large apartment, and with washing-tubs, hot and cold water, soap, soda, the use of an ingenious apparatus for drying them in a quarter of an hour, and with irons for ironing them. Finally, before leaving the house, they may enjoy a warm or cold bath, if they choose to avail themselves of either, likewise gratuitously. When we think of the serious incon-

veniences and annoyance to which thousands of poor people dwelling in the crowded and narrow streets and lanes of the eastern part of the metropolis were subjected, before the existence of these baths, and to which many more thousands are yet exposed in other parts of it, and in most of the large towns in the kingdom, by being obliged to wash, dry, and iron their clothes in the one sole room in which a large family are so commonly 'cabined, cribbed, confined,' and where they have to cook their meals, eat and sleep, dress and undress, and perform all the minor offices of life, we can then understand and appreciate the invaluable boon which such an institution confers upon those who are able to avail themselves of its privileges. But the institution does not stop here. The kind-hearted and sagacious man who presides over it has sought to adapt its advantages to every conceivable phase and form of filth and wretchedness in which the human form and lineaments are so often found debased. Hundreds of persons—and many of them very young persons too—of both sexes, are so utterly destitute and unfortunate as to possess no single article of clothing besides those which they have on their backs, and those are often scanty, and of necessity far from clean. How could the society aid those persons in washing their clothes, when their whole stock of habiliments was imperatively required to cover their nakedness? This obstacle has been surmounted. To individuals of this class, who wish to wash their clothes, the society furnishes a change of clothing, to be used by them whilst they are so engaged, and also materials and an apartment for mending them afterwards. Before leaving the house, they may likewise have a warm or cold bath; and all this accommodation is offered without any charge whatever. Nor is this all. Limited as have been the means at the disposal of the society, it has extended its services beyond the walls of the building, and attempted even more radically to promote universal cleanliness and health among the poor in the vicinity, by providing white-wash, and lending pails and brushes to persons desirous of purifying their humble dwellings; and the boon so offered has been eagerly accepted by great numbers in the neighbourhood.

With respect to the baths, there were only two at the commencement of the experiment; and, in consequence, six persons were obliged to use the same water successively—a regulation obviously objectionable, and which must have been unpleasant to the bathers. By the addition of two other baths, in the course of time two or three persons at the utmost had to use the same water; and now, since the erection of two other baths, making six in the whole, each individual bathing has a fresh supply of pure warm water. The bather is also supplied with a piece of soap and a clean towel. The arrangements of the baths, though they are destitute of everything like ornament, and in some respects somewhat rudely constructed, are unexceptionable as respects privacy and decorum. The writer himself took a warm bath on the premises, and had soap and a clean towel allowed him, for all which accommodation he was expected to pay only a penny. The bath was certainly not so neatly or commodiously constructed, nor contained in so comfortable an apartment, as the second-class baths at the public baths and wash-houses in George Street, Marylebone, near Euston Square; but it ought to be taken into account, in instituting the comparison, that the charge for a warm bath at the latter place is fourpence, and that the establishment is a self-supporting one, and conducted on a much

more extensive and pretending scale than that at East Smithfield.

We shall now briefly describe the internal economy of the institution. A large, lofty room, being the principal one in the house, is set apart for the washing and drying of clothes. We saw several women engaged in this work, superintended by the matron, amongst whom the greatest decorum and order were observable. We took occasion to interrogate the matron on the conduct of the people who came to wash, and she assured us that she had no trouble with them on that point, that they were uniformly civil in their behaviour towards herself and to one another, and that all of them expressed themselves grateful for the privileges afforded them. In this room there is a large steam boiler, used for the purpose of heating the water; not by boiling it in the ordinary way, but by pouring steam into wooden tubs filled with cold water, until it becomes heated. We saw only one objection to this method, which lay in having the tubs fixed in the masonry surrounding and supporting the boiler, by which the washers were exposed to the fierce heat both of the boiler and of the fire underneath. Washing clothes in warm water, under ordinary circumstances, is sufficiently hot work; but the process carried on as we have described it, especially on a day so sultry as that on which our visit was made, must have been painful, if not intolerably oppressive. Probably Mr Bowie, as ingeniously inventive as he is philanthropic, may be able to think of some mode of obviating this inconvenience: the only wonder is, that it was not foreseen in the first instance.

With the view of economising fuel, this boiler is used not only for heating the water in the wash-tubs, but also that in the baths placed in adjacent apartments; and, what is more remarkable, it is likewise made available for the drying of the clothes when washed, through the medium of an ingenious process which we shall describe, and which was suggested by Mr Bowie. A chamber, about the size, and having the appearance, of a large cupboard, is placed at the distance of a few yards from the boiler, with which it is made to communicate by a pipe of about eight inches in diameter, through which, by means of a revolving fan turned by hand, a column of heated air is sent into the drying chamber through the floor, which is of iron, and perforated with holes. The clothes intended to be dried are suspended from horizontal poles placed within the drying chamber; and by the agency of the heated air ascending through the perforated floor, they are effectually dried in the short interval of a quarter of an hour. This novel contrivance not only dries the clothes rapidly, but likewise ventilates and frees them from the peculiar smell that generally clings to long-worn garments; and thus, it is believed, all noxious, morbid, and contagious matters that may lurk in the habiliments are effectively decomposed, destroyed, or dissipated. The ironing and mending of the clothes are carried on in adjoining apartments.

The institution is open from eight in the morning till eight at night. During part of the day—namely, from eight until four o'clock—women are exclusively admitted to wash their clothes and bathe; and on the women retiring, from four until eight in the evening men are admitted to these privileges.

The reader by this time will be curious to know to what extent the class of people for whom these baths and wash-houses were more especially intended have availed themselves of the advantages which they offer. 'On the first proposition of the institution,' we are informed in the first Report of the committee, 'many benevolent-minded individuals doubted the utility of the trial, thinking the very poor so sunk in wretchedness, that they would not consider their appearance and personal comfort worth the trouble of improvement, and their filthy state more consonant with their circumstances.' These were men, we imagine, of the 'It

Can't-be-Done' school, who are ever found ready to throw cold water upon any philanthropic or patriotic project, the promoters of which seek to accomplish their object by wandering away from the ordinary and beaten tracks of benevolence. The event in this particular case, however, has falsified their prognostications. 'The progress of the experiment,' continues the Report, 'having proved the contrary, many of those who were lukewarm in their support, or declined rendering their assistance, are now among the most zealous supporters of the institution. Many of the poor, although unable to procure a sufficiency of food, are found to take an honest pride in cleanliness of person and clothes. The institution, by encouraging this feeling, has led to more benefit in fitting them to seek for employment, and to obtain sustenance by industry, than if it had distributed its means in mere articles of food. It is with just gratulation that the result is stated of the first year's essay of the institution—namely, 27,622 bathers, 35,480 washers and dryers of clothes, and 4522 ironers. This is the best proof of the desire of the poor to be neat, clean, and wholesome, when they can have the requisites; and as to their acknowledgments, those who visit the building hear the recipients express themselves to this effect—"God bless those who give us this benefit: it is the best thing yet that has been done for us, for it makes us feel stronger, and better able to go to seek for work, and more likely to get it, than when we were so very dirty." We were told by Mr Bowie that people came from Kensington and Greenwich, and indeed from almost all parts within twenty miles of London, to wash their clothes or bathe on the establishment, over and above those who resided in closer proximity to it. One poor man living at Ascot, having heard of the institution, on one occasion brought the whole of his family from that distance to bathe. At the time of our visit, the committee had made their Report for the second year; but it was not then printed. We learned, however, from Mr Bowie, that the number of poor people who came to wash and bathe on the premises during the second year had exceeded the number in the first year by about 15,000. About 140 persons, upon an average, bathe and wash in a day. Poor people who live in the neighbourhood are allowed to come twice a-week to wash. Most of those people have availed themselves of the baths and wash-house since their commencement. After four o'clock in the afternoon, a large number of labouring men employed in the London docks, which are adjacent to the baths, go to bathe every day. Of the persons who bathed and washed during the first year, upwards of 9000 came from a distance of from two to five miles; and above 1300 bathed and washed, who, on the preceding night, slept at places from five to twenty-five miles distant.

We have seen that the promoters, in their Report, dwell exclusively on the advantages resulting from their exertions in affording facilities to the poor for cleansing their houses and their persons, and so conducing to health, and multiplying the chances of their obtaining employment. These are unquestionably effects in the highest degree important; but we think this is taking too limited a view of the services rendered to the humbler classes by such institutions. We feel that they have a wider and higher vocation. They seem to us to be breaking up and preparing for moral and intellectual culture those waste and neglected spots which stud the surface of our great social territory, and which have heretofore teemed only with a rank, deadly, and poisonous vegetation of ignorance, misery, and crime. It is the uniform experience of all men who have sought to diffuse religious light and truth, or knowledge of a useful kind, among the great body of the poor, that there are depths in the social scale to which their efforts can scarcely penetrate, or on which they make no extensive or abiding impression. 'Cleanliness is near akin to godliness;' and we think we recognise, in the establishment of baths and wash-houses in our large cities and towns, and the efforts

made, and to be made, to promote sanitary improvements and regulations, so many handmaids to the spread of religion, and knowledge, and happiness among the people.

THREE WEEKS AT CONSTANTINOPLE.

On Saturday, June 26, 184-, we left London for Ostend, and proceeded thence to Ratisbon, and thence down the Danube to Vienna, Pesth, Drenkova, and Orsova. This latter place we left on the 8th of August, and for a time bade farewell to Christendom; once again launched upon the noble Danube, called by Wordsworth

— 'the wandering stream,
Who loves the cross, yet to the crescent's gleam
Unfolds a willing breast;'

and thence steamed our rapid course to Nicopolis, Sietova, Rutzchuk, and Czernavoda. At this latter place we bade farewell to the Danube, after a voyage down its stream of upwards of twelve hundred miles, performed in twenty-six days, including seven days spent at Vienna, five at Pesth, and four at Orsova; so that we were ten days and nights on board. It was early in the morning of the 12th of August that I took a farewell swim in the Danube; and we left Czernavoda for Kusterjé in light carriages, each drawn by four horses, driven by one postilion. The luggage had been forwarded over night by one of the bullock-wains. Czernavoda is rather more than forty miles from Kusterjé, and we went the whole distance with the same horses, stopping three times—twice for a very few minutes, and once for an hour and a-half. The journey was performed in less than seven hours, including the stoppages. The horses were small and active, and were driven at a gallop all the way. They did not appear to suffer in the least from the pace, or from the heat of the sun, and arrived apparently quite fresh at Kusterjé.

Kusterjé is finely situated on a small promontory overlooking the Black Sea. It was once, I believe, a flourishing town; but it is now in a very ruined state, having been almost totally destroyed by the Russians. It boasts of some antiquity. Fragments of marble columns, and rich remains of Roman structures, are met with amongst its ruins; and the sound of its ancient name, Constantina, still lurks in its modern appellation.

The Ferdinand steamer from Constantinople having arrived in the night, we embarked early, and bade farewell to Kusterjé. On the whole, we had fine weather for our voyage; but there was wind enough to make our vessel roll a great deal; and we received a most uncomfortable practical illustration of the force of Lord Byron's well-known couplet respecting the up-turned billows of the Euxine.

August 13.—At about ten in the morning we quitted the 'vast encincture of that gloomy sea,' and entered the mouth of the Bosphorus, passing the classical Symplagades on our right.

The charms of the scenery of the Bosphorus cannot easily be exaggerated. Hills, forts, towers, and villages, appear in succession, whilst its bays and windings endow it with the several beauties of river, lake, and sea. The water is of the most transparent purity, and of the most beautiful azure colour that can be imagined. A large shoal of dolphins accompanied us for several miles, gambolling and leaping into the air from wave to wave; and we could distinctly see them when darting along far beneath the surface, although the water was far from smooth. Nothing could be more delightful than our transition from a tumbling sea to the swift current of this beautiful strait, that bore us down through scenes so novel, so interesting, and so intrinsically beautiful, to a city equally celebrated in ancient and in modern times.

The minarets of Constantinople now appeared in sight; and, much sooner than we expected, we found ourselves at anchor in the Golden Horn. Just as we arrived, the sultan was embarking to cross the Bos-

phorus, on his way to a mosque on the Asiatic side, it being Friday, the Moslem Sabbath. The officers of state accompanied the sultan in their brilliant caïques. It was a gorgeous and animating spectacle; and the thunder of the salutes from the ships of war, gaily decked out with their ensigns and streamers, seemed to bid us welcome to the waters of the Bosphorus, and to the full enjoyment of the view of the imperial city, then before us in all its glory: or rather, I should say, to a view of three cities in one—Constantinople and the Seraglio Point on our right; Pera on our left; with Scutari on the Asiatic side; palaces, mosques, and their minarets; cypress-trees, towers, and shipping; sky, water, and sunshine—all blending and harmonising together!

In due time we left our steamer, and transferring ourselves and baggage to the light caïques of the Turkish boatmen, we landed, and walked over a pavement that must be seen and felt to be imagined, up the apparently interminable ascent of Pera, and along its principal street, to the Hotel Belle Vue, where we established ourselves, much to our satisfaction.

But some ludicrous realities are very apt to intrude upon the most charming illusions. As we were sitting in all the pride and freshness of an arrival in an Oriental city, enjoying the brilliancy of the evening, and the grandeur of the view of Constantinople and the Bosphorus, expecting every sound, as well as every sight, to be equally new, our ears were suddenly regaled with the popular air of *Jenny Jones*, most sonorously performed on the key-bugle, with an *ad libitum* accompaniment of loud voices, and the national adjuration, which Lord Byron calls the *English Shibboleth*, so plainly pronounced, as to satisfy us of what nation the musician and his companions were. In strong contrast to this, very shortly afterwards we heard the new and solemn sounds of the muezzin, calling the city to prayer.

Saturday 14.—Spent the greater part of the day in rambling about the hot, steep, and cruelly ill-paved streets of Pera and Galata. The whole town, now that the weather is dry, is very tolerably clean—thanks mainly to the dogs, hawks, and vultures, who are the scavengers of the place. The heat is very great; yet throughout the day there is an agreeable air from the Bosphorus. We were rowed out in the evening in caïques, and walked home after we were set on shore, making a little round by the cemetery of Pera.

August 15.—In the morning we crossed over the Golden Horn to Constantinople, to visit the slave-market. The slaves that are here exposed for sale are chiefly black females, who are bought by the Turkish ladies for household servants. They are said to be generally well treated; nor is the word *slavery* to be understood here in its ordinary vulgar sense of utter degradation and unmitigated suffering. We noticed a few white women and a few black boys to be disposed of. We walked round the market under a covered way, and saw, through lattices, a great many slaves in rooms set apart for their reception. Some were already equipped in the Turkish dress, and seemed to have the liberty allowed them of walking in and out of the apartment. They did not appear at all downcast, but were smiling, and seemed to have their joke amongst themselves as well as others. There were, however, some wretched-looking, black, meagre objects, leaning against the walls, half asleep in the sun, or squatting on the ground, riding one another of vermin. They had nothing on but the coarsest possible drapery of sackcloth thrown over them, and yet they contrived to wear it not ungracefully. From thence we walked by the mosques of Sultan Ahmed and of St Sophia, and visited the obelisks and brazen column in the Atmeidan. These are the remains of ornaments set up by the Romans, in what was formerly the Circus, probably in the space between the two *Meta*, called the *Spina*. The Atmeidan is now used for various exercises, chiefly military. We returned home to Pera, and I took a Turkish bath, which I found extremely agreeable.

You undress leisurely on a sofa, in a cool, airy part of the building, and a blue cotton cloth is wrapped round your middle, so as to form a sort of petticoat. You are next conducted into a room, the atmosphere of which is very hot, without being close or stifling. Water, hot and cold, is supplied from marble fountains, and runs in channels along the stone floor. Here you remain until the perspiration runs off the skin in large drops. If you can support it, you are conducted from hence into an apartment still hotter, and shortly an attendant arrives, who throws a bowl or two of water over you from the marble fountain, and then proceeds to lather you from head to foot with soft soap, at the same time gently rubbing and kneading the joints and muscles. After this you are again rinsed thoroughly with water, and are reconducted to your sofa, where you are carefully wiped and dried, and kneaded as before, and are left covered up, with a cloth, turban-fashion, wrapped round your head. Here you remain half an hour or more in a delicious tranquil reverie, to enjoy a pipe if you choose it, and inhale the fresh air of the apartment, and drink iced lemonade or sherbet. This may sound as if it were a dangerous proceeding; but it is the received custom so to do, and I suppose it allays beneficially the ferment raised in the circulation in the hot bath. The process throughout is agreeable, and leaves no subsequent lassitude, but rather confers a sensation of power to resist the heat of the climate.

After dinner we walked to the cemetery of Pera, and enjoyed a most lovely view of the Bosphorus. On one side was the setting sun, and in the opposite quarter of the sky a dark storm of rain, that cast a deep purple blush over the water, throwing a large ship of war, as she lay at anchor, out into bold relief. The picture was completed by the fine dusky hills of the Asiatic side of the Bosphorus, with the faint outline of Olympus in the distance.

August 16.—Visited Scutari, the city on the Asiatic side of the Bosphorus. Scutari is a large and ancient town, though considered as a sort of suburb to Constantinople. The principal street is wider than any we have yet seen in Constantinople or Pera, and the mosques and public fountains are beautiful. The cemetery is held in great veneration by the Turks. It is very extensive, and is adorned with vast groves of large and antique cypresses.

In the course of our walk we bought some excellent sweetmeats at a confectioner's shop, and seeing a pretty little girl of about seven years' old standing by, I offered her some; but she looked at me very gravely, as if I had affronted her, and ran away more than half-frightened. There were also for sale in the streets quantities of the most delicious grapes, of which we bought a large basketful; but it was evident that we were not looked upon in the light of eligible customers. It is generally observed that the inhabitants of Scutari do not take much pains to conceal their dislike of the Franks; very probably because it is less to their interest so to do.

The current of the Bosphorus is always strong, and when we returned, the wind had freshened considerably. This afforded us an opportunity of seeing the admirable manner in which the Turkish boatmen manage their caïques. They make use of sculls very much overhanded, and when there are two or more scullers, they pull powerfully and well together. The caïques are most elegantly formed, very light, and have their sides rather high out of the water. The sitters recline in the bottom, in order that the weight may be kept as low as possible. It is quite surprising how, in windy weather, they ride over the swell of the Bosphorus; and when it is calm, with what ease and rapidity they glide along. The Golden Horn, in particular, is throughout the day enlivened with hundreds of them, of all descriptions, in motion in every direction; from the caïque of the poor boatman, whose fare across is half a piastre, to the private caïque of the rich Turk, decked out with golden-fringed scarlet or blue draperies, and the rowers in their full-sleeved shirts and Greek caps, with the pasha him-

self, with his chibouk, majestically reclining in the stern.

August 17.—We went shares with another party of English in the expense of a firman, by virtue of which we gained admittance to the mosques and to the Seraglio Palace—the sultan being now resident at one of his summer palaces on the shores of the Bosphorus. I can scarcely pretend to estimate the number of square acres comprehended within the seraglio walls. I have heard its circuit estimated at three miles; but I believe this to be exceedingly vague. From without, you are agreeably bewildered by the domes and minarets, and the whole style of the architecture mingling so beautifully with the noble and ancient cypress trees; but when you are within the courts, or inside the apartments, you are occupied chiefly by the general idea of great spaciousness, rather than by any particular attractions offered to your view within; and you are not sorry to seize the first opportunity that presents itself of looking out of one of the windows upon the lovely prospects of the Bosphorus, commanded in almost every direction.

In many of the rooms there was a profusion of really handsome gilding; but the Turkish customs do not admit of the European style of furniture; and from the nakedness of the apartments, I thought it very likely that many such articles as rich carpets and ottomans are removed from palace to palace with the court. In one immense room we saw a very small table in bad French taste, and a few of the common French artificial bouquets under glass shades; but the arrangements of the bath-rooms, with their fountains and pavements of marble, were quite delicious. The few attendants that we saw about the palace were in their ugly, ill-made, European dresses—so generally adopted now by the Turks—and looked dirty and altogether ill-conditioned. The pleasure-gardens are not extensive, but are beautiful, and well-watered, and contain many plants growing in the open air which in England are seen only in hot-houses. Works of art, pictures, and statues, are not to be met with in the Seraglio Palace; but perhaps it is a relief now and then to visit a palace that does not possess them. It is the witnessing the beauty of the general effect produced by the whole, aided by blue water, sky, and sunshine, that repays you for the exertions of the day.

We were then indulged with a sight of the interior of the great mosque of St Sophia, of that mosque also called the Little St Sophia, and of the mosques of Sultan Ahmed and of Sultan Solyman. On entering these sacred edifices, we were compelled to take off our shoes, and put on thin slippers, or walk barefoot. We were agreeably surprised at the magnificent dimensions of these mosques, and their fine general barbaric effect. They tell you that the interior diameter of the dome of St Sophia is fifteen feet wider than that of the dome of St Paul's. It is one mass of gilt mosaic-work, and its exterior is surmounted by an enormous gilt crescent, the dimensions of which I have heard very variously stated; there are also some wondrous legends afloat respecting the distance at which it may be seen when the sun shines on it. St Sophia is the largest of the mosques we saw; but the others I have mentioned are perhaps as well worth seeing, from their unmixed style of Oriental architecture. Innumerable silver lamps and ostrich's eggs are suspended from the domes of them all. No detailed description of these wonderful edifices could be kept within any reasonable length of description. It was just at the hour of noon when we entered St Sophia; and at that moment the voice of the muezzin, himself unseen, rang with thrilling power through the entire building, and the whole of the Mussulmen present prostrated themselves to the earth. I never witnessed a more striking spectacle.

In the mosque of Sultan Ahmed we saw a kind of reading school for young lads, who were being educated, as they told us, as imams, or priests. They were reading, I believe, the Koran out loud, in concert with their teacher, in a noisy, chanting, and apparently irre-

verent tone. When they concluded, all that were present rose up, excepting one, a strange-looking figure, who persisted in remaining with his book open before him, which they at length took away from him; and he then got up, and stalked away with the self-important gestures of insanity. He was described to us as being a wandering dervish, and reputed mad, which greatly enhanced his sanctity. Before we quitted the mosque, we saw a Frenchman, who was admitted to the mosques in company with us, inadvertently spit upon the pavement. We immediately called his attention to what he had done; for had the Turks observed it, we might probably all have got into trouble. I mention this circumstance, because there will be occasions to allude incidentally to it again.

I then hurried back to Pera to see the mawlawi, or dancing dervishes. They met in a place of worship of their own, with a kind of circus in the midst, with a very smooth floor. I counted fourteen dervishes prostrate round the circle. Their chief knelt on his carpet opposite the entrance, and was engaged audibly in prayer, to which the rest from time to time made responses. The chief had on a sky-blue robe, and a thick felt cap of a light-brown colour, in the shape of a truncated cone, bound round with a green scarf. The rest wore the high cap without any decoration, and long robes of dark hues. When the chief made an end of his prayer, a dervish in the gallery began a very loud chant, whilst the whole company, headed by the chief, paraded twice or thrice round the room, with their arms crossed upon their breasts, the inferior brethren making profound obeisances as they passed the carpet on which their chief had been seated. Then commenced a low, wild, melancholy strain, without any definite melody, but still not unpleasant, performed on a flageolet and flute. This continued for about ten minutes. The dervishes then once more prostrated themselves with their faces to the earth. A small drum then sounded; upon which the dervishes rose up, and let fall their outward robes, appearing in short white jackets, and long white coarse petticoats, that trailed on the floor. Their feet were bare. The music then struck up again, accompanied by a loud noisy chant, and every dervish, except the chief, and one other, who acted some intermediate part, began a slow, solemn, rotatory movement or dance, with their arms held out horizontally, their revolutions throwing out the white petticoat into a conical shape, with its hem or border steadily floating a few inches above the floor. This continued without intermission for a quarter of an hour. The dervishes then ceased their revolutions, and recommenced the obeisances, and after that once more resumed the rotatory dance for a quarter of an hour, accompanied by the music and the song in the gallery as before. The ceremony closed with a dying fall in the music, pleasingly managed; and before the last two or three devotees had ceased to turn round, the friction of the bare feet upon the floor, now that the music was low and still, was distinctly heard. There was something almost touching in the quiet and composed demeanour of the chief and his followers. The entire absence of any appearance of fatigue or giddiness on the part of the performers in this extraordinary ceremony is really quite surprising.

August 18.—Went up the Bosphorus in calques to Therapia. In the afternoon we crossed the Bosphorus at Therapia, and ascended the hill called the Giant's Mountain, from the summit of which the view is really superb. You look in one direction to the Black Sea, and in the opposite direction, down the windings of the Bosphorus, to the Sea of Marmora, with Mount Olympus in the distance. We remained that night at Therapia.

August 19.—Walked and rode about Therapia and its neighbourhood. The scenery is exceedingly beautiful at every turn. Remained another night at Therapia.

August 20.—Returned from Therapia, by water, to Pera. The wind blowing rather fresh, there was more sea on than was agreeable in a calque. On our way we

stopped at the Sweet Waters, a delightful place of public resort on the Asiatic side of the Bosphorus. Here we saw a great many arabas, or carriages of the country, profusely gilt, filled with women and children, and drawn by oxen or horses with richly-ornamented harness. We caught glimpses of some very pretty faces among the women, who, for the benefit, no doubt, of breathing the air more freely, had loosened the asmacks of white muslin which usually envelop their necks and faces. There was, however, a guard stationed about the spot, to prevent anything like intrusion. The children were extremely pretty, with dark eyes and hair, and were handsomely dressed in their own native costume, which is peculiarly picturesque, and becoming to childhood. The ladies had coffee and sweetmeats with them in their arabas, with which they were served by their attendant black female slaves. Besides these, there were many family groups enjoying themselves under the trees, seated upon their bright coloured carpets, round the borders of which their yellow slippers were ranged in order. There were also present several Turks of rank, mounted on beautifully caparisoned Arabians, with boys on ponies; asses for hire, with scarlet housings; conjurers, venders of fruit, lemonade, sherbet, water, and sweetmeats. To complete the picture, the shore was lined with the calques of the company, assembled from various parts of the shores of the Bosphorus, with their gaily-dressed rowers lying on their oars.

PASQUIN.

WHAT is a pasquinade?—A squib, a satire, a lampoon, a scurrility. Why is it so called?—Because such *maximes plaisanteries* were affixed, by their anonymous authors, to the statue of Pasquin at Rome. For what reason?—For this reason:—

There was once a tailor in the Eternal City, whose heart was filled with bitterness as he reflected on the unmerited jibes to which his profession was exposed as if by a general conspiracy of mankind. Maestro Pasquino, for so was he called, could not, for the life of him, imagine what people could find ridiculous in a calling which concerned itself with the grand distinction between the human race and the inferior animals. 'The world is mad,' cried he at last; 'stark, staring mad!' and as he came to this natural conclusion, he set himself to trace the symptoms of folly around him with an enthusiasm which soon amounted to a passion. It was meat and drink to him to see a fool; and soon the echoes of the jests with which he seasoned this repast extended beyond the shopboard, and were heard in the neighbouring piazza Navona. All Rome at last crowded to the tailor's studio, which took the place of the apothecaries' shops in the provincial towns of Italy, and became a kind of public Exchange for those who would hear or communicate the news of the day.

But this news, it will be felt, took its colouring from the mind of Maestro Pasquino. Everything was converted into materials for mirth or malice. Great lords were no more spared than if they had been so many tailors; prelates and cardinals were unfrocked without ceremony; and even the pope himself set up as a target for the shafts of ridicule. And what recourse could he had, since all was traced to the shopboard of Pasquin? It mattered not who the speakers really were, since Pasquin and his decimal fractions of humanity were the ostensible authors. It was a part of the jest to clothe it in vulgar language, and no one, however much aggrieved, could think of condescending to take vengeance for anything so low. The tongue, at length, was recognised in Rome as at once a safer and sharper weapon than the dagger; and everything, from a personal lam-

poon to a political libel, was given out as one of the *pasquinade*, or sayings of Maestro Pasquino.

At length the thread of Pasquin's life was severed by the shears of destiny; and then the pontifical government, rejoicing in the fall of its great enemy, cried havoc, and let slip the dogs of the police. Jibing was no joke now. Every man was held responsible for his own jest, and made to laugh for it on the wrong side of his mouth. Humour was buried in the grave of Pasquin—but not for long; for it arose again, as we shall presently see, with his monument. Opposite the tailor's shop-door the kennel was hardly fordable in wet weather, and a large irregular oblong block of stone had been laid down across it to serve as a permanent bridge. This block, as happens frequently in Italy, was of marble; and as it lay prone upon the street, half imbedded in the earth, it bore a kind of uncouth resemblance to a human back. The analogy was first detected by the urchins of the neighbourhood, who took a fierce pride in trampling upon the effigy of one of the giants of their race; but after the death of Pasquin, a superstitious awe mingled with their triumph, and when the shades of evening had fallen, they were observed to look upon it with suspicion, and occasionally even to cross over, and, like the Levite, pass off the other side.

At length, in the progress of some improvements that were making in the street, this block of marble was raised out of the kennel, and, to the surprise and joy of the Roman antiquaries, discovered to be a splendid torso. Its place of sepulture was near the piazza Navona, the site of the ancient amphitheatre, where the Emperor Alexander Severus celebrated the Agonalia; and the grand puzzlement was to decide whether it was the remains of a statue of a fighting gladiator—of a Hercules—of an Ajax—or finally, even of a Patroclus carrying a Menelaus, since another torso was found at no great distance, which might originally have been in union with it. Whatever it represented, however, it was esteemed a fine monument of ancient art, and its reputation with connoisseurs continued to increase rather than diminish, till, in the course of another century, it was placed by a critic of some authority above the best remains of antiquity, even the Laocoon and the Belvidere Apollo. We are told, it is true, that a German antiquary took this decision in such bad part, that he was about to box the ears of the panegyrist, whom he believed to be laughing at him; but we shall find that it was the fate of the statue throughout to cause such misunderstandings.

When the kennel-bridge of Maestro Pasquino was discovered to be an antique torso, it was placed upon a pedestal against the Pamphili palace, on the other side of the way; but no change of position could sever its connection with the defunct tailor. The discomfited urchins, looking up in wonder and veneration, gave their great enemy his name; and while the antiquaries were arguing and scolding about its origin, the people decided that it was the statue neither of Hercules, nor Ajax, nor Patroclus, but of Maestro Pasquino. Nay, when the Pamphili palace gave way in 1791 before the construction of that of Orsini, the latter relinquished its own name, like an obsequious heir, and was known thenceforward as the Pasquin palace. This, however, is not to be wondered at, since, at the moment when the mutilated statue was exalted on its pedestal, it was consecrated by the genius of the tailor, that before had seemed buried with him. It spoke with his voice—even with the Doric vulgarities of his tongue;

it breathed around his fine and pungent spirit; and every morning the Romans ran in crowds to read on its twisted back the bulletins of Pasquin. Satire, sheltered once more under the venerable name, was now as free as ever. The pontifical police retired discomfited; libels and lampoons became anew the order of the day; and Rome was never off the grin for a moment.

A collection of the sayings of Pasquin would be a curious work; but more curious, we fear, than amusing, since the associations of the time which gave pungency to the wit would now be wanting. A few political squibs are all that are preserved, and even these are not very remarkable to us of the present generation. But Pasquin did not merely speak in his eloquent placards; he assumed, on great occasions, a befitting costume, and became thus one of the *dramatis personæ*. Nor was he always a railer or jester; sometimes, in deference to public honour and virtue, he converted his natural grin into an approving smile. This was a policy which the professional wits of our own day would do well to follow. There is nothing so dull as a jest-book, and nothing so tame and stingless as an unbroken succession of satires. In 1571, when Colonna returned in triumph from the battle of Lepanto, he found Pasquin clothed in warrior's garb, with his helmet surmounted by the watchful dragon, and in his hand the bloody head of the Turkish prince, with a mortal gash on the brow. Twenty years after, when Gregory XIV., on mounting the throne of St Peter, passed through the street on his way to the Lateran Church, he received the homage of Pasquin, who had transformed himself, for the occasion, into a true courtier. He had restored his nose, and his mutilated arm, and wore a gilded helmet; carrying a sword in one hand, and a pair of scales, a horn of abundance, and three loaves, in the other. All this signified generally justice and plenty; but the loaves were a personal compliment to the pope, who had placed loads of bread in the public places, where it was sold to the people at a third of the usual price.

All this, however, is out of the usual character of Pasquin, who generally mingled a sneer even with his commendation. He was a great patron, for instance, of Sixtus V., to whom Rome was indebted for numerous fountains; and he signified his satisfaction with the pontifex magnus by dubbing him *fontifex magnus*. One day a Swiss of the papal guard struck with his halberd a Spanish gentleman, who promptly returned the blow, and with such effect, that the Swiss died of the chastisement. Upon this, the pope caused it to be signified to the governor of Rome that he would not dine till justice was done, and that he wished that day to dine early. Everybody knew that it was needless to plead for the criminal's life; but for the honour of his family, the Spanish ambassador and several of the cardinals interceded with the pope to have him decapitated like a gentleman. 'He shall be hung!' was the reply; 'but in order to diminish the disgrace of the execution, I shall myself assist at the ceremony.' The gibbet was accordingly erected under his windows, and when Sixtus V. had his love of justice fully gratified, he went in to dinner, thanking God for his appetite. The next day Pasquin was seen loaded with chains, halberds, gibbets, cords, and wheels; and being questioned on the subject, replied, 'It is a ragout I am carrying to excite the appetite of St Peter.' Numerous other pasquinades were directed against the severities of the pope; but they were too much intermingled with the religious heartburnings of that day to be read with much interest in ours. Sixtus, however, took everything very tranquilly, being aware of the immunities of Pasquin; till, unluckily, the satirist attacked the dignity of his family in the person of his sister Camilla Peretti. This lady, before her brother's elevation, had been indebted to her own exertions in a particular line of industry for her support; and in allusion to the circumstance, Pasquin was one day seen in a very dirty

shirt, which he explained by saying that the pope had made his washerwoman a princess. Sixtus made many vain attempts to discover the author of this insult; till at length he offered him his life and a thousand pistoles for a confession, threatening him with the gibbet if he should be denounced by another. The terms were irresistible. The wit immediately presented himself at the Vatican, acknowledged his guilt, and demanded the reward. Sixtus was, as usual, just. He gave him his life, and the promised money; but had his tongue pierced, and his hands cut off on the spot, in order to prevent him from getting into any similar scrape for the future.

This affair, it may be supposed, shut the mouth of Pasquin for a time; but by degrees he resumed his audacity, till Adrian VI., in a transport of rage, ordered the anonymous joker to be cast into the Tiber. 'What!' said he, 'in a city where we can shut so closely the mouths of men, is it so difficult an affair to silence a block of marble?' But one of his courtiers turned him from the project, by assuring him that it would be vain to drown Pasquin, since his voice would be heard all the same from the bottom of the river like that of a frog in a marsh. But the threat appeared to be of more avail than perhaps would have been the actual deed; for it is certain that the spirit which animated the statue became comparatively silent from that moment; and in the present day, the jests of Pasquin are heard only during the sitting of a conclave.

In this brief memorial of Pasquin, it would be improper to omit mention of his rivals. The principal of these was Marforio, a statue discovered about the beginning of the sixteenth century near the arch of Septimius Severus, and eventually placed in the Capitol. The connoisseurs quarrelled about its origin as bitterly as about that of Pasquin; but although some would have it to be a Jupiter, some a Neptune, some an Oceanus, &c. it received its popular name from the place where it was found—the Forum of Mars. Pasquin and Marforio were rivals, inasmuch as the one represented the townspeople, and the other the aristocracy; but yet they were likewise comrades and accomplices, lending themselves to each other's jokes, like the Clown and Pantaloon of a pantomime. This was done by means of questions and answers. When Pasquin, for instance, appeared in the dirty shirt, it was Marforio's cue to ask him what he meant by such an impropriety. In fact the conferences between the two marble jesters became of public importance, and exercised a greater influence over opinion than is commonly imagined. 'Be virtuous and humble,' says Sabba di Castiglione, 'for thus only can you escape the tongues of those two old Romans, natives of Carrara—Maestro Pasquino and Maestro Marforio.'

The aristocracy and the townsmen of Rome being thus represented, a third interlocutor was in due time added to the society to speak for the people. This was a *facchino*, found near the church of San Marcello, spouting water from a barrel into a carefully-sculptured shell. It was not, like the others, of ancient origin, being born of a chisel of the fifteenth century; neither was there anything very remarkable in its form; but this made it all the more proper to represent the people. The fashion, however, did not stop here. Babuino, an old figure of a satyr, resembling more a baboon than anything else (whence its name), put in its word; and then came the Abbé Sevigi, another statue so called by the populace; and finally, Madona Lucrezia, a colossal female, the object of the rival gallantries of Pasquin and Marforio. The court was at length in dread of a general conversation among the monuments of Rome; but fortunately the fashion extended no further than the six we have mentioned; and even these, after a time, grew tired of repartee, and returned to their marble repose. As for Lucrezia, it has been surmised that, notwithstanding the coldness and hardness of the materials of her heart, she was in reality not untouched by the tender assiduities of her admirers; since, on the 25th of April in the

year 1701, the day of St Mark, and the festival of Pasquin, she was known to wear a new and elegant bonnet, and to have a lace scarf on her shoulders in the very last taste of the day.

PHILOSOPHY FOR FARMERS.

THE relaxation of commercial restrictions has had, among other effects, that of giving an impulse to agricultural industry, which has long borne the reproach of being behind the age. According to some authorities, agriculturists generally have proved themselves the most unteachable of mortals, willing rather to obey a mechanical routine, than to be guided by true principles. Whether such be the case or not, the ceaseless labours of the press are doing much to remove ignorance in every quarter; and science, which gradually insinuates itself into all human operations, is doing for agriculture what it has done for manufactures—taking it out of the domain of uncertainty, and showing it to be equally dependent on natural and philosophical principles. With these aids, and a more active competition, there can be little doubt but that agricultural pursuits will soon become characterised by a high degree of commercial activity.

It frequently happens that valuable scientific treatises are published, which remain totally unknown to the general reader, and thus become lost for purposes of practical utility. A paper of this character, on 'The Philosophy of Farming,' which appears to us to be deserving of wider circulation, has just made its appearance in the last volume of the 'Manchester Philosophical Society's Memoirs.' According to the author, Mr Just, 'all cultivation consists in bringing to the plant, or placing within its range of action, such a supply of material as natural means cannot furnish it with in the situation where it grows. In order to cultivate well, it is therefore as necessary to know what plants want, as for the builder and contractor of material to know what is required for building.' It is now pretty well understood that the growth of plants depends less on solid nourishment, than on fluid and atmospheric agents, of which the chief are carbonic acid gas, azote, and water. In chemical language, these comprise four atomic elements; and according to their presence in the soil, is the abundance and deficiency of the crop. On the continent, the investigations of Liebig and Dumas on this important subject, as well as those of scientific men in this country, have brought to light many important facts and data, the whole extent of whose application is yet a matter of research.

Perfect drainage appears to be no less essential for fields than for towns: to secure an abundant supply of the elements above enumerated, the main requisite consists in due permeability of the soil, so as to admit of proper drainage. Hence it is that clayey lands, by favouring accumulations of stagnant water, are in so many instances unproductive. The disposition of the drainage should, however, be such, that the whole of the soil concerned in the growth of the plants is permeable by the air, promoting a constant filtration and succession of materials that contribute to vegetable formations. Rain brings down ammonia from the atmosphere, and its beneficial effect on lands is greatly increased where the drainage is good, as the atmospheric particles then find their way readily to the roots of the plants, and the mineral substances in the soil are more effectually dissolved. 'The two fundamentals of all good farming,' says Mr Just, consist in 'thorough percolation of water through the soil, and a constant accession of air.' Rapid drainage is not less important; main drains ought to cease discharging at the end of four or five days, instead of, as at present, as many weeks, ceasing only in long droughts; and to be dug so low, that the superabundant moisture of the surface shall be at once effectually discharged, with a constant current, otherwise the drains soon become choked by mud. It is evident that the mechanical

arrangement of drains must vary with the nature of the locality to be drained; and no attempts at drainage should be made without first ascertaining the nature of the subsoil. The following data are given as guides to the inexperienced:—'If, when the soil has been carefully removed from an area of a few yards in extent, and the surface of the subsoil has been left to dry, water is found to accumulate within it, when dug into, then that subsoil is drainable, and will draw water from the surface according to the depth dug; and the ground may be made perfectly dry by the usual kinds of drains, provided those drains be laid sufficiently deep, and allowed a free discharge. Whereas, if, after the same preparation, the subsoil or clay, when dug to a greater or less depth, be perfectly dry, then no drainage can be effected therein by ordinary methods, and recourse must be had to opening transit for the surface water in open channels, so that the supersaturation of the soil may run off as directly and quickly as possible.' The author contends that land cannot be drained too dry, as fluids are not so essential to the growth of plants as aerial and gaseous matters, and perfect aëration is as much required as perfect drainage. Air brings constant supplies of material from every quarter; and where the soil is kept properly drained, conveys nourishment in certain but invisible forms to the roots of crops. Another advantage attendant on aëration of the soil, is the increased economy and effect of manure; the more perfect the pulverisation of land, the more immediate is its contact with, and absorption of, the manures thrown into it; the descent of new particles into the subsoil is facilitated, and the whole quantity of productive soil is increased, with a fund of capability, so to speak, always at command within it.

From discussing the mode of treating soils, Mr Just passes to that of sowing seeds. 'Scattering seeds,' he says, 'indiscriminately over the surface of the ground previously prepared for their reception, is no more sowing them, than tumbling stones into trenches properly dug for the foundation of a building is laying those foundations.' The object of sowing is to secure proper germination of the seed. Seeds are to vegetables what eggs and ova are to animals; the condition of development of the latter is warmth and protection. With seeds it is 'a proper degree of temperature, a sufficiency of moisture, and a free access of air, with exclusion from the direct action of light.' Hence the great advantage of complete pulverisation of the soil, that the seeds may not be buried deeply, and yet at the same time sufficiently covered: for, if within the influence of light, the chemical change of the farinaceous matter of the seed into living tissues is retarded; on the other hand, if buried too deeply, the plant is so much exhausted by its efforts to reach the surface, as to impede materially its future growth. A large amount of seed is annually lost by falling into the hollows between the furrows of ill-ploughed land. 'It is not to please the eye only that the ploughmen of Westmoreland, Cumberland, and other well-cultivated counties take so much pains in drawing their deep furrows as straight as a line can make them, and laying them so compact, that not a crevice between them can be found in fields of many acres; but it is to favour this grand and fundamental principle of growth, though perhaps in few instances this service may either be known or appreciated by them.' The importance of these considerations becomes manifest, when regard is had to the physiology of seeds. The greater part of their substance is simple nutritive matter, intended for the support of the young plant until it can take care of itself. But if this nutritive matter is to be expended in efforts to escape from unnatural circumstances, it is clear that the capacity for growth will be diminished. A starved seed can no more grow up into a healthy plant, than a starved infant into a healthy man; and if so much care be bestowed on exposing steeped barley frequently to the air, to insure simultaneous germination, while being converted into malt, ought less care to be shown to

seeds while in the soil, when the food of millions is dependent on their proper growth?

The waste and misapplication of manure in this country is deplorable, and have been so often complained of by writers, that it might seem supererogatory to insist upon it farther; but there are some subjects to which attention can only be successfully directed by constant iteration and reiteration. In many parts of Germany and in Belgium, the most rigid economy prevails with regard to all waste animal and vegetable matter, and its proper application to land. In China, the same course has been pursued for ages; and, according to Mr Fortune's recent work, is still maintained in full activity. The measures now in contemplation for the effectual sewerage of towns are fraught with incalculable advantage to the agriculturist; but without some acquaintance with chemistry, no person can be certain that the manure he applies is that required by the soil, and a distinction must be drawn between germination and vegetation. Highly azotised manures are favourable to the latter process, but unfavourable to the former. Mr Just says, 'Guano sown along with the seeds of turnips prevents their germination, whereas, when scattered over the soil, or buried in the drills beneath the seeds, it promotes the vegetation of the plants to a very great extent afterwards. The same is the case when liquid manure, from banks in farm-yards, is applied to soils previously to sowing the seeds. I have known turnips sown on ground so treated fail to germinate entirely; and by injudicious application of night-soil, as a dressing for crops of barley, I have seen numbers of the grain totally destroyed by contact with it, and those which escaped pushed on to such a rank vegetation after this destruction, that they could neither fructify properly nor ripen.'

The same principle holds good with regard to propagation by means of buds and tubers; and here, at the risk of prolonging what is felt by many to be a wearisome subject, we quote Mr Just's observations on the treatment of the potato. 'The cuttings of potatoes,' he writes, 'or the whole tubers which we plant, have to undergo a similar change in spritting as seeds undergo in germination, and require similar conditions to favour that change and aid germination. Yet in our treatment of this most valuable and accommodating of all plants given to man for food, we err more against nature than in all others put together. Patient of every climate under the sun, we forget that it can be subject to any wrong, or require any of our care or concern for its welfare. Prolific beyond our wants, we have glutted our domestic animals with it, and employed it largely in the arts and distillery to contribute to our luxuries. Yet there is a limit to all things, and we are approaching the limits of the abuse which we can unrequitedly heap upon it. Something is wrong already both in the field and in the store; already it has partially failed in its germination during the spring; already it has become the prey of disease in its vegetation and maturation in the autumn. Nature is vindicating her right to be obeyed; and since we have neglected to learn from her by lessons of examples which she has offered, she seems determined to make us wise by dear-bought experience—to make us feel, that we may remember.'

'The first law of nature against which we transgress with regard to the potato, is in our total neglect of the due preservation of our seed potatoes. If they are only good for food, we never inquire whether they are fit for planting. Yet were we but to reflect one moment, we should soon see how unnaturally we treat them. Nature, when she alone takes care of them, keeps them within the soil—like all other subterranean buds—during their season of repose; and because, in the warm climates, where they are indigenous, they cannot easily be cut off from a due temperature for their germination, she checks it by keeping them dry in the soil. We, on the other hand, dig them up from the ground, because we fear, and properly, the effect of frost upon them; but instead of keeping them dry, we heap them up wet

in immense quantities on the ground, and cover them over there, to keep them so, *with soil*, thereby furnishing them, if they do not rot, with one requisite for germination; while the masses themselves raise and keep up the temperature to supply them with another, so that germination has not only commenced, but proceeded considerably, when we dig them up again for planting. Then, calculating upon the extraordinary degree of vitality with which nature has endowed the tubers, we pull off the sprits, cut up the potatoes, and endeavour to reduce that vitality to as low an ebb as possible before we plant them. If, by the spritting of potatoes, the whole of the diastase, situated just below the embryo in seeds, be expended, then there is no provision left for the conversion of fecula into saccharine matter for the formation of the first tissues of germination, and germination must therefore fail.'

When it is borne in mind that the cuttings, weakened as described, are in most instances planted in highly azotised soils, surprise at the general failures which have taken place will be greatly lessened. The remedy consists in storing up the potatoes intended for seed in places perfectly dry and dark, and, instead of one large mass, in small heaps, so that all tendency to generate heat may be obviated. The precautions with regard to the aëration of young grain crops are equally to be attended to with the young plants of potatoes. Without frequent stirring of the soil while the roots are forming, and complete aëration or ventilation, however favourable other circumstances may be, proper growth is not to be expected. The objects to be striven for by the agriculturist and cultivator are of such importance, as to reward any degree of perseverance. Implicit obedience to natural laws never fails of commanding success. Nature is not to be forced or diverted from her economy: the bringing to bear a little plain practical common sense on her multifarious modes of action, must tend to the realisation of the sound theoretical views of the chemist and meteorologist.

BARROW-BEGGARS.

MANY of our readers may not be aware that, some forty years ago, it was common, and still may be in some districts of Scotland, for mendicant cripples to be carried about the country in a handbarrow. It was incumbent on the individual at whose door the cripple was set down, to bestow the customary alms of a handful of oat-meal, or whatever largesse their bounty might prompt, and forward him or her, as the case might be, on to the next farmhouse—sometimes a few yards' distance, sometimes a mile—or, if not so forwarded, the beggar behaved to be lodged and fed by the person at whose door he was placed. In villages or small towns such conveyance was easily accomplished; but in thinly-populated country districts it was not unfrequently a matter of much trouble and inconvenience, where the great distance between the dwellings rendered it a positive burden.

Occasionally, the house at whose door such lamiter was laid was tenanted only by females, sometimes by a solitary aged woman, or by an aged and decrepit woman and her equally aged and decrepit husband. In such cases the only alternative was to hire assistance, if it could be found; or if the party was too poor to pay, the individuals who brought them would resume their burden, and tramp on to the next dwelling; and as these *barrow-beggars* were generally peremptory and irascible in their manners, to get rid of them was usually accounted a boon. Thus these lordly sorners performed a sort of alms-gathering ovation through the length and breadth of the land. When I was a boy of ten years of age or thereabout, one of these pests was set down at the farmhouse where I was the herd. She—for it was one of the tender sex—was a large, sallow, broad-shouldered Amazon, with a world of well-filled *meal-pokes* hanging round her burly person, over which depended a piece of greasy blanket, by way of mantle, and which was

secured at the throat by a large brass bodle-pin. She was dignified too, and evinced the bearing of a Semiramis—surly, imperious, and commanding as any beggar on horseback could be; and as the master and all the men and womenfolk were half a mile off, busy on the hairst rig, the goodwife—who, with myself and a half-witted son of the farmer, a lad of sixteen years of age, were the only inmates of the town—was sadly perplexed as to the disposal of the vagrant.

She had received a liberal *assuance* of two *goupens* of meal, bread and cheese, and a drink of milk, for which she evinced not a particle of gratitude, but sat on her well-stuffed cushion (I remember wondering if it could be meal) in sulky and offended dignity, till she should be conveyed to the next farm—steading, nearly a mile distant. After waiting nearly an hour, during which period this locomotive volcano manifested various symptoms of an eruption, by breaking out at frequent intervals in wrathful mutterings, at length a welcome relief appeared in the person of Randy Rob, a weaver lad from a neighbouring village, who at this juncture came up the croft whistling 'Maggie Lauder.' Rob had been fishing in the Earn, which ran immediately in front of the house; and to him the goodwife applied, with the promise of a liberal hire, to carry the lame woman to Cauldside, the next farm town. Rob readily undertook the job, provided Tam (the daft son) would carry one end of the barrow. Tam was delighted at the proposition; and after the two had whispered together for a moment, they were to be seen, with their portly burden, moving solemnly down the path that led by the side of the river, Rob in front, Tam behind. At first their pace was grave, then lively, then briak, then zig-zag; anon, as if a new fancy inspired them, they danced and sung as they went, making the mendicant perform the most wonderful feats with her body and arms to preserve her equilibrium. At last, as if impelled by a new whim, they took to running; and as their path was close on the margin of the stream, and the jolting immense, the beggar woman was sadly put to her trumps to keep herself steady. The race was a short one; for as soon as Rob perceived that the footpath led them close to the river, where it was free of brushwood, he shouted, 'Noo, Tam!' and in an instant the beggar, bags, barrow, and all, were soused in the Earn.

In another instant she stood up to her middle in the stream, from which she was not long in extricating herself. To disencumber herself from the saturated meal-pokes, and rush after her now affrighted tormentors, was but the work of a moment; and the speed with which she gained on them was astonishing. The goodwife and myself had at the outset mounted the loupin'-on-stane to see the fun; and the worthy woman, with uplifted hands, uttered an ejaculatory 'Loeh guide us!' as she beheld the beggar woman—she that had been born a cripple—overtake Randy Bob, and lend him a 'lunt i' the lug,' as she phrased it, 'that laid him on the craft as dead's a herring.' With Tam she was less successful, for Tam was lathy and light of foot, and mortal terror had lent wings to his heels. But the lame woman, after swearing like a trooper, and threatening 'to gi'e the hale toun a het waukening for't some misty morning,' took herself off, and was never again seen in that part of the country.

As for Randy Rob, he always maintained that 'he kent she could gang, but never jaloused the jaud was sae souple o' fit, or he wad ha' ta'en sooner to his heels.' As it was, he said 'his lugs rang wi' that uncanny thud for sax weeks after.'

OCEAN PENNY POSTAGE.

UNDER the name of 'Ocean Penny Postage,' Elhu Burritt, that indefatigable apostle of peace—would that he could impress his hatred of war on his own countrymen!—has for some time been agitating the project of extending the penny post to correspondence with America. As the weight of letters on ship-board must be relatively trifling, it does not appear to us that any physical difficulties could

stand in the way of such a scheme, and in other respects we feel assured, with Burritt, that there could be no serious obstacles to the undertaking, at least none that would not disappear on an earnest consideration of the subject. Of course this consideration would require to be mutual on the part of the British and North American governments. The real difficulty, we apprehend, will not be found with England, but with the United States, which have not yet obtained even a domestic penny post. In the following observations of Burritt, contained in what he calls 'An Olive Leaf for the English People,' the argument as to how an Ocean Penny Post 'will pay' seems fairly reasoned:—

'In asking England to give the world an Ocean Penny Postage, we do not ask or expect her to sacrifice a single farthing of revenue. Leaving for a while the consideration of the vast benefits which would accrue to commerce, civilisation, and Christianity, from an Ocean Penny Postage, let us discuss the important question, whether such a measure be practicable, or, in other words, whether it would *pay*; whether England would derive, directly and indirectly, as much revenue from a *penny* rate as from the present shilling rate of ocean postage. As the commerce and correspondence between England and America must be greater hereafter than that between any other two sea-divided countries on the globe, and as provisions are made and making for more frequent steam communication between them than between any other two countries divided by such an expanse of water, let us first inquire whether an Ocean Penny Postage would pay, if established between these two kindred countries. In instituting this inquiry, we would present the evidence of certain facts connected with the present and proposed rates of postage between England and America.

'1. The present shilling rate of postage, being exacted on the English side too, in all cases, and thus throwing the whole cost of correspondence upon the English or European correspondents, greatly diminishes the number of letters which would otherwise be transmitted to and from America through the English mail.

'2. In consequence of the present high rate of postage on letters, newspapers, pamphlets, magazines, &c. a large amount of mail matter conveyed across the ocean lies *dead* in the English post-office—a dead loss to the department—the persons to whom it is addressed refusing to take it out on account of the postal charges upon it.

'3. Under the present shilling rate, it is both legal and common for passengers to carry a large number of *unsealed* letters, which are allowed as letters of introduction, and which, at the end of the voyage, are sealed and mailed in England or America, to persons who thus evade the ocean postage entirely.'

Of the benefits of an Ocean Penny Post, commercial and social, much could be said; as a means of creating and preserving friendship, it would be invaluable.

'It would,' continues Burritt, 'put it into the power of every person in America or England to write to his or her relatives, friends, or other correspondents across the Atlantic, as often as business or friendship would dictate or leisure permit.

'It would probably secure to England the whole carrying-trade of the mail matter, not only between America and Great Britain, but also between the new world and the old, for ever.

'It would break up entirely all clandestine or private conveyance of mail matter across the ocean, and virtually empty into the English mail-bags all the mailable communications, even to invoices, bills of lading, &c.; which, under the old system, have been carried in the pockets of passengers, the packs of emigrants, and the bales of merchants.

'It would prevent any letters, newspapers, magazines, or pamphlets from lying dead in the English post-office, on account of the rates of postage charged upon them; and thus relieve the department of the heavy loss which it must sustain from that cause under the present system.

'It would enable American correspondents to prepay the postage on their own letters, not only across the ocean, but also from Liverpool or Southampton to any port town or village in the United Kingdom; to prepay it also to England, by putting two English penny stamps upon every letter weighing under half an ounce.

'It would bring into the English mail all letters from America directed to France, Germany, and the rest of the continent, and *vice versa*.

'It would not only open the cheapest possible medium of correspondence between the old world and the new, but also one for the transmission of specimens of cotton, woollen, and other manufactures; of seeds, plants, flowers, grasses, woods; of specimens illustrating even geology, entomology, and other departments of useful science; thus creating a new branch of commerce, as well as correspondence, which might bring into the English mail-bags tons of matter, paying at the rate of 2s. 8d. per pound for carriage.

'It would make English penny postage stamps a kind of international currency, at par on both sides of the Atlantic, and which might be procured without the loss of a farthing by way of exchange, and be transmitted from one country to the other at less cost for conveyance than the charge upon money orders in England from one post-office to another, for equal sums.'

CONTENT AND DISCONTENT.

Two little girls went into the fields to gather flowers. Here they found buttercups, dandelions, violets, and many other pretty blossoms. One of the children was pleased with everything, and began to pick such flowers as she met with. In a little while this girl had collected quite a bunch of flowers, and though some of them were not very handsome, yet altogether they made a beautiful bouquet. The other child was more dainty, and determined to pick no flowers but such as were very beautiful. She disdained to gather the dandelions, for they were so common; and she would not pluck the buttercups, for they were all of one colour, and did not take her fancy. Even the blue violets were not good enough for her. Thus the little pair wandered on through the fields, till they were about to return home. By this time the dainty child, seeing that her sister had a fine collection of flowers, while she had none, began to think it best to pick such as she could get. But now the flowers were scarce; not even a dandelion, a buttercup, nor a violet was to be found. At length the little girl begged a single dandelion of her sister, and thus they returned home. When the two children went to their mother, she asked how it happened that one had so pretty a bouquet, while the other had but a single flower. The children told their story, and their mother then spoke to them as follows:—'My dear children, let this little event teach you a useful lesson. Jane has been the wiser of the two. Content with such flowers as came in her way, and not aiming at what was beyond her reach, she has been successful in her pursuit, and has brought back a beautiful bunch of flowers. But Laura, who could not stoop to pick up buttercups and dandelions, because she wanted something more beautiful than could be found, collected nothing from the field, and was finally obliged to beg a dandelion of her sister. Thus it will always happen, my children, in passing through life. If you are content with simple pleasures and innocent enjoyments, such as are scattered freely along your path, you will, day by day, gather enough to make you contented and happy. If, on the contrary, you scorn simple pleasures and innocent enjoyments, and reach after those which are more rare and difficult to be obtained, you will meet with frequent disappointments, and at last become dependent upon others. Seek not, then, my children, for costly enjoyments or extravagant pleasures. Be industrious in gathering those which are lawful, and which are adapted to your situation. In this way you will cultivate a contented spirit, and secure your own peace. If, on the other hand, you disdain enjoyments that are suited to your taste and capacity, you will be hard to please, and perpetual discontent will dwell in your bosom. Thus you see that one course will result in something better than riches, while the other will bring evils that are worse than poverty.'—*Green's Annual*.

DOGMATISM.

Maintain a constant watch at all times against a dogmatic spirit: fix not your assent to any proposition in a firm and unalterable manner, till you have some firm and unalterable ground for it, and till you have arrived at some clear and sure evidence—till you have turned the proposition on all sides, and searched the matter through and through, so that you cannot be mistaken. And even where you think you have full grounds for assurance, be not too early nor too frequent in expressing this assurance in too peremptory and positive a manner, remembering that human nature is always liable to mistake in this corrupt and feeble state.—*Watts*.

LAMENT OF THE 'RASH BUSS.'

I'm an auld residenter on mony a farm,
And never yet dreamed that I did ony harm;
Among nature's gentry I held up my head—
Took up wi' nae greedy or grovelling weed;
My food is the rains, and the dews, and the springs,
My neebors a' happy and innocent things:
I canna weel tell what offence I can gie,
A sponsable, dounce residenter like me.

Fræ could sleety showers I defended the lamb,
That gratefu' played round me when simmer days cam';
The gowans and buttercups found me a bield;
Each humble companion I'd shelter and shield;
The lark in my bosom oft biggit her nest,
And nursed her brood till they flew from my breast;
The patrick, the pewee, the wild bumble bee,
Looked up to an auld residenter like me.

When schuils they wad scale, how the bairnies wad scrow
Around me, and ilka ane pook at my pow!
They thoughtna o' lesson, o' question, or creed,
While plaiting o' caps for each wee curly head;
Wi' whips or wi' rattles, the simmer day lang,
The wee bits o' birkies were happy and thrang.
But alas for their daffin, their fun, and their glee,
There's a plot laid to starve and exterminate me!

When threatened, I thought that I never could fall
Of safety, while lasted the law of ENTAIL.
My last hope is vanished, for now ye maun ken
My doom is decreed; for the parliament men
Have loosened the strings o' the purse o' the State,
And lavished forth gold for to hasten my fate.
The high and the low men of every degree
Have leagued for to starve and exterminate me.

They've cutt'd lang undays, I think they ca' drains,
The deil tak' the hale o' the pack for their pains!
They've ta'en my heart's bluid wi' their newfangled plans,
I wither and pine 'neath their merciless hands.
There's Smith, and there's Parkes, and there's Mechi, and
thers,

Although just no banded thegither like brithers,
Yet in their great object they stiverly agree,
And that is to starve and exterminate me.

They say that there's multiplied mouths on the earth—
A 'spirit' abroad—I must yield, and so forth;
I'll lift up my voice, and as lang as I'm able,
I'll cry like the frogs to the boys in the fable—
'This sport may be brimful of hope to mankind,
This sport may heap blessings on blessings behind;
Though sport unto them, ah! it's death I maun drce:
Sad fate for an auld residenter like me!'

ANNAN, July 1847.

JOHN PALMER.

CHAMBERS'S INFORMATION FOR THE PEOPLE.

SOME months ago, we announced that, after the 1st of May, we could not insure a supply of odd numbers of the above work, and expressed a hope that parties would not delay to complete sets. Since that time, the stock of numbers on hand has been pretty nearly exhausted, and, with a few exceptions, we cannot now undertake to furnish any separate sheets. In the course of October, the stereotype plates of the work will be either altogether cancelled or considerably altered, with a view to the issue of a new edition, the publication of which will commence, immediately on the completion of the Tracts, towards the end of November.

This proposed new edition of the *INFORMATION FOR THE PEOPLE* will consist of the same extent of numbers (100) as that now withdrawn, but will in other respects be very materially improved. Some subjects will be omitted, or greatly condensed, and others of a more enduring and important nature will take their place. The subjects will also undergo an entirely new arrangement, and the appearance of the work will be improved by leaving out the general title on each sheet. The principal aim of the publishers is to render the work more encyclopedic than it has hitherto been, more perfect as regards the later discoveries of science, and consequently more worthy of the approbation which it has been so fortunate as to secure. Prospectuses further explanatory will in due time appear.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 98 Miller Street, Glasgow; W. S. OMA, 147 Strand, London; and J. M'GLASHAN, 31 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 190. NEW SERIES.

PRICE 1½

A VISIT TO WESTMINSTER—BUT NOT THE ABBEY.

ABOUT ten o'clock in the morning, as you walk down towards Westminster, it need not excite your surprise to meet a pretty considerable current of individuals setting out on their daily profession of begging—real or sham poverty-stricken wretches, blind, lame, or deformed; women in rags, hung down with infants; organists, fiddlers, and hautboy players. All are going out on an excursion in search of daily bread, and respectively take themselves off towards the streets of the opulent and compassionate. Each has his beat. Mingled with this stream of mendicants may be observed numbers of individuals going forth, not to beg, but to seek for some species of honest employment—workmen out of work, and pale-faced sempstresses who gladly toil the livelong day for a groat. Towards evening a different set of persons—shabby, but clever, ingenious, and up to anything—issue from the same locality. Bedouins of the streets, their line of business is plundering the rest of the community. The spot whence these various classes proceed is one of many such in the metropolis. Situated immediately to the north of Westminster Abbey, from which it is separated only by a thin border of decent-looking mansions, it consists of a cluster of narrow streets, lanes, and courts, the whole of which seem very much left to themselves in the way of scavenging. On the same principle that an Irishman in rags is more picturesque than an Englishman in a whole doublet, the scenery of these streets would form a favourable study for artists. George Moreland would have found subjects for his pencil in every alley—windows broken, and partly mended with paper and old hats; pigs in one corner of a court, and a donkey eating cabbage-blades in the other; queer-looking men and women lounging at doors; viragos scolding children, whose amusement for the last hour has been throwing about a dead rat; nondescripts in half-male and half-female attire selling decayed strawberries out of wheelbarrows—such would be the materials of the picture. The yells and smells to complete the piece could not unfortunately be put on the painter's canvas. And all this is going on daily within a stone's throw of one of England's proudest temples! How grateful to the wearied soul the sweet tones of the organ swelling through the aisles of the abbey! How beautiful and appropriate to man's infirmity the prayers and litanies chanted by priests and choristers! How utterly valueless the fabric and all its contents, living and dead, as far as the Christianising and humanising of the neighbourhood is concerned!

Deserted pretty much by church and state, or left only to the perambulations of the policeman, the quarter to which I allude has latterly been discovered to be not

exactly what it should be; and so far has improvement gone, that at present a strath of houses is in the course of clearance, in order to permit the opening of a new thoroughfare. But as nothing is correspondingly done to lodge the dispossessed inmates, it may be doubted whether the new and fine street will substantially lighten the bills of mortality. Another move towards improvement has been the introduction of schools for the lower surface children of the district. This move, as usual in such circumstances, has not come from the state; it has originated entirely in private benevolence. Yet the utmost which has been done is a mere trifle in comparison with what ought to be accomplished. Thousands of children roam about altogether unschooled, and thus in complete preparation for ruin body and soul. The case is a bad one; but the world cannot expect that a handful of benevolent people are to give half-crowns and guineas to educate all the children who come into existence. It is the public's business, and the public should see to it.*

A few weeks ago, in company with Mr Walker, a city missionary, and Lord Kinnaird, I visited this densely peopled part of the metropolis. Our first call was at a school where about a hundred and twenty children received gratuitous instruction; and from this we proceeded to the Juvenile Refuge or Ragged School, which has recently been set up in the neighbourhood, in Old Pye Street. Formerly a tavern of a disreputable kind with a skittle alley behind, the house has been repaired and adapted for the purposes of an establishment for feeding, educating, and teaching boys of the most abandoned and destitute class. The Ragged School Union, a body of benevolent subscribers, which has other similar establishments in operation, is at the expense of the undertaking. The manner in which the school is conducted resembles what I had seen in Aberdeen and Dundee, with this difference, that a few boys, who have no proper home, are allowed to sleep in the house with this exception, the pupils get dinner and a little bread for supper. The utmost pains have been taken to render the place unattractive as respects subsistence; nevertheless, I was told that the temptation of dinner and supper, poor as it was, had an evident tendency to empty the no-food-giving schools—a circumstance viewed with justifiable alarm by the managers, as which will require to be closely watched and guarded against. My own conviction from the first has been that unless conducted on a system of rigorous invest-

* By a statement lately published concerning Westminster, it is shown that out of a population of 57,000 persons, there are 16,000 children under twelve years of age, of whom 12,000 do not attend school. In Spitalfields and Bethnal Green, out of 112,000 persons it has been found lately by examination from house to house, that 16,000 children of an age for school do not go to any, not even Sunday school.—Third Annual Report of Ragged School Union.

gation, this class of institutions may, to a certain extent, prove demoralising, and seriously injure schools of a useful kind at which no meals are given.

There were nearly a hundred boys present at the time of our visit. The whole had just bathed, and were going through some bodily exercises to warm themselves. Of almost every one of them some anecdote could be told: a history of crime, suffering, and less or more of reclamation. One was the son of a coiner, lately transported, and his early years had been spent in signalling the approaches of the police to his father's abode; another who was pointed out was the son of a cab-driver, from whom he had habitually stolen all the money he could lay his hands on: this boy was now reclaimed, vastly to the satisfaction of his parent. Some rather curious facts were mentioned:—A well-known thief in the neighbourhood had brought his son to school, in order that he might not acquire his own bad habits. 'I lead a dog life,' said he, 'from which I would willingly preserve my boy; as for myself, I am too far gone to mend. Had there been such schools when I was young, I should not have been what I am. I propose giving a pound yearly to help the institution.' What a revelation! A man acknowledging himself to be a public predator, offers to support a school which is to prevent crime! Can society do nothing to bring this generous and repentant thief back to virtue?

The teacher, however, affords the best insight into the nature of the school. In his report he observes, 'I began work with a dozen boys, and gradually increased the number to fifty, all of whom were filthy and ragged, knowing nothing of order or decency. Some of these boys had been sent out daily by drunken parents to provide them with money by begging and stealing, being often treated cruelly if unsuccessful; others were employed in vending and assisting in the manufacture of base coin; many of them had been in the habit of prowling the streets at night, sleeping in sawpits, staircases—one among the ruins of an old arch, another for three successive nights in the inside of a large garden roller; others frequented theatres and public-houses, and some had been committed for petty thefts. Thus the school is a refuge for those who are just entering on a course of vice, or who may be discharged from prison for the first time. Already a great improvement is visible in these poor lads. They seem grateful for the care bestowed on them, anxious to please their teacher, attentive to his instructions, and decidedly improved in their moral character. Any one of the boys (eight in number) who sleep in the house I can now safely trust with money; and of all the parts of clothing which I have been enabled by kind friends to the school to give to the boys generally—such as trousers, shirts, boots, caps, and pinafores—not an article has been lost or misapplied. The masters of trades, in their daily reports to me, give equally favourable accounts; and for the very short time they have been engaged have made great progress. Some of the most ragged are already clad in trousers of their own making; the once filthy are becoming tidy; the lately vicious are now showing signs of superior habits; the formerly irregular are now punctual; and some come to school each day without breakfast, and go through their various exercises without tasting food of any description until dinner hour. This change in the boys is in many families already beginning to produce a powerful effect on the parents, begetting a care and solicitude for their children hitherto unknown, as well as a very kindly and respectful estimation of the institution itself.'

Our next visit was to a model lodging-house, 25 Great Peter Street. Various houses of this useful class have lately been established in London with a generally good effect. Ordinarily, the establishments in which

a poor person gets a night's lodging are of a very horrible character—dens of filth and disorder, the fertile sources of crime and disease. Not unusually from thirty to forty persons—men, women, and children, married and unmarried—are crammed into one apartment, without any regard to comfort or decency; and the scenes of confusion, fighting, and noisy disturbance they for the most part present baffle description. To supersede houses of this kind, it is not necessary for societies of benevolent individuals to do anything more than show from a few examples that a humble class of lodging-houses may be conducted on a proper footing by private parties, and yet be *made to pay*. This has been the view taken of the subject by Lord Kinnaird and his friends. They do not desire to arrest private enterprise, but only to give it a proper direction. Two houses of three storeys each, with a communication between, have been fitted up and rented; no expense for building has been incurred, the houses having been taken as they stand. One of the houses contains beds for single men, and the other has beds for families. Several beds are in each room; but those for families are secluded by intervening curtains. Nearly seventy individuals, exclusive of children, can be accommodated nightly. The beds appeared clean and neat, considering their character; and all else was in the best order—charge for a single bed 3d., for a double one 6d. For these charges, however, the inmates have the use of a kitchen, wash-house, and sitting-room, with every suitable accommodation for twenty-four hours. Conducted down stairs to the kitchens, I found several persons engaged in cooking. In the wash-house adjoining, several rows of small lockfast cupboards were pointed out, and each inmate can have the use of one on depositing 2d. for the loan of a key. If deposits were not taken, many keys would disappear and be lost. Up stairs, on the street floor, is the general sitting-room, with the rules of the house inscribed over the fireplace, and a table in the centre, at which books and papers may be perused. The keeper produced a small stock of books and periodicals (chiefly our own publications), which he described as being read with avidity, and, it may be hoped, with advantage. Three things, we were informed, contribute to maintain perfect order in the establishment—firmness in enforcing the rules, reading, and devotional exercises. Morning and evening a chapter of the Bible is read, and a few comments or words of exhortation follow; an appropriate prayer is also offered up. The officiating minister is a town missionary; but sometimes the inmates engage in reading verses of the Scriptures alternately, for mutual improvement and edification. It is interesting to know that these pious exercises are well attended, and eagerly indulged in; nor can we entertain a doubt of their efficacy. I remember being told of a dissolute individual—a victim—who in a distant country had brought himself to the depths of misery by his misconduct, bursting into tears on hearing read the first verse of the twenty-third psalm—

The Lord's my shepherd, I'll not want,
He makes me down to lie
In pastures green; he leadeth me
The quiet waters by.

Recollections of a happy childhood, of a fond mother and pious father, of sunny school days and early aspirations—aspirations blighted—all rushed across the mind of the unfortunate. A chord deep in the heart had been struck. From that time he was an altered man. Circumstances of this nature occasionally occur in the lodging-house we are speaking of. Religion, through the revival of early impressions, asserts her efficacy, and, let us hope, with permanent benefit. 'I have never,' said the missionary, 'met with the least opposition or disrespect at our meetings; the utmost attention prevails; and any one passing through the apartment is careful to make no noise. I never witnessed a more serious congregation. As to practical results, the general conduct of the lodgers has much

improved; cases of profane swearing and drunkenness, which at first were common, seldom occur; several have been expelled for drunkenness; some have begged to be admitted again, promising to reform, and have kept their promise; a number have obtained places and regular employment, and are in all probability rescued from a life of vagrancy. Several have given up dissolute courses, and been restored to their friends.' The intelligent keeper of the establishment corroborated these statements; and gave it as his opinion that the religious exercises were of the utmost value in producing a spirit of happiness and decorum among the inmates.

The order, cleanliness, security, and comfort which the institution offers, have made it a favourite resort of well-disposed individuals, who would otherwise have to seek refuge in the mean receptacles in the neighbourhood. Hundreds are refused admittance for want of room. And how does it pay? Admirably well. The entire expenses per annum, including interest on original outlay, are £150. The returns are from £4 to £5 weekly, or about £250 during the year; thus proving beyond a doubt that a humble class of lodging-houses may be well conducted, and yet be a source of profit. The returns, however, might be greatly extended, by increasing the accommodation, were that in the present instance desirable. But profit is not in itself wanted. The whole affair is a mere experiment, and as such it has already been most efficacious. Keepers of 'travellers' lodging-houses' in the vicinity have been compelled to attempt a reform. Thirty persons lying indiscriminately on the floor will no longer be tolerated. Nearly all the houses have been less or more cleaned; one keeper has introduced a distinction of rooms for married and single; and a house of the worst class has been shut up. The conviction is gaining ground that nothing but decency will any longer answer, and that good order is by no means incompatible with a full and sufficient profit. Similar efforts have led to similar convictions in other parts of London; and we may by and by expect to see the ordinary rivalry of private enterprise effecting a universal reform in one of the worst features of the metropolis.

From the model lodging-house in Great Peter Street, we proceeded on an excursion into some of the meaner alleys and courts in the neighbourhood, in order to see the accommodation of families in separate dwellings. It was all very bad—as miserable as what comes under notice in any parts of Edinburgh or Glasgow, though by no means with the same enviroining of filth. It is only in Scotland that dirt is indelicately obtrusive. In one room about ten feet square, we found living an old shoemaker, two sempstresses, and a girl. They seemed to have scarcely space to turn themselves; and, except a bundle of rags in a corner, there was no vestige of a bed. Yet there was cheerfulness in this dismal den. The cobbler was busy with his hammer; and the two drudging females had received the pleasing intelligence that the making of shirts was up a halfpenny. Here and elsewhere were terrible complaints of the dearth of bread. When I mentioned that I was sure there would be a good harvest, and that great quantities of corn would soon arrive from America, the good news seemed to come like a ray of sunshine in the midst of gloom, and for a moment sent a thrill of joy through the heart. I was sorry for one poor woman whom we found inhabiting a small dingy room on the ground-floor of a house in a very narrow alley. She was rheumatic, and had not been able to walk for fifteen years: she could go to the door only by crawling on her hands and knees. This poor old creature, nevertheless, did not appear unhappy. She spoke resignedly of her sufferings. On inquiring if two little girls who were with her were her grandchildren, she replied 'that they belonged to a neighbour who had to go out daily to work, and that she took charge of them as a matter of duty. It was our duty to assist each other.' In this way are the poor constantly found assisting the poor,

Mr Walker, the missionary who accompanied us in this ramble, mentioned that, some years ago, when he began his domiciliary visits in Westminster, he was received with great jealousy and open threats of vengeance. The people could not understand how any person in his station should come about them unless for some selfish purpose; nor could they believe that their children should be invited to go to school unless to make a job of them. Their notion was, that the free schools were a new trick on the part of the rich to squeeze the poor! With the quiet perseverance of a Scotsman, Walker combated with, and ultimately vanquished, these fancies. The free schools are now exceedingly popular; and the missionary is a recognised friend and counsellor throughout the district. Of this we had some evidence: in the course of our walk, he was several times stopped by women of a humble class to get his advice on matters which concerned them. I should imagine from this, and other circumstances which have come to my knowledge, that town missionaries, even as regards secular counsel, are of the greatest possible service, and form an indispensable enginery of humanity and civilisation in the present condition of large cities.

As we entered the chariot which had been in attendance, and drove into the glare and bustle of Palace-yard—amid crowds of ladies and gentlemen hurrying to see the new House of Lords, and lawyers pushing along with their bags towards 'the hall'—I almost felt as if suddenly dropped into a new world; so totally dissimilar are two states of things closely in connection with each other.

W. C.

THE BOUNDARY LINE.

A SKETCH.

It is a sweet, bright day in early spring. Young leaves are upon the hedges; primroses are gemming each grassy bank; and 'the corn is springing fresh and green.' The scene is in Ireland, and beautiful as ever; for the desolation of the land seems to have passed away. So at least thought a young stranger, a visitor from a more favoured spot, as silently placing her hand on that of her companion, to check the ponies' reins, she stood up in the little carriage in which they then were driving, and gazed downwards from the summit of the hill, over wood and dale and shining river, drinking in, with sanguine heart and glistening eyes, the glorious prospect—the fair promise—of that fertile, verdant land.

Full of the hopes that view had excited, she had turned eagerly to share them with her friend, when her attention was caught by the sound of people at work inside the hedge; and the expression of chastened delight, which had just rested on her face, flitted into a smile full of mirth, as she exclaimed, 'Do look at that animated active group; were ever there women so hard at work before!'

And a busy, and even cheerful picture at the first glance it was. As the little carriage now drew up beside a wider opening in the fence, Clara pointed out to her companion, close by within the field, three girls working, as she had observed, 'with might and main.' She could not well interpret the grave and half-reluctant smile with which her own merry glance was returned, and surprised, but still amused, she continued looking through the hedge. Though a moment's reflection showed her they were not quite suitably employed, still the hearty good-will with which they lent themselves to their task, the look of rosy health that mantled in their cheeks, and the comfortable substantial clothing in which they were attired—all lessened the dubious feeling with which she felt tempted to regard an occupation that seemed in this instance as much a matter of choice as of necessity.

And so she still looked on smilingly at the energetic movements and glowing faces of the young girls, thus manfully employed in levelling the old ditch that had once bounded the road, and which they were now

wheeling out in heaps to top-dress the field. With a smile she looked on—but it was only for a while; for at last she saw one girl lift her hand to her heated brow, and then work on; another drop her arms languidly by her side, as she turned her barrow over on the heap; while the third, the fairest and slightest, raising her head at the sound, gave one anxious glance at the weary ones, and then with a gay laugh hastily throwing her shovel aside, insisted that it was her turn to wheel the barrow now. Then a noisy, good-humoured altercation ensued, the elder ones protesting that she was too soft and too young for that heavy part of the work; until at last the five minutes required to overcome her generous intention afforded all sufficient rest and renewed strength to commence their unfeminine employment again.

'Five minutes more, Clara,' said her companion, whose turn it now was to smile at the thoughtful expression transferred to that lately beaming face—'five minutes more, while I just ask one question, for I have known those industrious girls long and well.' And as she spoke, the youngest turning her head, with a blush and smile of recognition dropped her little curtsy, while another, who was still nearer, leaped up on the bank to inquire whether their honours wanted anything she could do.

'Nothing now, thank you, Joany; I see you are hard at work. But where is your father? I suppose employed on the roads, while you mind the farm?'

A free but good-humoured laugh lighted up Joany's black eyes as she carelessly answered, 'Wisha, no, ma'am; he wasn't good enough for that same; you'll find him below there on the sunny side of the ditch, and mighty proud he'd be to stop your honour for a *shanamone*;'* and throwing an arch look across the hedge as she made this somewhat familiar reply, she bounded off the bank, and the next instant was wheeling her barrow again.

'Poor motherless girls, with an idle good-for-nothing father,' said the lady with a sigh as the ponies crept slowly down the hill. 'By degrees he has habituated them to do the work of men; and, like the females we read of in savage life, there they labour, day after day, summer and winter, while he spends his time, as Joany just hinted, sauntering and gossiping by the highway-side. Then the elder ones, grown bold and hardened, at last have lost all taste for the quiet duties and minor comforts of home; while the youngest, always delicate, but neglected and lonely, feels herself, for the sake of companionship, forced to follow in their steps; and with that cough and pain in the side, caught when the weather was less genial than now, will in all probability be low in her grave before she sees another spring.'

Poor Ireland! Often as she has been held up as a warning, it is somewhat hard to derive one from the industry of her daughters; and instead of averring that 'even her failings lean to virtue's side,' to declare that her best efforts have their alloy. And yet who that has dwelt amongst those children of her soil in months lately past; who that has witnessed their struggles, their mistakes, their resignation, but must have sorrowed over the long and deeply-rooted habits which leave them without the ability, and almost without the inclination, to meet their altered circumstances. An out-of-door friend surely the potato was—out of doors it was cultivated, and out of doors it was kept. What experience, then, of domestic management could be attained by her who thus spent her hours abroad, bearing more than her share in the culture and preparation of that food which never required her presence within doors, except during the simple process of placing it on the fire? Or how can she now turn, without many a failure, almost hopeless, to the thrifty meal-cheat, the complicated pudding, and the store of bread?

But not in Ireland alone, not only amidst her unfor-

tunate peasantry, can examples be met of the mistake to which we now advert. There are other classes too, other places may be found, where unpleasant consequences have resulted from shifting the load of life to unfitting shoulders; from placing the hand to the machine it is incompetent to guide. 'Bear ye one another's burthens,' is a rule of conduct far different from doing one another's business; and much as a labour of love can lighten toil, either of body or of mind, when mutually borne, the *boundary line* drawn between occupations proper to either sex can seldom be passed without some unfortunate result.

We have known the young and fair seek to heighten their attractions by vying with the bolder sex in their amusements, by entering into more than the spirit of their sport—shooting at a mark, or feathering an oar; and one—that brightest beauty who, since then, has aspired to royal honours—we can remember in long-past days was never so much at home as when in the saddle, never so eloquent as when speaking of her steed. But these are comparatively harmless follies—straws on life's lighter current; 'only pretty Fanny's way,' forgiven for her sake, or forgotten when she grows wiser; and wiser she must grow, if she would safely climb the onward path. Yes, a time comes when amusement can be no longer the object, when graver interests are concerned, and a steadier line must be pursued; and then, be assured that the more definite is each orbit, the brighter and the happier will be the mingling of the two at the points where they unite.

Was ever business more prosperous when the wife kept the accounts and wrote the letters, while the husband sought amusement, or gossiped at his club? Was ever parish worthier where the pastor visited the markets, or enjoyed a hit at backgammon, while his more than help-meet penned eloquent discourses within the study walls? And yet such things have been: while, on the other hand, oh tell us were the threads more fairly spun when Hercules held the distaff amidst the Lydian maidens?—or was the infant wail less frequent when Hooker rocked the cradle, and penned his immortal work upon his knee? No: go hand in hand, true partners through life, aiding each the other in your separate or united way; but never, never take advantage of the willing heart to throw on it your own allotted burthen; never, never let the vain, ambitious, over-active spirit undertake the province of another, and engross to itself the things that should concern it not.

But to come back to our story, or rather—for that was but one instance—to commence a new one. There once was a gentleman and a lady who married for love: they had many good things beside—a fair house, broad lands, and smiling friends; and if these accessories did prolong the charm, still the love was all the same; for a twelvemonth passed away, the bride glided into the wife, the wife became a mother, and yet their happiness was undiminished—fresh and new, as if they had but just doffed their bridal robes. At home or abroad, they were inseparable still; indeed home seemed their chosen sphere of enjoyment; and though the Nimrods and Justice Shallows of the neighbourhood laid wagers, and smiled, and wondered how long it would last, still the spell remained unbroken, and the gentleman remained at home.

A year and a day, as old story runs, glided away, and thus they might have been seen—the lady in her garden, the gentleman beside her: she a queen amidst her flowers, he her devoted minister; and all—husband, gardener, clustering roses—all bending to her sway; her judgment planning, her taste presiding; the flexible branches, the shapely beds, 'the gay enamelled' borders, the harmonious contrasts, all bearing witness to her perfect taste; while quite allowable, and most amusing, was the little absolute air with which she asserted her sovereignty, and defended her possessions; repelling all interference when her husband, in his ignorance, would suggest some alteration—as if lilies could overshadow pinks, or tulips rival roses!

* Gossip.

Not quite another year has passed again, and still the lady and the gentleman are to be seen together; but now it is a wintry day, on a bleak hill-side, and the pretty broad-brimmed straw-hat, with its fresh gathered garland, has been replaced by a close bonnet, which, we must confess, tied down closely as it is to resist the blast, droops so deeply over the face, that it shuts in the bright eyes, and only displays a mouth that somehow forgets to smile. No wonder: we have intruded on a serious discussion—we had almost said debate—but it is not yet come to that. There is a plantation to be laid out, its form defined, and the lady is quite right, for she stoutly maintains that the curve is the line of beauty; but as that line, in the present instance, would include the best of his meadows, the gentleman has insisted that a right angle is far more correct: he maintains his ground, and the beautiful and the useful are at issue now.

Ah, lady, do not pass the boundary line: pause for a moment—you know not whither you may wander, or how near you may be to abandoning the beautiful for ever: turn back to your own kingdom—your bright flowers, your cradled child—raise up those shrouded eyes, bring home the smile to that lip, and let woman's wit and woman's heart on the instant devise some means of mutual extrication from the horns of that dilemma. But no: before our words have been spoken, the sentence is pronounced—'Have it all your own way'; and moodily the husband has turned away and walked down the hill, while, with a look of triumph that disdains to notice the cloud gathering in the horizon, the lady gives her directions, the labourers set to work, and the line of beauty sweeps in grace across the field.

Another year—can this be the fireside once so charming? Where are the open books, the attentive ear, the intelligent remark? Where the sweet music, the fairy tones, the blended voices; and where the artless prattle of that gleesome child? The instrument is closed—the music in its portfolio—the books are on their shelves symmetrically ranged—and the boy—oh, he was so noisy, he never could be quiet; let him rout away in the nursery, and stun the servants if he likes, but here it could not be borne, for his parents are both—asleep!

Blame them not: the gentleman has been up since the gray of the morning; he has ridden twenty miles to cover, he has had a run of as many more, he has killed his fox, and he has ridden home again, and after a late dinner, he has finished his bottle; what could be more natural than that he should now take a nap? And the lady—could you have only seen her through this arduous day; had you seen her yesterday, could you see her tomorrow, and every day again as the year passes on, you would wonder still less that books, and music, and childish prattle had lost their charm, and that nothing was half so delightful as that easy-chair.

It is now many a day since the plantation was commenced; already it towers above its enclosure, and changes the face of that bleak hill-side, adorning its rugged brow with a leafy crown. There it stands, a monument of the taste that presided over its formation, a proof of the advantage that may be sometimes gained even by a trifle. But was it a trifle? In itself most surely; as a first step, who could reckon its importance? If the hill-side is changed, what have those years been doing to the lady? Come suddenly into her presence now, and recognise, if you can, the bright queen of the roses in other days. Were we sharp-sighted, then we might have seen, even in that flowery garden, in the will that would rule supreme, in the spirit that would brook no interference, the germ of that temper which has been so fully developed since; and yet even a microscope, in the brightest ray of the sun, could have hardly revealed the poison that was lurking there.

We have related how the husband gave up his point, and walked moodily away; but the mood did not continue, and they met again with smiles. The sun rose

brightly next morning, and they wandered together to each favourable point of view, until he saw with her eyes only, and acknowledged she was quite right. She was right—and she never allowed him to forget it, until at last he acquired the habit of thinking that nothing was right without her; and proud of the constant appeal, the reliance on her judgment, she forgot how unsuitable, how incongruous, were the subjects she sometimes ventured to discuss. Thus for a while they ran in harness together: but only for a while; the sphere was too petty for a divided rule; the more energetic spirit took the lead; and at last, weary of sometimes agreeing, sometimes jarring—weary of a yokefellow that would never yield an opinion, and yet admitting those opinions were often the most judicious—the husband gradually loosened himself from his share of the burthen, and once again repeated, 'Have it all your own way.'

But this time it was no passing phrase: he had been taught a lesson, he had become convinced in his own mind by trial, by opposition, by defeat, that no one was so intelligent, so energetic, so faithful—in fact, that he was possessed of a steward beyond all price; and congratulated on all hands for having such a treasure of a wife—so clever, so active, so alive to his concerns—at last, well content, he left them all in her hands.

And she, quite proud of the trust and the responsibility—delighted with the authority and absolute command—exchanging her graceful drapery for a weather-proof cloak, tying her coal-box bonnet closer down upon her head, and drawing on her husband's boots—reader, only his boots!—resolved to defy all seasons and their change, and indefatigably plunged into the mysteries of draining, the management of turnips, and the merits of guano.

It is said that women do nothing by halves; whatever passion they indulge in for the time, absorbs their whole nature; so no wonder that the lady's fancy for out-of-door pursuits entirely engrossed her, and that thus she might have been seen more and more devoted to her farm day after day: and without referring to any general rules, no wonder that home lost its attraction to the once delighted husband, or that, in relinquishing the control of his acres, his active propensities sought another field where he might sometimes take the lead: no wonder that the bright boy grew weary of his uncompanionable maid, that he often escaped from his nursery into what company and what mischief he could; and no wonder, at last, that the picture we have drawn should close the day—yawning, instead of conversation; instead of music—sleep.

The lady has just descended by that winding path through the brushwood deep into the quarry, and somewhat severely she has been lecturing the workmen there; for the ground is ploughed and waiting, the limekiln is ready, and yet the lime is not burned, the stones are not even broken yet. Her brow clouded, and her temper slightly ruffled at the dilatoriness with which her orders have been executed, she has turned away with a passing conviction that had sometimes obtruded itself before—that a woman's authority is but limited after all; and she was just in the act of meditating a complaint on the subject to her now careless but good-humoured husband, when suddenly a wild and piercing scream struck upon her ear, and rooted her to the spot. It was echoed back by a loud cry from the labourers she had just left, and at the same instant what appeared a bundle of clothes thrown over the edge of the precipice fell through the tangled bushes, and lighted heavily on the ground, a few paces from the path where she stood transfixed. Strangely familiar that bundle looked—that green velvet—that snowy drapery, as it fluttered amidst the stones: could any one have been stealing the raiment of her child? Oh, think so, poor mother, as long as you may! Look not upwards to that floating feather, where the little cap is caught upon a bough; slowly and gently may the truth dawn upon you! But now the workmen rush past; a suppressed yet fearful murmur strikes upon her brain, and

before she can half collect its sense, before her failing limbs can move towards the heap, they raise it up tenderly—her very child itself!

The fire burns brightly on that hearth as of yore, yet the candles are not lighted or the curtains drawn; for the evenings are still long, and a gentle moon is shining through the windows and chequering the floor. The room, too, is very quiet, the books are unopened still, and still the piano is mute; but the fireside is deserted, the easy-chairs are vacant, and those who used to occupy them with so much enjoyment are no longer—asleep. Look round the room, and you will perceive a still greater alteration, bringing back a memory of earlier days. Fresh flowers are on that marble slab, flinging their odour through the apartment; bright pictures scattered on that table; a guitar upon that stool; and though all seems settled for the amusement of one neither literary nor industrious, though books and workboxes are still in the back-ground, yet decidedly the room has lost the look of unoccupied arrangement which gave it such a formal, dreary air in those fox-hunting and farming days. Within the moonlit window is a silent group: no sound is in that chamber but the crackling now and then of the oaken boughs, as they light up briskly on the hearth, or the faint vibration of the last chord as the guitar is placed upon the floor beside the lady, who sits upon a stool almost as low, and rests her head on the pillow of the sofa, where, pale and still, a little figure is laid; while, leaning on the casement, looking down with deep tenderness on both, stands the husband and the father, restored to hope and happiness again.

The room is very still—a hushed and solemn stillness, as if a prayer had just been uttered, or a hymn been softly breathed: at last the silence was broken—hardly broken by a faint silvery little voice, as the fair child, leaning his head backwards on the pillow, turned his face upwards to his father with a sweet and loving smile, and said, 'Papa, look out into the moonshine, and tell me is the hawthorn still in blossom. It was the first flower of the year, mamma, which I thought to throw that morning at your feet, when in my haste to get away from Jane, I lost my balance, and fell over myself.'

'My own fairest flower!' said his mother tenderly, pressing the little hand within her own to her trembling lip; 'many a bud has blown and withered since that sorrowful morning—passing away all unheeded, while our own one was struggling back to life; but that is so long ago, that instead of flowers in the moonshine, the scarlet berries are now ripening on the thorn.'

The child mused thoughtfully; then he murmured, 'So long ago—and I thought it so short. Oh, mamma, it must have been because I was so happy; you never leaving me—beside me all the day, with your soft hands, and your sweet voice, and your loving eyes; and then, in the long evenings, when papa would come in with his little stories and his pleasant smile. Oh, I am never, never lonely now; I will never be so again. Tell me, mamma, will it not be always so?'

'With God's blessing, my child,' replied the lady with emotion, as she arose and bent to kiss him, then turned to the window; the next moment an encircling arm was round her, and something glistened like a tear in the eyes that answered her own. Just then the moon was going down, sinking behind the tuft of trees that crowned the opposite hill, but its round edge seemed to linger for a moment, pouring a flood of light across the landscape, and resting on the boundary line of that plantation, the scene of her first triumph, the monument of her perseverance and her taste. Beautiful it looked as the pale orb threw a silvery veil over each separate tree; graceful was that undulating line as it shone out into radiance or deepened into shadow; and most perfect and enchanting was the combination of all. There was no stiffness, no formality, no awkward turn; yet the lady gazed on it in silence with saddened eyes, gazed till the bright circle had diminished to a

thread; then, while just light enough was left to read her husband's face, to meet the confiding look that sought her own candid brow, she chased away her tears with a brightening smile, and pointing to the hill as she turned from the window, whispered softly 'That was a great mistake after all!'

EVERY-DAY ENTOMOLOGY.

THE GNAT FAMILY.

THE gnat family is universally detested, as among the most unwearied, bloodthirsty, and formidable of insect tormentors. Their insatiable appetite, joined to their venomous powers, and these added to their enormous productiveness, and their hateful ubiquity, justify us in regarding them as one of the scourges of the human race. They are excessively troublesome even in our own country, the temperate climate of which is unfriendly to venomous creatures of most kinds; but their annoyance is felt under both extremes of temperature, exasperating alike the unhappy inhabitants of Mosquito Bay, and the wretched tenants of the most northerly regions. In spite of the irritable feelings we can scarcely help bringing to the inquiry, it will be found that there is much that is instructive, much that is even entertaining, in the history and habits of these little blood-suckers.

The proper—that is, the technical—name for this tribe of insects is the *Culicidæ*: they belong to the order of Dipterous or double-winged insects. The common gnat, *Culex pipiens*, is a delicate pretty insect, rather less than a quarter of an inch in length. It is furnished with a long slender proboscis, which projects downwards and forwards, having at its extremity a pair of little sucking discs: this organ forms the siphon up which the creature draws its fill from our life-stream. On the sides of this are placed, at different distances, several lancet-like processes, some of which appear intended simply to cut, while others seem adapted also to inject the irritating poison into the minute wound; and these are barbed, and resemble in some respects the sting of the bee. The 'hum' of the gnat, or, as the poet Spenser calls it, 'its murmuring small trumpet,' is a sound familiar to every ear—to most of us far more familiar than agreeable. This, which is really a pretty and not unpleasant sound in itself, were it not that it is a flourish preparatory to an onslaught, is produced by the rapid vibration of its delicate gauze-like wings. The sound has a precise analogue in the deep-toned hum of the 'fan' of our blast-furnaces, where the vanes of the blower cut through the air with vast rapidity, and produce, in so doing, the musical notes we hear. The fragile wings of this insect have been estimated by Latour to vibrate at the rate of three thousand times a minute; a rapidity which, when it is regarded as a succession of muscular contractions and relaxations, is something far more wonderful than the most enormous speed to which mechanism was ever driven. The gnat makes its appearance in the greatest numbers at evening, but its persecutions are by no means confined to that period. It delights chiefly in shady woods and in moist situations, from whence great hosts may occasionally be observed to issue, and in the vicinity also of stagnant pools, which form the nursing-places of the young. It has been frequently remarked, that it is the female insect which pursues us for our blood, and that the male is innocent altogether of the crimes his partner delights to commit. The insect makes its attack in the following manner:—After the flourish as aforesaid, and with a courage equal to all its noise, it flies directly upon its victim, and falls to. Alighting gently upon the surface, it lowers its formidable weapon, gently and gradually thrusting it into the skin until it has pushed home all its lancets. The fluid which produces the subsequent pain in the wound is then injected into it, as has been plausibly supposed, for the purpose of rendering the blood more fluid, and better adapting it to the

suctorial capabilities of the insect; and now the thirsty creature takes its fill. These operations are repeated until it is satiated, when it flies away, oftentimes becoming gorged and less active, as if completely intoxicated with its potion.

The early history of the gnat is peculiarly interesting. It contains one of those exquisite demonstrations of the skill of the Creative hand of which the kingdom of animated nature is replete. The celebrated entomologist Reaumur made it the subject of some of his beautiful and accurate investigations. From his account of the operation, we glean the following particulars relative to the deposition of the eggs of this insect. Let us go to some stagnant pond between five and six in a summer morning, and we shall see this interesting phenomenon, if we watch pretty narrowly, going on over its whole surface. There is a female gnat; she has taken her station upon a broken twig, or a fallen leaf floating on the water. She is then seen to cross her two hind limbs like the letter X, and in the inner triangular interval she commences her ingenious labour. In this interval she places first three eggs in the form of a triangle, which, being moistened with a kind of glue, adhere firmly together. This forms one extremity of a *boat* she is about to make. Her crossed limbs form, so to speak, the 'lines' or scaffold by which she regulates the subsequent shape and size of her tiny vessel. She proceeds laying egg after egg; and by gradually opening her scaffolding, she shapes the boat accordingly, and in this manner proceeds until the egg-boat is completed, each of which contains from two to three hundred eggs. The animated scaffolding is then removed. The mother takes her flight, and commits her craft to the mercy of the wind and waves. This wonderful little structure has been aptly likened by Messrs Kirby and Spence to a London wherry in configuration, being sharp, and higher at both ends, somewhat convex below, and concave above, and always floating on its keel. It is not the least remarkable fact connected with this amazing feat of nautical architecture, that each individual egg, if dropped into the water, would sink to the bottom. The boat is quite buoyant; it defies the most tempestuous blast which crosses the mimic ocean in which it sails; the waters may go over it, or it may be forcibly pushed down to the bottom, but it will rise again to the surface, its buoyancy unaffected, and without a drop of water in its cavity. How plain and broadly-marked even in these workings of a humble and insignificant insect is the Divine forethought and skill, which, while rearing a universe, and mapping out creation, remembered, and so securely provided for, the wants of the family of a gnat! In hot weather the eggs are rapidly hatched; and in about three days the larvæ, having left their temporary habitations, are to be seen in full activity, with their heads downwards in the water. As these larvæ are uncommonly funny fellows on the field of the microscope, they have the honour of frequently showing off at popular exhibitions; and the surprising feats of agility they perform have long been the admiration of the spectators. They are well known in the north as '*scurs*,' and may be collected in abundance during summer from almost every wayside pool. The larva breathes in a very odd way by means of its tail! at the extremity of which is its respiratory apparatus. It has the power of leaving the surface of the water, and diving to the bottom; but it must always return for fresh air; and most comical it is to see it thrust its tail up for this purpose, while its great head hangs some distance below the surface. This larva has several changes to undergo before it becomes the perfect insect: after moulting several times, it becomes transformed into the pupa; and then comes the final change to the perfect gnat. The pupa now serves as a boat for the emerging insect. The time comes on; the necessary preparations are complete; the insect raises itself from its floating tomb, places its feet upon the water, expands its tender wings, and takes farewell of its former dwelling. From first

to last, these transformations occupy about three weeks or a month.

Sometimes gnats make their appearance in incredible numbers, or are unexpectedly seen to pour in dense clouds like smoke from some locality. A correspondent of the 'Entomological Magazine' states that in one summer, in a particular district, they appeared in such numbers, as actually to make it necessary to 'shovel them' out of the houses. It is related also 'that, in the year 1736, they were so numerous, that vast columns of them were seen to rise in the air from Salisbury cathedral; and an alarm was actually raised that the cathedral was on fire. A letter in an early volume of the 'Philosophical Transactions' states, that on one occasion they filled the atmosphere near Oxford, and rose in several tall columns from some apple-trees to a considerable height in the air. At Norwich, an alarm of fire was created by the inhabitants observing a dense volume, apparently of smoke, stream forth from one of the spires of the cathedral. It was mentioned that these insects are numerous and excessively annoying even at the poles. Captain Sir John Ross, in the Appendix to the narrative of his second voyage, states that gnats first made their appearance about the 10th of July, and by the 22d had become so excessively numerous, as to prevent the necessary duties of the ship. They were seen in vast clouds overhanging the marshes, their larvæ contributing the principal food to the trout of those lakes. The poor Laplanders are horribly tormented by them. It is almost in vain that they smear their bodies with fetid unguents, birch oil, and fearful meases of all offensive things; the blood-thirsty insect scorns such defences, and sends its proboscis through them all. They are in the habit of stopping up the vents of their huts, allowing the interior to be filled with suffocating smoke, and thus protected, they betake themselves to rest; yet even then, the indomitable creature will scarcely consent to leave them unmolested. In short, what defence can be suggested against an army of invaders so numerous as to be compared to the dust of the earth or the flakes of a snow fall?

The mosquito has been generally considered by naturalists as belonging to the gnat family, the *Culicidæ*. Some doubt may exist upon the subject, but there can be none that it is the true representative in the tropics of the gnat at the poles and at home. The mosquito is not quite so large an insect as the common gnat; but if less in size, it is a much more dreaded and dreadful enemy. It is, we believe, Mr Westwood who considers the mosquito to have been 'the plague of flies,' the emissaries to execute Divine wrath upon the Egyptians. Neither is its sphere of torment limited alone to hot climates; it appears to endure the intense winter of the Crimea, and does dreadful mischief in its summer to the Russian soldiers. Dr Clarke says they are actually compelled to sleep in sacks! and even this does not prove an efficient protection, as cases of mortification in consequence of their bites are not unfrequent. In America, the accounts of mosquito-bitten travellers are most painful to read. We sometimes meet with the travels of a learned enthusiast, who gives us a glowing picture of the glories of the banks of the Orinoco: let us take some scattered remarks from Baron Humboldt's 'Personal Narrative' as a set-off against these romancings. He says there are three different species of mosquito. Some will sting from an early hour in the morning all day long until five in the afternoon, when they disappear, and a second set 'mount guard.' These have their hour of attack, and then retire, and are followed by the night army, the most dreadful and venomous of all. During the intervals of the disappearance of one host, and the appearance of the next, a brief and delightful repose is given to the tortured Indians. All along a particular district of this great stream, the lower strata of air, from the surface of the ground up to the height of fifteen or twenty feet, are filled with these insects to such a de-

gree, as to give the appearance of a condensed vapour. The Indians say there are 'more mosquitoes than air.' The swelling caused by their bites does not disappear for several weeks. An old missionary, in accents of despair and grief, said 'he had spent his twenty years of mosquitoes in America;' and his limbs were so much covered with the enduring marks of their wounds, as not to have a single spot of native whiteness about them! Some of the Indians living in these districts are so hard put to it, as to be compelled to bury themselves in sand, only leaving out their heads, which they cover with a handkerchief. A curious anecdote is related in 'Loudon's Magazine of Natural History' regarding the effect of mosquito bites upon the countenance. A gentleman having indulged over-freely in wine, lay down to sleep on a sofa without the customary protection of a mosquito net. He reclined in such a way, as to expose exactly half of his face to the operations of the enemy, which soon attacked him in great numbers. His appearance the following morning was something wonderful; one side of his nose and face preserved their usual expression, but the other was so hideously contorted and swollen, as to make him appear on that side a totally different person.

Expedients for defence against these plagues are frequently almost in vain; but such as are in use it may be as well to mention. In India, mosquito curtains are the common preservatives; but wo to him who suffers even one of his little tormentors to get within his white walls! Just before retiring to rest, a kind of whisk is whirled about in the air, putting the ranks of the enemy in confusion; the favourable moment is seized, and the individual leaps into his cot, while the curtains are rapidly drawn behind him. The Indians in America go at night to sleep on islets in the midst of the cataracts, where few mosquitoes will follow them. They also anoint themselves with turtle oil, and cover their bodies with paint and bolar earth, but are wounded through these. In some fenny districts in England, where gnats are very numerous, it is said to be the custom to wear veils. The pain of the bites may in some cases be alleviated by a solution of ammonia, or soothed by a weak lotion of hydrocyanic acid. With these remarks, we take our leave of this tiny but troublesome family.

PLAIN ANSWERS TO PLAIN QUESTIONS ABOUT EMIGRATION.

MANY things have occurred to deter conscientious persons from recommending emigration, but the theory, for all that, remains intact. Nothing is more natural than for people to overflow from an old and closely-occupied country into one the reverse in all respects. The main consideration is as to the qualifications of individuals for the hardships inseparable from the settlement of new countries. These once overcome, there is certainly much of a gratifying nature in the life of the independent settler. Entertaining these views, we are always glad when we can publish any information likely to be of use to intending emigrants. On the present occasion, we present the substance of a letter lately written by an experienced colonist, from Pyrenees, in the Port Philip district of Australia. We have retained the arrangement of the letter, and as far as possible the simplicity of the language; and the reader is requested to observe, that it contains the replies of a plain uneducated man to the questions of a familiar friend, who was thinking of joining him at the antipodes.

I. Climate, diseases, and remedies? The climate is very healthy; hot in summer, but not sultry, as in India; cold in winter, but mild and bracing. We have frosts in the morning, but they clear off about two hours after sunrise. As for diseases, there are none peculiar to the country, which is in general very healthy, and persons living in the bush more especially are seldom or never ill; a store of medicine, therefore, is hardly necessary.

II. The average price of lands next year? This question I cannot answer, not being able to form the slightest conjecture as to what government intends doing with us squatters after the 30th June 1847, when our present license expires. At present we pay L.10 a-year for occupying government lands, according to this process:—If a settler can find any space of country with sufficient water and pasture ground to keep his stock upon, he applies to the Commissioner of Crown Lands, who grants him a license, whether he has a large or small quantity of stock; the Commissioner generally marking the boundary in the proportion of twenty-five square miles for every four thousand sheep or six hundred head of cattle. But there are many stations that are not twenty-five square miles, and will not carry more than two or three thousand sheep; while, on the other hand, there are many that will carry fifty thousand; and yet all pay alike L.10 a-year. There is likewise an assessment of one penny per head on sheep, threepence on cattle, and one shilling on horses, a-year. But as we expect there will be entirely new regulations next year, I must refer you to the newspapers, as also to the colonial coffee-houses, where you will get some information four months before it reaches us.

III. Intercourse of settlers? However desirable it is to be near each other, and pleasant to have frequent intercourse, I would not have you set your mind upon it; for at present the country, for upwards of sixty miles all round us, is occupied, and it is only a chance if any might be for disposal at the time you require it. When a station that has been occupied is to be disposed of, its value is always included nominally in that of the stock, as government will not sanction the buying or selling of crown lands.

IV. Price of sheep, and fair number to begin with? The price of sheep always fluctuates according to that of wool. Two months ago they were worth 12s. per head, now they have fallen to 6s. 6d.; in fact they are regulated by the wool market at home; and if you were to read the Port Philip papers at the colonial coffee-houses, you would generally see under the heading of 'Sales this Week' something near the price of sheep; but put no faith in the price current at the end of the paper. Wool is our ruling commodity; therefore, if you find at home that wool is likely to rise to 1s. 6d. or 2s. and upwards, you may be sure sheep are up to 10s. or 15s. &c.; if likely to go down to 1s. or 1s. 3d. as now, sheep are from 5s. to 7s. per head. We sold our wool for 1s. 3d. last year, but it will be only 10d. or 1s. this; so that you see you must judge entirely by the home market. This in a great measure answers the other question, as to what amount of capital to commence with. As sheep fluctuate so much, the number must entirely depend on price; but I would not advise beginning with less than from seven hundred to one thousand ewes. If you lay out L.500 in sheep, you require L.300 to carry you over the first two years; after that your wool would pay expenses.

V. As to wages, and the propriety of bringing out servants? This question I can answer with confidence. Bring no servants of any kind; for although the law indicates the means of compelling them to serve out the period of their agreement, still there are such facilities of evasion, and so many inducements to evade, arising from the high rate of wages, and the scarcity of all kinds of labour, that you would be subjected to much annoyance and loss. I have enclosed a paragraph I saw in the paper the other day, which will give you some idea of the amount of wages, although 10s. per day, I am told, is an error of the press, they earning considerably more. Married couples are getting L.35 to L.50 a-year; female servants L.20 to L.25; shepherds, &c. L.28 to L.30 (with rations); and mechanics L.1 a-week; in fact, labour is so scarce, that any money is given sometimes, especially in harvest and lambing time.

VI. Bringing out agricultural implements, tools, &c.? Bring out nothing; everything here is as cheap as in England, even iron and steel. We have no mines in

this quarter, though there are plenty in Adelaide. Coal has been found near Western Port, about forty miles from Melbourne; but it is worked only to a very limited extent, on account, I suppose, of the scarcity of labour.

VII. As to water and crops? Settlers only take up that country which is sufficiently watered by creeks, rivers, or lakes. In this district we have nothing but creeks, which only run in the winter, and form a sort of water-holes in summer. On the Goulbourn side, there are several large rivers and running creeks, but no navigable rivers anywhere. The country generally will grow any kind of crops, and any description of seeds. Bulbs and plants can be obtained at the market gardens.

VIII. Advantage of sheep-farming? It is impossible to give an accurate idea of this; for sheep-farming, like every other farming business, entirely depends on management. There is no doubt of it being a good speculation, if you can make up your mind to work hard yourself, put up with privations, and do without hired labour as much as possible.

IX. Bringing out a wife? Though I am an advocate for matrimony, still I must warn you that English young ladies are not at all fitted for the bush. When at home by their comfortable firesides, they imagine they will be able to rough it; but let me tell them it is a very difficult matter to get quietly into the way of doing so. There is only one class of females fit to emigrate with young beginners—and these are farmers' daughters who have been brought up to work; for I can assure you there is no dancing the Polka in the bush.

X. First steps on landing? There are steamers that will take you from the ship to Melbourne for 2s. 6d., and your luggage, if a small quantity, and all ready; but they will not wait. If you have a large quantity, it must be forwarded to you by lighters, which will cost about 5s. per ton. There you will find plenty of carts waiting to convey your luggage, for a couple of shillings, to any respectable boarding-house or hotel. I would recommend Mrs Larriniore's or Mrs Hamilton's boarding-houses, where ladies and gentlemen are boarded and lodged for L.1 per week. The hotel charges are about the same as in London. All kinds of provisions are considerably cheaper than in England—namely, Meat, 2d. per lb. of all kinds; bread, 7d. 4 lbs.; cheese, 8d.; tea, 1s.; sugar, 3d.; flour, 2s. per stone; potatoes, 4s. per cwt. Bring as little clothing as you possibly can do with. Coloured shirts are always worn on board ship and in the bush. In fact, incumber yourself with nothing but what is absolutely necessary for the voyage—every article of wearing apparel being quite as cheap as at home, except boots and shoes, which are much dearer. In order to give you some more precise idea, I would say bring out two pairs of Gambrun, and one pair thick coarse cloth trousers for shipboard; one pair corduroy trousers for the bush; two coats for shipboard and in Melbourne, as in the bush you do not require them; a pea-coat and blue cap for the voyage and bush; two dozen coloured shirts; two dozen pairs socks; half-a-dozen thin merino or flannel shirts (if you are in the habit of wearing them); pewter utensils for your cabin; a lamp, and six pounds sperm candles; bed and bedding. Our dress eight months in the year is nothing but a coloured shirt, pair of trousers, and leathern belt. In winter, we generally wear a blue baize shirt over the coloured.

XI. Is a frame-house necessary? No. Melbourne is as large as Ostend, and you can rent houses from one to twenty rooms as cheap, or cheaper, than in England. In the bush a slab hut can be put up quickly and cheaply. Our timber is hard to cut, and therefore all bush work is done with cross-cut saws, mauls, and wedges. All timber is felled with cross-cut saws, not axes, as in America. As boring for water is a thing very little known or practised in the bush, I am unable to say what depth you would have to go, so much depends upon situation.

Finally—If you are a sportsman, and set a value on a good gun, why, then, bring one; but if only for casual purposes, I should say not, as you can get one, with everything requisite, as cheap in Melbourne. My principal advice all through this letter is, bring out nothing but money, save and except what you cannot do without; for when I tell you we make our own steam-engines, and every description of castings, and that you can purchase from a grand piano to a penny rattle as cheap as in England, you will see the absurdity of incumbering yourself with more luggage than is necessary. Whatever money you have, pay into the Bank of Australia, save and except about L.50 in sovereigns, and a little silver, which bring with you for use, or voyage, landing, &c. Have your letters directed to the post-office, Melbourne; but remember, no paper money is current here save Melbourne notes, therefore bring no English bank-notes.

A NEW HEROINE.

A LADY one day complained of the state of her health. Even the newspapers had lost their excitement—'She could not relish her murders as usual!' This is not a *jeu d'esprit*, but an actual speech; and it is enough to make one fear that the publicity of the journals is not an unmixed good. But as the bad parts of human nature must continue to be exhibited in the thousand mirrors of the press, those who would neutralise the evil should take every opportunity of calling into action the higher and purer sympathies of the heart. And not rarely does the daily news itself supply us with the means of so doing, and present in the very same page an antidote to the poison, although we are only too liable to pass over the former in favour of the chalice which offers a coarser intoxication.

That the details of crime, as given daily in the newspapers, inordinate the sensibilities—just as frequent public executions used to breed felons at the foot of the gallows—cannot be denied; but they present likewise, and not unfrequently, details of virtue, which require only to be brought prominently forward to counteract the former influence, and maintain a healthy tone in the mind. Among the latter, we have just observed, in a provincial journal, an anecdote of female heroism which merits record much more than the most splendid deeds of valour in the field, and we are proud to afford it a wider circulation and a more permanent page. An obliging correspondent, who resides near the place in question, not only vouches for the truth of the facts, but enables us to give the incident with some completeness.

In a house in Morden Street, Troy-town, Rochester, a young girl called Sarah Rogers, about fifteen years of age, was in charge of a child ten months old. She had laid down the infant for a time, and missing it on turning round, ran out into the garden to look for it. The child was not to be seen; and the poor little nurse, in obedience to a terrible presentiment, rushed to the well. Her fears were only too just. The covering of the well was out of repair; and on dragging away the broken boards, she saw the object of her search in the water at the bottom—a distance of sixty-three feet. A wild scream broke from the girl at the sight; but she did not content herself with screaming, and she knew that if she ran for aid, it would in all probability come too late. Sarah Rogers, therefore—this girl of fifteen—lowered the bucket to the bottom, and grasping the rope in her hands, descended after it. In thus descending, without any one above to steady her, she swayed against the rough stones of the well, and mangled her hands to such an extent, that the flesh is described as having been actually torn from the bones.

She reached the bottom nevertheless; and although standing in three feet water, contrived to get hold of the drowning child with her lacerated hands, and raise it above the surface. She then emptied the bucket, which had filled, and placing her precious charge in it, awaited

the result. That result was fortunate and speedy, for her scream providentially had drawn several persons to the spot, and Sarah Rogers had presently the delight to see the bucket ascending with the infant. Still the brave and generous girl was unsatisfied; and when the bucket was lowered for herself, she could not be prevailed upon to enter it till they had assured her of the safety of the child.

The infant was found to be severely, but not dangerously hurt; while it was feared that its preserver would lose for ever the use of her hands. But this, we are happy to say, is now not likely to be the case. The wounds will in all probability yield to the influence of care and skill, and Sarah Rogers will be able, as heretofore, to earn her bread by the work of her hands. But she is a poor, solitary girl, with no relations able to assist her, and even no home upon earth but that of the grateful parents of the child. These, unfortunately, are not in a condition to render their aid of much importance. They have declared, it is true, that for the future Sarah Rogers shall be like one of their own family; but the husband is nothing more than a clerk on board her majesty's ship Poictiers, and is probably but ill prepared to sustain such an addition to the number of his household. Would it not be well, in a case like this, in which governments are necessarily passive, for such private individuals as have not more pressing claims upon their liberality, to come forward, and do honour publicly to fidelity and intrepidity, even when found in a poor, little, friendless servant-girl?

THE FRENCH INSTITUTE.

ACADEMIES were originally nothing more than schools, in which philosophers communicated certain doctrines to their disciples or scholars. The name was adopted from the circumstance of Plato teaching in some shady recess of the garden of Academus at Athens; while Aristotle taught or disputed as he walked about the Lyceum, whence his adherents were called Peripatetics. The former name suited better the sedentary habits of learning; and though distinguishing at first the school of Plato exclusively, it came to be applied to succeeding learned and literary societies, whose common object was the cultivation of knowledge. The Academy of Alexandria served still more directly than the schools of Athens as a model for the modern world. It had its philosophers and scholars, its resident members and foreign associates, and, in fine, its celebrated library, destroyed eventually by the Caliph Omar. In Rome, the entertainments of Mæcenas were the only substitute for an academy; for Augustus was the patron, not of letters, but of flatterers and parasites; and it was not till after the fall of the Western Empire, that any attempt was made to resuscitate the literary institutions of Egypt and Greece.

The founder of the first academy of the modern world was Charlemagne, who, with the assistance of the English monk Alcuin, instituted a society in his palace for the study of grammar, orthography, rhetoric, poetry, history, and mathematics. The Academy of Oxford, founded a century later by Alfred, was rather a school of instruction; and it was not till the revival of learning in the fifteenth century, that true academies sprung up in almost every country in Europe. But our present business is with that constellation of literary luminaries known later, in a collective form, by the name of the French Institute.

The father of the French Academy may be said to have been Valentine Conrart, a gentleman of some distinction, being a counsellor and secretary to the king, who, about the year 1630, brought together a society of literary persons, calling themselves successively—Academy of Beaux-Esprits, Academy of Eloquence, and Eminent Academy. Four years after, the reunion was mentioned to Cardinal Richelieu, when already Gomberville had declared—

Qu'il n'est point d'Apollon que le grand Richelieu ;

and the cardinal at once offered his protection. The offer was accepted, though not without some dissentient voices being heard, and the society was re-named the French Academy. It had now a director, a chancellor, and a secretary; kept records of its transactions; and was confirmed by royal letters patent in 1635. In 1663, the Academy of Inscriptions and Belles Lettres was instituted by Colbert, and called by Louis XIV. the Little Academy, from the circumstance of its being at first composed of four members of the French Academy. These individuals the great minister assembled from time to time in his own house; and the chief task he prescribed for them was the illustration of the passing reign by means of inscriptions on monuments and medals. They superintended, likewise, the designs of the royal tapestries, the contemplated embellishments of Versailles, and other matters of taste.

Some time before this, as we are told by Dr Birch, certain worthy persons residing in London, being 'inquisitive into natural, and the new and experimental philosophy, agreed to meet weekly on a certain day to discourse upon such subjects, and were known by the title of the Invisible or Philosophical College.' This society waxed gradually, till at length it attracted the attention of Charles II., and became illustrious under the name of the Royal Society of London. Colbert was not slow in perceiving the national advantages attending such an institution; and only three years after the date of its charter—namely, in 1666—he called around him the most celebrated geometers, natural philosophers, mechanics, anatomists, and chemists, and established the Academy of Sciences. Although Colbert, however, was only the founder of these two academies—that of Inscriptions, and that of Science—his services were all-important to the French Academy, of which he had long been a member. To him it was indebted for most of the distinctions and privileges it obtained during his ministry; and it was he who commenced the library of the Academy by a donation of six hundred and sixty volumes. He installed it in the Louvre in 1672, and commemorated the event by a medal. The title of academicien was an unfailing passport to his favour, and he delighted to entertain his colleagues in his elegant house of Sceaux.

Then came the Revolution, when academies of learning were but little thought of, and when the heads of some of the most distinguished members rolled, with as little distinction as those of mere nobility, upon the scaffold. The greatest of these victims was Lavoisier, the founder of modern chemistry, who, at the age of twenty-five, had already distinguished himself so much, as to become an associate of the Academy. Twenty-six years after, when he was in the very height of his fame, he was arrested and dragged before the terrible tribunal. Only one man in all Paris dared to raise his voice in his favour. This was M. Hallé, a brave and noble citizen, who read publicly at the Lyceum a report on the discoveries of the great chemist, which was afterwards transmitted to the tribunal. Lavoisier himself condescended to request permission to live for a few days, that he might finish some important experiments; but the chief of the small number of mean and insignificant men whom the French of that day permitted to decimate them, without daring even to utter a cry, replied, with a ferocious growl, 'We have no more need of savants!' and the philosopher, who had not completed his fifty-first year, was cut off in the very commencement of his glorious career. This was not one of the political or party murders of the time. He was sacrificed in the mere frenzy of ignorant imbecility, together with twenty-seven other men who, like him, were by profession farmers of the revenue.

After the Reign of Terror, it was discovered that France really had need of savants, and that some savants had been of great use even in matters relating to the defence of the country. Chaplat and Berthollet had taught the improvement of gunpowder, and Monze that of cannon; and men began to wish that the three

Academies, tacitly dissolved in the confusion of the time, could be reconstructed anew. This was at length effected, and in a way which added greatly to the solidity of the edifice. The three were fused into one great whole, called the National Institute; and this divided into classes, comprehending the physical and mathematical sciences, moral and political science, and literature and the fine arts. The object was generally the advancement of the arts and sciences, and this was to be obtained by continual researches, the publication of discoveries and transactions, and correspondence with learned and literary men in other countries. The number of resident members was one hundred and forty-four, with an equal number in the provinces, and each class had the privilege of choosing eight foreign associates.

But soon the exigencies of the time robbed France of a great proportion of its savants; for Bonaparte carried with him into Egypt nearly a hundred men who had attained eminence in the arts and sciences. This illustrious corps shared the fatigues and dangers of the common soldiers, and on more than one occasion excited the admiration of the whole army by their heroic courage before the enemy, and the patient endurance with which they bore the privations of the desert. At Cairo they were formed into an Institute of Egypt, which cannot be considered otherwise than as a branch of the French Institute. Monze, one of the founders of the Polytechnic School, was the first president; Bonaparte the second; and their place of meeting was one of the greatest palaces of the city. Their task was to compile an exact description of the country; to execute a detailed map; to study ruins and natural productions; to make observations in physics, astronomy, and natural history; and to inquire into the practicability of ameliorating the condition of the people by the introduction of machinery, canals, and new processes adapted to the soil. All this was soon at an end. The French were compelled to evacuate Egypt, the savants were called away in the midst of their labours, and the fragments of the eastern Institute were reunited to the Institute of France.

In 1803, when Bonaparte was silently preparing to ascend the imperial throne, he regarded with some alarm the condition of the Institute, the greater part of whose members had by this time become attached to studies connected with moral and political science. Discussions on such points were very awkward at the time; and the 'man of destiny' discovered that the classes into which the Institute was divided were too few for the requirements of its object, and very liberally gave it a new organisation, dividing it into four classes instead of three. These were—1st, Physical and mathematical science, consisting of sixty-five members; 2d, French language and literature, forty members; 3d, History and ancient literature, forty members; and 4th, The fine arts, twenty-eight members. This, it will be seen, as compared with the republican constitution, divided literature into two—French and universal; and entirely swamped moral and political science. His next step, after he changed his name from Bonaparte to Napoleon, was to make a corresponding change in the name of the society, which from the National became now the Imperial Institute.

The imperial régime passed away, and the Restoration restored the Institute nearly to its original form, as well as to its national name. In 1815, the Bourbons abolished the four classes of the emperor, and re-established the four original academies, but in this order: the French Academy, the Academy of Inscriptions and Belles Lettres, the Academy of Sciences, and the Academy of Fine Arts. Thus united, they formed the National Institute, under the personal direction of the king, but each with an independent organisation, and the exercise of certain peculiar powers. In 1832, the class suppressed by Bonaparte was restored by Louis-Philippe, under the name of the Academy of Moral and Political Sciences; and the Institute therefore may now be supposed to have reached its highest development.

The business of the different academies is multifarious. The dictionary, we all know, is due to the French Academy, and it cost an infinite deal of time, trouble, and speech-making. When Colbert attended a sitting to judge for himself how they proceeded in their labours, he listened for two mortal hours to a debate on the single word *ami*, and left the house impressed with the conviction that no society could get on more rapidly in a work of the kind. The Academy of Inscriptions and Belles Lettres is unlimited in the number of corresponding members; and through this branch the roll of the Institute is embellished with the names of the most distinguished scholars in Europe. This academy is charged with the superintendence of public monuments, and the conservation of those already existing; and it has likewise the principal part in editing the '*Journal des Savans*.' The Academy of Sciences is divided, as at first, into two principal departments—the physical and mathematical. The number of its foreign associates is limited to ten. Bonaparte was proud of his distinction as a member of this branch; and when he was already decorated with the trophies of Italy, he appeared more than once, in public solemnities, in the habit of the Institute. The Academy of Fine Arts is divided into five sections, and has a committee charged with the publication of a dictionary of the fine arts. The Academy of Moral and Political Sciences is likewise divided into five sections, but has only five foreign associates. The honoraire attached to the title of member of the Institute amount to 1500 francs (L.60) a-year.

It will be observed that the grand distinguishing feature of the Institute, is its combining in one society the principal departments of human knowledge. We do not see very clearly the advantage of this kind of centralisation; which is attended with the effect of rendering the title of member somewhat obscure. A 'member of the Institute' may be either a farce-writer or an astronomer.

THREE WEEKS AT CONSTANTINOPLE.

SECOND ARTICLE.

August 21.—Crossed the Golden Horn in the morning, for a ramble about Constantinople. Went first to the leather bazaar, where we made a few trifling purchases; and thence to the madhouse. This latter is divided into two spacious courtyards; in the first of which we were shown, much to our surprise, some wild beasts in large dens!—by way, I suppose, of preparing us for what we were next to see. Accordingly, in the next court, we saw the patients, about twelve in number, all confined by very strong iron chains and collars round their necks. Their cells were large, but neither paved nor floored; and it seemed as if the poor wretches must often suffer agonies of cold. They were all more or less clothed, though rudely enough; and their persons were not wholly neglected. One poor wretch, who was just about to undergo a washing, was a pitiable spectacle. He was quite naked, but with the iron chain and collar still about his neck, and his body disfigured with bites of vermin. As he sat on the ground in this condition, with his bare shaven head, he was no inapt representative of Job in his affliction. We noticed but one very noisy patient. There was an Arab patient, with only a rough blanket thrown over him, sitting in the farthest window of his cell, with the sun streaming in through the bars over his dark features, as he laughed and conversed wildly with a visitor. Such a study for a painter I scarcely ever saw before. Two other patients, in opposite corners of the same cell, had been smoking, and were now throwing their cherry-stick pipes at one another. Another, whose arm was bound up, as if severely injured, had, as they told us, twice broken his chain. We were given to understand, I know not how truly, that it was permitted to irritate the patients to frenzy, as though their ravings were oracular, and the effect of divine inspiration. Any one within the court had

access to the cells and the patients. I was surprised with myself at not feeling more shocked than I did, at a spectacle which I should certainly have shuddered at had I heard it described as I saw it with my own eyes. There is something in our preconceived ideas of happiness or misery that usually exceeds the reality.

We continued our walk to the desolate site of the barracks of the exterminated Janissaries. The whole quarter is in a most ruinous condition. We saw what had been a beautiful marble fountain quite dried up and disfigured—the truest emblem of desolation. We then came to a single column, with the Roman eagle at each of the four corners of the capital. The design of the column was not very striking, and was apparently of late Roman architecture. From thence we made our way to the historical column, or the column of Honorius and Arcadius. Of this the base alone is standing, and even that is in a very ruinous condition. The column fell down about the year 1716, two years before Lady Mary Wortley Montagu came to Constantinople. We ascended the remaining steps of the winding staircase, which once, I conclude, conducted to the summit of the column, and found a small chamber inside the base. The whole seems to have been constructed of white marble, the blocks of which material are very large.

August 22.—Went in the afternoon in a caique to a spot called the European Sweet Waters, on the European side of the Bosphorus, on the banks of the little river that runs into the Golden Horn. Here there is a pretty summer kiosk belonging to the sultan.

August 23.—Made a few purchases in the bazaars, and dined in Constantinople on kabob, a genuine Turkish dish, and very good. It consists of mutton cut into small pieces, broiled on skewers, and served up on large flat cakes resembling crumpits.

August 24.—Dancing dervishes again at two o'clock.

August 25.—Rode round the old walls of Constantinople. It is a curious and interesting round to take, with some fine points of view. On our way we passed under the aqueduct of the Emperor Valens, which is a stupendous work, and still serves as an aqueduct; but without the assistance of natural scenery as an adjunct, aqueducts are rarely beautiful objects.

In the course of our ride I saw several hoopoes, birds which I never before saw on wing. They are frequently sold in the streets as articles of food. On our return, we passed by the smoking ruins of above a hundred houses that had been burnt down four days ago; but a hundred houses is not considered as a conflagration of much consequence in Constantinople.

Before we reached home, we met a Greek funeral. The corpse was carried on an open bier, strewn with flowers, and its face exposed. The Bible was laid upon its breast. Two boys followed with lighted candles, with priests, friends, and hired mourners, chanting a dirge. We rode home by the bazaars, and crossed the Golden Horn by the bridge of boats, and so through the cemetery to Pera.

August 26.—Grand military review at Scutari. This, we were informed, was the first review that had taken place in the present sultan's reign, and the second only since the adoption, to a considerable extent, of European military systems and dress. About eight hundred troops were reviewed—light and heavy cavalry and artillery, and large columns of infantry. The light cavalry regiment of lancers looked well in a body, and the red fez, or bonnet, with its deep blue tassel, and the red pennon of the lance above, presented, when viewed in a mass, a surface tinted like the flowers of the cactus. Individually, men, arms, and accoutrements were very shabby. There were no scabbards to the bayonets; and as far as we could judge, knowing next to nothing about military matters, much could not be said in praise of the manœuvring of the troops. The artillery practice, however, was more creditable. The review took place on a fine tract of undulating open country, with mountains in the distance—the Sea of Marmora, the Bos-

phorus, Constantinople, and the cypress-crowned cemeteries of Scutari filling up the view. The sultan, preceded by a guard and the officers of his household, came on the ground in an odd but picturesque carriage, with a body of the shape of a sedan-chair, richly gilt, with a crimson hampercloth, and drawn by four beautiful white horses. He was followed by the queen-mother, and the foreign ministers, in carriages, and by the chief officers of state, superbly mounted on Arabians. We obtained a very good view of the sultan's features: he is much marked with the smallpox, but has fine dark eyes.

Here were also several very handsome arabas, filled with the women of the imperial harem; but they were closely veiled, and their guards kept all spectators at a most respectful distance. The arabas were drawn by white oxen of great size and beauty, with handsome frontlets, and from the yokes over their necks proceeded long bent pieces of wood, curved backwards, to which the tails of the animals were attached, and held up in the air with pendant bells, tassels, and ribbons.

Presently, what should we hear but a report that a Frank had got into a dispute with the Turks, and that he had been severely beaten, and dragged to Scutari as a prisoner between two horse soldiers, and that in all probability he would undergo the bastinado. The account had been, as usual, exaggerated; but it was true that he had been beaten, and was obliged to keep his bed in consequence. One of our party went to visit him, and he turned out to be the identical Frenchman who had accompanied us to the mosques, and who spat upon the sacred pavement. We never heard the origin of the quarrel on the day of the review; but it is clear that a man who could commit so gross an inadvertence as he did on one occasion, might well be supposed not to have acted very wisely on another. On our return, we bought another basket of the delicious grapes of Scutari.

August 27.—Saw the sultan go to mosque on horseback, attended by the grand vizier and other officers of state. We then, by a short cut, got up the hill before the cavalcade, to a point where the road wound round the ascent, and again secured a good position for seeing the procession. Several Turks stood by with petitions to present, which were all received in order by the appointed officer as the sultan passed by. It was quite realising one of the scenes we had read of, in childhood, from the Arabian Nights' Entertainments. The sultan's saddle-horses, of which several were led, and those on which his officers were mounted, were of the greatest beauty.

August 28.—In the course of our walk we passed once more through the slave-market, which had a livelier appearance than when we visited it before. The greater part of the slaves were black females. We saw some miserable-looking objects among the little black girls; and one black lad was being rubbed all over with oil, in the hot sun, which gave him a most attractive polish. But what delighted us most, was to see some dishes of hot potatoes and garlic, which a man was carrying on his head, upset in the crowd, and the little hungry black wretches scrambling for them. This slave-market, notwithstanding the dirt of it, abounds, like every other corner of Constantinople, with interesting studies for painters. We were then just going to look about us once more in the bazaars, when we heard the cry of 'Fire in Pera!' This was to us equivalent to 'tam proximus ardet Ucalegor!' and we lost no time in hurrying back across the Golden Horn, with a mixed mob of Jews, Armenians, and others, who closed their shops with all haste in the bazaars, and hurried away to save their property in their dwelling-houses in Pera. We got across the water in the midst of an extraordinary tumult, and rushed up the hilly streets of Pera—not the pleasantest or the easiest ground in the world to hurry over. We found that the fire was not far from our hotel, but that it was being rapidly got under. I saw one small brass fire-engine,

that could scarcely have had as much power as an ordinary garden engine, hurried along on men's shoulders to the scene of action. But the Turkish firemen wore workmenlike dark dresses, and were armed with powerful axes, and very long poles, with iron hooks and spikes at the end, intended to be used, if necessary, or thought to be so, in pulling down the houses adjoining those on fire, so as to smother the fire with the rubbish. Turkish houses, it must be observed, are not built for perpetuity, being, in fact, little stronger than temporary wooden sheds. One way or another, however, the fire was extinguished; whereupon we all recrossed the water, to prosecute our day's excursion in the streets of Constantinople, and no sooner got thither, than we again heard the alarm of 'Fire!'—this time in Constantinople. Passing by the shop of a perfumer, with whom we had had some bargainings in the early part of the day, we found him hastily shutting up his shop, and hurrying off to the scene of the conflagration, which was near his residence, just as we ourselves had hurried off to Pera a short time before.

August 29.—Ceremony of the dancing dervishes at their convent at Cassim Pasha. I went rather in expectation of some ceremony different from that which I had already witnessed at Pera, but was disappointed. I here saw a very little boy, quite a child, running about in the dress of a dervish. The high conical cap gave him a most ludicrous appearance. When the ceremony began, the poor little thing went through the prostrations and reverences with the rest. But I was really quite glad to see that he soon grew tired, and so put on his slippers, and went out to play in the open air with others of his own age.

In the afternoon we rode round by the bridge of boats to the aqueduct of Valens, and to the old city walls, as before, and outside the city to the suburb of Eyoub. Eyoub, or Job, the standard-bearer of Mahomet, was killed by the Saracens, and was buried there. Hence Eyoub is considered by the Turks as a most sacred place of burial, and here also is their most sacred mosque, where each succeeding sultan is inaugurated, by girding himself with the sword of Othman. The Turks, as true believers, do not much like the Franks to approach the place. The cemeteries are here kept in good order, and the tombs are covered with ivy and creepers of various kinds, and are picturesquely disposed (as indeed everything is in Constantinople) beneath the shade of lofty trees. We then ascended the hill beyond, and obtained a superb view of Constantinople and the Golden Horn. We rode from thence along the brow of the hill, looking down upon the valley of the European Sweet Waters; and in a valley near the sultan's kiosk we saw an encampment of Turkish artillery, to which we descended, and so crossed the hills home to Pera.

August 30.—To Therapia for the second time. Rode in the afternoon to the gigantic plane-trees in the Sultan's Valley, and to the Valley of Roses, and the village of Buyukdéré. Slept at Therapia.

August 31.—From Therapia, on horseback, to visit the city aqueducts, by the villages of Belgrade and Pyrgos, and so to Justinian's aqueduct, and home to Pera, making a ride of about thirty miles through a very interesting country. We first ascended the valley of Buyukdéré, and highly enjoyed the beautiful prospect, as we looked back upon the Bosphorus from the great arch of Sultan Mahmoud's aqueduct, between Buyukdéré and Bagdache Koi. On arriving at Belgrade, we saw the whole system of collecting water in large reservoirs, or bends, as they are called, for the use of the cities of Pera and Constantinople. The forest of Belgrade is the only woody region near Constantinople. The thick shade is considered a great protection to the reservoirs, and on this account the wood is never cut; and this, again, is probably the cause why Belgrade is, at certain seasons, extremely unhealthy, and very subject to malaria fever. Two out of the seven aqueducts, we remarked, were not conducted in a

straight line, but with a considerable curvature in the line of their direction.

On arriving at Justinian's aqueduct, we halted for an hour under the shade of its immense structure, and examined it in every accessible part, and climbed up the hill that formed one side of the valley across which the aqueduct is built. On the summit, where the stonework was broken away, the stream of water conveyed by the aqueduct was visible. It was two feet deep, and two feet across; but the channel was only half-full. The water was running with considerable rapidity. Underneath the shade of the arches were two wild-looking shepherds, with sheep, cows, and goats. The goats were hanging about the stonework in the most picturesque manner possible. I observed a few fine butterflies in the woods of Belgrade. In the course of the day we saw several hoopoes (birds which I have made mention of before), and caught a tortoise, and met some strings of camels laden with charcoal. Water-wheels were in general use for irrigating the cultivated lands.

September 2.—At two o'clock, to the ceremony of the howling dervishes of Scutari. The preliminary prayers and prostrations resembled those of the dancing dervishes, but with this difference, that incense was made use of, and that the accompanying song had a slight resemblance to what I have heard in Roman Catholic services. These howlers do not wear a dress peculiar to themselves, as the dancers do, but appeared to consist of devotees of every kind of profession and denomination. However, to show that there must be a community of feeling between the dervishes of both kinds, I will mention that we saw one of the dancing dervishes standing, in a composed attitude, amongst the chiefs of the howlers. After a repetition of some long prayers, and hideously-vociferous and noisy responses, the devotees, at least fifty in number, stood up in a row, quite close together, and began to recite or repeat the words, '*La-Allah-il-Allah*' (accented agreeably to the quantities I have here marked), bowing themselves backwards and forwards, keeping strict time to their recitative. This motion, and the repetition of the words, became gradually more and more rapid, with occasional violent ejaculations of '*Hu!*' whilst the noisy chant and responses, in a yet shriller key, were kept up without intermission by two others who remained kneeling on the floor. The movements and vociferations gradually assumed a more frantic character; the agitations of the devotees, and, I am shocked to add, of several children who bore their part in the ceremony, became dreadful. The heads of some were tossed about so violently, that their features were scarcely distinguishable, and their limbs quivered with excitement, whilst they uttered appalling guttural noises, mingled at the same time with some extremely fine deep bass notes, which were heard at intervals in the storm of vociferation; but at a signal given by the chief who presided over the whole, all the howlers resealed themselves round the room with the utmost apparent composure! Some few, indeed, wiped the sweat from their brows; but not one appeared exhausted, or even out of breath.

A pause now ensued, during which the dancing dervish, who had hitherto remained a tranquil spectator of all that had passed, came forward and pirouetted, after the manner before described of his own sect, in the middle of the circle by himself for several minutes. Then the howlers rearranged themselves, and began all their movements afresh, with the exception that this time their motions were rocking from side to side, instead of backwards and forwards, with their recitative as before, but with the accentuation of the syllables changed, from anapestic, as it were, to iambic, thus, '*La-i-lah-il-lah-lah*' Again, in the second act of the performance, did the noise become stunning; again did the contortions and excitement of the devotees seem to be approaching some inevitable climax; again did the poor children bear their part as before; when the whole exhibition, at a given signal from the chief, ended quite

suddenly: the dervishes quietly resumed what outer garments they had laid aside, and—walked away!

The whole was little better than a revolting and obscene sight. All these howlers were low, ruffianly-looking fellows. There were several blacks and several soldiers amongst them. We were given to understand that they are tolerated by the government, but that they have had their orgies modified, and their ceremonies cut down, by command of the late sultan. They are generally considered as impostors, and are held as far less respectable characters than the mewlewli or dancing dervishes. Round the room in which the ceremony took place were suspended various iron instruments, with which the howling dervishes used to maim and torture themselves, or at least pretend to do so; but such exhibitions have been forbidden by authority. However, our impression was, that had they indulged in such pastimes, we should have felt little or no pity for any pain they might have suffered. The exhibition lasted two hours.

September 4.—Visited the great cistern of Constantine. It is underground, and contains a vast body of water. It is constructed inside with very handsome arches and pillars, and scarcely conveyed the idea of having been originally intended as a cistern. It was impossible for us to see the whole extent of it. I understand its Turkish name signifies 'The Thousand and One Pillars.' To-day we again passed by the Burnt Column, as it is called. It is the shaft of a Roman column that seems to have once been in the middle of a terrible conflagration, so ruined, split, and blackened is it by the fire. We had frequently seen it before in the course of our rambles.

September 7.—In the afternoon we left Constantinople for Malta by the French steamer.

Thus we passed twenty-four days at Constantinople; and without making any excursion to a greater distance than Therapia or Belgrade, we were actively employed during the whole of the time. With the exception of the interiors of the mosques, in my opinion the chief attractions of Constantinople lie out of doors, in the exquisite views of the hill-enthroned city, and of the Bosphorus and its shores, that you obtain on every side. Above the general mass of the houses rise the spreading cupolas, relieved so happily by the lofty and glittering minarets, which, not without an elegance all their own, partake of the gracefulness both of a church spire and of the mast of a ship. These, together with the dark cypresses, the ever-clear and blue Bosphorus, with its light caiques and shipping—the ever-busy scene, the gay harmony of lively colours, the sky, sunshine, and fresh breeze—are the chief ingredients in the picture; a combination perhaps unequalled in any other part of the world. Happy are they who possess the talent of drawing! Not only the general large features of Constantinople, but the boatmen, the porters under their enormous burdens, the beggars, the itinerant venders of a thousand different articles, are subjects for the pencil—on the water and on the land, all equally admirable.

The Turks are apparently not without a certain natural refinement of manner; but I do not imagine that much insight into their true character can be obtained, or that anything can be learned concerning their domestic economy, unless some proficiency in their language be made, and after a long residence in the country, or through opportunities afforded only to a few. I have heard, from high authority in such matters, that a dinner at a pasha's table is really excellent. From what may be seen in the shops, they appear to be good cooks and delicate confectioners; and when this natural talent comes to be assisted by a few hints from the cuisine of France, the result is no doubt, as it is said to be, eminently successful.

It is a drawback at Constantinople that there are no public places of entertainment. All acquaintance with the manners and customs of the people must be picked up in the daytime in the streets and bazaars. Neither

is it very safe to go out of doors after dark. The troops of dogs without homes or masters that are seen in every street during the day, generally asleep in the sun, towards dusk give themselves the rousing shake, and begin to show their wakefulness by barking at every Frank they meet. At night they prow about the city, and would probably, especially in the winter season, attack any one that fell in their way. There are several dismal stories current of persons, strangers to the conditions of the place, who have been actually devoured in this manner. Further, whoever is taken up in the streets at night without a lantern, is forthwith consigned to the guardhouse.

The goods in the bazaars are set out in most picturesque and tempting array. One bazaar is appropriated to the sale of arms, another to the sale of drugs, a third to leathern slippers, a fourth to horse furniture; and so on, for furs, jewellery, silks, embroidery, &c. &c. The motley crowd, exhibiting the dresses of all nations, and made up of all ranks, degrees, and callings, and the brilliant and varied colours of the greater part of the articles exposed for sale, seen down the bazaars in long perspective, with the arched roof of the building high over all, with a light subdued just sufficiently to take off the glare, form a scene that a painter might succeed in expressing on canvas, but of which words cannot convey an adequate idea. I need not add that the sellers reap a tolerably plentiful harvest from the European customers. The bargaining, without which no purchase is ever completed, is often very amusing. Half, or even one-third, of the original demand is usually taken with the greatest composure.

It is absolutely necessary in Constantinople to walk a great deal, and to be equal to fatigue. The arabs are the only wheeled carriages, which only go at a foot-pace, drawn by oxen; and to these most of the streets are inaccessible. Nor is riding on horseback always convenient. However, very good horses are to be procured, when required for distant excursions. They gallop well, and are remarkably sure-footed in steep and slippery places.

In such a merely amateur and sketchy excursion as ours, we must, in a city like Constantinople, have passed over a thousand points important to be studied and understood. Much, however, that is perhaps of value, and certainly much that is very pleasing, will remain indelibly fixed in our recollections; serving at the same time to feed and cherish one predominant feeling of satisfaction and thankfulness—that England is our home.

JUDICIAL COMBATS AND THE WARS OF NATIONS.

ONE of the dark spots on the disk of the middle ages was the trial by judicial combat. When the fierce tribes of Huns and Alans, Goths and Lombards, at once inundated and destroyed the Roman empire in the west, they also displaced its enlightened civil jurisprudence, and at the same time established a rude appeal to justice, in accordance with the system of Feudality which they organised throughout Europe. This rude appeal to justice was the trial by judicial combat. The savage of a tribe considers it his right and duty individually to revenge wrongs or to repel attacks; the administration of justice is with him a personality; he individualises awards and punishments; he takes judicature into his own hands; he has no notion of giving up his individuality in this respect to society. As Feudality was but a more definite organisation of Tribism, so also was the trial by judicial combat but a more organised system of personally settling a quarrel, a dispute, or a difference between individual and individual. The difference, and the progress, so to speak, in favour of the latter development was, that it was public and recognised, not private or secret.

As the quarrel between two persons is in close analogy, on a small scale, with the war between two nations,

having similar origins and developments, it may be well to trace something of the history of the trial by judicial combat, since it may lead us to inferences upon the military system, of which it is a portion, generally.

The trial by judicial combat was the offspring of feudality. In that state central power was weak. The monarch and his court had little influence during the greater part of its history. The state was composed of tribes, newly fixed in their position, and holding their land from their chiefs under the tenure of fiefs. These barons, therefore, had a court and centre of their own, and in this they claimed to administer justice, with little reference, if any, to their lord paramount—the monarch. They had conquered the lands upon which they had settled with the sword; and drawing his blade, every injured baron sought justice with its point. His adversary met him also with the sword, and the vassals of each supported their respective leaders in the contest. There was no appeal to a written law, to a regular magistracy, or to the decision of a sovereign national court. The same system spread from the barons to their vassals, until it became a recognised public institution, and the form of trial by judicial combat established itself throughout Europe. In civilisation, written documents, witnessed deeds, or attested agreements, regulate the stipulations between individuals, and are evidence as to the facts. In feudality, on the contrary, reading and writing were too rare attainments to be useful in the general affairs of life. National treaties and royal charters were indeed committed to the pen of a clerk, but transactions between private parties, and the details of personal business, were carried on by word of mouth or delegated promise. The proof of claims, and the evidence of facts, was thus therefore difficult, and encouraged both deception and evasion, whether in criminal or in civil cases. The definition of evidence, the decision as to whether a court should accept positive or circumstantial proof, the determination as to the respective credit to be attached to discordant witnesses, and generally all intricate questions, were, under these circumstances, matters of extreme difficulty. Recourse was consequently had to the appeal to trial by combat between the adversaries. They publicly fought hand to hand, and thus decided their differences before their judges. Undoubtedly the innocent often fell thus under the more mighty arms of their guilty antagonists; and by this absurd system justice was left to the decision of chance or force. Yet so military was the nature of feudality, in which every soldier was a freeman, and every rood of ground held by tenure of martial service, that the judicial combat was, for a considerable period, considered as one of the wisest institutions both of civil and criminal jurisprudence. It gradually superseded the ordeal by fire, water, or dead body, as well as the plan of acquittal by oath or compurgation, until it became the distinguished and cherished privilege of a gentleman over all Europe to claim the trial by combat. Not only contested questions, but abstract points undetermined by law, were thus decided by the sword, until justice dropped the scales, and waved only a bloody blade. Evidence was in the point of the sword, and the successful argument in the keenest edge, wielded by the strongest arm. Witnesses, and even judges, were not exempt from a challenge to the combat, nor could it be refused by them without infamy. Moreover, women, children, ecclesiastics, and aged or infirm persons, who could not, from circumstances of sex, or age, or position, be expected to use the judicial sword in their own right, had nevertheless the liberty, or rather obligation, of producing champions, who would fight upon their behalf from individual attachment, or from consanguineous or mercenary motives. In fine, religious ceremonies were added to the judicial combat; and what was really a recourse to the decision of fortuity, or to the preponderance of animal prowess, became superstitiously accounted a direct appeal to God. Its arrangements were settled by edicts, commented

on by legists, and became almost the sole study of the feudal nobility.

Such was the origin and development of the trial by judicial combat. Although its institution was popular, and accordant with the spirit of the times, its evil effects soon manifested themselves. The clergy, whose canon law was excellent, and who perhaps regretted the disuse of those ordeals which appeared to appeal more to the interposition of Providence than did a personal conflict, were among the first to protest against the trial by judicial combat, as contrary to Christianity, and inimical to good order. So consonant was it, however, with the fierce spirit of the times, that even superstition fell powerless before its influence, and the censures and admonitions of the ecclesiastics were disregarded. At length the evil became so obvious, that the civil power could no longer disregard it. Henry I. of England prohibited the trial by combat in questions of property of small value, and Louis VII. of France followed his example. The central power of the feudal monarchs was, however, yet feeble, and any restrictions which were to be made upon an institution so popular among the barons, required to be effected with prudence and policy. It was nevertheless the interest of the kings to abate these ferocious contests, and centre the administration of the laws in their own courts. Louis of France, not inaptly named St Louis, earnestly attempted to introduce a better system of jurisprudence. He wished to displace judicial combat, and to substitute trial by evidence. The great vassals of the crown, however, possessed such independent power, that his beneficent regulations were principally confined to his own private seignory. Some barons, nevertheless, of their own accord, gradually adopted his plans; and the spirit of such courts of justice as existed grew daily more and more averse to the trial by combat. On the other hand, the successors of St Louis, awed by the general attachment to judicial combat, still tolerated and authorised its practice; and so the struggle continued for several centuries. In the course of these, however, the royal prerogatives gradually increased; and what was of more importance, the ideas of the people received a more pacific and intelligent development, as the first germs of the municipal system were manifested among them. Still, instances of judicial combat occur as late as the sixteenth century both in the annals of England and of France. As these decreased, with the ferocious habits they engendered, a great impulse was given to European civilisation by a more regular administration of justice. The authorisation of the right of appeal and of review from the courts of the barons to those of the king, was the grand desideratum; and this was gradually obtained. Royal courts, hitherto held at irregular intervals, were fixed as to time and place, and to these judges of more distinguished talents were appointed than those who administered in the judicature of the barons. They regulated the forms of law, and endeavoured to give consistency to its decisions; and the people were thus led to have more confidence in their decrees than in those of the barons, and were eager to exercise the new right of appeal. The order and precepts of the canon law in use among the ecclesiastics, being good in themselves, also contributed to this reform in jurisprudence. About the middle of the twelfth century, likewise, a copy of 'Justinian's Pandects' was found in Italy; and this led to a revival of the study of the Roman imperial code of laws, and so added greatly to the growth of more enlightened ideas on the administration of justice. Thus gradually was the trial by judicial combat abolished, and a more liberal system of jurisprudence established in its stead throughout Europe.

Let us now see what analogy exists between the history of judicial combat and that of national war. A person is a separate individuality. A nation is an aggregate individuality. As the judicial combat was a contest between the individuality of two persons, so also is war a contest between the individuality of two

nations. The origin of the trial by judicial combat was in the barbarous habits of our ancestors. Such likewise was the origin of war. The first was contrary to the spirit of Christianity: so also is the latter. The one was opposed to reason and enlightenment: so likewise is the other. The analogy so far between them is perfect, and requires no argument to liberal minds. Let us try to discover, therefore, if we may not build upon it a hope for the cessation of national wars. In doing this, let us first bear in mind that however obvious may be any error which has crept into the human mind, its eradication requires a long period. Absurd and barbarous as was the custom of judicial combat, its abolition occupied centuries; and in like manner, although the protestation against national warfare has already for some while been raised, but little progress was made until the last half century. Gradual, however, as was the abolition of judicial combat, it *was* at last effected, and effected too by causes which have their parallels in relation to national warfare. As an individual person is to a nation, so also is an individual nation to the world. Judicial combats destroyed national order, as the wars of nations disturb the harmony of the globe. As it was the interest of the nation to abolish the one, so also is it the interest of the world to abolish the other. As the king represented the nation, so likewise does the people represent the world. It was the interest of the king to abolish the judicial combats of the feudal barons, and it is the interest of the people to abolish the wars of the national kings. In the one instance it was the policy of royalty to abolish the former, as in the other instance it must be the policy of the people to abolish the latter. In all cases an enlightened interest is powerful, and must ultimately prevail. Christianity, again, was opposed to judicial combat: its ministers denounced it. Christianity is also opposed to national warfare; and its ministers begin to declare against it. Lastly, the progress of enlightenment directed its opposition against judicial combat, which fell before these reiterated attacks; and an enlightenment, most probably more potent than ever, is now directing its powers to effect the downfall of national warfare. It must fall ultimately before these united influences. As judicial combat was abolished, so also will national warfare be abolished by the combined efforts of popular interest, religious feeling, and enlightened reason.

ONLY TRY.

The United States Gazette translates the following from a French paper:—They used to say that every soldier carried in his cartridge-box a marshal's baton. Might not one say in these days that every chorister carries in his windpipe a fortune? Here is one example at least:—About thirty years ago, in a little city of Italy, at Bergamo, by a singular contrast, the company of the opera-house was quite indifferent, while the choristers were excellent. It could scarcely have been otherwise, since the greater part of the choristers have since become distinguished composers. Donizetti, Crivelli, Leodoro, Bianche, Mari, and Dolci, commenced by singing in the choruses at Bergamo. There were, among others at that epoch, a young man, very poor, very modest, and greatly beloved by his comrades. In Italy the orchestra and the choristers are worse paid than in France, if possible. You enter a bootmaker's shop—the master is the first violin. The apprentices relax themselves after a day's work by playing the clarinet, the hautboy, or the timbrels in the evening at the theatre. One young man, in order to assist his old mother, united the functions of chorister to the more lucrative employment of journeyman tailor. One day, when he had taken to Nozari's house a pair of pantaloons, that illustrious singer, after looking at him earnestly, said to him very kindly, 'It appears to me, my good fellow, that I have seen you somewhere.' 'Quite likely, sir: you may have seen me at the theatre, where I take a part in the choruses.' 'Have you a good voice?' 'Not remarkably, sir; I can with great difficulty reach *sol*.' 'Let me see,' said Nozari, going to the piano: 'begin the gamut.' Our chorister obeyed; but when he reached *sol*, he stopped short, out of

breath. 'Sound *la*—come, try.' 'Sir, I cannot.' 'Sound *la*, you fool.' '*La, la, la*.' 'Sound *si*.' 'My dear sir, I cannot.' 'Sound *si*, I tell you, or I'll—' 'Don't get angry, sir, I'll try: *la, si, la, si, do*.' 'I told you so,' said Nozari with a voice of triumph; 'and now, my good fellow, I will say only one word to you. If you will only study and practise, you will become the first tenor in Italy.' Nozari was right. The poor chorister, who, to gain his bread, had to mend breeches, possesses now a fortune of two millions, and is called *Rubini*.

GROWING OLD TOGETHER.

You have promised that through life
We shall journey heart-united,
Husband fond, and faithful wife,
And I trust the vow thus plighted:
Hand in hand, and side by side,
Through life's storms and sunny weather,
We will our one fortune bide,
And at last grow old together.

What if Time's unsparing wing
Of some pleasures has bereft us?
Let us not by murmuring
Lose the many that are left us.
What though youth and bloom depart,
Swift as birds of lightest feather?
Why repine with feeble heart?
Shall we not grow old together?

Few indeed have been our years,
Yet enough our hearts to bind, love;
And to show how many tears
In life's brightest cup we find, love!
Since in our united youth,
We twain sported on the heather,
Dearest! It is meet, in truth,
That we should grow old together!

D. M. M.

THE SHOWER-BATH.

Although the shower-bath does not cover the surface of the body so universally as the usual cold baths, this circumstance is rather favourable than otherwise; for those parts which the water has not touched feel the impression by sympathy as much as those in actual contact with it. Every drop of water becomes a partial cold bath in miniature; and thus a stronger impression is excited than by any other mode of bathing. The shower-bath, for the following reasons, possesses advantages superior to all others:—1. The sudden contact of the water, which in the common bath is only momentary, may here be prolonged, repeated, and modified at pleasure. 2. The head and breast, which are exposed to some inconvenience in the common bath, are here effectually secured, by receiving the first shock of the water; the blood is consequently impelled to the lower parts of the body, and the patient feels no obstruction in breathing, or undulations of blood towards the head. 3. In the cold bath, the heavy pressure on the body, occasioned by the weight of the water (the free circulation of the blood, in the parts touched by it, being, for some time at least, interrupted), is an unfavourable circumstance in certain instances. The shower-bath, on the contrary, descends in single drops, which are at once more stimulating and pleasant than the immersion into cold water, and it can be more readily procured, and more easily modified and adapted to the circumstances of the patient. When this kind of bath is first resorted to, it may be used gently, and with water having some degree of warmth, so as not to make the shock too great; but as the patient becomes accustomed to it, the degree of cold may be increased, and the water may be allowed to fall from a greater height, so as to make the shower heavier.—*Dr Graham*. [As an additional precaution, we should recommend beginners to cause the water to fall on the neck and shoulders, instead of the head.]

HISTORY OF A BURNIE.

'The Muse, nae poet ever fand her,
Till by himsel he learned to wander
Adown some trotting burn's meander,
And no think lang;
O sweet, to stray and pensive ponder
A heart-felt sang.'

BURNS.

FAR and high in a mountainous tract of the south of Scotland, in a hollow more green than brown in the side of a hill, the burnie commences its existence in a spongy or mossy piece of ground, all covered over with plants bearing small white flowers. It is a wild solitary place, where few living things are seen besides the hoodie crow, which comes here occasionally to converse with companions of his own species about dead lambs and such windfalls. At first you can see nothing like a rill—it is only a *syke*—but a little way onward, the syke begins to assume the form and movements of a burnie, and you may see it stealing along under the grass in a thread so slender, that the fairies might step over it at night, and scarcely know it is there. A very infantine affair is the burnie as yet—and rather like a sleeping than a waking infant:—you might lay your ear close down to it, and you would only hear it making the faintest murmur among its pebbles and its grass, like the breathings of a baby in a cradle. By and by, however, it begins to grow, and to become more noisy, and to leap over little stones that lie in its way, as if it had acquired a taste for fun, and were determined to indulge it. And yet it is doing so 'its leufu' lane,' as they say in Scotland; for not a soul is at hand to witness its pranks. The very rushes that fringe it get leave to grow as long as they will, there not being a bairn within several miles to come and pull them. At length our burnie comes to a place where there was once a herd's house, a little green and sheltered spot—people lived in it for many years, and were well acquainted with the burnie at this stage of its life-course—but they have long since left the place; and the only trace of them now is a few grassy mounds that once were walls. Onward it goes for many a turn, beneath the green hills—quite happy in its companionless journey—trotting, hopping, jumping—singing a merry song to itself, though there is not a bird to answer the descant—for we are yet far above the region of birds and bushes too—shining out brightly in the sunshine, though there seldom comes an eye to catch its dazzle. Well may it be thus bright and happy, for see how innocent it is—not a tinge in its clear waters—not a speck on the clean-washed pebbles left dry by its margin! Happiness and purity—how well they suit each other!

Such is the infancy of a burnie. But infancy is but a passing stage with burnies as well as bairns. Our burnie must leave these alpine solitudes, and come into

society, albeit to lose a little of the beautiful simplicity of its character. Bushes now begin to be seen along its banks; one of the first is an old thorn, with the earth all worn away round its roots, in consequence of the sheep coming there to rub themselves against its bark. In sheltered places, the ferns grow luxuriantly along the little haughs. The immediately adjacent braes being too steep for the sheep to feed along them, we see them all starred with primroses. Here at last is a green place, with short grass all besprent with gowans, opened fully to the sun—and upon it a lassie laying out clothes to bleach. Turn a corner, and behold a herd's house: it is the eldest hope of the family who is now putting the waters of our friend the burnie to their first economic use on the green. Two younger children, somewhat farther down, have made a side channel for a portion of the stream, and are busy erecting thereon their mimic rush-mills. Truly our burnie is now in a hopeful way. The house—a wee wee cot-house it is—has one little window at its end, directed towards the burn; and there sits a cat, winking with listless satisfaction under the glow of the summer sun. There, too, sits a curched grand-dame working her stocking, and rejoicing in the genial warmth which perhaps rarely comes so far up the glen—thinking, mayhap, of the days when she was full of young life like the burnie, and little recked of the many cares she has since gone through, or the sad memories which she has in the course of family years laid in the auld kirkyard.

Whisking blithely past this outpost of civilisation, our burnie now descends into a rough gully or ravine between steep banks, where it suddenly falls into a dreadful passion—kicks and flings, and fumes and sputters, at an awful rate; takes first one big stone in the side of the head, and then another, jumps madly over the heads of some, and goes poking under the ribs of certain others that are too big to be so dealt with—in short, it is a terrible specimen of youthful violence for the time it lasts, which fortunately is not long. After the whole scene is past, we see our friend coming out calmly along an open green, as if nothing of the kind had taken place. It has now come to the place where farm-steadings begin. You see them with their lowly thatched roofs at different points in the surrounding landscape. One or two plantations also vary the sombre hues of the hill-sides. Here the burnie may be said to have come into the world. Old-fashioned country wives put it to a good deal of use in bleaching their linen webs. Bairns paidle about in it the whole summer day. There are now some nice haughs along the banks, with cocks of meadow-grass dotting them all along. Gentlemen occasionally come up thus far to fish. Perhaps you may have been all along indulging in delightful fancies as to the simple innocence of our burnie; but if you consult some of the people hereabouts, it is

far from unlikely that you hear a different account of it. They probably repute it as a very wicked burnie, exceedingly apt—for all so small and gentle as it looks just now—to rise in great floods, and carry off hay-cocks, and claes, and pigs, and whatever else, before any one has the least idea of it. Also a very capricious cappernoitie burnie with regard to its channel; sometimes on one side of the strath, and sometimes on the other; leaving in some places as much breadth of dry channel-stones as would serve for a good large river, let-be a burnie. Hard-headed country lairds never out of lawsuits about bounds in consequence of its pranks! To all of which, however, pray lend an ear of caution and reserve; for if people are known best at home, so also are they apt there to be subjects of prejudice. No doubt our burnie has a spate now and then, and takes its own way with the strath; but are not these only traits of a lively energetic character? Isn't it better to have a boy who makes us a little uncomfortable now and then, than one who is everlastingly tame and stupid? Depend on it, as to our burnie, even its failings lean to virtue's side.

Still in the uplands. Still the green hills rise on every side. Scraggy old forests patch the braes here and there. Sometimes a ruined tower, green and yellow with moss and lichen, stands like an old broken-down robber in our path. Our burnie has now grown to be a pretty copious flood. One thinks of it, as of a jacket-outgrowing boy, that by this time something might be made of it. Fatal thought! See half a mile onward, down the glen, our burnie's first mill! Seized the moment it has sufficient strength, and yoked into this eternal machinery—poor burnie! Is there house-room for nothing in this world but what will work? Alas, no! And yet a mill by a burn-side is not exactly what a mill is in some other circumstances. A pleasant enough sort of place it generally is, of shade and sunshine, birds and bees, daisied greenward, sparkling waters: the very wheel has a mossiness of outline that extinguishes half the idea of the mechanical. And then the miller is always such a comfortable fellow—

'Merry may the maid be
That marries the miller,
For foul day and fair day
He's aye bringing till her.
He's aye a penny in his purse
For dinner and for supper,
And, if you please, a good fat cheese,
And lumps of yellow butter.'

The unfortunate thing is, that, once discovered to have any power of work in it, the burnie can get no more rest, but must drive a wheel every half mile of its course as far as it goes. See then a long series of mills along its banks—some for meal, some for sawing, and so forth—all of them very neat little establishments, and no doubt exceedingly useful to the natives; yet one cannot but regret the drain they make upon the proper channel of the flood, diverting it nearly all into tame mill-courses, and leaving in dry weather only a track of pebbles where there ought to be a sparkling streamlet. The only consolation is, that there really is something so respectable in the useful. Not that it gratifies selfishness in man, but that it enables so many to breathe in and enjoy this bright world, who otherwise would not do so. Bravo, then, thou burnie, since this mechanic power of thine has such associations—since this very water that the miller's children are so happy to dabble in, seeking for mennoons and eels (though never catching any), gives them the bread they eat, and puts those very duds upon their backs—not to speak of the service which hundreds of other people find in the results of its unconscious and unwearied toil!

In this advanced part of its career, the burnie has a sober middle-aged appearance. The sparkle of youth is past—no more pranking with opposing stones, or jinking under overhanging bushes—no more brawling and scampering down rough glens. It has become a dounce-looking water, flowing for half a mile at a time without a ripple, and only having a little fun and

prattle at fords, or when it tumbles over a wear. It now passes through the stately woods surrounding dignified mansions, which advertise themselves as all the better of the capital trouting stream near which they are situated. Being no longer to be treated as a child, men have built bridges over it almost every mile of its course. In some places—for the sake of the land—it has been confined between two long mounds, showing decidedly that the days of chivalry are past with it, and that now there is nothing but rationality to be tolerated. These are great changes from the vicinage of the first herd's house and the daisy-pied washing-green; but the burnie submits, as knowing it to be all in the natural and proper course of things—like a sensible woman quietly donning caps when she knows that ringlets won't do any longer. Still, however, there is many a snug farm which rejoices in having the burnie running past its borders. Its long bright runs over the brown stones, terminating in deep black pools overhung by ashes and saughs, and each occupied by a clan of bull-trouts, yet afford good sketching ground for the lovers of the picturesque. All is not commonplace. There is a mixture of the *dulce* with the *utile*. There is even a town which gazetteers speak of as 'beautifully situated on the —,' naming the burnie, if it has a name, which peradventure it has, though many burnies pursue a pleasant existence anonymously. So do not suppose that this mediæval sobriety has quite taken away all that is worth noticing in our burnie.

A little farther on, its individuality terminates in its junction with a bigger water, which is again absorbed some miles lower down by a first-rate river. A sad moment it is which beholds the end of this one of nature's living things, albeit we know that its waters continue to exist in another form; and yet it is consolatory to think that its individuality has ended while yet free from all that is incongruous with its primitive brightness and purity. Cotton factories begin upon the water into which it falls. Coal-mines pour their ochry rills into that stream. It washes rags for sundry paper-mills, and takes on a vast deal of blue from a fulling establishment. Well that our burnie should have been snatched away from a recognised existence before it could be visited by any of these utilitarian degradations! Happy, happy, beautiful burnie! live thou for ever amongst the hills as hitherto—the loved of simple hearts, the joy of childhood that will never forget thee, however far it may wander—the same in all time, while every living thing that sees thee ages and ages till it goes to dust! Enough be it for thee that the bright lips of gowans kiss thee as thou flowest; that green woods delight to be reflected in thee; that summer's own sun has a heightened lustre in thy glancing waters. Enough be it that duties are assigned thee which, if thou hadst consciousness, thou wouldst not grudge to perform, seeing that, while they take not from thy beauty, they cheer human hearts, thus linking thee sensibly to that humanity which, in the wonderful harmony of all things, feels that such essences as thou belong to and are a part of itself.

THE NERVOUS SYSTEM.

THERE is no subject perhaps which is so often mentioned, but so little understood by the public in general, as that of the 'nerves.' How often do we hear all classes of the community refer any unpleasant sensation or fanciful ailment to their being merely nervous; little understanding, however, when they make use of this term, what possible connection there can be between their feelings and their nervous system. Perhaps we shall surprise them when we mention that they can neither eat or drink, walk or talk, nor perform any action whatever, either voluntary or involuntary, but through the medium of their nervous system—a 'system' the nature and functions of which we shall here endeavour to explain.

In man and other vertebrate animals, the great centre

of the function is the brain and spinal marrow; the latter a prolongation of the brain, as it were, down the spine. Now this great centre of nervous matter is endowed with two distinct functions. 1. That of being able to convey *motor power* to the muscles, by whose agency we are enabled to perform all the ordinary actions of the body, all the movements of our limbs. 2. That of sensation, which is of two kinds—*common sensation*, or that feeling of pain which is produced on the injury of any part of our body; and *special sensation*, to which are to be referred the five senses—of feeling, of sight, of hearing, of smelling, and of taste. From this mass of matter, capable of endowing the parts of our bodies with the power of motion, and of feeling or sensation, numerous trunks are sent off to all parts of the human frame—ramifying over its structure to such an inconceivable state of minuteness, that we cannot touch any part of our body with even the point of a needle without being conscious of pain, proving that some part of this great nervous centre has been injured or excited into action.

The great nervous trunk which supplies the lower extremity of man is equal in thickness to his little finger; divide it, and he loses all power of moving his limb, all sense of feeling: the limb, to all intents and purposes, is dead; and, deprived of its nervous influence, mortifies. This power of endowing parts with motion and sensation is situated in two distinct structures, of which the brain and spinal marrow are composed; and anatomists, from their colour, are accustomed to call them the *white* and the *gray* matter. In the brain, the gray matter for the most part is external, enclosing in its folds the white matter; whilst in the spinal marrow it is internal, being completely surrounded by the white. Now, as a general rule, all the nervous trunks of the body and their branches, with the exception of nerves of special sensation, are composed of fibres derived from these two sources—that is, from the white and the gray matter; and these nervous trunks are conductors of that *change* produced in the nervous centre by the influence of the *mind*, which gives rise either to motion or sensation. But a most extraordinary fact, and one which is capable of being proved by direct experiment, is, that the change which takes place, to give rise to the phenomena of motion, has its origin at the great nervous centre, the source from which the trunks arise; and further, that this change takes place in the white matter. On the other hand, the change which gives rise to the phenomena of sensation takes place at the extremities of the nervous trunks—that is, at their ultimate distribution; and this change takes place in the gray matter.

The anatomist, in his dissections, is able to prove satisfactorily the origin of these nervous trunks; and he finds that all those arising from the spinal marrow, and most of those which are said to arise from the brain, do so by two roots, one of which is connected with the white matter, and the other with the gray. He can, and has still farther proved by experiments performed on the living animal, that irritation by pinching or pricking of the root which arises from the white matter gives rise to no sensation, as the animal shows no signs of suffering whatever; but irritate the root arising from the gray matter, and evident signs of suffering are immediately induced. Again: if in the dead animal we excite muscular contraction by means of galvanism, we must send the charge of electricity through the limb by means of the root arising from white matter, as no effect would be produced if we attempted to do it by means of the root arising from the gray. Allowing, then, the fact, that these nervous trunks are composed of two sets of fibres, one conveying sensitive, the other motor influence, let us apply it to practice.

Some part of the body meets with an injury—a change is immediately effected in the extremities of the sentient fibres, sensation is developed, and the change thus induced is conveyed by the sentient fibre to the brain, and through its medium to the mind. Through the myste-

rious agency of the mind, then, the motor power of the great nervous centre is brought into action, and a change is induced; this change is conveyed by the trunks to the muscles supplying the injured parts, or to other muscles, by whose combined action it is removed from further injury. But it is not necessary that an injury should be inflicted that motor influence should be generated, as the mind has the power of inducing it at will. All the movements of our bodies are effected by muscular action, and through the agency of the will. We move not a hand or foot, nor look at an object, without the mind having first willed that it shall be done.

But there are many actions in the human body which are performed independently of the will, though evidently under the influence of the mind, and through the medium of a nervous system; and this system is called by the anatomist the *sympathetic*. It consists of a number of little knot-like bodies called by the anatomist *ganglia*, which are extended along each side of the vertebral column—the whole of these ganglia being connected, by means of fibres, together. Now, it appears that each of these ganglia is capable of generating nervous influence, independently of the brain; hence each may be considered as a distinct nervous centre. The trunks arising from these ganglia are distributed principally to all those organs on which the vitality of the body depends, which are employed in secretion and its nutrition. It is the medium by which all parts of the body are brought into relation with each other, so that no one part shall become diseased or injured without the rest sympathising with it, and indirectly, therefore, becoming affected as well. Familiar examples of this fact are of every-day occurrence: a violent blow on the head will produce vomiting, owing to the sympathy which exists between the brain and stomach; and *vice versa*, a blow on the stomach will produce fainting, and even death, from the shock to the nervous system, and the arrest of its influence through the medium of the brain.

And now let us turn our attention once more to the influence of the mind over the functions of the body, through the agency of this part (the sympathetic) of the nervous system. We will here select a few familiar examples. What is referred to when one's mouth is said to be 'watering' at the sight of some favourite fruit or food, is dependent on the influence of the mind acting through the medium of the nervous system supplying the organs secreting the saliva. Tears, again, are abundantly secreted under the moderate exciting influence of the emotions of joy, grief, or tenderness. When, however, the exciting cause is violent, they are suppressed; hence, in excessive grief, the anguish of the mind is lessened on the flow of tears. Fear stops the flow of saliva; and it is a common practice in India to detect a thief among the native servants by putting rice into their mouths, and he whose mouth is driest after a short time is considered the culprit. Under mental anxiety, persons become thin; freedom from it favours deposit of fat. It would be an endless task, however, to recapitulate the many examples that could be brought forward proving this influence of the mind; so that nervous complaints must be looked upon as disorders of the mind, and not of the body; cure the one, and you will cure the other.

Mental influence having then this power over the functions of the body, we cannot be surprised at many diseases being a consequence of its depraved or abnormal condition. Nor can we be surprised at many of the remarkable phenomena displayed by mesmerists: their patients on whom they exhibit are generally highly sensitive, with minds naturally liable to become excited under the manipulations of the operator. For this reason, also, homœopathy, hydropathy, &c. have succeeded in curing many patients of their fancied ailments, because it only required some strong excitement to remove the morbid mental impression. Hence change of scene and diet, change of usual habits (for all the followers of these systems make it imperative on their patients to follow implicitly certain rules), and lastly, and not

least, a full determination, desire, or will on the part of the patient himself to get better—have succeeded, in a variety of complaints arising from mental causes, in effecting a cure.*

THE TWO SISTERS.

'As mine own shadow was this child to me,
A second self, far dearer, and more fair.'—SHAKESPEARE.

I WAS born in the village of Offingham, of which my father was the vicar. I have lived long, and have visited many lovely spots, and been the inmate of many happy homes; but never have I seen on earth a paradise like this, my early home. The village was a small sequestered spot, far from the bustling world; our house was an old-fashioned stone dwelling, with deep mullion windows, tall chimneys, and small projecting turrets; a broad terrace ran along the front, from which a bank of soft green turf sloped to the lawn beyond. The house was covered to its roof with myrtles and roses, and the garden was a wilderness of sweet flowers and shrubs. Yet lovely as was the scene without, within there was a far greater charm—peace and content reigned undisturbed. I have often since wondered whether my parents, up to the time at which my tale begins, had known what sorrow was; my remembrance of them is like that of a soft yet brilliant evening sky, where not a cloud chequers the deep blue vault of heaven, or casts a shadow on the earth beneath. I cannot recall one look of sadness on their faces, or remember one anxious or discordant word. Heaven's own peace brooded o'er the house.

But sorrow comes to all sooner or later; and how heavily it falls on the heart grown old in happiness and prosperity! Life opened brightly on me amidst these influences: a happier, gayier child never gladdened its parents' hearts. Soon after I had attained my seventh year, I was awakened early one morning by an unusual commotion in the house. People were hurrying past my door; I heard voices speaking in subdued tones in the passage, and amongst them recognised my father's, giving hurried directions to the servants. An undefined sense of coming evil fell on my spirit; I lay still, scarcely daring to breathe, watching with a beating heart the time when my nurse would come to dress me. Several hours must have elapsed; all was so silent, that even to me, young as I was, the suspense became insupportable: I sprang from my bed, and stealing along the corridor, knocked softly at the door of my mother's room. A strange woman opened it: seeing me, she bent down and whispered, 'Go to bed, miss, your mamma is very ill.' But I would not be repulsed; and pushing past her, entered the darkened chamber. When my eyes became accustomed to the dim light, I saw my mother lying very still and pale, and my father sitting on the bed beside her, with his head buried in his hands; on a chair by the fire sat my nurse, with a baby on her knee. I did not cry, though my little heart was bursting with emotion; but creeping gently round the bed, I said, 'Harris, may I speak to mamma?' I think my father must have heard my voice; for with a convulsive sob he said, 'Take her away!' I was led back to my room, and desired to lie still until Harris came to me. I cried bitterly when left alone, but fell asleep while listening for her step. It is needless to dwell on that time. By degrees I was made to understand the truth: my mother had given birth to a little girl, and expired a few hours afterwards. It is difficult, even for a mind inured to these bereavements, to comprehend at first their full extent; how much less can a child realise the truth of such afflictions. They told me that my mother was dead—that I should see her

no more on earth. I saw the hearse that bore her away; her chair stood empty by the fireside, and I no longer heard her sweet voice in the house; and yet I believed that I should see her again; and often in the daytime I went to her favourite haunts in the garden, hoping to find her there; and whenever, in the silence of the evening, I could escape from observation, I stole into her room with an assured certainty that she would have come back: not finding her as I expected, I lay down on her bed and cried bitterly.

Sorrow cannot, however, dwell long in the heart of a child; and mine was soon dispelled by the smiles of my little sister. I could not understand the silent abstraction of my father: his grief was too deep to seek relief from any earthly source; he shut himself up in his study, and allowed no one to enter; he never asked for his children, and I observed that the baby was carefully kept from his sight. Long and fearful must have been the struggle in my father's soul: the wife who had cheered and blest his home was gone, and life for him had lost its brightness. In the first anguish which her loss occasioned, he refused all comfort: but succeeding months brought calmer thoughts; his children, *her children*, remained to him; for their sake he would rouse himself, and devote the remainder of his life to their improvement, and strive by redoubled tenderness to supply the loss they had sustained. Selfishness was foreign to his nature, and even in grief he forgot himself in the desire to benefit those around him. The house gradually resumed its cheerfulness; and though we never ceased to feel the change that had fallen on our home, yet we were once again a merry, happy family.

As I grew older, my father saw the necessity of placing me under the control of some judicious lady: the rough and fearless girl, the playmate of many brothers, needed the guidance of a female friend. And never was choice more fortunate than that made for me: Miss Franklin became a blessing to us all. Quietly and gently she assumed the management of the household, and we soon unhesitatingly obeyed; for we respected as well as loved her. Even the impetuous spirit of my brothers yielded to her mild control. I never remember any contention between them; she seemed at once to command their obedience, and to guide them as she chose. With me, no authority was needed: I followed wherever she led, an unquestioning and devoted pupil: to be near her, to listen to her words of kindness and instruction, became the chief pleasure of my life. I had dreaded her arrival, and with childish waywardness had determined not to love her myself; and above all things, not to allow her to tyrannise over my darling Amy. This sister had already become the first object of my life: I loved her passionately, and had constituted myself her teacher, and controller of all that concerned her; I therefore looked upon Miss Franklin as an unwelcome interloper, a rival to my power over Amy. I met her with little courtesy, and am afraid showed very plainly my predetermined intention of disliking her. It was not, however, in the power of mortal to resist Miss Franklin; at least it was far beyond mine; and I not only yielded myself submissively to her guidance, but, what was far more difficult, learned by degrees to see her gaining influence over Amy. This child loved her with an energy peculiar to her nature, and I felt at times a pang I cannot describe in seeing her growing partiality for Miss Franklin, whose gentle and unobtrusive manners won Amy's love, whilst my own vehement caresses were received with careless indifference. I endured all the torments of jealousy, for Amy's love was the only thing on earth I really cared for: yet, in the midst of my unhappiness, I do not think that I was ever unjust to Miss Franklin. I never blamed her, for I felt her superiority; and while I mourned Amy's preference, I could not but acknowledge how wise it was. I think few people understand how deeply and silently a child may suffer: childhood is regarded as the gay, buoyant period of life; and those

* The reader will receive this explanation of mesmeric phenomena as a hypothesis representing only the individual opinion of the writer of the above paper.—Ed.

alone who make children their study, can tell what a world of joy and sorrow, of struggle and suffering, lies in their little hearts. Insignificant as the events of their baby-life may seem to the matured mind of man, they are all-important in themselves, as the means by which the child is trained for the coming duties of life. From this want of entering into their feelings, I have seen many a one punished for sullenness, when a word of sympathy in its little grief would have saved its temper from the ordeal of unjust correction. At this period of my life, had my silence and irritability been misconstrued, how might my character have suffered! But Miss Franklin read my heart, traced each feeling to its source, and checked the evil that was springing. 'Fanny,' she said one day when I had long sat moodily at work, 'I wonder what you love best in the world?'

'Oh, Miss Franklin, how can you ask? Amy, to be sure: I love Amy better than the whole world beside.'

'I am sure you *think* so; but tell me what you mean by love? I think our definitions of the word would differ strangely.'

I remained silent, for indeed I did not understand her question. My love for Amy seemed a part of my very life; and I could no more define the feeling, than I could have analysed the beams of light which shone from the bright sun above our heads. I looked up inquiringly, I believe, for Miss Franklin continued, 'Your love for Amy springs from love of yourself, not from pure devotion to your sister: you love her as your plaything, as the creature over whom you have a fancied right. That readiness to yield our own wishes to promote the happiness of others, which I regard as an essential attribute of pure disinterested love, I do not see in you. When Amy is happy with me, and in the simplicity of her heart shows a preference for my company to yours, a cloud gathers on your brow, and the colour mounts to your cheeks. Dearest Fanny, this is not love; it is selfishness.'

I was deeply mortified, and Miss Franklin, who never willingly wounded the feelings of any one, dropped the subject. I never, however, forgot her words, and as I grew older, I felt them influence my actions more and more. Amy's welfare and happiness became dearer to me than my own, and gradually I learned to feel the bliss of resigning my own desire to hers. It was Miss Franklin's continual study, as we grew older, to render us dependent on each other for amusement and happiness; and often she would say, 'Fanny, when I leave you, you must be Amy's guardian friend; she needs your care; the gay volatile child cannot yet stand alone; to you she must look for everything.' I have since felt that the chief aim Miss Franklin had in view in all her instruction, was to give a right direction to the love I bore my sister, to render me a safe guide and judicious friend to the creature whose beauty and talent already threatened to be dangers in her path. Amy was the idol of the house; caressed and spoiled by all, she manifested the faults peculiar to a child thus situated. To make me aware of these faults, to point out to me the perils that beset her, was Miss Franklin's constant endeavour. It was as if a foreshadowing the peculiar trials that were to be our portion was ever present to her soul. Alas! how soon were my prudence and wisdom to be tested.

My father's health had been long failing. In spite of his efforts to shake off grief, it had slowly done its work: he was no longer young when my mother died, and the ravages made in his constitution by sorrow for her loss were never repaired. He gradually became feeble, and Miss Franklin did not conceal from me the knowledge that death was fast approaching. My brothers had all quitted our home: one by one they had taken their places in the world. Two were already in India, one at college, and the youngest was studying engineering in a distant town. I was therefore the only child left to comfort my father's declining days. I look back with melancholy pleasure to the hours I spent with him at this period. I was old enough to be his friend and

companion, and he loved to pour out his heart to me. He talked of his early days, of my mother, of the unbounded happiness they had enjoyed together, of her death, and all that he had since suffered. The thought of rejoining her was ever present to his mind; and as I listened to his hopeful trust in the mercy of God, and his glad anticipation of a reunion with her he had lost, I learned the best lessons of religion.

With his own thankfulness to depart and be at rest, however, mingled many an anxious feeling for his daughters. 'My boys,' he would say, 'must fight their own way in the world; for them I am content; but for you, Fanny, and for my little Amy, I often tremble: yet why distrust our Father's love? When I am gone, will He not still remain, an all-sufficient Friend, the orphan's sure Protector? Trust in His goodness, my child, He will never fail you.'

Then he would talk to me of Amy—that precious legacy bequeathed by his dying wife; and with tears in his eyes intreat me never to leave her; to watch over her, and be her guide, adding these words, which sank deep into my soul, and became the spring of my future actions, 'Live for your sister; study her happiness before your own: thus when we meet in Heaven, you may present her to the mother who died in giving her birth, with the joyful consciousness that you have faithfully fulfilled your mission on earth.'

Soon after this my father died: the lonely desolation of the weeks that followed his decease I will not describe. I was stunned by the blow; but soon recognising the importance of my task, I roused myself to fulfil the duties which now devolved upon me. Had it not been for my excellent friend Miss Franklin, all my efforts would have failed: she was my support, my counsellor: in the painful arrangements which followed our bereavement, she spared me every needless pang; and consulting with my brothers, she arranged our future plan of life. It was of course necessary to quit the vicarage immediately, as the new incumbent was impatient to take possession. The property destined for us was invested in the hands of my eldest brother, a merchant in Calcutta, and had been the nucleus of his present immense fortune. The interest was carefully remitted to us, and as far as pecuniary means went, we were without anxiety. A pretty cottage, which had formed part of my mother's fortune, was chosen for our future residence. With an aching heart I left the home of my happy childhood: in spite of my better reason, a foreboding of coming evil seized upon me; and as I entered the carriage that was to convey us to our new abode, I felt as if all my happiness were left behind in the dear old vicarage we were quitting. It was not so, however; though sorrow and difficulty awaited me, and long years of self-denial and labour were in store for me, yet peace and content lay beyond. In the severe school of adversity, my spirit gained strength and vigour; and the blessedness which accompanies every act of self-sacrifice, the peace which attends every conscientious effort to perform the painful duties of life, were eventually to be my portion.

We were so far happy as to retain our dear friend with us for some years, until I was old enough to take upon myself the full responsibility of directing our little household. I had attained my twentieth year when she left us. She had, for our sake, postponed her marriage with one to whom she had been long and devotedly attached, and whose urgent and reiterated claim upon her she felt it wrong longer to resist. Her loss was irreparable; but we could not oppose her departure. In quitting Amy and myself, she had the happiness of seeing us united in the closest bonds of affection: sisters in heart and soul, firm and faithful friends. Her lessons had not been lost on either of us. Amy was the joy and pride of my life. Often as I looked at her, I thought how easy was the duty my father had bequeathed me, and recalled the solemnity of his manner with a smile. Alas, alas for the weakness of human nature! the struggle was yet to come.

Miss Franklin had not quitted us more than a few months, and we were already planning a visit to our friend in her new home, when one morning a letter was put into my hand, the contents of which struck dismay to my heart. Hastily folding it, I rose, and with all the self-command I could assume, walked to my own room. There I again read the letter: it was all true. In plain legible characters I saw that ruin—worldly ruin—stared us in the face. It contained the news of the death of our brother in India, and at the same time announced to us that, as he died insolvent, all remittances would henceforth cease. The business-like tone of the letter struck a chill sense of the extent of our calamity home to my very heart. I buried my face in my hands, and for a while brooded in utter hopelessness over the fate before us. All passed in rapid vision before my mind: poverty, with all its attendant miseries; poverty, not for myself alone—that I could have faced—but for Amy, my sister, the child of so much tender love—the gay, bright, sunny creature, whose step bounded over the earth as if it yielded nought but flowers—must the chill hand of penury blight her young life, and wither ere its prime that bud of promise? The thought had agony in it. Then did my father's solemn injunction recur to me, nerving my heart to bear, and strengthening my soul to do, all that might be demanded from me. In that moment I bound myself to shrink from no effort, to dare all things, so that my beloved sister might be shielded from the impending evil. I prayed for strength, I implored Heaven to guide and aid me in my firm resolve. As I rose from my knees, the sound of her sweet voice came from the garden beneath. 'Fanny, sister,' it said, 'what keeps you away from me so long? I am waiting for you.' I hastened to join her; and with all the calmness I could command, told her of our misfortune. The gentle girl scarcely comprehended the meaning of my words; but seeing the sorrowful expression of my face, she laid her head upon my shoulder, and with her sweetest smile said, 'We may be poor, dear Fanny, but we shall still be together: poverty cannot separate us.' I clasped her to my heart: 'No, Amy, our hearts can never be disunited.' I already felt that we must part, and her unconscious words pierced me to the soul.

I wrote to our dearest friend, now Mrs Wentworth, begging her advice. The next day brought her to us, and again she stood between us and sorrow. She saw that we could no longer keep up our little establishment, and wisely counselled us to give it up at once. She arranged all for us; and after seeing everything put in a right train, she carried us to her house, where we were welcomed with cordial kindness by her husband.

I had now leisure to think on the course I must pursue. My brothers were all involved with ourselves in this ruin, and were, moreover, either married, and with families dependent on them, or still struggling to establish themselves in the world: we could look for no help from them. For the first time I stood alone. I could not ask advice from Mrs Wentworth: she would hear of nothing but our remaining with her and her husband, and this I could not listen to. Their means were limited, and I could not consent to be a burden to our friends. God had given me strength and health; to the liberality of my father, and the care of Miss Franklin, I owed an excellent education; and I felt that I could myself maintain Amy. For her sake labour would be sweet. I resolved to seek for a situation as a governess; and though well knowing the trials and difficulties of such a career, I felt as if the motive would give me courage to meet them all. The thought that my dear sister was safe from harm would animate my drooping spirit, and send me on my way rejoicing. Having taken my resolution, I sought Mrs Wentworth. At first she opposed my plan, bringing forward all the difficulties it would entail upon me, all the sacrifices I must make, and urging me, with the warmth of a loving friend, not to leave the home she offered me. Seeing that my purpose was unalterably fixed, and in her heart, I am

sure, approving the spirit that urged me to seek an independence, she gradually yielded. I accepted, without hesitation, her proposal, that Amy should remain under her care. With her I knew my sister would be happy, and in no other situation could I have been satisfied to leave her. Amy was now thirteen, and from her peculiar disposition, needed the guidance of one who understood her well. Proud and haughty by nature, she would have been a tyrant had she not lived with those whom she respected and loved, whose intellectual as well as moral superiority she was compelled to acknowledge. With a warm enthusiastic temperament, she loved the few to whom she gave her affection with passionate devotion, and by this love she could be guided like a little child. Mrs Wentworth and myself alone possessed this power over Amy, and to her I gratefully confided my treasure.

It so happened that my friends had been applied to a few weeks before to find a governess for two little girls whose mother, from delicacy of health, was obliged to give up the charge of their education. The situation promised many advantages, and I thankfully accepted it. My hardest task still remained. As yet, Amy was ignorant of my design. I knew that she would oppose it with vehemence; her pride would rebel against the idea of her sister's becoming a governess; while her generous nature would shrink from the thought that, while she remained idle, I was labouring for her advantage. It was long before I could make her listen patiently to my reasons: she clung to me, and with passionate sobe intreated me not to 'degrade' myself—to stay with her. Finding arguments fail, I determined to appeal to her feelings, and gently told her that, by such conduct, she rendered my task doubly difficult; that without her assistance I did not feel equal to the duty that lay before me; that she must try to help me to do that which I was sure her better judgment would show her to be right. She looked wistfully at me through her tears, and struck with the calm sadness of my manner, 'Fanny,' she said, 'I am very selfish. While you are thinking only of me, I am making you more unhappy. Kind sister! teach me to be like you; teach me how I may help you, and you shall not find me ungrateful or unworthy of all your goodness.' I then explained to her the various reasons that rendered the step necessary; to which she gradually yielded her assent, ever repeating, however, that when she was old enough, she would work for me; to which I answered, we would then work together. This thought seemed to cheer her, and she soon regained her wonted gaiety.

I will not dwell upon our parting, nor detail the many trials that awaited me in my new abode. I am sure that it was the desire of the whole family amongst whom I now became domesticated to be kind and considerate; but none except those who have tried this mode of life can know the lonely feelings that attend it. To exchange a happy home, in which I had been the loved and honoured mistress, for the chill and enforced courtesy of strangers, was painful enough; but more than all did I suffer from the contrast between my pupils and my darling Amy. At first, it seemed all labour in vain to endeavour to influence these wild and giddy creatures, and often have I wept to think how little success attended my utmost efforts. I was, however, but a novice in the work of education; and had yet to learn, that before the seed-time comes, the ground must be weeded and tilled, or the harvest will fail. I have lived to see my dear pupils grow into sensible and refined women, and to bless God that I did not abandon my task as hopeless.

The neighbourhood in which Sir William Monkton's residence was situated was peculiarly devoid of society, and Lady Monkton's health rendered all formal visiting impossible; the monotony of our life was therefore seldom broken in upon, except by intercourse with the curate of the parish, who was a frequent and ever-welcome guest. He was one of those rarely-endowed beings whom it is a privilege to know, whose presence exerts

a powerful influence on all around him; one whose graceful manners and gentlemanly deportment are but the external signs of a pure heart and a cultivated mind. He devoted himself, with heart and soul, to the high profession which had been his early choice; every talent, every energy was absorbed in the fulfilment of the duties it imposed upon him. He was idolised by the poor, while the rich and educated never failed to leave his society the better for his cheerful, earnest conversation and unostentatious piety. At Monkstown his company was welcome to all: in the weary hours of languor and suffering which composed the life of poor Lady Monkton, his presence cheered and supported her; from his lips she learned lessons which turned her sorrow into joy: to Sir William he was a frank and intelligent companion; while his playful humour rendered him a favourite with the little girls. Such was Herbert Somerville when I first became acquainted with him. I saw him day after day, and soon found in his kind sympathy the best support under the trials of my new position. He aided and encouraged my efforts to fulfil its duties, and by always setting before me the purest motives for my actions, made me feel that even Amy's welfare must be subservient to the higher desire of doing the will of God. He taught me to look for happiness alone in the endeavour to do what is right and well-pleasing in the sight of Him who searches the hearts of men; and while he thus elevated my moral nature, he led me on to new and vigorous mental efforts, by opening to me the higher walks of science and literature. Our intercourse became more and more intimate; and it will scarcely be matter of surprise that, as I esteemed him more, I unconsciously learned to love him. I have heard many people call it unmaidenly in a girl thus to bestow her affection unsolicited by the object of her choice; but it seems to me that those who so condemn know little of the innocence and singleness of mind which form that peculiar charm of the female character. I do not speak of those who are trained in the school of the world—who, living amidst its artificial glare, early imbibe a spirit foreign to the native purity of woman—but of the many who walk along the calm, unfrequented paths of life, ignorant alike of the ambitious aims and heartless vices of the world beyond. In the breast of such, love springs unconsciously, and has already grown to be the master-passion of her nature ere chance betrays it to herself. Thus it was with me: I walked beside an abyss, heedless of danger.

Let me, before proceeding further, exculpate Herbert from all blame, which others, in compassion for my subsequent sufferings, may feel disposed to attribute to him. He never, by word or look, showed me a preference that could have misled one better versed in the world's ways than I was. His affectionate interest in me was such as a brother feels for a dear sister; and when, taught by experience, I retraced his actions, I felt that his kindness sprang from friendship, not from love.

I had resided five years in Sir William Monkton's family, during which time I had frequently visited my dear sister. Each time I saw her, I felt increased surprise and delight at the progress I perceived in her mind, as well as at her surpassing beauty. Her face, lighted by the lamp within, beamed with a radiant loveliness, which nothing but the rare union of high mental power with the gentler virtues of the heart can give. Her form was instinct with grace—that native grace which emanates from a pure and lofty soul, and breathes in every gesture. She was indeed a creature to command the highest admiration, and at the same time win her way to all hearts. On my return from these visits to Mrs Wentworth, I could not refrain from speaking to my pupils of Amy. They had often expressed a strong desire to see her. Lady Monkton now joined in the wish, and at her request I wrote to invite my darling sister to Monkstown. She joyfully accepted the invitation so kindly given, and soon became the favourite of the house. Never did a mother

watch a child with more proud delight than I followed this gay and joyous being, as she moved along, attracting universal admiration.

It was not long before I saw one eye bent upon her with such an earnest gaze that I started as I beheld it. How could it be? I had eagerly desired that Herbert should see my Amy—should admire and love her: it had seemed the one thing needful to my happiness that these two should know and love each other. As day by day passed on, I felt increasing disquietude; my eye restlessly followed Amy whenever Herbert approached her; and a chill sensation crept through me as I saw him pay her those nameless attentions which bespeak the existence of love. Amy's manner of receiving them proved to me how well she appreciated Herbert's noble qualities of mind and heart: I saw that they already loved, and my reason told me they were worthy of each other. Suddenly the truth was revealed: I discovered in the same moment that I too loved, and that he whose priceless heart I would have died to win, already loved another—that other, my own sister Amy. In the stillness of the night did my soul vent its bitter anguish: the first wild burst of grief had subsided, the tumult of feelings too fearful to be dwelt on had been appeased, and my father's voice again, in the deep silence of that midnight hour, sounded in my ears, 'Live for your sister; study her happiness before your own.' Alas! alas! the moment was come in which I could only insure her happiness by the sacrifice of my dearest earthly hopes. 'Yea, father!' I exclaimed, 'with God's help I will redeem my pledge;' and falling on my knees, I poured forth my soul in prayer and supplication for wisdom and strength to fulfil the arduous task imposed upon me.

With renewed powers I now began to survey the position I held. One comfort I had—that no one ever suspected the love I had cherished in secret: it must be my first object so to control my feelings, that none might ever guess the sacrifice I must make. I trembled to think of the watchfulness it would require to veil my heart's secret from Amy—from her who had ever read my soul, and from whom no thought had been concealed. I foresaw that I should become the confidant of both parties, and I nerved myself for the task. If I could once see them happily united, I thought I should then have rest; but how to meet the suffering which lay between this time and that which would see the sacrifice accomplished! Amidst such reflections I passed the night; the morning with its cold gray light dawned in the east; the time for action was approaching. I could not feign illness, for what illness would have kept my faithful Amy from my side? and it was her searching glance I now shrank from encountering. Sweet, innocent, guileless Amy! Happy in the first consciousness of being loved, she was less alive to any change in me than she would otherwise have been; and thus I was spared many a pang. I do not shrink from the avowal that at times my courage failed: there were moments when the effort of concealment seemed too great for me, when I longed to lay my burden down at their feet and die. My hope in life, or aught it could bring me, was dead. Amy no longer required me; she had found in Herbert a friend and guide whose love was more to her than mine; and though she would indignantly have spurned the idea, yet I felt that my work was done. I have lived to see that this was but a morbid, selfish feeling. The work of life to one earnestly resolved to do his duty can never end; and at this moment while I write, though age has dimmed my sight, and left me helpless and alone as far as the severance of earthly ties can leave us so, yet do I wait in patient hope of still further usefulness to my fellow-creatures. God spares the withered tree with wise design; let us not mar it by our selfish murmurings.

In a few months Amy and Herbert were betrothed. From the moment in which I first became aware of their mutual attachment, I never wished it otherwise. I laboured to promote their happiness; I listened to

the outpourings of these two hearts devoted to each other; I strove to awaken in Amy's sanguine nature a due sense of the cares and responsibilities she was taking upon herself; taught her to perceive the finer shades of beauty which lay beneath the reserve of Herbert's nature; tutored my mind once more to listen to her praises from his lips without a shudder; and learned, after many struggles, to live for them alone.

At length the day arrived on which I was to give up all claim to Amy, and resign her to a husband's care. The habit of self-command had, by hourly practice, become so strong, that I did not flinch even at this most trying time. The wedding was to take place from the house of our beloved friend Mrs Wentworth, who in this, as in all former events of our lives, acted a mother's part to us. The morning of the important day dawned brightly. I assisted my beautiful Amy to array herself in her simple bridal attire, and led her down to her expecting friends. My heart was proud of my lovely sister; and happy in her joy, I forgot myself. I placed her hand in Herbert's, and with a firm voice said, 'Herbert, I give to your charge my dearest earthly treasure; love and cherish her, as I have done.' The ceremony was performed by our kind friend Mr Wentworth, and we returned to the parsonage to breakfast. While I could look on Amy's happy beaming face, it was easy to bear up; but the time of separation came. I saw them depart, and watched the carriage that bore them away with apparent calmness. When it was out of sight, I hurried to my own room; but ere I reached the door, fell heavily to the ground.

Months passed, and still Mrs Wentworth devised new excuses for keeping me near her. But my pupils had waited for me: Sir William and Lady Monkton, with a kindness unparalleled, refused to fill up my place; and at length I returned to their hospitable house, and resumed my former duties. Herbert and Amy had pleaded eloquently that I should live with them; but this I firmly, though gently resisted. It was a source of heartfelt joy to think of them, to visit them occasionally; but hourly to have witnessed their domestic happiness, would as yet have been a martyrdom. I continued to live for many years at Monkstown, until the marriage of my two pupils left me no pretext for a longer residence there. Lady Monkton's sufferings had ended in a calm and peaceful death soon after my return from Amy's wedding; and though Sir William would have placed me at the head of his house, and given me the honourable title of his wife, my heart too decidedly rejected the thought of marriage to allow me to hesitate for a moment. I declined his proposal, but retained his friendship.

Amy had four lovely children; and conscious of my own strength, I now gladly consented to become the inmate of their home. Years had changed my feelings; Herbert was to me no more than the husband of my beloved Amy—my own kind brother. Their children became my own in heart; I loved them, and devoted myself to their education with an energy I had thought lost to me for ever. People often wondered why Miss Jerningham never married, and prophesied that I should yet renounce my self-imposed duties as maiden aunt; but time rolled on, and found me at my post, still zealously and happily employed.

God has lengthened my days beyond the usual span allotted to man. I have survived all my race; I have wept over the graves of the young and the old, as they one by one fell from my side. Some were taken in full maturity; others dropped like blossoms from the tree. But death cannot separate the hearts that truly love. There is a world beyond the tomb where my beloved ones wait for me; there I shall rejoin the spirits that are gone before me—parents, sister, brothers, adopted children of my love, friends—I shall see you all! And now, while I linger here, the thought that the secret of my heart was faithfully kept, my pledge to my father redeemed, and Amy's happiness secured, will gladden my few remaining days. Let those who would be happy

themselves, learn that the only means of attaining their end is to devote themselves heart and soul, without the smallest reservation for the idol self, to the welfare and happiness of others.

THE SCOTTISH PARISH SCHOOLS.

AMIDST the discussions which have lately ensued on the subject of national education—some arguing for a state endowment, and others as strenuously representing its impolicy—it is somewhat strange that none of the belligerents has attempted to draw any distinct and practical conclusions from the Scottish parochial system of instruction. For a century and a half, Scotland has had a state-endowed national education; and it would go far to settle the question as regards England, if we could ascertain how the Scottish system has wrought. Nothing can be more easy than to make this investigation.

At the Reformation, there was a clean sweep of the whole ecclesiastical and educational institutions. The mob pulled down the abbeys and churches, and the landed gentry and crown got the revenues of the incumbents. Knox included the institution of parish schools, as well as kirks, in his schemes of renovation; but he made little progress in his designs, because the holders of the church revenues foresaw that they would be called on to support the teachers. James VI., in 1616, while Episcopacy was the established form of religion, enacted that there should be parish schools. Charles I., in 1633, ratified this enactment: still nothing was done. The landed gentry were too powerful for the Stuarts. The institution of parish schools was not effected till 1646, when the Convention enforced the establishment of an elementary school in every parish; enjoining that two-thirds of the salaries of the teachers should be paid by the landlords, and one-third by the tenants. From this epoch might have been dated the general establishment of schools, had the Restoration not intervened. When Charles II. ascended the throne, all the acts of the Convention were rescinded, and among others that on education. From this time, all was confusion in Scotland till the Revolution, when a vigorous and rational policy was substituted for misrule. The old laws relative to parish schools were now discussed; and in 1696, an act of the Scottish parliament was passed, ordaining the appointment of a school in every parish, and compelling the expenses to be borne by the heritors (landed proprietors). The new Presbyterian clergy, to whom had been given the power of supervising education by a previous act of 1693, warmly espoused this arrangement. From 1696, therefore, every parish in Scotland (a few in burghs excepted), to the number of about a thousand, has had a school for elementary education. Such is a very brief outline of the efforts to establish a national system of instruction in this portion of the United Kingdom. It is interesting to observe that even as early as the Reformation the subject was agitated: it was agitated from time to time afterwards, over a space of a hundred and forty years; nor did the agitation cease till it was finally successful in its object. What, therefore, is but a modern and spasmodic movement in England, assumed a determinate character in Scotland nearly three centuries ago.

Since 1696, various acts of parliament have been passed, tending to improve the condition of the parish schoolmasters as respects house and salary; the burdens being continued, as they originally were imposed, on the heritors. At present, the minimum annual salary is

L.25, 13s. 4d., and the maximum L.34, 4s. 4d.* School fees, however, within regulated bounds, are taken; and, with the endowment and fees together, a large number of the schoolmasters may be said to realise about L.50 per annum. The house and garden, to be sure, are worth something—perhaps L.8 or L.10 yearly: more it can scarcely be; for by a stupid blunder in the act of parliament, the schoolmaster's house is 'to consist of not more than two apartments, including a kitchen.' It is almost needless to say that the word *more* ought to have been *less*—a serious error for the unfortunate educators, for it confines them, in many instances, to an order of dwellings little removed in character above the cottages of the peasantry. Besides these emoluments, the schoolmasters, in the greater number of parishes, derive certain fees from the registration of births, marriages, &c.; but all such employments as clerk to the kirk-session, distribution of poor funds, and the like, form no part of their statutory duties, and ought to be prohibited, as distracting attention from the higher vocation of a teacher. They are generally conferred with a view to eke out an income which all admit to be too scanty; and we are sure the intelligent teacher, were he enabled to '*live by his calling*,' would be the first to relinquish them.

The appointment of the schoolmaster, as well as the nature and amount of his qualifications, rests with the heritors; but previous to settlement, he requires to pass an examination before the established clergymen of the presbytery, and subscribe the Confession of Faith. For a number of years, the appointment, as well as the supervision of the teachers, and likewise the prescription of books and routine of instruction, may be said to have slipped in a great measure out of the hands of the heritors, and come under the authority of the clergy. Though originally and legally a civil institution, a resolute attempt has been made to render the parish schools part of the ecclesiastical establishment; as if, in fact, the school of each parish were nothing more than a pendicle of the church. It is only necessary to say that no officious interference of the clergy can substantially alter the character of the institution, however much it may limit its usefulness. The only valid excuse for the undue clerical rule to which the schools are exposed, is the frequent neglect or indifference of the heritors, many of whom, being habitual absentees, can give no proper attention to the social condition of the parish in which their property lies. The obligation to sign the Confession of Faith still further tends to bring the schools under the domination of the clergy. Acting as a test, it limits the appointment of teachers to members of the Established Church, and thus imparts an exclusive and sectarian character to what ought to be of the widest application.

The education conferred by the parish schools is for the most part strictly elementary; but as the fees for attendance are very moderate—usually from 2s. to 3s. a-quarter—no one need complain of being without the means of instruction, such as it is, for his family. Both from the universal diffusion of the schools, and their unexpensiveness, 'education,' as Dr Chalmers observes, 'has been visibly obtruded on the notice of every little vicinity; and had it not been for this aggression upon them from without, the people would have felt no impulse towards education from within,

and so would have stood fast in their primeval ignorance.' There can, indeed, be little doubt that to the establishment of parish schools the Scotch are primarily indebted for the taste for education which now generally prevails amongst them. An institution of a humble kind has aroused faculties which might have been otherwise dormant, and laid the foundation of that social order and prosperity for which this part of the United Kingdom is fortunately distinguished. The advantages of the parish schools are perhaps most visible among the rural population. All are able to read and write. Every man and woman can at least peruse their Bible, and sign their name—accomplishments still comparatively rare among the peasantry of England. So far, therefore, the parish school system of Scotland has wrought well. Endowed by the state, and propped up by state functionaries, it cannot be said that it has in any respect fostered a spirit of subserviency, or cramped the nobler desires of the people. To say anything of the kind, would be to give the parish schools credit for infinitely more energy and purpose than they have ever possessed. Confining themselves to a humble species of technical learning, there they rest, or only go the length of inspiring higher tastes than they can adequately satisfy.

The truth is, the Scottish parish schools, as they now exist, are an institution of the past—they have had their day. Neglected by heritors, curbed by ecclesiastical superiors, and without a vestige of popular government, they have become an antiquated and effete thing. Society has shot far a-head of them; and though the teachers as a body have greatly advanced in point of acquirements within the last twenty years, yet so inadequate is their remuneration, and the machinery at their command, that they are either compelled to forego their schemes of improvement, or to seek for situations beyond the pale of the Parochial System. Schools of a much superior kind, supported principally by fees from pupils, have been almost everywhere established. Some years ago, it was found, on investigation, that the parish schools did not instruct above from a fourth to a fifth of all the children receiving education in the country, the great majority being educated in other schools; and since that period, we have no doubt the proportion has greatly diminished.

Other causes besides meagreness of instruction have conspired to ruin the reputation of the parish schools. The most fatal of these has been their sectarian character. When instituted in 1696, nearly the whole people belonged to the established Presbyterian church; and to prevent 'papists and prelatists'—the bugbears of the day—from becoming teachers, a religious test was instituted. As long as the kirk was the only communion of any importance, no objection was taken to the test, or to the general scope of the instruction. With dissent, new feelings arose. The kirk, during the last hundred years, has suffered some half-dozen secessions—parties dissatisfied on points of church government—and these have latterly become so important in point of numbers and spirit of resistance, that the kirk may be said to be at present struggling for existence. As the test for teachers includes an obligation to support the established church, it of course not only excludes candidates from among a vast body of the people, but provokes the erection of schools by dissenters. From this cause alone the parish schools have gradually lost much of their hold on popular affection. Another circumstance has materially helped to injure their usefulness. Whether from the want of legal powers in superiors, want of funds to allow of retiring salaries, or general want of energy, many schools are afflicted with teachers incompetent, from age or infirmities, to execute their duties in a suitable manner. The removal of a schoolmaster from physical or moral imperfections is a rare event. We happen to know of a case in which a teacher, who

* The salary is regulated every quarter of a century by the average far-price of grain during that period; so that the minimum and maximum above given are periodically liable to a rise or fall as the case may be.

frequently presented the spectacle of a drunkard to his pupils, lived unchallenged, and died in his vocation.

Attempts have in different places been made to improve the character of parish schools by special endowments and otherwise. The largest bequest is that of a person of the name of Dick : it amounts to upwards of £4000 per annum, and was made for the maintenance and assistance of the country parochial schoolmasters of the counties of Aberdeen, Banff, and Moray : the money was directed to be applied in *addition* to the contributions of the heritors, and in such a way as to encourage active schoolmasters, and elevate the literary character of the schools. To some extent this bequest has acted beneficially ; but as the old government of the schools remains unchanged, with the addition of a special regulation far from generally palatable to the teachers interested, it has not effected the degree of improvement which a broad national principle would have enforced. Efforts, bold and intelligent, directed to the renovation of single schools, have usually been as unsuccessful. In vain has benevolence showered her gifts on a favoured institution. It has been found impossible for teacher or patron to enlarge courses of instruction which may any day be brought back, by clerical interference, to the narrow routine which squared with the notions of our grandfathers. We know of no task more preposterous and ungracious than the attempt to improve the Scottish parish schools, without reorganising them on an entirely new footing. With a view to elevating the position of the teachers, government, we understand, proposes to supplement their salaries from the national exchequer. We would earnestly deprecate a step of this kind, unless the existing test were at the same time abolished, and the government of the schools thoroughly reformed. To give an additional endowment in present circumstances would, in Scotland, be considered equivalent to endowing the schools of a sect—a sect which assumes the guise of nationality ; while at the same time it would perpetuate abuse, and render subsequent reform a matter of extreme difficulty.

It is much to be feared that government lacks the knowledge and energy to deal with this important question on the scale it deserves ; and it is also doubtful if Scotland has representatives in parliament willing or able to point out the true course to be followed. Hitherto, the Scottish members have been scandalously neglectful of this great subject, allowing one of the most admirable institutions of the country to dwindle into comparative insignificance. Now is the time to remind representatives of their duty. The Scottish parish schools ought not to be sacrificed by neglect, but be made the basis of a far grander and more widely-applicable institution.

Before pointing out what we consider to be the reforms desirable in the parish schools, it may be useful to recur to what should constitute the true principles of national education. These may be stated almost in a word. The state, as a matter of duty and expediency, is bound to provide means for educating the whole people. In justice, it must educate either the whole or none ; for the whole contribute equally to the national purse. Elementary education consists of two things—secular and religious instruction. The two should go together, so that the child may grow up with a full consciousness of his duty to God as well as to his neighbour. As there are widely different sects, however, it would not always be practicable to impart religious in the same classes with secular instruction ; and therefore there must be a division to a certain extent. From the example shown by other countries in precisely analogous circumstances, it would be quite possible, and certainly advisable, to put the secular instruction into the hands of the appointed teachers, and to leave the religious part to parents, or the pastors of those congregations to which the children respectively belong—with the exception of such elementary religious instruction as would be approved of by the parishioners :

to this extent religion might be taught by schoolmasters. All that is desirable and proper, therefore, is, for the state to pay only for the erection and support of school-houses, and for the secular branches of education. With respect to the religious culture, its cost, if anything, will be cheerfully liquidated by the religious bodies to which the parents of the children are attached. Whether the funds requisite for conducting the schools should be contributed immediately from the national exchequer, or partly raised from local and general assessment, is a point of detail that admits of consideration, and which it would not be difficult to settle. Our own opinion inclines to local assessment, at least in part, and also to local administration, subject, nevertheless, to general supervision and control. In all countries where a national system of education has been instituted, there exist a head and departmental boards ; and without some such machinery in this country, it is difficult to see how a universally applicable system of instruction could be carried on.

Such are our views as to national education, expressed in as few words as possible. These views are not new. They are the result not only of long consideration, but of personal investigations into methods of school instruction in now nearly all the countries of Europe. Ten years ago, we saw a system such as we have figured working beautifully in Holland ; and it is no little happiness to find that the sentiments we promulgated (1838), in describing the national education of that country, have since been embraced by men of widely-differing persuasions in both England and Scotland. We, in fact, from all things around us, feel assured that no other system than such as has been indicated will be practicable, or carry with it the public esteem. The time has gone by for endowing the schools of sects. Any such plan is the mere make-shift of men incapable of appreciating public feeling, or who lack the courage to bring forward, and adhere to, a project for sound national education.

Why, it may possibly be asked, should we not be contented to see sectarian schools endowed, as is at present proposed by the Committee of Privy Council, in lieu of what they assume to be impracticable as respects a national system ? All who are disposed to think seriously on the subject, must reject a compromise of some kind. Laying out of view the invidiousness of some sects receiving, and others rejecting, the national bounty, is it no small matter to endow and perpetuate distinctions which, it is to be hoped, if left to themselves, will by and by subside ? Christianity is at present in a condition of working towards purity and unity through the conflicts of contending opinions. Why, then, do anything to exasperate and prolong divisions ? Why endow a multitude of separate sects which, in the progress of society, will coalesce and disappear ? But there is perhaps a still more serious ground of objection. It is of the first consequence that the children of a parish, town, or district, should all attend one school, and be reared in kindly intercourse with each other. This can be achieved only by a national system of instruction. Already, by the erection of sectarian schools—provoked into existence by exclusive tests—a very serious evil has been done, the seeds of much future strife and enmity having been sown. And we can well foresee how greatly intestine dissensions would be aggravated by extending the means which keep alive so unholy a course of procedure.

Entering into the spirit of these observations, the plan for improving the parish schools of Scotland is exceedingly apparent. 1. The test must be abolished, and the office of teacher thrown open to general competition ; 2. Teachers should receive a respectable salary, varying in amount, however, according to capacity and extent of duties—say from £50 to £100, independently of the fees, which they would be entitled to exact ; 3. The government and supervision of the schools should be reposed in a general board, and also in local boards, elected wholly or in part by rate-payers ; 4. District

schools in towns, and in populous rural parishes, to be embraced in the general system; 5. The expense of the schools to be borne by general local assessment on all property, along with contributions from the state, as might be agreed on;* 6. With respect to religious school instruction, Scotland happens to be favourably situated. By far the larger proportion of the people are Presbyterians, who, however differing on points of church government, agree as to religious doctrines and formula; and therefore, except in a few parishes and districts, there would most likely be no dispute on this subject. Wherever there was any difference of opinion, the plan of separate religious instruction could easily and satisfactorily be arranged. Of other parts of the organisation, including normal schools, it is unnecessary to speak. We confine ourselves to the general features of a plan which must sooner or later be resorted to, if the parish schools are to be brought into harmony with the age—if dissensions are to be appeased, and the cause of social melioration advanced.

Oh for the return of days of vigorous statesmanship, when there were courage and manliness to propose and adhere to measures which the conscience suggested as being in accordance with truth and justice! Oh for an end to the days of sham and of unprincipled make-shift expediency!

W. C.

THE CHIFFONNIER OF PARIS.†

THE chiffonnier of Paris differs in national and individual qualities from the street-grubber of London, though earning his bread in a not very dissimilar manner. In one respect both are alike: their trade is easily begun, nor is it usually commenced till everything else has failed. When the victimised Parisian finds himself without character and without resources, he wants but half-a-dozen francs in his pocket to provide himself with a back basket and an iron-pointed crotchet or rake, to begin the world anew, and embark in an independent profession. Once equipped as a chiffonnier, he has no sooner familiarised himself to the ignominy of this wretched trade, than, having adopted it by necessity, he continues it by inclination. He finds a charm and a recompense in his nomadic existence, in his endless wanderings, in his vagabond independence, and indulges a profound contempt for the slaves who shut themselves up from morning to night in a workshop or behind a counter. Let them, mere machines of others, regulate the employment of time by the hands of the dial; he, the chiffonnier, the philosopher, works when it pleases him, and rests when he chooses, without thought for the night or care for the morrow. If the east wind freezes him, he warms his blood with a dram; if the heat incommodes him, he doffs his harness and his tattered frock, stretches himself in the shade, and goes to sleep. Is he hungry—he can soon earn a few sous, and feasts, like Lucullus, upon a crusty loaf and sour cheese. Is he sick—what matter? 'The hospital,' says he, 'was not invented for dogs.'

The victim of every privation, the chiffonnier is proud, because he believes himself free. He treats with haughtiness even the rag-merchant himself, to whom he carries the harvest of the day, and from whom he is in the habit of receiving from time to time a slender advance upon that of the morrow. He gives himself the airs of a patron; and declares that if the dealer does him less than justice, he will transfer his commodities to a rival. His pride is visible through the multiplied fissures of his tattered vesture.

The rag-merchant is the able alchemist who transmutes into gold the offal and refuse of the streets; and

with the proceeds of rejected rags and putrefying bones, speculates in the rise and fall of stock. He receives the chiffonniers in a fetid and filthy shed, and his fashionable friends in an elegant saloon. His place of business is hideous beyond description, incumbered with the most disgusting impurities, masses of the foulest tatters, rotten planks, and decaying anatomies that infect the air, the whole brought thither by beings of an aspect scarcely human, and weighed in balances of a formidable and grotesque appearance, under the surveillance of a noisy, quarrelling, and decrepit shrew. But if we pass beyond this forbidding vestibule, and penetrate into the private apartments of the merchant chiffonnier, we shall encounter the usual pomp and appendages of civic luxury—the gilt and gorgeous *pendule*, the collection of showy pictures and prints, the bronze bust of the emperor, the sideboard loaded with crystal and porcelain, and the grand pianoforte of madame or mademoiselle, the latter a well-educated and accomplished lass, the worthy heiress of no scanty hoard. We could mention the name of one of this fraternity, living at present in the Rue Jean Tison, who gave at the marriage of each of his two daughters a dowry of sixty thousand francs.

If the wholesale dealers realise such gains, it is plain, considering the nature of their merchandise, that but little is left for the actual chiffonnier; in fact the most industrious among them seldom get more than three or four francs a-day. These are they who, in defiance of a regulation yet in force, that of the 26th July 1777, perambulate the streets during the night. The chiffonniers, like the moths, are composed of two races—the diurnal, and the nocturnal; and these latter, commencing their peregrinations at the moment when the street-sweepers retire to rest, have the best chance of some fortunate discovery. They adopt certain favourite quarters, generally giving the preference to the Faubourg Saint Germain, the Chaussée d'Antin, the Faubourg Saint Honoré, abounding in noble residences of the most opulent classes. Constantly attending the same circuit, they become known to the household servants, and particularly the cooks, from whom they receive occasional contributions from the larder, engaging in return to restore any lost article of value which they may discover in their researches among the offal of the establishment. Once established and recognised in a certain beat, they begin to derive an income from other sources than their professed occupation. Lazy and sleepy subjects, whom fortune has condemned to rise early in the morning, see them to break their slumbers. We have the honour to know a chiffonnier who goes every morning from Mount Sainte Genevieve to the Assomption to knock at the doors of a grocer, a confectioner, and a wine-seller. This commission brings him in thirty centimes, each party paying him ten (or one penny) per day; an amount which this thrifty economist informs us defrays three-fourths of his expenses for lodging.

The day practitioner does not consider himself debarred from social pleasures. He will be found at the barriers, on Sundays and holidays, dancing and drinking with his wife; and he patronises the drama when the piece is to his mind—tender, touching, sentimental, and interesting; such as *Lazare le Pâtre*, *Grace de Dieu*, or *Paul et Virginie*, or any other of the class, where, above all other recommendations, *the traitor is punished in the last scene*.

Whatever his prosperity, the chiffonnier has never any furniture of his own; he sleeps in furnished lodgings, at the settled price of twenty centimes a-night, which the mistrustful proprietors generally exact in advance—'Twopence down, or you don't lodge here.' The individual who can disburse, throws himself, without quitting his rags, upon a straw mattress. In these dismal chambers, open to all the miserable offspring of poverty and crime, the common bed is a long sloping plank, and the common coverlet a remnant of decayed carpeting, nailed to the wall at one side of the room,

* We refrain from complicating the question by any reference to church property—which is essentially public property—now in the hands of the heritors. Whether that property, at least in part, should be devoted to purposes of education, will not escape consideration when the subject comes fairly before the country.

† The principal particulars in this paper are gathered from an article on the subject in a French work, purporting to describe the humbler trades of Paris.

and fastened with hooks at the other. Should any quarrel arise in the night among these 'strange bed-fellows,' the keeper of the den makes his appearance, armed with a long and portentous bludgeon, and by angry threats, or the application of his weapon, seldom fails to reduce to order the refractory party.

In such squalid resorts the chiffonniers often come in contact with robbers, of whom they involuntarily become the passive accomplices. They are not expected to take part in the crime; but to reveal the mystery of a criminal enterprise, would be to devote themselves to the implacable vengeance of the gang. An old chiffonnier, suspected of having betrayed two thieves, was found one morning assassinated at the corner of a court. The murderers had surprised him at early dawn; they had severed his head from his body, and, by an atrocious refinement of barbarity, had thrown it into his basket.

The chiffonniers, both male and female, talk slang; the general dialect of thieves, it would seem, in all countries, though not exclusively confined to them. The class under consideration have nevertheless a general character for integrity, which they could never have earned, much less maintained, but by repeated acts of honesty and disinterestedness. Restorations of recovered property are frequent among them, of which we could relate numerous instances. On the 11th of October 1841, the widow Boursin, an old chiffonnière of the Rue Mouffetard, well known in the neighbourhood of the Chaussée d'Antin, discovered in a mass of rubbish a diamond shirt-button of considerable value. She occupied the whole day in going from house to house before she found the owner, to whom she immediately restored his property, demanding the price of her day's labour, and refusing all further reward. We should also make honourable mention of Père M——, an old soldier of the Imperial Guard, a chiffonnier, and a chevalier of the Legion of Honour. This veteran had two orphan grandchildren left to his charge: he dedicated his pension to the purposes of their education and establishment; and mounting the basket and crotchet on the shoulders so long familiar with the knapsack and gun, sought his own subsistence in the offal of the streets. For this he is held in honour among the tribe, who duly appreciate his virtue and self-denial.

Perhaps the worst characteristic of this class is their love of strife and tumult, which shows itself in a perpetual inclination to quarrel with one another, and with all the world. In every popular outbreak, they are the first to commence deeds of violence, and the last to be reduced to order. The most stable government has trembled to its base at the mad outcries of the chiffonniers, when, at the head of a torrent of the wan and haggard population of the faubourgs, they have rushed upon the wealthy quarters of the city. The cause of terror is not the apprehension of pillage, but of the overthrow and destruction of the whole social fabric. They feel how feeble are the regulations of public order against an army of insurgents who have nothing to lose.

In quiet times, the chiffonniers make war only on the domestic animals—the dogs and cats, whose carcasses they sell to the knacker. A mastiff fetches from thirty to forty sous; a dog of average size from five to ten; a cat four sous in summer, and eight in winter. The fat of the cat is used by the 'tondeur,' or dog-barber, a trade peculiar to Paris; and dogs'-foot oil is in continual request among the various craftsmen of the capital. The furriers receive the skins, under whose hands that of the dog becomes the veritable black fox; and the hide of poor puss a genuine zibeline, or sable.

Collateral branches of this delectable profession extend beyond the walls of Paris, and provincial practitioners are to be met with in all the principal towns of the departments: but these are mostly dealers, not doers: the true chiffonnier, such as we have described him—

independent, thoughtless, proud, somewhat honest, thoroughly undisciplined, and '*toujours Français*'—is as essentially Parisian as the Column Vendôme or the Arc de l'Etoile.

A VISIT TO A VEGETABLE GIANT.

In the western part of the island of Java are some relics and remains of a very great and ancient city named Padjajaran. This city was formerly of so magnificent a character, as to have been sung and celebrated in the verses of the poets, and to this day the strains of Wayang tell of its vast extent, of its glorious buildings, and, above all, of the size and majesty of the palace of the kings of Padjajaran. The earthquake and time have swept the city and its inhabitants into a common oblivion, and have left little but the poetry to inform us that there ever existed this glorious and famous city. But one vegetable monument remains behind, which the earthquake might shake, but could not destroy, and which time itself has only strengthened—this is the Vegetable Giant, a visit to which we are now about to describe.

This huge tree, which spreads out its great branches over a large area of ground, formerly overshadowed the royal palace, and was the wonder of the whole city; and now, when palace and city are only constituents of the dust around it, the tree flourishes, and commands the admiration of the traveller, and the adoration of the majority of the Javanese nation. The place where it is found is now known as Batatulis. At its foot is a small wooden structure where a few Mohammedan priests officiate, to whose care is committed the conservancy of this monarch of the forest, and of some supplementary relics, upon the proceeds of the exhibition of which, and on the fees for the attendant religious ceremonies, they contrive to pick up a tolerable livelihood; for the tree is in an odour of sanctity beyond all other trees in the island. Wo and bad success to that miserable peasant who goes to market without paying his adorations and coin at the shrine of the giant tree! Besides this, the fame of the tree has spread far and wide, and many come to behold and wonder, who may pay the customary offerings without adoring the deity of the place. The subsidiary relics consist of some pieces of old Padjajaran tombstones, and a marvellous bit of rock, into which some Hercules of old is said to have set his foot. These are held in equal veneration with the great tree, and their worship is commingled with the services of the mighty vegetable idol which towers above them. The tree stands at no considerable distance from the wayside, and forms an imposing feature of a landscape by no means deficient in grandeur. It is placed upon an elevated plain, and is conspicuous from all sides of it, and attracts the attention of every one even at some distance. So noble is its appearance, so majestic its port, that it has been said if once beheld, it cannot soon be forgotten. Coffee plantations crown the fields and the sides of the hills, offering a striking contrast of feebleness and colossal strength in the vegetable kingdom. Shining rivers, waving rice-fields, woods and mountains, with a fuming volcano in the distance, complete the picture of its situation.

The trunk of the tree is of dimensions so vast, that very many men, by their united hands, cannot embrace it; botanical data do not exist for the determination of its age; the tree is too sacred probably to allow of the requisite steps for that examination. The trunk at first sight almost appears as if it consisted of a number of trees all intimately united together; and from all sides of it huge irregular boughs jut up of all sorts of shapes, and in every direction, while the deep furrows and hollows consequent upon extreme vegetable old age contribute to give the monster a grandeur and awfulness of character not easily conceivable. Perhaps the greatest marvel about the tree is the remarkable fact, that it is actually made up of two trees united into one; and most curious to relate,

two trees of the same genus, but of *different species*! Both have grown together, so as to form one indivisible trunk of enormous size; but the distinctive features of each species come out in the branches, and appear, even to the eye of the casual observer and untutored savage, in the remarkable difference in the colour of the foliage. At a little distance the spectacle is very peculiar. The leaves of one species are of the most lively and beautiful green, while those of the other are dark green on the upper surface, and a very pale green on the under. The one species has long, slender, drooping branches, adorned with elegant foliage, refreshing even to look upon; from its majestic appearance this kind is commonly planted before the palaces of the Indian princes; its larger branches put forth fascicles of roots, which, instead of descending as they commonly do to the earth, have crept along the aged trunk, wrapped their strong arms around it, and have ultimately blended themselves with its substance. The other species, less graceful in growth, has shorter, more rugged, and lustier branches, and by these and the colour of its leaves was readily distinguished from its twin sister. Below, both were, as it were, fused into one vast mass, mingling its juices and fibres together. The trees both belong to the natural family *Moraceæ*, a race of trees which has given birth to some of the giants of the vegetable world: they are of the genus *Ficus*. This genus is held very sacred in Java, for it is believed the spirits of the departed delight to make their habitation in the grateful shadows of its branches. In this tree, above all others, the manes of the dead are wont to dwell, holding intercourse the one with the other, and propitiated by the services, or exasperated by the neglect, of the relatives and friends they have left behind. Solemn, indeed, therefore was the regard, and deep the religious estimation, in which this monster tree was held by the Javanese.

It was in the latter part of the year 1818 that my visit to this celebrated wonder was made. The visiting party determined on setting out on the expedition before sunrise, which is the pleasantest period for travelling, impelled not merely by the idle curiosity excited by the thousand fables current relative to this marvellous, marvellously-great tree, but instigated by the more praiseworthy desire of ascertaining its scientific character and standing. Since, however, the natives regarded the tree with a superstitious awe of no common intensity, and considered it a heinous degree of sacrilege for a European so much as to break off the smallest branch, it was probable they would resist all botanising attempts upon its sacred boughs, and it became expedient, therefore, to get the authority of the Indian prince then having power in the island to sanction the meditated investigation. This was readily granted, and with it the assistance of a military convoy; and so all started before day-dawn. The route lay for the most part along the military road; and after passing long rows of the huts of the natives, the party at length emerged upon the plain on which the tree stands. Immediately to the right was the vast object of attraction, its aspect imposing in the extreme, which was heightened by the dim shadows of a departing night, still covering hill, valley, mountain, and plain in a dusky mantle of vapour, through which the first beams of the sun were now struggling. Even at this early hour, the belief of the wonderful blessings which were bestowed upon the worshippers who made the proper offerings to the leafy god, had drawn a considerable number of them together, some of whom were lost in contemplation of the green idol, while others were humbly kneeling before the pieces of stone, and the giant's footmark in the bit of rock in the chapel. On perceiving their occupation, the expedition halted, not wishing to disturb their devotions; but these were instantly stopped when the visitors were descried, the devotees rising from their knees, and quitting the chapel. The priests then approached, and stood near the entrance of the chapel, waiting to learn the purpose of the invaders. They were ad-

dressed by an Indian interpreter, who, after saluting the venerable fathers in the Oriental fashion, gave vent to a long harangue, which stated in a good many words what we may express by a very few. The principal visitor had recently arrived in Java, from the most distant regions of the earth, to examine the plants of the island, and more particularly to make himself acquainted with this venerable and most sacred tree. Their lord the prince, himself a real lineal descendant of the most noble and ancient race of Padjarian kings, having therefore a hereditary right over the tree, on being acquainted with the visitor's intentions, had been pleased to vouchsafe his consent to the expedition, and had given orders that the visitor might cut with his own hand a few of the smallest branches of the sacred tree. It was also intimated that nothing would please the prince more than if the departed spirits who dwelt in the tree would suffer the visitor to remove a few of the precious flowers growing upon it.

This rather startling proposition was attentively listened to by the priests, who seemed puzzled to comprehend its entire import. They held an earnest conference together, and commenced pronouncing in a gentle whisper certain mysterious verses; after which, kindling some rice chaff, they threw upon it a quantity of incense, the smoke of which went up in a dense cloud, and filled the tree with its sweet odours. Every eye was fixed upon the curling wreaths rolling from branch to branch; and when at length the whole mass of the foliage was enveloped in the cloud, the chief-priest, an aged, awful-looking person, stood forth, and after bidding the stranger welcome, proceeded to inform him of the result of their sacrifice. Never had the priests of this most holy tree beheld a better omen in the rise of the sweet-smelling vapours and their dispersion through its branches, than on this happy occasion. The visit of the illustrious stranger was most agreeable to the spirits of the departed; they were most willing to grant his requests, and to give him many additional blessings; while those who with sacrilegious hands should presume to desecrate this holy tree, disease and evil should fall upon and utterly destroy. The great difficulty was thus removed; the full permission of the priests being gained, and the customary offering made at the shrine, the visitor proceeded to scramble in a most irreverent manner up the aged sides and lateral branches of the tree, the priests themselves urging several peasants who were at hand to ascend also, and assist the stranger in collecting what he required. On ascending, words can scarcely describe the scene which presented itself. The tree was clothed all over with elegant flowers and parasitic plants. Orchids, in a multitude of species, crawled up its withered branches, and flung down flowers, and roots, and leaves, in one waving mass of fantastic fragrance and elegance. Lichens scaled up the wooden cliffs, and ferns of many species grew up from the dark hollows, while *loranthus* sucked the vital juices, and *acrophulariads* covered the branches in a patchwork of brilliant hues. The tree was, in fact, a garden in the air: the rain of ages had washed down into its cavities dead leaves and decaying material, and thus a rich vegetable mould existed in them, which was highly fitted for, and gave exuberant nourishment to, the host of plants which in some inexplicable manner had found their way thither. After remaining in the tree for some time, and fearing to exhaust the patience of the priests, the visitor descended, together with his delighted coadjutors, bringing down with them a vast collection of flowers from this parterre of nature—if the phrase is not too violent—and even then perceiving, to their regret, that fully half the species had not been gathered by them.

On unfolding their treasures, one little flower especially was found, which was hailed with vast exultation by the peasants and priests. Its petals were of a beautiful rich crimson colour, but the throat of the flower was of the colour of glittering gold. This was the celebrated flower, the possession of which would confer riches and

happiness inconceivable upon the owner. It was a splendid reward, then, for the toil of the amateur collectors to receive a few of these bliss-bestowing flowers; each received his portion with the liveliest joy. The most lovely objects of all, however, were the flowers and fruit of a plant originally discovered by Thunberg, and named the *Fragaria auriculata*. The flowers are very large, of the most magnificent aspect, and quite equalling the very loveliest members of the glorious Indian Flora, and the fruit seems to the eye equally lovely and inviting. This plant, living a half-parasitic kind of life, and also nourished by the decaying soil before-mentioned, pushed aloft its stem and branches in unparalleled luxuriance, marking over the dead boughs of the great parent with charms and a verdure long since departed from themselves. Altogether, the result of this very curious and interesting botanising excursion was the discovery of upwards of thirty-four species of plants living upon the vegetable giant; and it has been said many were even then left behind. After carefully preserving their specimens, and bidding farewell to the priests, the party returned, in no ordinary degree gratified and instructed by their visit to the Vegetable Giant.

It is not right that the name of the visitor should be withheld: it was the illustrious botanist—the author of the ‘*Flora Javoe*,’ ‘*Rumphia*,’ and other works of the highest rank—C. L. Blume.

THE SKATING REGIMENT.

In Norway, the ground is overspread with snow for three quarters of the year, and not unfrequently to a depth of ten feet. When a thaw comes, it is only the surface of the mass that melts; and then the next frost of course covers the whole country with a crust of ice. In such circumstances, there is no getting along in the usual way. The people must still ascend the hills and dive into the valleys in pursuit of game; they must still traverse the hoary forests to gather wood for fuel; and they must still journey to the distant towns to bring food to their isolated hamlets. In these excursions, whether long or short, they use skates. Skating is with them neither a mere amusement nor a gymnastic exercise; it is a means of locomotion which the nature of the ground renders indispensable, and a man who could not skate would be unable to walk to any useful purpose.

It is melancholy to think that one of the most delightful winter customs has, like many other things good in themselves, been pressed into the service of war. In the army of Norway, there is a Company of Skaters, dressed in the dark-green of English riflemen, and armed merely with a slight musket slung upon the shoulder, and a dagger-sword. They are likewise provided with an iron-pointed staff, seven feet long, resembling those used by the Swiss when traversing the glaciers; which serves to balance them as they sweep along the ice, and which they strike deep into the ground when they desire to stop in their headlong career. The staff is also indispensable as affording a rest for their pieces when they fire. Their skates are of a peculiar construction, being singularly long; and when thus shod, it is a strange sight, and in times of peace, like the present, an amusing one, to see this light company climbing with ease the icy hills, gliding down their precipitous sides, and striding, as Klopstock says, with winged feet over the waters, transmuted into solid ground, as if in defiance of the common laws of nature.

Skating was known to the ancestors of the North-men, as we take the date assigned by some authors to the Edda as evidence, eight centuries ago; the god Uller being represented in the Scandinavian scriptures as remarkable for his beauty, his arrows, and his skates. The exercise is not mentioned by the Greek and Roman writers, though so well acquainted with all other

gymnastics; but Klopstock, Goëthe, Herder, and other German poets, sing the praises of the art. In Holland, it is practised, as in Norway, not for its gracefulness, but for its utility; and there it is common for the country people to skate to market. During the famous expedition of Louis XIV., this art of locomotion was used against the Dutch themselves in one of the most curious and daring exploits recorded in history. When the States sued for peace, the terms offered by the pride of Louis were so monstrous, that the people tore open their sluices, and laid the country under water. The frost after a time, however, rendered even this unavailing; and at length General Luxembourg, one dark and freezing night, mounted twelve thousand men on skates, and sent them over the ice from Utrecht to surprise the Hague. The result is given as follows by a writer who takes his facts from a French historian.

‘When they left Utrecht, it was clear frosty weather, and the effect of the moon and stars upon the even sheet of ice, over which they swept like a breeze, was truly magical. By degrees, as they advanced, the visible horizon of earth was obscured by vapour, and they could see nothing around, above, or beneath them, but a circular expanse of ice, bounded at the edge by thick gray clouds, and canopied by the starry curtain of the sky. The strange groaning sound which ever and anon boomed along the frozen wilderness, had at first something inexpressibly terrific to the imagination; and as it died fitfully away in the distance, the space surrounding them seemed extended almost to infinity. The sky at length was gradually covered by the vapours rising, as if from the edges of the circle of earth; a veil of dull and hazy white overspread the heavens and obscured the stars; and a dim round spot of watery brightness was the only indication of the site of the moon, by which alone they could now steer their course.

‘A rapid thaw had come on; their skates sunk deeper and deeper into the ice at every sweep; and at last, the water gathering upon the surface, as it was agitated by the night-wind that had now risen, assumed the appearance of a sea. The wind increased; the sky grew blacker and blacker; their footing became more spongy and insecure; they plunged almost to the knee; and the ice groaned and cracked beneath them. Every one looked upon himself as lost; and the horrors of a fate hitherto untold in story, and appearing to belong neither to the fortunes of the land nor of the sea, appalled the boldest imagination.

‘At length a faint twinkling light appeared in the distance, sometimes seen and sometimes lost in the varying atmosphere; and they had the satisfaction, such as it was, of at least knowing the relative bearings of the place on which they were about to perish. The light proceeded from a strong fort in the enemy’s hands, impregnable without cannon; and what added bitterness to their misery, was the knowledge that beyond this fort was a dike, which in all probability afforded a path, however narrow and muddy, by which they could have returned to Utrecht. The fort, however, was the gate to this avenue of safety; and even if they had possessed the requisite means of siege, if it was defended for a single day, they would either be swallowed up by the waters, in the continuance of the thaw, or perish miserably through cold and fatigue. But anything was better than inaction. The water creeping insidiously around them was a deadlier enemy than stone walls or cannon-shot; and they determined at least to make a rush upon the immovable masonry of the fort, and provoke the fire of its defenders. It is impossible to account for the result. It may have been that the sight of so large a body of men rushing in upon them, as if from the open sea, their numbers multiplied, and even their individual forms distorted and magnified in the mist, struck a panic terror into the hearts of the garrison; while this may have been increased by the shouts of courage or despair, booming wildly over the icy waste, and mingling like the voices of demons with

the rising wind. But however it was, the gates of the fort opened at their approach, and the helpless and half-frozen adventurers rushed in without striking a blow.'

MARIA LA FANTESCA.

TOWARDS the close of the seventeenth century, there dwelt in Rome a young girl, whose singular history rendered her an object of universal interest. Her surname was never known, but she was commonly called *Maria la Fantesca*, or *Maria the Servant-girl*. She was born in one of the villages near Rome, and at an early age was placed by her parents, who were very poor, in the family of an eminent sculptor. Before she came of age, she had conceived such an admiration of her master's works, that she formed the bold resolution of devoting herself to the study of art; pursuing it at first in secret, but cherishing a hope of one day attaining public success. Maria confided her intentions to an artist who frequently visited her master's studio, and begged of him to give her secretly a few lessons in drawing and modelling: the artist not only granted her request, but induced his friend Dr Corona to aid him in the instruction of the enthusiastic girl.

This first step gained, Maria devoted every moment she could snatch from her household duties to modelling and drawing: she was never idle. To execute something worthy of her master's praise, was the highest object of her ambition. Life had now new charms for her: if her resolution at any time wavered, or she felt overcome by the difficulties of her task, Maria used to go secretly to the Vatican, and there, surrounded by the great works of ancient art, her enthusiasm was speedily rekindled, and her courage revived. She would pass hours together in looking at her favourite statues, and gazing upon them until she felt her mind thoroughly imbued with their beauty. These were her lessons. She was determined not to fail; and as if aware that in this resolution she possessed the surest guarantee of success, she laboured unremittingly, and overcame obstacles which would have daunted a less hopeful spirit.

The pursuit of sculpture as an art has rarely been attempted by a woman, and difficulties met Maria at every step; still she allowed nothing to turn her from her purpose. She listened eagerly to every word of advice and instruction which she chanced to overhear her master giving to his pupils, and treasured all up in her memory; and afterwards, in her quiet hours, when she had time for reflection, or to pursue her studies, she turned this instruction to good account.

By this steady pursuit of her object, by her perseverance, and a careful economy of time, Maria made a progress that astonished the friends who were in her secret. At length she set to work upon a statue, on which she had bestowed long and anxious thought, and which she hoped to render worthy of public exhibition. She told no one of her project; and it was only in hours stolen from her daily duties, or, more frequently, from her nights' rest, that she could prosecute her work. Two years did the energetic girl labour on in secret, unaided even by the voice of encouragement, but supported by her own enthusiasm. At length the statue stood before her, a finished work! It was a statue of *Minerva*; and although by no means faultless in execution, its deficiencies in finish and proportion were compensated by a grandeur in the attitude and general expression, and a beauty in the features, which seemed almost inspired. The statue was completed; the last finishing touches were given to it; and Maria had it secretly conveyed to the hall in which the exhibition was to take place. The judges appointed to award the prize to the successful candidate were assembled; crowds flocked from all parts of Rome to the Capitol, and every seat was occupied. All were eagerly discussing the merits of the various works of art exhibited.

It so happened that Maria's master was president on this occasion, and it consequently fell to him to crown

with a wreath of laurel the prize work of art selected by the judges. Maria, in her simple servant's dress, unnoticed and unsuspected, had followed in the crowd, and taken her seat in the gallery. With a beating heart she sat watching intently the progress of the ceremony. There was a breathless silence, and the opinion of the judges was at length declared—it was unanimous. Reader, can you imagine the feeling of mingled rapture and amazement which overpowered poor Maria, when she saw her master step forward, and, amidst the deafening applause of the assembled multitude, place the laurel crown upon the head of her *Minerva*? On every side she heard the praises of the statue, and of the talents of the unknown artist.

Maria returned home, silent and alone; and here a still greater joy, if possible, awaited her. She went back to her ordinary duties, but her face was flushed, and her whole frame fevered with excitement. Presently her master's bell rang, and she obeyed the summons: but when she now entered the room, she could control her emotions no longer. She fell on her knees, and bursting into tears, confessed her secret. Her master looked at her in silent astonishment and admiration, then raising her up, he overpowered her with questions as to the means by which she had attained such proficiency in an art so entirely removed from her sphere of life. Maria humbly and modestly related her story. She told him of the irrepressible desire which first determined her to be a sculptor—the study and labour she had devoted to the art—and all the hopes, the fears, and difficulties which she met and overcame. The good old man listened with deep interest; and embracing the poor girl affectionately, he promised to adopt her as his daughter and his pupil, assuring her that such a beginning augured the brightest success.

Maria's story was soon known throughout Rome, and a universal feeling of interest was awakened in the fate of the self-taught artist. She was courted and flattered, and received into the highest circles, all vying to bestow the greatest honour on *Maria la Fantesca*; but her joy was no longer the same as that which had animated her in her secret hours of study, when, unknown and uncared for, she laboured on, stimulated only by the love of her pursuit, and the sole companion of her hopes and aspirations. Then, indeed, she had looked forward with rapture; she now looked backward on the past with satisfaction, but not wholly without regret.

Maria's triumph was of short duration: the brilliant star shone but for a moment, and then vanished. Whilst her fame was the universal theme in society at Rome, she was fast fading away. Excitement and over-study had undermined her health, and she fell a victim to a rapid decline. The poor girl had plucked the flower of her hopes, but only to see it wither in her grasp.

KIND WORDS.

They do not cost much. It does not take long to utter them. They never blister the tongue or lips on their passage into the world, or occasion any other kind of bodily suffering; and we have never heard of any mental trouble arising from this quarter. Though they do not cost much, yet they accomplish much. 1. They help one's own good-nature and good-will. One cannot be in a habit of this kind, without thereby pecking away something of the granite roughness of his own nature. Soft words will soften his own soul. Philosophers tell us that the angry words a man uses in his passion are fuel to the flame of his wrath, and make it blaze the more fiercely. Why, then, should not words of the opposite character produce opposite results, and that most blessed of all passions of the soul, kindness, be augmented by kind words? People that are for ever speaking kindly, are for ever disinclining themselves to ill-temper. 2. Kind words make other people good-natured. Cold words freeze people, and hot words scorch them, and sarcastic words irritate them, and bitter words make them bitter, and wrathful words make them wrathful. And kind words also produce their own image on men's souls; and a beautiful image it is. They

soothe, and quiet, and comfort the hearer. They shame him out of his sour, morose, unkind feelings; and he has to become kind himself. There is such a rush of all other kinds of words in our days, that it seems desirable to give kind words a chance among them. There are vain words, idle words, hasty words, spiteful words, silly words, and empty words. Now kind words are better than the whole of them; and it is a pity that, among the improvements of the present age, birds of this feather might not have more of a chance than they have had to spread their wings. Kind words are in danger of being driven from the field, like frightened pigeons, in these days of boisterous words, and warlike words, and passionate words. They have not the brass to stand up, like so many grenadiers, and fight their own way through the throng. Besides, they have been out of use so long, that they hardly know whether they have any right to make their appearance any more in our bustling world; not knowing but that perhaps the world was done with them, and would not like their company any more. Let us welcome them back. We have not done with them. We have not yet begun to use them in such abundance as they ought to be used. We cannot spare them.—*New York Evangelist.*

INNOCENCE AND GUILT.

The boldness of innocence, and the timidity of guilt, so often observed by moralists and poets, may be thus easily accounted for. The virtuous man is conscious of deserving nothing but reward: whom, then, should he fear? The guilty man is conscious of desert of punishment, and is aware that every one who knows of his offence desires to punish him; and as he is never certain but that every one knows it, whom can he trust? And still more, there is with the feeling of desert of punishment, a disposition to submit to punishment, arising from our own self-disapprobation and remorse. This depresses the spirit, and humbles the courage of the offender, far more than even the external circumstances by which he is surrounded. Thus says Solomon, 'The wicked flee when no man pursueth; but the righteous are bold as a lion.'

What stronger breastplate than a heart untainted?
Thrice is he armed who has his quarrel just,
And he but naked; though locked up in steel
Whose conscience with injustice is corrupted.

—*Wayland's Moral Science.*

SMELTING BY ELECTRICITY.

The lately patented process of smelting copper by means of electricity, says a London journal, is likely to effect a change that will be quite prodigious. It produces, in less than two days, what the old process required three weeks to effect. And the saving of fuel is so vast, that in Swansea alone, the smelters estimate their annual saving in coals at no less than five hundred thousand pounds. Hence, it is clear that the price of copper must be so enormously reduced, as to bring it into use for a variety of purposes from which its cost at present excludes it. The facility and cheapness of the process, too, will enable the ore to be largely smelted on the spot. The Cornish mine proprietors are anxiously expecting the moment when they can bring the ore which lay in the mine yesterday into a state to be sent to market to-morrow, and this at the very mouth of the mine. In Australia, also, the operation of this discovery will be of the utmost importance. Ten thousand tons of copper-ore were sent from Australia to England last year, to be smelted at Swansea; and the result was only 1600 tons of copper. But Australia in future will smelt her own copper, by a 36 hours' process: saving all this useless freight of the 8400 tons of refuse, and saving also the cost of the old and expensive process. In a very few years, Australia will send to market more copper than is now produced by all the rest of the world. But if our future penny-pieces are to bear any proportion to the reduced cost of the value of the metal, they must be made of the size of dinner-plates!

CURE FOR VAGRANCY IN INDIA.

The following very characteristic order has recently been issued by Sir Charles Napier, and very strongly recalls to mind the stringent laws against vagrancy promulgated in the days of Queen Elizabeth:—'The cantonment of Kur-rachee is infested by vagabonds who came with the troops from Bombay. The police and bazaar-master are to arrest all such men as have no ostensible means of earning their

bread, and send them back to the place from whence they came to Scinde. Those who do not belong to Bombay, are to be put to work on the roads for a month, and then liberated for three days; at the end of which time, if they do not find work, they are to be again sent to the road-gangs. There are good wages and plenty of work going on in Scinde! and the lieutenant-general, governor, will not allow vagabonds to be loose on the public to rob industrious people. This order to apply to all the other stations in Scinde.'

POETICAL ANTIDOTES.

Oh sing me a song about love, the fond true love of the olden days,
Of undying faith, of heroic deeds, achieved in those glorious days
When chivalry's laws were omnipotent, and all save honour was given,

To win one sigh from the worshipped one—the sigh that makes
earth a heaven!

Oh sing me a song of poesy, gushing forth from fount and rill,
Where nymphs reposed in wild wood shade at noontide bright and still,

Or fairy folk their revels held what time the moon did fling
A silver glare from her pale lamp to light the festive ring.

Oh sing me a song of music's joy when the bursting chorus rose,
And a hundred timbrels and harps of gold awoke that dread repose,
Where the depth profound of the solemn fane re-echoed sacred story,
And one sweet voice, heard lone and clear, called on the Lord of Glory!

Oh sing me a song of the sculptor's hall, but in mystic numbers
sweet—

For 'tis holy ground! Be still, be hushed—here soul with soul doth
meet;

Words but profane this solemn place, where, in wrapt illusion
blest,

The weary heart of the world-worn man in the sculptor's hall may
rest.

Oh sing me a song of the painter's fame, of that immortal art
Whose talisman calls into life and light the phantoms of the heart;
Before whose idols the people fall, no dream as they pay their vow,
That 'tis to the genius of godlike man the souls of the vulgar bow!

Oh sing me a song about breathing flowers, and gardens, and happy
groves,

Where birds and butterflies rove at will, and a thousand sportive
loves;

Wreaths roses around the ancient trees, fling coronals in the air—
Ye gems of earth! ye lovely things! so fading, frail, and fair!

Of nature oh sing! of art divine—of aught that hath power to raise
The spirit, borne down and crushed beneath the weight of these
leaden days:

Air, water, earth—I demand of ye a medicine for the soul:

But all will be vain till, Genius, thou dost consecrate the bowl!

C. A. M. W.

PLENTY FINERY, BUT NO AIR.

In a late newspaper, we observe an account of the decorations of a new steam-vessel which has begun plying between Glasgow and Liverpool. The painting, carving, and gilding are described as something beyond all previous efforts at steamboat embellishment. Not a word is said as to whether the cabins are ventilated. How often would passengers give up all the finery which surrounds them for a mouthful of that article so grudgingly dispensed in steamers—fresh air!

FINE SUMMER WEATHER.

The heat has now reached its climax. During the last three days the thermometer has been gradually rising up to blood heat, which it actually reached in many houses yesterday. The external air could be compared to nothing more appropriately than to the blast of a heated furnace.—*Calcutta paper, May 27.*

THE NOVEL-WRITER'S WORLD.

THERE is a point of view from which fiction may be studied with advantage, but from which I never had the pleasure of seeing it contemplated. There might, I think, be derived from this department of literature a great sense of thankfulness that the actual world was not, as the fictitious one is, of the novelist's creation. It is very true that the fictionist makes a number of much more entirely virtuous men and women than the Author of nature has done; but then comes in the sad drawback that they are thinly sown, and mixed up with such a set of horrid people of all kinds, that they are of no manner of use but to be married at last, or at least to live happily all the rest of their days after the novel is concluded. The question is, if a world composed of a few Mr Allworthys, and Lady Bountifuls, and Lord True-loves, in connection with a host of such indifferent characters as the novelist deals in, would answer. I say not. The villain of the piece would to a certainty have us murdered, or at least cast in a ruinous lawsuit, before Mr Allworthy could come to the rescue or hear of our case. Virtuous innocence would have no chance, for it would be found that that system of making a heroic peasant of the name of William Hawthorn spring out of the wood, to play off an irresistible sapling cut from the last hedge, would not work in real life. It would always be ten to one against the worthy fellow coming at the proper time. I have great doubts, moreover, if those admirable reduced widows, who live in cottages or fifth floors, with paragons of daughters, would find themselves saved, in any considerable number of instances, from executions, by the happy return of long-lost sons with fortunes from India. The unparalleled inhumanity of the landlords of all poor widows' houses, in novels, would be too much for that set of amiable characters, and the consequences would be extremely distressing.

ONE great result of our having the novel-writer's creation established, would be a putting down of that vast class, the 'good enough people.' Now I much fear that we should not do nearly so well in this world if we wanted that class. They serve an immense number of useful purposes those good enough people. The most of the new generation are brought into the world and educated by them—they raise the corn, furnish the butcher-meat, and import all the groceries required by mankind, not to speak of many other professional services. I don't know but they pay nearly the whole of the taxes. What we should do without such serviceable, albeit commonplace citizens, I cannot pretend to imagine. The novelists, indeed, would take care to provide us with a set of most romantic, and far more sinned against than sinning malefactors, who might be supposed to make up in some degree for the absence of

the good folks; but I have doubts if a few amiable house-breakers and high-minded assassins would quite come to be the same thing. There could not fail to be some inconvenience felt from this great blank in society. Who knows but it might be fatal to the entire machine?

ANOTHER result would be a very general separation of the inclination from the ability to be liberal and generous. In the actual world, of the people who are able to be generous, there must be a very considerable number who are likewise disposed to be so; for how otherwise should our public charities be supported, not to speak of private benefactions, which we may also presume to be numerous? But if the novelist's world were established, all who had any money in their pockets would immediately become to the last degree selfish and hard-hearted, and there would be no liberality except amongst the coinless. It would obviously serve a poor purpose if we only found we could get names to bills from persons who had no credit at the bank, or invitations to dinner from individuals forced to live upon potatoes and point. It would help marvellously ill to get us over a difficulty, if every one we applied to were to say, 'My dear friend, I have all the wish in the world to oblige you, but I am myself at my wit's-end for half-a-crown.' It would only be tantalising to find the desire of advancing our fortunes exclusive to those who were themselves out of suits with fortune. Better, we would think, that all were iron-hearted alike. But the positive inconvenience of living in a world where rich people could in no way be bled, must strike everybody so forcibly, that it is scarcely necessary thus to dilate upon the subject. A world without heat, or light, or water, or some other of the great physical elements of existence, can be contemplated with some degree of patience, but not a world without a rich relation, or a friend susceptible of being squeezed.

IT seems to me also very clear that the actual character of our relatives and associates in the world is greatly superior to what the novelists would give us. In the actual world, one often has a decent enough sort of uncle—perhaps half a father to one, supposing real fathers to be wanting—always sure to have an exhibition of lamb and sherry at his nephews' service on Sunday afternoons, and pretty sure to help handsomely in the outfit of nieces for marriage at home, or for expeditions to go and reside with married sisters in India. Now this the novelist would entirely deprive us of, giving us, instead, some rascally old dog who conveys wills in our favour, and treats us with all sorts of gross cruelties. Stepmothers of actual life are often exceedingly worthy creatures. I have known many who were a blessing to their adopted children. But the stepmothers of the novelist—what atrocious wretches they always are! That, too, were a bad exchange. Then as to persons connected with us in our affairs.

Did anybody ever know a novelist's steward or agent turn out aught but a rogue? Only imagine us obliged to commit our property to such persons as fiction can furnish for that purpose, what a beggarly reckoning should we have of it in a few years! Beyond a doubt, every estate in the country would, in a novelist's world, shift owners each generation. It must be owned that, in the ideal creation, we should probably have some small consolation in one of those exceedingly faithful and attached old servants who always insist upon sharing their ruined master's or mistress's fortunes without wages or perquisites. This may, however, be allowed, and still the balance will be vastly in favour of the real world, seeing that the stewards of that creation are usually worthy persons, doing their best for their employers' interest, and thus saving them from all occasion to evoke the disinterestedness of their inferior domestics.

There are a few features of the novelist's creation that I am not quite sure about. For instance, that certainty of murder coming out. One somehow feels it to be an unpleasant peculiarity of the actual world that a throat may be cut, and the doer of the deed escape detection. It seems much preferable that the guilty man should be sure to be exposed by some bloody handkerchief, or some marks of his feet on the floor, or some bone discovered in digging a well, as is the common case in novels; so that he is sure to be punished for his crime. On the other hand, there are so many things to give us a general assurance of the good management of Providence, that we may perhaps be allowed to doubt if a certainty in the detection of murder would be an improvement. It is just possible that the tightening of this apparently loose screw might lead to the unfastening of some other of greater importance, in which case we might wish that murder was once more concealable. Since there is a doubt, however, I am willing that the novelists should have the benefit of it. It will not serve them much.

Finally, in one grand particular the novelist's world is so much inferior to that which actually exists, that even the most determined lovers of excitement may be happy to think that there is no fear of the one being exchanged for the other. I allude to the infinitely higher strain of romance attaching to the character of the persons and events of the actual world. Not that the novelist would not willingly give us as much romance in character and incident as we chose to have; but then we do not choose to have much from him, always demanding that he shall consult probability, or our notion of the average of things, and refusing to him whatever seems to trespass in the least upon the domains of extravagance. For this reason, the fiction-world is necessarily a tame equable sort of world. Very different is the world of actuality, where one day a Bonaparte rises to astonish mankind, and another day ships take upon themselves to sail against wind and tide, and men begin to journey from London to Edinburgh between breakfast and supper. Men, too, do such strange things in the actual world—things come about in such odd ways—life is so full of whimsical surprises, and happy coincidences, and entirely original trains of events, that there is no end to our entertainment. In the progress of science, a liberal mind can never be without something like a continual feast. Even the newspaper of the day presents in general such wondrous doings in some part or other of the world, in public or in private affairs, that the best romances are apt to appear tame in comparison.

I return, then, to the expression of thankfulness with which I started—that we live in the actual, and not in a fictitious world.

'TIS USELESS TRYING.

'You will never succeed—'tis useless trying,' was the answer we received one day when talking of something quite unimportant to you, dear reader, but very near our own heart. The voice was one we always listen to, and not seldom follow; but this time its discouraging arguments were unheeded. We *did* try, and we *did* succeed.

The fact set us moralising on the good or evil tendency of these three words—'Tis useless trying.' And the conclusion we came to was this, that for one vain idea dispelled, one wild project overturned by their prudent influence, these chilling words have rung the knell of a hundred brilliant and life-sustaining hopes, and paralysed into apathy a thousand active and ardent minds, who might otherwise have elevated themselves, and helped the world on in its progress. What would America have been if that strong-hearted Columbus had been discouraged by sneers and arguments about the uselessness of his attempt to discover a new world? Or where would have been Newton's stupendous theory, if, at the commencement of his researches, some meddling friend at his ear had whispered, 'Don't try; you will be sure to fail?' In aid of the 'Never-try' doctrine comes vanity, with its potent arguments that no attempt at all is better than a failure. We deny the fact in too. Should a man fail in a project too high for him, he at least becomes acquainted with the extent of his own powers; he loses that inflated self-exaltation which is the greatest bane to real merit; and in finding his own level, he may yet do well. And better, far better, that all the pretenders in the world should sink back into deserved obscurity, than that one spark of real talent should be extinguished by the cold-hearted check—'Tis useless trying!' Now, having prosed enough, let us enlighten our arguments by a story.

Between ten and twenty years ago—the precise date is immaterial—there was in the city of New York a barber's apprentice, a young boy named Reuben Vandrest. His Dutch lineage was shown by his surname, which, in course of years and generations, had been corrupted from Van der Deest to Vandrest, while for his Scriptural Christian name he was indebted to a worthy Quaker, his maternal grandfather, who had come over with William Penn. These names were, in truth, all the boy owed to his progenitors, as from his cradle he had been an orphan, cast on the charity of the wide world. But the excellent sect to which Reuben's mother had belonged, is one of the few who never cast the lambs from their bosom, and the orphan child was not deserted. The Friends took care of him; and when he was able to earn a livelihood, one of their number received him as an apprentice. Such was the short and simple story of the barber's boy.

Without entering on metaphysics, every human being has some inner life which the world outside knows nothing of. Thus from his earliest childhood the passion of Reuben Vandrest had been music. He would follow the itinerant minstrels of the city through one street after another, often thus losing his meals, his rest, everything except his schooling, which precious thing he was too wise to throw away even for music. He made friendships with blind pipers, Italian hurdy-gurdyists, and, above all, with wandering fiddlers; for, with an intuitive perception, the violin—the prince of stringed instruments—was his chief favourite. From all and each of these wandering musicians Reuben was intent on gaining something: they were won by his childish manners and his earnest admiration—for love of praise is the same in a blind fiddler as in an opera-singer—and by degrees Reuben not only listened, but learned to play. No instrument came amiss to him; but his sole private property was an old fife; and with

this simplest of all orchestral varieties the poor barber's boy used to creep to his garret, and there strive, with his acute ear and retentive memory, to make out the tunes he had heard in the streets, or invent others.

But the grand era in the boy's life was coming. One day as he stood wistfully looking at a violin which he held in his arms fondly and lingeringly, prior to returning it to its right owner, a poor street musician, the idea of its construction first entered Reuben's mind. He had been accustomed to regard a violin as a mysterious thing—a self-creating, sound-producing being; and never once had he considered of what it was made, or how. Now he began to peer into its mysteries, and to find out that it was only wood and catgut after all. He questioned his friend the fiddler, but the man had scraped away during a lifetime without once casting a thought on the mechanism of his instrument. True, he could replace a broken string, and at times even manufacture a bridge with his penknife, but that was all. When Reuben inquisitively wanted to learn how violins were made, the fiddler shook his head, and said he did not know.

'Do you think I could make one?' pursued the anxious boy.

A burst of laughter, so cuttingly derisive, that Reuben's face grew crimson, was the only answer. 'Why, you little simpleton,' cried the fiddler when his mirth had subsided, 'surely you'll not be so silly as to try? You could as soon build a house.'

'But violins must be made by somebody.'

'Yes, by people who know all about it; not by a lad like you. Take my advice, and don't try.'

Reuben said no more; but he could not get the idea from his mind. Every violin that he saw he begged to look at: he examined the varieties of construction, the sort of wood used, the thickness and fashion of the strings; and after weeks of consideration, he at last determined to try and make one for himself. During the long light summer nights, he worked hour after hour in his garret, or on the roof of the house; his natural mechanical skill was aided by patience and ardour; and with the few tools which he borrowed from the good-natured carpenters who had given him the wood, he succeeded in forming the body of the violin. But here a long cessation took place in Reuben's toil; for he had not even the few pence necessary to purchase strings; and the bow, which he could not make, it was utterly out of his power to buy. He sat looking in despair at the half-finished instrument—a body without a soul—and even his life could not console him.

But one day a kind-hearted customer noticed the slight pale-looking boy who had arranged his locks so gently and carefully, and Reuben became the glad recipient of a dollar. He flew to buy catgut and an old bow, and with trembling hands strung his instrument. Who can describe the important moment? Leverrier's crowning calculation for the new planet, Lord Rosse's first peep through his giant telescope, are little compared to poor Reuben's first attempt to draw sounds from his violin. The sounds came; string after string was tuned; the bow was applied; and the violin had a soul! Feeble and thin the notes were, but still they were distinct musical tones; and the boy hugged his self-made treasure to his beating heart, actually sobbing with joy.

He played tune after tune; he never noticed that evening darkened into night; he forgot his supper; he forgot too—what but for his musical enthusiasm would long since have come into his mind—that though the childish life might pass muster in the house of his master, a violin never would. The good Quaker, one of the strictest of his sect, thought music was useless, sinful, heathenish; and a fiddler in his eyes was equal with a thief. Therefore who can picture Reuben's consternation when his garret-door opened, and his master stood before him? Reuben bore all Ephraim's wrath in silence, only he took

violin safe from the storm, by pressing it closely in his arms.

'Thou hast been neglecting thy work and stealing fiddles,' cried the angry man.

'I have not neglected my work,' timidly answered the boy; 'and I have not stolen the violin—indeed I have not.'

'How didst thou get it?'

'I made it myself.'

Old Ephraim looked surprised. All the music in the world was nothing to him, but he had a fancy for mechanical employments, and the idea of making a violin struck him as ingenious. He examined it, and became less angry. 'Will it play?' asked he.

Reuben, delighted, began one of his most touching airs; but his master stopped him. 'That will do,' said he; 'I only want to see if it sounds—all tunes are the same. And I suppose thou wilt turn musician?'

Reuben hung his head and said nothing.

'Well, that thou canst never do, so I would advise thee not to try. Forget the fiddle, and be a good barber. However, I will say no more; only thou must play out of doors next time.'

But all the discouragements of the old Quaker could not repress Reuben's love for music. He cut, and curled, and shaved, as in duty bound, and then fled away to his violin. From the roof of the house his music went forth; and in this most original sonnet-room, with the open sky above him, and the pert city sparrows, now used to his melody, hopping by his side, did the boy gradually acquire the first secrets of his art. It is needless to enumerate the contrivances he resorted to for instruction—how he wandered through the streets with his violin at night, to gain a few cents wherewith to purchase old music; and how he gradually acquired skill, so as to be admitted into a wandering band.

One night when this primitive orchestra was engaged for a ball at a private house in the city, the first violin mysteriously disappeared. In this dilemma young Reuben found courage to offer himself as a substitute. It was a daring thing. The other musicians first laughed at him; then heard him play the part, which no one else could take; and finally suffered him to try. For the first time in his life the barber's boy witnessed the glare of a ball. It seemed to him a fairy scene: he was dazzled, bewildered, excited, and in his enthusiasm he played excellently. The night wore away; the dancers seemed never weary; not so the aching fingers of the musicians. Reuben especially, to whom the excitement was new, grew more and more exhausted, and at last, just as he had finished playing a waltz, fell fainting from his chair. Most of the gay couples passed on—it was only a poor musician; but one young girl, in whom the compassionate and simple nature of a child had not been swept away by the formalities of young ladyhood, held a glass of water to the boy's lips.

'Cora Dacres bringing to life a fainting fiddler!' said a tittering voice. 'Oh what a nice story when we go back to school!'

The girl turned round indignantly, saying, 'Cora Dacres is never ashamed of doing what is right. Are you better now?' she added gently to poor Reuben, who had opened his eyes.

The boy recovered, and she disappeared again among the dancers; but many a time did the Auburn curls, and soft, brown, sympathising eyes of the little school-girl float before the vision of Reuben Vandrest; and the young musician often caught himself repeating to his sole confidant—his violin—the pretty name he had heard on his waking, and dimly recognised as hers—Cora Dacres.

Long before he was twenty-one, Reuben had entirely devoted himself to the musical profession. The turning-point in his career was given by a curious incident. One moonlight night, as he was playing on the roof as usual, he saw a head peep out from the uppermost window of the opposite house. This head was drawn in when he ceased playing, and again put forward as soon

as he recommenced. A natural feeling of gratified vanity prevented the young man from yielding to his first shy impulse of retiring; and besides, sympathy in anything relating to his art was so new to Reuben, that it gave him pleasure to be attentively listened to even by an unknown neighbour over the way. He threw all his soul into his violin, and played until midnight.

Next day, while at his duties in his master's shop, the apprentice was sent for to the house opposite. Reuben went, bearing the insignia of his lowly trade; but instead of a patient customer, he saw a gentleman who only smiled at his array of brushes.

'I did not send for you to act as barber,' said the stranger in English, which was strongly tinged with a foreign accent, 'but to speak to you about the violin-playing which I heard last night. Am I rightly informed that the performer was yourself?'

'It was, sir,' answered Reuben, trembling with eagerness.

'Who taught you?'

'I myself.'

'Then you love music?'

'With my whole heart and soul!' cried the young man enthusiastically.

The stranger skilfully drew from Reuben the little history of himself and his violin, and talked to him long and earnestly. 'You have a true feeling for that noble art, to which I, too, belong,' he said. 'You may have many difficulties to encounter; but never be discouraged—you will surmount them all. You have had many hindrances; but listen, and I will tell you what befell me at your age. I once came, a poor boy like you, to the greatest capital in Europe, my heart full of music, but utterly without means. My only wealth was my violin. I left it one day in my poor chamber, while I went out to buy a loaf with my last coin. When I came back, my violin was gone! It had been stolen. May God forgive me for the crime I contemplated in my mad despair! I rushed to the river; I plunged in: but I was saved from the death I sought, and saved to live for better things. My friend,' continued the musician after a long silence, during which his face was hidden by his hands, 'in all the trials of your career remember this, and take warning.'

'I will—I will!' cried Reuben, much moved.

'And now, after having told you this terrible secret in my life, it is as well that I should not reveal my name; and besides, it could do you no good, as I set out for Europe to-morrow. But should you ever be in Paris, come to this address, leave this writing, and you will hear of me.'

The gentleman wrote some lines in a foreign language, which Reuben could not make out, though among his musical acquaintance he had gained a little knowledge of both French and Italian. He then gave Vandrest the address, and bade him adieu. The young man long pondered over this adventure, and it was the final point which made him relinquish a trade so unpleasing to him for the practice of his beloved art.

It is a mistake to suppose that the profession of music is an easy, careless life, to which any one may turn who has a distaste for more solid pursuits. In no calling is intellectual activity and arduous study more imperatively required. He who would attain to even moderate eminence in it, must devote years of daily patient toil to dry and uninteresting branches of study. A poet may be one by nature: it is utterly impossible that a musician can be great without as deep science as ever puzzled a mathematical brain. He must work—work—every inch of his way; must dig the foundation, and enrich the soil, before he can form his garden and plant his flowers. Thus did our young ex-barber of New York: he studied by science what he had before learned through his natural genius, and rose slowly and gradually in his profession. Sometimes his slight and ordinary appearance, which made him look more boyish than he really was—his quaint old-world name—and,

above all, a simplicity and Quaker-like peculiarity in his dress and manner, aroused the ridicule of his companions, who followed music more for show than through real genius and love of the art. But the story of his early perseverance always disarmed them; and it was a common saying, with reference to young Vandrest, that he who could make a violin, would surely learn to play it.

By degrees the young violinist rose into note, and became received into society where he could hardly have dreamed that he should ever set his foot. But it is a happy peculiarity in the domestic manners of the new world, that real talent ever finds its way, and takes its own rank in society. Thus many a rich citizen was pleased to welcome to his house Mr Vandrest, the young and unassuming musician, whose gentle manners and acknowledged talent were equally prized. The barber's apprentice of New York was utterly forgotten, or only thought of as a proof of how much a man's fortune lies in his own hands, if he will only try.

In one of those elegant reunions which were established when worthy Brother Jonathan was first beginning to show his soul and mind—when Bryant's songs, and Allston's pictures, and Channing's lectures, first gave evidence of transatlantic genius—Vandrest again heard the name which had never utterly gone from his memory through all his vicissitudes—Cora Dacres. He turned round, and saw the altered likeness of the girl who had held the water to his lips on the night of the ball. She had grown into womanly beauty; but he remembered the face still. She had not the faintest memory of him—how could it be so? Light and darkness were not more different than the pleasing, intellectual, gentlemanlike man who was introduced to her, and the pale, angular, ill-clad boy whom she had pitied and aided. Sometimes Vandrest thought he would remind her of the circumstance; but then a vague feeling of sensitiveness and shame, not entirely the result of the memory of those poverty-stricken days, prevented him. He went home, and again his old violin might have heard breathed over it the name of Cora Dacres; but this time not in boyish enthusiasm for whatever was pleasing and beautiful, but in the first strong, all-absorbing love of manhood, awakened in a nature which was every way calculated to receive and retain that sentiment in its highest, purest, and most enduring character.

Reuben Vandrest (hate him not, dear reader, for having so unheroic a name: I will engage that, if Cora loved him, she thought it most beautiful; and so would you, if any one dear to you bore the same): well, Reuben Vandrest, who had hitherto cared for nothing on earth but his violin, soon learned to regard Miss Dacres with the enthusiastic attachment of an earnest and upright nature; for with all the allurements of a musical career, Reuben continued as simple-minded and guileless in character as the primitive sect from which he sprung. And Cora was worthy to inspire the love of such a man: whether she returned it or not, Reuben did not consider—he was too utterly absorbed in the new delight of loving, and of loving her, to think of asking himself the question. He visited at her house, and became a favourite with her father—a would-be amateur, who took pleasure in filling his drawing-rooms with musicians, and treating them as costly and not disagreeable playthings.

But at last Mr Dacres was roused from his apathy by the evident and close friendship between his daughter and young Vandrest. Though he liked the violinist well enough, the hint of Reuben marrying Cora sounded ill in the ears of the prudent man, especially when given by one of those odious good-natured friends with whom the world abounds. The result was a conversation between himself and Vandrest, in which, utterly bewildered and despairing, poor Reuben declared his hidden and treasured love, first with the shrinking timidity of a man who sees his inmost heart rudely laid bare, and then with the firmness given by a conscious-

ness that there is in that heart nothing for which an honest man need blush.

'I am sorry for you, Mr Vandrest,' said the blunt yet not ill-meaning citizen. 'But it is impossible that you can ever hope for Cora's hand.'

'Why impossible?' said the young man, recovering all his just pride and self-possession. 'I am not rich; but I have an unspotted name, and the world is all before me. Do you object to my profession?'

'By no means; a musician is an honourable man, just as much so as a storekeeper.'

At any other time, the very complimentary comparison would have made Reuben smile; but now he only answered, while the colour deepened on his cheek, 'Is it because of my early life? My father was of good family; but, it may be, you would blush to remember that your daughter's husband once served in a barber's shop?'

'My dear sir,' said Mr Dacres, 'you forget we are Americans, and talent and wealth are our only aristocracy. The first you undoubtedly possess; but without the second, you cannot marry Cora; and there is no chance of your ever becoming a rich man.'

'Will you let me try?' eagerly cried Vandrest.

'It would be of no use; you could not succeed.'

'I could—I could!' exclaimed the young man impetuously. 'Only let me hope. I would try anything to win Cora!'

And in this earnestness of love did Reuben pursue his almost hopeless way. He had pledged his word that he would not speak of his love to Cora, that he would not try to win hers—this her father imperatively demanded; but Mr Dacres also promised that he would leave his daughter free, nor urge her to accept any other husband during the three years of absence that he required of Reuben Vandrest.

They parted—Reuben and Cora—with the outward seeming of ordinary acquaintance; but was it likely that a love so deep and absorbed as that of the young musician should have been entirely suppressed by him, and unappreciated by her who was its object? They parted without any open confession; but did not Cora's heart follow the wanderer as he sailed towards Europe?—did she not call up his image, and repeat his unmusical name, as though it had contained a world of melody in itself?—and did she not feel as certain in her heart of hearts that he loved her, as if he had told her so a hundred times?

When Vandrest was preparing for the voyage, he accidentally found the long-forgotten note of the stranger musician. It directed him to Paris; and to Paris he determined to proceed, as all Europe was alike to one who knew not a single soul on the wide expanse of the old world. He arrived there; and found in his unknown friend the kind-hearted and talented Swede, who, on the death of Paganini, had become the first violinist in the world—Ole Bull.

The success of the young American was now made sure. The great violinist had too much true genius to fear competitors, and no mean jealousy kept him from advancing the fortunes of Vandrest by every means in his power. Reuben traversed Europe, going from capital to capital, everywhere making friends, and, what was still more important to him, money. He allowed himself no pleasures, only the necessities of life; and laid up all his gains for the one grand object of his care—the acquiring a fortune for Cora. He rarely heard of her; he knew not but that her love might change; and sometimes a sense of the utter wildness of his project came upon him with freezing reality. But intense love like his, in an otherwise calm and unimpassioned nature, acquires a strength unknown to those who are alive to every passing impulse; and Reuben's love,

'By its own energy, fulfilled itself.'

Ere the three years had expired, he returned to America, having realised a competence. With a beating heart the young musician stood before his mistress,

told her all his love, and knew that she loved him too. It was very sweet to hear Cora reveal, in the frankness of her true heart, which felt no shame for having loved one so worthy, how her thoughts had continually followed her wandering lover, and how every success of his had been doubly sweet to her. But human happiness is never unmixed with pain; and when Cora looked at the altered form of her betrothed, his sunken and colourless face, and his large bright eyes, a dreadful fear took possession of her, and she felt that joy itself might be bought with too dear a price. It was so indeed. Reuben's energy had sustained him until came the reaction of hope fulfilled, and then his health failed. A long illness followed. But he had one blessing; his affianced wife was near him; and amidst all her anguish, Cora felt thankful that he had come home first, and that it was her hand and her voice which now brought comfort to her beloved, and that she could pray he might live for her.

And Reuben did live. Love struggled with death, and won the victory. In the next year, in the lovely season of an American spring, the musician wedded his betrothed, and took her to a sweet country home, such as he had often dreamt of when he used to sit on summer evenings on the house-top in New York looking at the blue sky, and bringing music from his rude violin. And in Reuben's pleasant home was there no relic more treasured than this same violin, which had first taught him how much can be done with a brave heart and a good courage to try.

Reader, the whole of Reuben Vandrest's life was influenced by his acting up to that little word—'try!' Two old proverbs—and there is much sterling wisdom in old proverbs—say, 'Everything must have a beginning,' and 'No man knows what he can do until he tries.' Now, kind reader, keep this in mind; and never, while you live, damp the energies of yourself or of any other person by the heartless and dangerous sentence, 'Tis useless trying.'

CLOUDS.

Clouds have long done good service in the cause of the poet and the moralist: the one has found them objects of grandeur and beauty; the other, emblems of the vanity and perishableness of human ambition and human life. But the endless variety of form, hue, and appearance assumed by clouds, is no longer the exclusive property of fancy; the philosopher has classified and reduced them to a certain degree of order; and as observations accumulate, they will become as important in the interpretation of what are at present atmospheric parables, as they have been in illustrating a thought or pointing a moral.

To Luke Howard is due the credit of first giving distinctly recognisable names to certain forms of clouds. The terms which are intended to express the different appearances are—*cirrus*, *cumulus*, and *stratus*. The first and last of these are the two extremes of cloud formations the most widely separated; between them, however, various combinations occur, which are described by different combinations of the words—*cirrostratus*, *cirrocumulus*, *cumulostratus*, and *cirro-cumulo-stratus*.

Observations on the weather require a large share of patience and perseverance on the part of the observer, as a great number of facts must be recorded before the slightest approach can be made towards the establishment of a law. These qualities, with a moderate degree of intelligence, are sufficient to enable any one to institute a course of daily and systematic observation, the results of which might prove of high value in the hands of the scientific. A treatise* just published at Prague

* Ueber die Periodischen Erscheinungen am Wolkenhimmel. Prague: 1846.

by Karl Fritsch, a member of the Bohemian Academy, is an instance of what may be accomplished by diligence. The author, aided by his sister, has maintained a series of hourly and daily observations on the clouds during several years—the form, mass, outline, colour, all have been noticed; and the general conclusions appear to be suggestive and interesting.

Stratus is the long level layer of cloud seen frequently at sunrise or in rainy weather, resting apparently upon the horizon. When the vesicles of which it is composed are so loosely diffused as not to prevent the view of distant objects, it comes under the designation of fog or mist. Its formation commences with the exhalations that rise from the earth immediately after sunset; for some time after sunrise, they remain condensed in the lower regions of the atmosphere, where the masses of air are not yet sufficiently warmed to prevent their accumulation. As the warmth increases, currents of air begin to ascend more or less rapidly, carrying the stratus upwards into the higher and colder regions of the atmosphere, where further condensation takes place, producing cumulus and cumulostratus, until the region is reached where the temperature is at the freezing point; the mist is then converted into a mass of floating crystals, forming those light feathery clouds classed under the term cirrus.

Cumulus is that massy spherical form of cloud described by sailors as the 'ball of cotton.' It is sometimes piled in such gigantic heaps, as to resemble a mountain range covered with snow; forming, with its various colours, the grandest spectacle in cloud-physics. In fine weather, it is the cumuli which first appear; and for several days together they may be seen going through the process of accumulation and dispersion with the regularity of an established routine. Some hours after sunrise, when the temperature of the air increases rapidly, cumuli rise slowly out of the stratus, and collect in huge masses in the east. That their formation is influenced by the sun, is shown by their following him in his course; at mid-day they are in the south, and in the evening in the west. They gradually increase in bulk until the temperature reaches its maximum, after which they decrease, till, just before sunset, they disappear. At other times, while new cumuli are added from below, cirri are rapidly thrown off above; a portion of the former pass into the form of cumulostratus—a layer or bank of cloud with cumuli resting upon it—and the cirri become cirrostratus. If the process continue, other formations originate from these four varieties of cloud—cirrocumulus, and cirro-cumulo-stratus. The transition from one to the other is so gradual, that a quick eye, and rapidity of discrimination, are required to enable the observer to pronounce between them. The cloud last mentioned may be confounded with the *nimbus*, or rain-cloud; and in fact, partaking, as it does, of all the formations, it frequently gives off copious showers, which, reproducing the stratus—the formation of every kind of cloud at the same time—may often be seen in rainy weather.

Cirrus, as before described, is the light feathery cloud seen in the highest regions of the atmosphere. Among seafaring men it is known as 'cat's-tail;' and although consisting of frozen particles, it is the most changeable in appearance of all the clouds. Sometimes it has the form of a cluster of threads—more commonly of filaments—crossing each other so as to resemble an immense network, with the knots at the intersections. At other times it has a fleecy, shaggy appearance, moving along with a lazy motion, until towards sunset, when it is condensed, through all the modifications, into a brightly-illuminated nimbus. The general direction of the filaments or parallel bands is from south-west to north-east. At the equator, Humboldt found it to run north and south, thus favouring the hypothesis that cirri are conductors between distant foci of electricity.

The simultaneous formation of the different kinds of cloud is more frequent in summer than in winter, owing probably to the greater height to which they ascend,

and to the more frequent change of wind in the former season; it appears also to depend materially on the simultaneous movement of contrary currents of air. Cirri are produced in horizontal, cumuli in vertical currents. The formation of the first-named takes place gradually, and is most favoured by a south-west wind; the latter appear suddenly, the north-east wind being most favourable to their formation. Cirri are most frequently formed at changes of the weather; and when they undergo rapid alterations of form, assuming that of a bow or of a whirlpool, rain, it is said, will soon follow.

The outlines, mass, general appearance, and direction in which the clouds move, inform us respecting the condition of the higher regions of the atmosphere, which we are unable, except at rare intervals, to reach with instruments. The line, and duration of their movement, necessarily change with the winds, the change being least frequent where the clouds are highest. Cirri frequently follow the same direction during an entire day; while stratus, in the course of a few hours, will be drifted from every quarter of the compass. Taking the clouds in the regular order downwards—cirrus, cirrostratus, cirrocumulus, cirro-cumulo-stratus, cumulus, cumulostratus, and cumulus—there is no uniformity of motion among them; each formation seems to possess a movement peculiar to itself, in which, regarding them as a spectacle, their chief beauty perhaps consists. The early nations of the north were so impressed by these phenomena, as to interfuse their religion with their wildness and mystery: readers of Ossian will remember the succession of varied images which they furnished to the bard.

Sometimes the clouds appear to cling to a certain fixed point in the heavens, calm and motionless, indicating either a profound stillness in the air, or the prevalence of such relations in the distribution of heat, that the vapour borne by aerial currents can be thrown down only in one particular situation. The wind most favourable to the formation of clouds is the south-west, the least favourable the north-east; a fact easy of explanation. The south-west wind sweeps over the warm zones and the Atlantic, and reaches our latitudes charged with abundant vapours; while the north-east wind, on the contrary, brings us the cold dry air from the immense flat regions of Northern Asia. The fluctuations of the trade winds and monsoons, the predominance of one or the other wind, and the nature of the conflict which takes place at their semi-annual change, have a material influence upon the state of the atmosphere in the latitude of Britain. In the quarter where the currents meet, rain-clouds are formed, and on the oscillations of these essentially depend those atmospheric changes popularly termed 'weather.'

A mixture of cold and warm currents is required to produce rain, with such an amount of moisture as may suffice to saturate the whole. Immediately before thunder-storms or heavy showers, the cirrus sometimes suddenly thickens, and takes the form of cirrostratus, while the cumuli, violently hurried aloft, are resolved into cumulostratus, and, together with the cirrus, condense into nimbus. The change in the form of clouds is not an arbitrary process: stratus does not become all at once cirrus; it assumes the latter form only by passing through the successive gradations, as already described. Clouds of a sharp, well-defined outline, betoken rain, their condensation being far beyond that of the loosely-piled masses. Those clouds which sweep along half-hidden in a ragged coat of mist, often detaching themselves from cumulus or cumulostratus, bring light showers. Hall clouds, more than any other, are enveloped in these mists, owing probably to the great depression of temperature in their vicinity. Rain seldom falls from the smaller cumuli, however numerous they may be, when they are equally distributed over the sky. Cumuli generally disappear at sunset; but sometimes they remain, and subside into cumulostratus—an indication that the upper regions of the atmosphere are approaching the point of complete saturation.

tion, and about to discharge their contents. Thomson describes the process :—

'At first, a dusky wreath they seem to rise,
 Soars staining ether; but by swift degrease,
 In heaps on heaps, the doubling vapour sails
 Along the loaded sky, and, mingling deep,
 Sits on the horizon round a settled gloom.'

When the cumuli formed in the morning are not changed into cumulostratus, the continuance of fine weather may be expected, as those two conditions are required for the formation of nimbus. The latter cloud may always be known by its uniform gray tint, the individual forms of the masses of which it is composed being indistinguishable. The lower edges of nimbus have a fringed appearance, caused by the accumulation of falling drops. In continued rains, the approach of fair weather is foretold by the resolution of the nimbus or cirro-cumulo-stratus into the formations from which they originated, particularly when the transition is into cumulus or stratus; and the more rapidly this is effected, the nearer is the change in the weather. Shelley's vigorous and animated lines on the clouds eloquently depict the phenomena they present: he makes one say—

'I am the daughter of the earth and water,
 And the nursing of the sky;
 I pass through the pores of the ocean and shores;
 I change, but I cannot die.
 For after the rain, when, with never a stain,
 The pavilion of heaven is bare,
 And the winds and sunbeams, with their convex gleams,
 Build up the blue dome of air,
 I silently laugh at my own cenotaph,
 And out of the caverns of rain,
 Like a child from the womb, like a ghost from the tomb,
 I rise and upbuild it again.'

It is seldom that the clouds are completely motionless; the pleasure we feel in gazing on them is greatly enhanced by their various movements: their chief beauty, however, is to be found in their alternations of colour. Although the hues appear so numerous, they are produced from ten colours, chiefly combinations of red and green. Many variations of hue are naturally caused by the sun's rays: the lower clouds are shadowed by those above them. Green clouds are the rarest, and blue the most numerous; the next in order are red and yellow, modified by the different power of reflection. The ice crystals of the cirrus are good reflectors, while the cumuli reflect and refract the rays thrown down upon the stratus. The tints of the lower clouds are modified by reflected light from the earth, to which cause the green tint is perhaps to be attributed. We have described the gradual increase and diminution of cumulus between sunrise and sunset; the appearance of colours is consequently regulated by the same law: cirrus and stratus diminish while the sun is easterly, and increase when it is westerly—precisely the reverse of what takes place with regard to cumulus. The greatest variety of colour will be seen in the morning and evening, as the sun's rays then pass in long lines through the atmosphere, giving rise to endless effects of refraction and reflection, which are lost at mid-day, when the rays fall more direct.

The circle within which the clouds appear is twice as large in summer as it is in winter: in the latter season there is more condensation, and the masses occupy a lower position. According to Herr Fritsch, their formation appears to be governed by some law. Cirrostratus, cirrocumulus, and cumulus, are most abundant in winter; cirro-cumulo-stratus is less in quantity in the spring than in the other three portions of the year, during which it is equable. Cirri increase from February to May, and decrease from May to August; from August to October they again increase, and again diminish from October to February. Cumuli increase from January to July, and decrease in the latter half of the year. An opposite law prevails with regard to stratus: cumulostratus is most abundant at the summer solstice, and least abundant at the corresponding period in winter.

The clouds present other phenomena worthy of observation, among which their rising and falling most deserve attention. The real cause of their suspension in the atmosphere is not yet ascertained; the assumption is, that they are supported in their place by ascending currents of air acting on the whole mass of vesicles of which clouds are composed. Dependent as vegetation is upon the weather, it is clear that any means of arriving at certainty, with respect to its fluctuations, must be of essential importance to cultivators. The periodical and other phenomena exhibited in M. Fritsch's pages, are not exclusively confined in their effects to physical science: they have a bearing on the well-being of mankind. And notwithstanding the disposition to escape from the operation of natural laws, society is inevitably influenced by their periodicity.

A VISIT TO ACKWORTH SCHOOL.

HAVING heard much of this remarkable seminary from friends brought up within its walls, I had long had a desire to see it. Accordingly, when, a few weeks ago, an opportunity of visiting it in company with some friends who were going thither to attend the general meeting presented itself, I gladly embraced it. Assembling at Manchester, we proceeded by railway to Wakefield, and thence, by a cross-country conveyance, to Ackworth, which lies about a mile off the road between that town and Doncaster. We arrived in time for a hasty dinner at the Temperance Hotel; but the impatience of my friends to see their relatives soon hurried us off to the school, where we found as fine an assemblage of healthy-looking youths as ever graced any playground in England. Some were engaged in their sports, some were busied in their little gardens; but by far the greater number were clustering round the porter's-lodge, on the look-out for the friends whom they expected to arrive. The school is built on a gentle slope, and forms three sides of a square; and being entirely of stone, has a very handsome appearance. The principal building, which fronts to the south, contains the boys' dormitories and dining-room, the committee-room, the reading-room, the library, and other offices belonging to the school. On the east side, connected with the principal building by a colonnade, are the meeting-house and the school-rooms; and on the other side, connected in a similar manner, is what is called the girls' side, containing their school-rooms, dining-room, dormitories, &c. all under the same roof. The fourth side is filled up by the gardens, which are extensive, and tastefully laid out, and at the same time turned to a very profitable use. There is also a space of ground at the end of the school-rooms apportioned out for the boys' gardens—to each a certain length and breadth—and great is the emulation among them as to who shall make the finest display of horticultural skill. In the middle is the green or playground, divided into two parts, for boys and girls, by a flagged walk, which runs the whole length, and forms a sort of neutral ground, on which both sexes may meet.

The Friends, it is well known, date their origin from the times of George Fox, their original founder; and though by no means distinguished by their zeal for proselytism, they have since then continued to increase. At the present time, they form a very numerous, respectable, and wealthy body, distinguished in a remarkable degree by their love of social improvement, and their hatred of war and other barbarisms. The want of a great school was long felt among them; at length, about seventy years ago, the present building, which had formerly been a founding hospital, was purchased,

and appropriated to the purpose. Since then, Ackworth School has continued open, without a vacation, to the present time. Many alterations and improvements have been, and are now being made; and in a short time this school will be able to vie with any of the kind in England. The number of pupils at present is upwards of three hundred, of both sexes. The boys are instructed by six or seven masters and ushers—the latter called apprentices—in all the branches of a liberal English education. There is also a Latin class; but this is not very far advanced. The girls are under the guidance of the same number of governesses and their apprentices; and over the whole school is placed an able superintendent, who was himself a scholar here. The external affairs of the school are regulated by two committees—one composed of country Friends, which meets monthly at the school; while the other, to which the financial matters are exclusively committed, meets in London. This year, for the first time, the committees have decided upon trying a new experiment in the government of the school—that of giving a summer vacation for five weeks—which, if it works well, is in future to be the established custom of the school.

We proceeded on a tour of inspection through a well-lighted and ventilated corridor, running the whole length of the principal building, to the kitchens, well worthy of such an establishment. It is right to state that the school is a complete colony in itself, having within its walls its own baker, cobbler, tailor, &c.; not to forget its own doctor's shop. The immense pile of loaves in the bakehouse (nearly half a ton of ten-pound loaves), gave goodly evidence of the daily doings; and the baker assured us, with an air of nonchalance, that 'he did not suppose he should have to bake above twice more in the course of the week'—(this being Tuesday)—'for in this hot weather the lads' appetites were but middling!' A visit to a wonderful machine, which usurped the office of a shoe-black in a most successful manner, completed our survey; and we retired to our lodgings in the village, which had been retained for us by mine host, highly pleased with what we had seen.

Next morning we repaired again as early as possible to the school; and the scene which presented itself to our notice was peculiarly interesting. The occasion of the general meeting had attracted Friends from all quarters in great numbers; and many of those who had friends and relations among the pupils, having found them out, were promenading about the green in all directions. Here might be seen some fond father with two tall girls clinging round him; there a group of lads round some female relative, who was detailing to them the latest news from home. One benevolent old man was walking up and down with a crowd of both sexes, most of them children of his friends, who had no fathers or mothers of their own there to walk with them. All was quiet gaiety and enjoyment. Old gentlemen from different parts of the country were gravely discussing the state of the crops, and other matters of general interest; demure-looking young Quakers, as they walked by, were throwing sly glances in the direction of the females, who, like other young ladies on similar occasions, endeavoured to look as amiable as possible. In one corner Mr Samuel Gurney, brother to the late estimable Joseph John Gurney and to Mrs Elizabeth Fry, with his fine white head and his lion-like port, had a crowd of lads assembled round him; and after a long and suitable oration, was exhorting them to behave themselves well during the ensuing vacation, and show themselves worthy of the indulgence, concluded by promising to each of them sixpence as

pocket-money to take home;* a generosity which was received with universal applause. Suddenly, however, all was bustle and confusion; the bell for meeting for worship, by which the proceedings commenced, rang forth; each sex hurried off to their respective quarters, from which, in a short time, they re-emerged in a state of preparation—the girls, in white tippets and sleeves, looking particularly neat.

When worship, which lasted about two hours, was concluded, a meeting was held for the transaction of business, to which strangers, like myself, were not admitted. However, I managed to find amusement in the croft behind the school, which was converted into a temporary playground: and truly the lads scattered up and down, each group pursuing its own particular amusement, formed a very picturesque sight. Some were strolling along the banks of a small stream which ran along the bottom of the field, endeavouring to form whistles out of the rushes which they found there; some were converting the drying-poles into gymnastic apparatus; others, among whom were many young men, former pupils of the school, revisiting the old spot at this festive season, for whom the discussion of business matters possessed few charms, were engaged in a game of cricket. Leap-frog, however, seemed to be the greatest favourite; many rows, according to their sizes and capabilities of 'setting a back,' were stretched out in long lines in various parts of the field: all were enjoying themselves as heartily as if there were no such thing as a public examination impending. No doubts, no hesitation, no gloomy forebodings of being 'plucked,' as I have seen in my own school-days, seemed to disturb any one—all were merry and light-hearted. Few scenes more illustrative of unrestrained happiness and enjoyment could well be imagined. From thence I proceeded to view the improvements which were in progress. The village of Ackworth is divided into two parts—higher and lower—about half a mile distant from each other. Higher Ackworth partakes most of the influence of the school: a considerable addition to it is being made by the new buildings in course of erection by the committee for the reception of their various artisans.

After dinner the examination commenced. The whole body of Friends present were divided into eight committees; and to each committee a class was assigned for examination. The head class and the Latin class were reserved for the following day; and with this exception, the whole business was to be got through in one afternoon. Having obtained permission from the committee to attend, I, after visiting all the classes in succession, attached myself at last to the eighth—that is to say, the senior class in the school but one. The examination was quite open, though conducted in part by the respective masters. Every Friend present on the committee was at liberty to put whatever questions he pleased to the boys. Each class, according to its standing, displayed in its various branches of study a proficiency not merely superficial, but one which appeared to proceed from a well-grounded knowledge of the subject of examination, and evinced by its answers the fruits of much care and perseverance on the part of its master. The only deficiency was, I thought, in the reading; and this was apparent throughout the whole school. The highest and the lowest class read with exactly the same intonation, the same pauses, and the same cadences: no difference between poetry and prose. In the signification of words, and in their derivations from Latin and Greek roots, the highest classes displayed great quickness; also in history and geography. The examination was, I believe, on the whole highly satisfactory; and many Friends expressed their pleasure at the great improvement which had taken place during the past year. Each committee drew up its own separate re-

* Since writing the above, I understand that Mr Gurney intends hiring a house at Scarborough, in which to keep those pupils, about thirty in number, who, being orphans, or from some other cause, have no home to go to during the vacation.

port, from which the general report was to be formed, and then the examination was over shortly after six. A stroll in the gardens, together with a game at 'prisoner's base' among the lads, concluded the day's proceedings.

At seven o'clock next morning the examination of the Latin class commenced. This was in two divisions—one, which was yet in the *Delectus*; and a few who were reading *Cæsar's Commentaries*. The examination was of course but short, the class being only of recent formation; but the knowledge evinced of grammar and of Latin construction would not have disgraced a class of like standing in any grammar-school. After breakfast the great business of the day came on—the examination of the senior class. At ten o'clock all the committees assembled for this purpose in the meeting-house, as affording more room for the increased number of spectators. The examination was essentially the same as that of the other classes, though of an advanced character—reading, spelling, derivation of words, grammar; and some excellent specimens of writing were handed about, which afforded good evidence of the proficiency of the rest of the school in that branch. The examination in mental arithmetic was very good; the lads often distancing their examiners in quickness of calculation, and nearly always proving to be right even in the fractions. The historical questioning—partly on English history, and partly on the history of the Friends as a body—was very satisfactorily answered; though one unlucky wight exultingly proclaimed that the chief religious principle of the Friends was abstinence from 'turn-down collars to their coats.' Had he been much older, I should have suspected him of a sly stroke of irony at some of the young gentlemen present, who, in the fulness of their dandyism, seemed inclined to abjure this ancient standard of their forefathers.

The examinations showed the pupils to have formed an intimate acquaintance with the Scriptures, and to be well versed in sacred history. The boys repeated whole psalms in unison, with numerous texts, inculcating the Christian duties—love, faith, prayer, &c. This was the concluding part of the examination, which lasted three hours. A meeting for worship concluded the proceedings, and nothing now remained of the Ackworth General Meeting for 1847 but the remembrance. When we returned from a short walk to view the Hounders's Institute, the throng had begun to thin, coaches were rolling off to the various railway stations, the green began to look almost deserted, and save the pupils, and a few friends who, like myself, were extending their stay till the next day, few of all that had but a few hours ago crowded the promenade remained. This Hounders's Institute, by the way, of which little save the foundations is yet visible, is intended as a sort of training college for the Society of Friends. The funds are derived from a very liberal bequest of the late Mr Hounders. It is situated on the hill directly opposite the school, and when finished, will no doubt be one of the finest places of the kind in England. After supper we visited the dormitories; and though more than an hour had elapsed since the boys had retired to bed, we did not find one asleep; all were either reading or conversing, yet as orderly as the most rigid disciplinarian could have wished. Though the night was hot, the excellent ventilation of these rooms kept them comparatively cool; and the moonlight view from the windows was delightful. In the distance, the rich corn-fields, just beginning to assume their golden hue; the smell arising from the newly-stacked hay coming sweetly through the still air; the gardens and the court below, lately so crowded, and now so utterly deserted, that not a creature was to be seen, nor a sound to be heard—contributed to cover this most unsentimental of all places—a school—with an air somewhat approaching to the romantic.

Next morning, after a plunge into the school baths, which are about half a mile distant, and a hearty

breakfast, to which we had invited nearly a dozen delighted lads, we bade adieu to Ackworth—I, for my part, with regret that I had omitted so long to visit a place where I had had so much enjoyment; for though not a member of the Society of Friends myself, I had seen enough, in these few days, of their sterling and unassuming worth, to make me always respect and admire them.

ENGLISH AND FOREIGN HOTELS.

Nothing in continental usages appears to differ so entirely from its counterpart in England as the system of hotels. In its various details of management, attendance, and accommodation, the continental hotel offers something to condemn, but much more to admire and imitate. A hotel in any part of Great Britain is a mansion fitted up very much like a private house. People live in it apart from each other, as they would do in a lodging establishment; and for this seclusion, and the special way in which they are served, they usually pay at an extravagant rate. The consequence of this extravagance is, that people go to hotels as little as they possibly can, instead of resorting to them freely.

A hotel in Belgium, France, Switzerland, or Germany, has no resemblance to a private mansion. It is a structure of vast dimensions, built for the purpose, with a large front to the street, and a gateway which conducts you into an inner court, surrounded with buildings belonging to the establishment. Within this court is usually situated the kitchen, apart from the sleeping and eating departments; and by this means you are not sickened with smells of hot plates and cookery, such as almost universally pervade the hotels in England. Within the gateway is the entrance to a large saloon, resembling an English ball-room; and this is the eating apartment common to all the inmates. One or two long tables ordinarily stand ready covered; and the walls and windows are for the most part very prettily decorated. One of the finest saloons we have chanced to see is that in Streit's hotel, Hamburg. lofty and spacious, like a concert-room, and lighted from the roof, the walls are ornamented with a kind of fresco painting, illustrative of characters in the 'Cid.' Three hundred people may dine in this handsome hall. The number that sat down daily during our stay in the house was about a hundred and thirty, which, consisting of ladies as well as gentlemen, had an imposing and elegant appearance. The other parts of a continental hotel are rooms for the private accommodation of guests. Every apartment is at once a bedroom and sitting-room. On one side are two small French beds, generally without curtains, and therefore not conspicuous. The wood of the bedsteads is mahogany or walnut, and goes to the floor all round like a box, showing no open space beneath. The floor, well polished, has a table in the centre, suitable for writing. The wash-stand often resembles a chest of drawers, from which the top lifts back with a hinge, disclosing the requisite utensils below. There are so many mirrors in gilt frames round the apartment, that a special dressing-glass is not required. The weak point in the arrangements is the provision for washing. Instead of a basin, the stand contains an oval pie-dish, flat in the bottom; and for a water-jug is substituted a long-necked crystal bottle. The pie-dish is of course a subject of universal laughter among English continental travellers, who are long in becoming reconciled to so odd an apparatus. It may afford some consolation to be told that basins and water-ewers are actually beginning to make their way abroad. At Ostend, Bruges, Brussels, and Hamburg, we lately saw them for the first time; farther inland they have not yet penetrated; but we cannot entertain a doubt of their in time driving pie-dishes and case-bottles out of use.

The number of rooms in some of the continental hotels is surprising. Sixty to eighty apartments, each containing one or two beds, are quite common. In large towns, however, we have seen hotels with a hundred

and fifty to two hundred bedrooms, and every one filled. A book is always kept, in which guests inscribe their names on arrival—a practice complained of by some travellers, but really causing no sort of trouble, and useful for various purposes. At a large hotel in Leipsic, a method of inscribing names is adopted, which struck us as valuable. On a large black board, hanging in the gateway of the house, are rows of figures, corresponding to the numbers of the apartments, and in spaces opposite the figures the names of guests are written in chalk as soon as they arrive. By this means the landlord sees at a glance what rooms are occupied; and visitors, without asking, can very easily learn who are in the house, or in what number they may find their friends. When guests depart, their names are erased. No plan could be more simple for the purpose it is to serve.

To prevent confusion as to bells, a curious improvement has lately been introduced into continental inns. Instead of each room having a distinct bell, there is only one bell for every floor. If the house, however large, consist of six storeys, there are no more than six bells. Twenty persons, in as many rooms, may all be tugging at the same bell, and yet the attendant will answer each. The way the thing is done is this: Each bell-rope pulls two wires—one going down stairs to the bell, and the other going no farther than the adjoining passage. Here, in the passage or lobby, is affixed an apparatus against the wall, consisting of a board, with numbers inscribed, corresponding to the numbers of the apartments on the floor. Over each number is attached a cover, or lid, which falls down by a hinge. The wires from the rooms are led to this apparatus. Say that we pull the bell of No. 20, down falls the lid or flap which covers No. 20 on the board, and consequently the attendant sees the number of the room in which the bell was rung. The flap is put back by the attendant, so as to again cover up the number, when she has executed the object for which she was called. It fastens by a spring catch, and remains up till the bell is again applied to.

Continental hotels are evidently got up by persons of considerable capital; and that the proprietors are possessed of no small degree of taste, is apparent from the elegant manner in which their establishments are embellished. The quantity of dinner plates, knives, and silver forks they possess, must in some instances be immense. At Streit's, in Hamburg, for example, each of the hundred and thirty guests above-mentioned had his plate, knife, and fork changed ten times during dinner. Three hundred people served on the same scale, would require three thousand plates, knives, and forks; but as on such occasions the apparatus first removed is, we believe, rapidly cleaned, and again served, much fewer would suffice: still, the quantity in demand must be enormous. From all that has come under our notice, we are inclined to think foreign landlords superior, as a class, to persons in the profession in this country. They are, in fact, recruited from a higher rank in society; and generally smart-looking personages, in the dress of gentlemen, they may be observed mingling familiarly, and without subservieny, among their guests. Perhaps a key to the character of these men is found in the character of their servants. No two beings in a similar occupation are more unlike each other than the *garçon* and the waiter. Young, active, intelligent, communicative, and obliging, the *garçon* is prodigiously a-head of his English prototype. Dressed in a neat dark jacket and white apron, he is the impersonation of alertness. The waiter, on the other hand, has for the most part a broken-down look; he perhaps wears a shabby long coat, and shabbier waistcoat, and at best he is imitative in his attire: he is always aiming to look like a gentleman, instead of what he really is, a waiter. The *garçon* can never be taken for anybody else than a *garçon*; he keeps to his professional costume, appears what he is, and is therefore invariably respectable. The *garçon*, however, enjoys the advantage of not being looked down upon. His occupation is not degraded, nor does it degrade its professors. A young man belonging to

a respectable grade in society may be a *garçon*, and not lose caste: the situation of a waiter is considered to be below that of a footman. Thus esteemed, the *garçon* knows how to conduct himself. Nobody ever saw a *garçon* with a red nose, or smelling of drama. A *garçon* speaking thick, and having some difficulty in balancing himself, is an impossibility. The *garçon* does not drink; he is above such abominations. Another thing remarkable in *garçons*, comparing them with waiters, is their want of subservieny. The waiter bows down, almost prostrates himself before you, agrees to everything you say, no matter what nonsense you utter—always looking forward to a consideration. The vision of half-a-crown in the distance will make him submit to any species of indignity. The *garçon* is respectful, but never in the least subservient; he will commence a conversation, and chat agreeably on a number of pleasant things. We have often got a good deal of information out of *garçons*; for, besides observation, many of them have read the best authors of their country.

English waiters rarely speak any other language than their mother tongue. The greater number of *garçons* speak at least two languages; many of them manage to have three—French, German, and English; and on a late occasion we discovered one who spoke six—French, German, English, Danish, Swedish, and Norwegian. The very acquisition of foreign tongues marks the earnest diligence and professional anxiety of the *garçon*. A gentleman of our acquaintance, who was lately lodging in a hotel at Strasburg, noticed that the *garçon* spoke English remarkably well, though in a formal way; on asking how he had acquired the language, he replied by stating 'that he had for some time studied it daily under a master, between the hours of five and six in the morning, and eleven and twelve at night, such being the only time he was disengaged.' Could a more striking or pleasing instance be found of the pursuit of knowledge under difficulties? It may convince the young that 'where there is a will there is a way'—that even the impediment of late hours at labour is not always a valid excuse for ignorance.

Many *garçons* acquire foreign languages by serving in the hotels of countries distant from home. The Germans are most addicted to this practice. A lad who comes out as a *garçon* in Vienna or Berlin, does not consider himself proficient till he has served for a year or two in a hotel in Paris, and as long in London, or some of our provincial cities. A few weeks ago, while residing in a hotel at Leamington, we were waited on by a native of Baden. He mentioned that his father was a person in respectable circumstances in the Black Forest; that he had left his home to qualify himself for the situation of *chef des garçons*; first having served in a Parisian hotel for two years, he now had come to England for the sake of the language. He spoke French fluently; and already, though only a few months in the country, by dint of observation and hard study, he expressed himself in English with wonderful propriety. This young man spoke complainingly of the degradation to which a *garçon* is exposed in English hotels. 'In France or Germany,' said he, 'a *garçon* has a precise duty to perform—that of attending on guests; but in England, a waiter is expected to help to shake carpets, clean windows, scour knives, and do many other menial services: a foreign *garçon* coming here to learn the language feels that to be very disagreeable.' Of course we sympathised with this migratory *garçon*, so far from home, and wished he might rise to be a chef, if not an actual hotel-keeper, in his own country.

The English flatter themselves with the idea, that wherever they go on the continent, improved hotel usages follow in their train. They have certainly introduced tea in many places, nor will we deny that their dragooning as to certain points in cleanliness has had its effect. But the true missionary of English comfort is the wandering *garçon*. Coming to England, and seeing a multiplicity of odds and ends essential for cleanliness

and comfort in our system of living, he carries away a knowledge of them to his own country, and at the first opportunity effects their introduction into hotels. Acquainted with what the English like, he tries to please them. In this way foreign hotels have added various English comforts to their own peculiar arrangements.

It is at the table-d'hôte that the garçon is seen exhibiting his proficiency as a waiter. One of his clevernesses consists in carrying a tray covered with dishes on the palm of his hand, and this, elevated above his shoulder, he brings into the saloon as soon as the guests are seated for dinner. A troop of garçons, carrying trays poised on the uplifted hand, is a sight worth seeing. The most accomplished practitioners whom we have seen are the garçons in the Hôtel de Flandre at Brussels, where, apropos of table-d'hôte, about the very best and cheapest dinner in Europe is to be obtained. It is impossible to go through the operation of dinner here without acknowledging that John Bull is still vastly behind in the arts of cooking and eating. And why will not John take a lesson from the French? Is it not monstrous that you shall pay the good and sufficient sum of three shillings at an English hotel for a beef-steak, or a slice from a leg of mutton—in either case called dinner; while at any hotel in France or Flanders (where markets are as high as in England) you will get a choice of twenty dishes for less money? The charge for dinner at the table-d'hôte of the Hôtel de Flandre is three francs; and just look what sort of a dinner it is. The following dishes were one day served round:—Soup, roses of brain, mutton chops dressed, fricandeau of veal, vol-au-vent, sweetbread, roast veal, roast lamb, stewed pigeons, stewed fowls, goose liver (a most *recherché* dish, which we tasted for the first time), salad, ham, crebs (a kind of very small lobsters), dressed peas, cauliflower, new potatoes, Italian cream, strawberries, pudding, cherries, preserved ginger, cheese, and various sweetmeats and cakes. Such a dinner as this, paraded at any London tavern, would cost ten or twelve shillings a-head, and yet the English purveyor would probably have but a small profit. The wonderful cheapness and profusion of the table-d'hôte dinners is traceable to one circumstance—the French do not cook large joints: the trick of their fine dinners lies in preparing small dishes—a little of this, and a little of that—just so much as will be eaten. When a large dinner is served in England, the house has cold meat and hash—*which we detest*—for a week. Would it not be a great saving, and more consistent with common sense, to cook only what is likely to be used? At present, variety is sacrificed for the sake of huge expensive joints, the bulk of which leave the table not the tenth part eaten.

Seriously, we should like to see a reform in these things; and nothing is so well calculated to bring about a change as the introduction of the table-d'hôte system—a system by which the various parties in a hotel would dine comfortably and economically together, in place of each requiring a distinct suite of dishes to be served to himself. If the aristocratic habits of English society cannot tolerate eating in company, the more, we say, is the pity, and the sooner we get quit of such habits the better.

One more last word on dinners. According to the continental plan, all the dishes are first placed on the table, so that you may have a view of the viands, and mentally form your selection. The dishes are then removed to a side table, where they are carved by an expert garçon (usually with a knife of immense size and power), and one after the other handed round. If there be twenty distinct dishes, each in its turn comes round; fresh plates being at the same time supplied by subordinate garçons, who are continually going about for the purpose. A dinner of this sort, in good houses, lasts about an hour and a-half. Can we for a moment compare these methods of carving and serving with what prevails at public dinners in England, where, amidst the hurry-scurry and confusion, every one is glad to get anything that stands near him, or which

some good-natured soul is willing to carve for the sake of his neighbours? At such dinners, we have known half-a-guinea paid for what was not worth a shilling or eightpence. One cannot but wonder that the English, with all their profound sagacity in the matter of the stomach, should continue to tolerate these stupidities. As all societies now succeed whose name begins with *Anti*, we propose the institution of an Anti-bad-public-dinner Association.

TWO NOTES OF INVITATION.

A COURTLY CURIOSITY OF THE LAST CENTURY.

'Your presence is requested on the occasion of the religious profession of the very high and mighty Lady Mademoiselle Henriette-Jacqueline-Olympe-Anastasie de Lenoncour de Herouval de Baudricourt, the ceremonies of which will take place on Saturday, the 14th of the present month of March 1765, in the chapel of the royal abbey of Panthemont, Grenelle Street, Paris.'

'The profession will be received by the most illustrious and Right Reverend Lord Christopher Henry de Beaumont du Repayre, Archbishop of Paris, Duke of Saint Cloud, Seventh Peer of France, Lord of Ivry, of Bercy, and of other places, Prelate of the Royal Order of the Saint-Esprit, Counsellor of the King in all his councils, &c. &c. &c.'

'My Lord Pie-Sinebald-André Doria of the Princes of Melphe and of Colombrona, Archbishop of Amathonte *in partibus infidelium*, and Apostolical Nuncio at the court of France, will bestow the papal benediction, with the application of a plenary indulgence.'

'The sermon will be preached by Messire François-Joachim-Gabriel-Archange de Pierre de Bernis, Canon and Count of Lyon, &c. &c. *Veni, Creator Optime!*'

Here is a note, perfect in its kind! The inditer of it was Christine-Alberte de Rupelmonde, born Countess of Warangest and of the empire, Canoness of Maubeuge, &c. &c. whose whole life seemed but a continuation of her ancestors' existence. Genealogy and heraldry were the only studies she deemed worthy of her attention. She could only speak of crests and escutcheons—of feudal rights and privileges. She was a clever woman.

'Here are seventy-four invitations for Versailles,' said a little gentleman clothed in black to a tall man in the rich livery of Burgundy, the head lackey of the countess's household. 'Here are three hundred and ninety for our own quarter of St Germain; then about twenty for the quarter of the Capuchins, between the Place Vendôme and the Porte St Honoré. There are half-a-dozen for the Marais. (Madame says we must not seem to despise the *Parliamentaires*.) Take care to send expressly a man on horseback with the invitation to the Comte de Mercy, the imperial ambassador; and choose a man with some *nous* to find out where the commander of consols has taken up his abode. How could he ever dream of fixing himself in that vile neighbourhood of the Hôtel d'Antin? A miserable quarter, full of mean people; without one ancient edifice, or one place which lives in anybody's memory!—not one street or one church which bears an aristocratic name!—and the streets are as muddy as the roads in a country village. Desire the messenger to put on leathern gaiters.'

This small gentleman, M. Tievulet de la Barotte, secretary to the Countess de Rupelmonde at Warangest, had laid aside eight invitations in manuscript, and not printed, like the others. 'There are our invitations to the princes and princesses of the blood,' said he to himself, while gazing complacently on his own neat cramped handwriting. He had taken due care not to dry it with sand or with red powder, lest their royal highnesses' eyes might receive damage thereby; a precaution taken in conformity with the etiquette established by the Maréchal Duc de Villeroy, who, during the king's minority, was always in terror lest his ma-

jeasty should be poisoned through the medium of some petition. M. Tievulet then took a large seal, on which was engraven the countess's coat of arms, with the decoration of the chapter, and the Rupelmonde motto—'Quy-Qu'en-Grogne.'

He sealed the princely invitations with black wax, as is prescribed in all votive ceremonies; signifying thereby the civil death of those who devote themselves to a monastic life. This important operation was performed to the entire satisfaction of M. Tievulet, except that he detected on one of the seals an imperfect impression of the *cri-de-guerre-au-provocation*. While his eye rested on this slight failure, a loud voice startled him from his meditation.

'Come, come, La Barotte; make haste if you can!' exclaimed the Countess de Rupelmonde, as she entered her antechamber where the secretary was at work. 'What have you been doing here?' she continued in a bitter and irritated tone. 'Have you fallen from the clouds, sir? Pray, Monsieur La Barotte, have you not been with me long enough to know better than to commit such blunders?'

'But, madame, I am not aware what—'

'How, sir! you are so ignorant or so careless as to seal letters with black, which are addressed to princes of the blood, when the court is not in mourning! You would have me pass for a fool, and make me the talk of the whole court. There are your fine notes in the fire, sir! Black seals to princes of the blood who are not in mourning! It puts me into a fever even to think of it. Only think of what would have happened had I not fortunately come to look after you!'

M. Tievulet resumed his work with a submissive and contrite look, because the Countess Brigitte de Rupelmonde was a noble lady of between fifty and sixty—exacting and proud; rather violent, and extremely impatient to her inferiors. She had a masculine voice; her skin was olive-coloured; her eyes green. She had bushy eyebrows; and, moreover, she was coadjutrix of the very noble chapter of St Aldegonde de Maubenge. The Countess Brigitte being canoness of Maubenge, she wore in right thereof an ermine trimming to her black dress, and the large blue ribbon of the order of the Saint-Esprit. We must add, also, that she was the aunt and guardian of Mademoiselle Henriette de Lenoncour—the fair novice who was on the morrow to pronounce in the abbey of Panthemont her vows of absolute obedience and perpetual seclusion.

The notes of invitation were all despatched; and in the evening of this aforesaid 13th of March, the Countess of Rupelmonde was visiting at the Hôtel de Beauvau, where the ceremony of the ensuing day was talked of.

'It is a thousand pities to bury alive so young and lovely a creature,' said a lady present to the Countess Brigitte; 'you ought to have married her to her cousin the Vicomte de Gondrecourt.'

Madame de Rupelmonde made no answer, but with a displeased look turned away, and soon after took her leave.

She was no sooner gone, than the Princess of Craon said in a low voice to her next neighbour, 'I am afraid the coadjutrix is a wicked woman!'

'My sister!' cried the Maréchal de Beauvau, who had overheard her; 'she has always been an incarnate devil!'

Whereon Madame de Craon took courage to relate that she had visited Mademoiselle de Lenoncour two days before at the convent grate; and that, after a few moments of melancholy silence, in which they gazed sadly upon each other, the pretty novice said in a despairing tone that she besought Heaven for grace to pardon her cousin for the misery he had inflicted on her during the last six months.

'What do you mean, my dear child? I understood from your aunt that you had a very decided vocation!'

'Ah, he is married!' was her reply, while the tears rolled silently down her cheeks.

'Married! I never heard of it. But, beloved friend, are you quite sure of this?'

'Alas! it is too true, madame; my Aunt Rupelmonde has told me so.'

'What!' cried the Chevalier de Castellux; 'he married? If he is married, it is to despair or death. Oh the wicked Rupelmonde!'

'Is it possible,' said the Marquis de Mirepoix, 'that she has devised such a scheme for the sake of inheriting the wealth of this poor Henriette, who is her ward and her niece, and who has, I hear, a yearly income of twenty thousand crowns?'

'How terrible—how infamous!' re-echoed through the room. 'What an abominable transaction for a near relation! But, above all, for a canoness—a nun! How shameful!'

'As for that,' said Madame de Coislin, 'no insolence is to be compared to that of upstarts who ape the nobility, and no wickedness is so great as that of hypocrites who act the saint!'

'But, prince,' interrupted the lady of the house, addressing her husband, 'do you not approve of my going to speak to the archbishop about it? There is not a moment to lose,' added she in a calm firm voice; 'you know the profession will take place this coming morning—the vows will be pronounced a few hours hence!'

The maréchal bowed assent; and twenty minutes afterwards, the Maréchale Princesse de Beauvau was at the gates of the archbishop's palace, where it was found no easy matter to awaken the Swiss porters, seeing that it was now half-past two in the morning. The great clock of Notre Dame had struck three before the two Swisses appeared, in full costume, with their halberds in hand, at the door of the princess's carriage. They had put on their grand liveries, laced with silver and amaranth; neither had they neglected to slip on their fringed shoulder-belts, from whence hung long rapiers. They wore small cocked-hats, surmounted by a plume of the Beaumont colours. All this finery had caused half an hour's delay; and on the maréchale demanding whether it were possible she could see the archbishop, they replied that his Grace was probably *en retraite* at the seminary of St Magloire, unless, indeed, he were gone to keep the Feast of St Bruno with the reverend Chartreux fathers in the Rue d'Enfer; or perhaps he might be found at St Cyr, where he was regularly invited by the Bishop of Chartres to join in the anniversary service for Madame de Maintenon. It was therefore hopeless to seek for the archbishop previous to the hour appointed for his arrival at the church of Panthemont for the morning ceremony. The first gleam of day appeared when Madame de Beauvau returned sorrowfully to her own hotel.

At seven in the morning, the maréchale's equipage drew up at the abbey of Panthemont, and she sent in to beg that the abbess would admit her to an interview as soon as possible. Madame de Richelieu returned for answer that she could not go to the parlour, because she was obliged to attend in the choir for the service of the canonical hours. Madame de Beauvau sent again, to intreat that she might be admitted for a moment into the convent, as she had a most important revelation to make; but received for answer that it was utterly impossible for Madame de Panthemont to grant such permission, without the consent of the archbishop of Paris. Madame de Beauvau seated herself once more in her carriage, and resolved to remain stationary at the church door, to await the arrival of the prelate. Meanwhile the gilt carriages—the *vis-à-vis* with seven windows—the princely and ducal equipages, roofed with crimson velvet, and each drawn by six plumed horses—the crowd of gay and saucy lackeys—all filled up the fine street de Grenelle, and obstructed every avenue to Panthemont. The clock had struck eleven, when a valet, clad in crimson velvet braided with silver, hastily approached his mistress's carriage.

'Madame la Maréchale, the archbishop is already in

the abbey; he has entered by the cloister door, and the ceremony is about to begin.'

Madame de Beauvau wrote a few hasty words on her tablet, and ordered her chief lackey to make way through the crowd, and lead her, without a moment's delay, to the vestry.

The church was adorned with superb tapestry, above which was a girdle of white damask, fringed with gold, and covered with blazoned shields. A large pennon, on which were painted the arms and alliances of the noble novice, was hung up, according to custom, in place of the sanctuary lamp. The royal lustres and torches added to the brilliancy of the gorgeous scene. The sanctuary was filled with noble bishops, in purple cassocks, with venerable Benedictines, Bernardines, Minims, and Capuchins, in their several picturesque costumes.

In the centre of this oecumenical council was seen the commanding figure of the Lord Christopher de Beaumont, encircled by his four archpriests and his vicars-general. He was seated with his back to the altar. When he bent his eyes upon the ground, his pale severe countenance had something almost deathlike in its stillness; but as soon as he raised his large dark eyes, with their earnest animated glance, all hearts were filled with reverence for this venerable champion of the faith.

At a little distance from M. de Paris was a diminutive prelate, who leaned gracefully against a massive arm-chair. He had so pleasing and intelligent a countenance, his whole bearing was so unassuming, and yet self-possessed, that he was inaccessible to the shafts of ridicule. It was M. Doria, the apostolic nuncio, an able diplomatist, whose language being as concise as his person was small, Madame de Créqui bestowed on him the appropriate surname of the *Pope's Brief*.

Not far from the nuncio might be remarked a young abbé, well powdered and well dressed, in a cassock of rich *mairé* silk, and a surplice of Alençon lace. He wore the noble fleur-de-lis cross of the Chapter of Lyons, which was hung round his neck by an ample flame-coloured ribbon. He seemed engrossed in the study of his breviary, only that now and then might be detected a sidelong look towards the Roman envoy, to see if he were edified by his devotion. His complexion was feminine in its delicacy, and he was esteemed the very flower of abbés at Versailles. In short, it was the Abbé Comte de Berri, who was preparing to preach a most edifying sermon.

The assembly was an illustrious one, comprising the princes of the blood, and the highest aristocracy of France. All were in mute expectation, when the grate of the choir was heard to turn on its ponderous hinges, and the abbess of Panthémont led in the charming novice, and handed her over to her aunt, the Countess Brigitte de Rupelmonde, who conducted Henriette to her *prie-dieu*, whereon she sunk in the attitude of prayer. Her magnificent dress ill accorded with the pale languor of her countenance; and it was but too apparent that she trembled with painful emotion. At this moment some disturbance arose at the lower end of the church, where the livery servants were collected; M. le Maréchal de Brissac rises—he is six feet high, and wears two white tails—'Make the attendants go out,' he says in a stentorian voice. The servants hastened to depart, bearing along with them a young man who had swooned away. He wore the uniform of an officer of the guards of King Stanislaus, Duke of Lorraine and Bar; it was whispered about that he was the Vicomte de Gondrecourt, and many of the young nobles hastened out to offer their assistance to him.

The archbishop of Paris had not raised his eyes until the moment that Henriette, led by the coadjutrix, knelt before him. He held in one of his violet-gloved hands a pair of gold-enamelled tablets. 'My sister, what is your age?' he inquired gently of the novice.

'Nineteen, my lord,' answered hastily the Countess de Rupelmonde.

'Madame, it is not your turn to answer yet;' and again the same question was addressed by the archbishop to the novice, who with a trembling voice replied that she was just seventeen.

'In what diocese did you receive the white veil?'

'In the diocese of Toul.'

'How! In the diocese of Toul?' cried aloud M. de Paris; 'the see of Toul is vacant. The bishop of Toul has been dead fifteen months, and no ecclesiastic in the diocese could be authorised to receive novices. Your novitiate is null and void, young lady, and we refuse to receive your profession!'

The archbishop of Paris rises from his seat, the mitre is placed on his head, and he takes his crozier from the hands of an acolyte—'My dear brethren,' he added, addressing the assembly, 'it is not fitting now that we should examine and interrogate Mademoiselle de Lenoncourt as to the sincerity of her religious vocation, there being at present a canonical hindrance to her profession; and as for the future, we reserve to ourselves the right of considering it; and we hereby prohibit all other ecclesiastical persons whatever from receiving her vows, under pain of suspension and of interdiction; and this we do in right of our metropolitan privileges, according to the terms of the bull, *cum proximis. Adjutorium nostrum in nomine Domini!*' continued he, chanting in a grave and solemn voice as he returned to the altar, there to bestow his blessing on the people.

The noble auditory being well accustomed to exercise restraint—may we not say *tyranny*—over their inward feelings, the archbishop's declaration was received as the most natural and ordinary thing in the world.

It is remembered that M. de Tessé gave this caution to his son, 'Be ever on your guard against astonishment; for surprise occasions many awkwardnesses. Do not betray astonishment at anything, unless you happen to hear the king or queen evil spoken of, or their favourite minister abused.'

All who were present bent their knees to receive the pontifical blessing; the Duchess of Orleans raised her glass to stare at Mademoiselle de Lenoncourt, who blushed and grew pale, and trembled so violently, that she was placed on the vacant seat of the nuncio, to whom the charming Abbé de Berri had just handed his eloquent discourse.

In consequence of the archbishop's admonition, Madame de Panthémont formally refused to allow Madame de Lenoncourt to resume her novitiate garments; she assigned to Henriette the pleasant apartment of a boarder, instead of the narrow cell of a recluse; and when, on the morrow, Madame Rupelmonde came to reclaim her niece, she was shown by Madame de Richelieu a lettre-de-cachet, by which Mademoiselle de Lenoncourt was restrained from leaving the precincts of the convent with any one except Madame de Beauvau.

The Parisian world made up amply for the restraint imposed on them in the church of Panthémont; for during a whole month, nothing was talked of but the loves of the handsome vicomte and the charming Henriette; the wickedness of the coadjutrix, and the prompt and kindly decision of the *maréchale*; and, above all, the perfect wisdom exhibited by the archbishop in baffling such an iniquitous manœuvre, without scandal, without compromising the noble name of Rupelmonde, and without departing from the meekness of his pastoral office.

Two months later, M. Tievulet de la Barotte was introduced into the Maréchal de Beauvau's library, and placed in his hands the sum of 340,000 livres, being the amount saved out of Mademoiselle de Lenoncourt's revenues during her minority.

This step was taken in consequence of an order of the council, which removed Henriette from the guardianship of her unworthy relative.

The Vicomte de Gondrecourt is an amiable officer of the Polish Guard. He is not deficient in talent or wit; he is an indefatigable cricket player, an admirable

horseman, and tolerably successful at chess. He has learned to embroider pretty well, but we must confess he is far less skilful in this accomplishment than his brother the colonel. He idolised his cousin Henriette, but being a younger brother, he had only an income of one thousand crowns a-year. This, however, did not prevent the fair novice from returning his tender attachment, neither did it prevent the issue of the following invitation to all the persons who had been summoned three months before by Madame de Rupelmonde to the abbey of Panthemont:—

'You are requested to assist at the celebration of the marriage of the high and mighty lord and lady, Messire Adrien de Gondrecourt, Vicomte de Saint-Jean-sur-Moselle, and Damoiselle Henriette de Lenoncour, Comtesse de Herouval and other places, which will take place on the 14th of this present month of June, at midnight, in the chapel of the archiepiscopal palace of Paris.

'On the part of the dowager Countess of Gondrecourt, mother of the intended; and of the Maréchal Prince de Beauvau, guardian of the bride elect.'

La Gazette de France of the 25th August has the following announcement—'Madame la Vicomtesse de Gondrecourt has just had the honour of being presented to their majesties, at their royal castle of Versailles, by Madame la Maréchale de Beauvau, accompanied by Madame la Marquise de Beaumont, and by Madame la Princesse de Craon.'

IRELAND SIXTY YEARS AGO.

THE long-protracted misery of Ireland—its apparently ceaseless exposure to party dissensions—its seeming inability to help itself—all this and much more leads to the common conviction on this side of the Channel, that the country is irreclaimable, doomed for ever to suffering and degradation. We cannot fall in with that opinion. The miseries of Ireland are a consequence, in the first instance, of English conquest and mismanagement. The people have not been allowed to manage themselves, so as to bring out the qualities of self-dependence and foresight. Always treated as incapables, incapables they remain. Ireland is nevertheless improving. The meliorations in law and government during the last few years have had a marked effect; the mere influence of imitation, as respects social usages, has rendered Irish society a very different thing from what it was at the middle of the eighteenth century. With not a little to complain of, Ireland will doubtless go on improving; and yet such is the force of traditional character, that long after many unpleasant features are gone, it will still be looked upon as a country of lawless turbulence, frolicsome folly, and confusion.

Whatever be its future fate, it is pleasant in the meantime to know that Ireland is substantially improving, at least as regards education and social order. Strangers, with heads filled with stories of Irish rows, are usually a good deal surprised to find that Dublin is a quiet respectable-looking town, with people going about in as decorous a manner as they do in London or Edinburgh. Instead of Irishmen leaping and yelling with a cudgel in one hand and a bottle in the other, as they are still made to do on the stage, we see a peaceful community minding its business, and only a scatter of beggars to bring to our recollection that the rural affairs of the country are still in a state of discreditable misarrangement.

The best way to convince the sceptical of the distinct advances made by Ireland, is to compare its present state of manners with what unhappily distinguished it two or three generations ago. Means for making this comparison have just been afforded by an Irish writer in a small work lying before us. 'Sketches of Ireland Sixty Years Ago,'* as this production is designated, affords a curious insight into the whole social fabric of

last century—the fights, abductions, robberies, frolics, gambling, and drunkenness for which the country yet traditionally suffers. Though lamentable in many of its details, the volume will be perused with much interest, and will afford no small degree of amusement.

The author commences with an account of the fights which used to take place in the streets of Dublin in past times, greatly to the disgrace, as we think, of the government for the time being. Here is a specimen: 'Among the lower orders a feud and deadly hostility had grown up between the Liberty Boys, or tailors and weavers of the Coombe, and the Ormond Boys, or butchers who lived in Ormond Market, on Ormond Quay, which caused frequent conflicts; and it is in the memory of many now living that the streets, and particularly the quays and bridges, were impassable in consequence of the battles of these parties. The weavers, descending from the upper regions beyond Thomas Street, poured down on their opponents below; they were opposed by the butchers, and a contest commenced on the quays which extended from Essex to Island Bridge. The shops were closed, all business suspended, the sober and peaceable compelled to keep their houses, and those whose occasions led them through the streets where the belligerents were engaged were stopped, while the war of stones and other missiles was carried on across the river, and the bridges were taken and retaken by the hostile parties. It will hardly be believed that for whole days the intercourse of the city was interrupted by the feuds of these factions. The few miserable watchmen, inefficient for any purpose of protection, looked on in terror, and thought themselves well acquitted of their duty if they escaped from stick and stone. A friend of ours has told us that he has gone down to Essex Bridge, when he has been informed that one of those battles was raging, and stood quietly on the battlements for a whole day looking at the combat, in which above a thousand men were engaged. At one time the Ormond Boys drove those of the Liberty up to Thomas Street, where, rallying, they repulsed their assailants, and drove them back as far as the Broad Stone, while the bridges and quays were strewn with the maimed and wounded. On May 11, 1790, one of these frightful riots raged for an entire Saturday on Ormond Quay, the contending parties struggling for the mastery of the bridge; but nightfall having separated them before the victory was decided, the battle was renewed on the Monday following. It was reported of Alderman Emerson, when lord mayor, on one of those occasions, that he declined to interfere when applied to, asserting that "it was as much as his life was worth to go among them." These feuds terminated sometimes in frightful excesses. The butchers used their knives, not to stab their opponents, but for a purpose then common in the barbarous state of Irish society—to *hough* or cut the tendon of the leg, thereby rendering the person incurably lame for life. On one occasion after a defeat of the Ormond Boys, those of the Liberty retaliated in a manner still more barbarous and revolting. They dragged the persons they seized to their market, and dislodging the meat they found there, hooked the men by the jaws, and retired, leaving the butchers hanging on their own stalls. The spirit of the times led men of the highest grade and respectability to join with the dregs of the market in these outrages, entirely forgetful of the feelings of their order, then immeasurably more exclusive in their ideas of a gentleman than now; and the young aristocrat, who would have felt it an intolerable degradation to associate, or even be seen, with an honest merchant, however respectable, with a singular inconsistency made a boast of his intimate acquaintance with the lawless excesses of butchers and coal-porters.'

In some respects the gentry exceeded the humbler orders in a taste for outrage. The most disorderly individuals were a class of 'gentlemen' called Bucks, who seemed to be above all considerations of law or decency. 'It was their practice to cut off a small

* Dublin: James M'Glashan. 1847.

portion of the scabbards of the swords which every one then wore, and prick or "pink" the persons with whom they quarrelled with the naked points, which were sufficiently protruded to inflict considerable pain, but not sufficient to cause death. When this was intended, a greater length of the blade was uncovered. Barbers at that time were essential persons to "Bucks" going to parties, as no man could then appear without his hair being elaborately dressed and powdered. The disappointment of a barber was therefore a sentence of exclusion from a dinner, supper party, or ball, where a fashionable man might as well appear without his head as without powder and pomatum. When any unfortunate *friseur* disappointed, he was the particular object of their rage; and more than one was, it is said, put to death by the long points, as a just punishment for his delinquency. There was at that time a celebrated coffee-house called "Lucas's," where the Royal Exchange now stands. This was frequented by the fashionable, who assumed an intolerable degree of insolence over all of less rank who frequented it. Here a Buck used to strut up and down with a long train to his morning-gown; and if any person, in walking across the room, happened accidentally to tread upon it, his sword was drawn, and the man punished on the spot for the supposed insolence. An account follows of the sacking of a tavern by a party of Bucks, one of whom was a lord, two were colonels in the army, and the others were officers of rank in the service of the Duke of Rutland, then lord-lieutenant. 'The latter interested himself on their behalf; and such was the influence of their rank, that the matter was hushed up, and the gentlemen engaged in this atrocious outrage, though all well known, escaped unpunished.'

Duelling also was universal. Between 1780 and 1800, three hundred duels were fought; and counties became distinguished for dexterity in using certain weapons—Galway for the sword; Tipperary, Roscommon, and Sligo for the pistol; Mayo for equal skill in both. 'Duelling clubs were actually established, the conditions of which were, that before a man was ballotted for, he must sign a solemn declaration that he had exchanged a shot or thrust with an antagonist.' Barriers used to retire to fight when they seriously differed in argument, and judges were equally ready to step down from the bench to have a round with persons with whom they differed. An anecdote is given of a famous duellist, who always rang the bell by firing a bullet against the bell-handle. 'He was such an accurate shot with a pistol, that his wife was in the habit of holding a lighted candle in her hand for him, as a specimen of his skill, to snuff with a pistol-bullet at so many paces' distance. He was seen for whole days leaning out of his window, and amusing himself with annoying the passengers. When one went by whom he thought a fit subject, he threw down on him some rubbish or dirt to attract his notice, and when the man looked up, he spat in his face. If he made any expostulation, Bryan crossed his arms, and presenting a pistol in each hand, invited him up to his room, declaring he would give him satisfaction there, and his choice of the pistols.'

Abduction, or the carrying away and marrying young heiresses against their will, was a common outrage against which the law long thundered in vain. 'An association was formed in the south of Ireland, which could not have existed in any other country. This association was "an abduction club," the members of which bound themselves by an oath to assist in carrying off such young women as were fixed upon by any members. They had emissaries and confederates in every house, who communicated information of particulars—the extent of the girl's fortune, the state and circumstances of the family, with details of their intentions and domestic arrangements and movements. When a girl was thus pointed out, the members drew lots, but more generally tossed up for her, and immediate measures were taken to secure her for the fortu-

nate man by all the rest. No class of society was exempt from their visits; and opulent farmers, as well as the gentry, were subject to these engagements of the clubs, according to their rank in life. The persons who were most usually concerned in such clubs were a class of men abounding in Ireland, called "squireens." They were the younger sons or connexions of respectable families, having little or no patrimony of their own, but who scorned to demean themselves by any useful or profitable pursuit. They are described by Arthur Young and other writers of the day as distinguished in fairs and markets, races and assizes, by appearing in red waistcoats, lined with narrow lace or fur, tight leathern breeches, and top-boots, riding "a bit of blood" lent or given them from the stables of their opulent connexions.' One of the most distressing cases of abduction by this class of men was one perpetrated in 1779, on two very young ladies, Catherine and Anne Kennedy. These unfortunate girls were stolen away at a ball, by two 'gentlemen,' under circumstances of great depravity and cruelty. Forcibly detained and bound on horseback, the two helpless young women were dragged from place to place for a period of five weeks. Ultimately they were rescued by friends, and the two abductors escaped to Wales. There, however, they were seized, brought to Ireland, tried, and condemned to death for the crime. As they had high connexions, it was supposed the sentence would never be executed. Powerful intercession was made in their behalf—But Scott, afterwards Lord Clonmel, was then attorney-general, and conducted the prosecution. He openly declared in court, that if this abduction were suffered to pass with impunity, there would be no safety for any girl, and no protection for the domestic peace and happiness of any family; and he called upon the government to carry out the sentence. His remonstrance was attended to, and the unfortunate gentlemen were hanged, to the great astonishment of their numerous friends and admirers. So strong and general was the excitement among the peasantry, that a rescue was greatly feared, and an extraordinarily large force of horse and foot was ordered to attend their execution; and such was the deep sympathy for their fate, that all the shops were shut up, and all business suspended in Kilkenny and the neighbouring towns. This sympathy with a couple of miscreants did not cease with their death. Instead of pitying the poor girls on whom a barbarous outrage had been committed, the people looked on them as the true offenders, and persecuted them with unrelenting virulence. It is no doubt this singular illogicality of the Irish mind which sustains the impression, that the people are radically incurable in their condition.

Passing over several chapters, we come to 'Prison Usages,' in which is presented a melancholy yet ludicrous picture of Irish prisons and their inmates sixty years since. 'The most shocking exhibition of the utter laxity of all discipline and want of decency was exhibited in the manner in which condemned capital convicts were allowed to pass their last hours. When so many petty offences were punishable with death, and commitment on suspicion was so often but the stepping-stone to the gallows, it was natural that, to the unfortunate felons themselves, an execution should be stripped of all the salutary terrors in which alone the utility of capital punishment consists, and should be by them regarded as an ordinary misfortune in their course of life. The numerous instances recorded of utter levity and recklessness exhibited by convicts on the very verge of eternity, clearly show this to have been so, not merely in Ireland, but in the sister kingdom. The practice of prisoners selling their bodies to surgeons, to be dissected after their execution, was common, we believe, to both countries; and the anecdote of the felon who took the money, and then told the surgeon, laughing, that "it was a bite, for he was to be hung in chains," we believe we can hardly claim as Irish wit. But there was one trait, evincing a similar careless indifference, which was peculiarly Irish. The coffins of condemned malefactors

were usually sent to them, that the sight might suggest the immediate prospect of death, and excite corresponding feelings of solemn reflection and preparation for the awful event. From motives of humanity, the friends of the condemned were also allowed free intercourse with him during the brief space preceding his execution. The result was, that the coffin was converted to a use widely different from that intended. It was employed as a card-table, and the condemned wretch spent his last night in this world gambling on it.' Our wonder at such scenes is lessened when we are told that at that period the school-books in ordinary use consisted of stories of robbers, murderers, and clever rapparees. The actions of lawless felons were held up as objects of interest and imitation; all sense of right and wrong was systematically confounded. What a change for the better in the present National School system of Ireland!

We draw our notice of this interesting volume to a conclusion, by citing one more anecdote illustrative of past times. It relates to the habits of intemperance which universally prevailed. 'An elderly clergyman of our acquaintance, on leaving home to enter college, stopped on his way at the hospitable mansion of a friend of his father for a few days. The whole time he was engaged with drinking parties every night, and assiduously plied with bumpers, till he sank under the table. In the morning, he was of course deadly sick, but his host prescribed "a hair of the old dog"—that is, a glass of raw spirits. One night he contrived to steal through a back window. As soon as he was missed, the cry of "stole away" was raised, and he was pursued, but effected his escape into the park. Here he found an Italian artist, who had also been of the company, but who, unused to such scenes, had likewise fled from the orgies. They concealed themselves by lying down among the deer, and so passed the night. Towards morning they returned to the house, and were witnesses of an extraordinary procession. Such of the company as were still able to walk had procured a flat-backed car, on which they heaped the bodies of those who were insensible; then throwing a sheet over them, and illuminating them with candles, like an Irish wake, some taking the shafts of the car before, and others pushing behind, and all setting up the Irish cry, the sensible survivors left their departed insensible friends at their respective homes. The consequences of this debauch were several duels between the active and passive performers on the following day.'

THE BAYEUX TAPESTRY.

The celebrated tapestry of Bayeux, doubtless the most ancient specimen of needlework in existence, is supposed to have been the work of Stratilda, queen of William the Conqueror, and her maidens, by whom it was presented to the cathedral of Bayeux in Normandy, where the canons were accustomed to gratify the people with its exhibition on particular occasions. This piece of needlework, formerly known by the name of the 'Toile de St Jean,' is now preserved in the Hotel of the Prefecture at Bayeux. It consists of a continuous web of cloth, two hundred and seventy feet in length, and twenty inches in breadth, including the borders at the top and bottom; these are formed of grotesque figures of birds, animals, &c. some of which are supposed to represent the fables of Æsop. In the part portraying the battle of Hastings, the lower border consists of the bodies of the slain. The whole is worked or embroidered with worsted, representing the various events connected with the invasion and conquest of England by the Normans. It is divided into seventy-two compartments, and comprises altogether, exclusive of the borders, about five hundred and thirty figures—three only being females. The colours, as may readily be supposed, from the period in which it was executed, are not very numerous, consisting only of dark and light blue, green, red, yellow, and buff; and these, after a lapse of nearly eight hundred years, have become considerably faded, whilst the cloth itself has assumed a brown tinge. This curious piece of needlework appears to have been wrought without any regard to the natural colours of the objects depicted—the

horses being represented blue, green, red, and yellow—and many of them have even two of their legs of a different colour to their bodies; as, for instance, a blue horse has two red legs and a yellow mane, whilst the hoofs also are of another colour. The drawing of the figures has been termed rude and barbarous, but in the needlework of that age we must not look for the correct outline of the modern painter. The work is of that kind properly termed embroidery: the faces of the figures and some other parts are formed of the material composing the ground, the outline of the features being merely traced in a kind of chain stitch. Nevertheless, taking the whole as a piece of needlework, it excites our admiration, and we cannot but wonder at the energy of the mind which could with so much industry embody the actions of so long a series of events.—*Miss Lambert's Handbook of Needlework.*

NATURE.

'Nature is but the name for an effect
Whose cause is God.'—COWPER.

NATURE, if our philosophers be right,
Is a magnificent machinery,
Moved by its own inherent energy;
All independently of other might.
With bards, whose ravings half a realm delight,
'Tis e'en an object that may worshipped be—
Both make Jehovah's works their deity;
And Him from his own world dispense with quite.

Nature, in heaven's philosophy, unfolds
The never-slumbering agency of Him
Who formed all creatures—from the seraphim
To the minutest insect: who still moulds
The dew-drop; does the sun's lamp daily trim;
And whose strong arm the universe upholds.

J. D. H.

METHOD.

A lady was complimenting a clergyman on the fact that she could always recollect and recite more of the matter of his sermons than of those of any other minister she was in the habit of hearing. She could not account for this; but she thought the fact was worthy of observation. The reverend gentleman remarked that he thought he could explain the cause. 'I happen,' he said, 'to make a particular point of classifying my topics—it is a hobby of mine to do so; and therefore I never compose a sermon without first settling the relationship and order of my arguments and illustrations. Suppose, madam, that your servant was starting for town, and you were obliged hastily to instruct her about a few domestic purchases, not having time to write down the items; and suppose you said, "Be sure to bring some tea, and also some soap, and coffee too, by the by; and some powder-blue; and don't forget a few light cakes, and a little starch, and some sugar; and, now I think of it, soda—you would not be surprised if her memory failed with regard to one or two of the articles." But if your commission ran thus: "Now, Mary, to-morrow we are going to have some friends to tea, therefore bring a supply of tea and coffee, and sugar and light cakes; and the next day, you know, is washing-day, so that we shall want soap, and starch, and soda, and powder-blue;" it is most likely she would retain your order as easily as you retain my sermon.'—*Smith's Irish Diamonds.*

TOLERATION OF FOLLY.

I have observed one ingredient somewhat necessary in a man's composition towards happiness, which people of feeling would do well to acquire—a certain respect for the follies of mankind: for there are so many fools whom the opinion of the world entitles to regard, whom accident has placed in heights of which they are unworthy, that he who cannot restrain his contempt or indignation at the sight, will be too often quarrelling with the disposal of things to relish that share which is allotted to himself.—*Man of Feeling.*

BEING AND SEEMING.

It has often struck me as remarkable, in regard to the great question of social happiness, that while so much stress is laid upon the sayings and doings supposed to promote or prevent it, such slight attention should be paid to the state of those deep inner agencies of thought and feeling which silently and secretly are producing by far the greater part of human weal or wo.

Children, and young persons in general, are involuntary and wonderful expositors of the interior nature of those with whom they have to deal. In vain would a sour morose-tempered person array his face in smiles, and offer the most tempting baits to procure their favourable notice. It may be granted him for the moment, in order to secure some proffered pleasure; but honest instinct, long before intelligence is mature enough to define the nature of sympathy or antipathy, will prompt the recoil which unamiable tempers always suggest. As acutely and rapidly also will these intuitive critics take the measure of the mind, and the value of the principles of those who are deputed to govern them. You expect, Mrs or Miss Teacher, as the case may be, that all your excellent precepts and instructions will be as earnestly and satisfactorily received by your pupils as they are delivered by you. Not a shadow of doubt enters your well-intentioned imagination respecting their entire conviction of your being yourself as admirable and praiseworthy a person as you are so strenuously recommending them individually to become: but be assured, my friend, that if you are not at heart a lover and practiser of the principles you advocate, your exhortations will be to them but 'as sounding brass and tinkling cymbals.' The under-current of *realities* is quietly and unconsciously sweeping away with it all the chaff that lies upon the surface, and with unerring sureness will land you exactly in the place and position that belong to you, both as regards your pupils and everybody else.

'Nobody,' it is said, 'is a hero to his valet-de-chambre;' but more truly may it be affirmed that nobody is a deceiver to those with whom he dwells. The atmosphere of spirit is the most potent of all atmospheres; and not more surely does the sun radiate light and heat, than the inner nature of the human being radiates its actual condition on all within its sphere.

What, then, will be the practical inference to deduce from these considerations? Would you like to know, sweet, hopeful seventeen, with but little brought away from the boarding-school (excepting, perhaps, your knowledge of arithmetic) that can be of much service to you in your journey through life? The practical inference, then, is, that you should aim to *be*, rather than to *seem*; and to think and feel rightly, rather than to express yourself so; and this not merely because

you would thereby be fulfilling your duty, but because it is of no avail to do otherwise.

'Of no avail!' methinks I hear you exclaim, as in the rapid glance of thought you scan the number of pretty things—rather of the nature of phantasmagoria, indeed, than otherwise—which you have been taught to store up in your mind, as a kind of stock in trade, wherewith to traffic for the notice and admiration of your fellow-creatures. 'What! all my pretty smiles and curtsays at one fell swoop?' Alas! they may be, and no doubt they are, exceedingly pretty things; and, as our friends over the Atlantic might say, 'a considerable deal' of talk and excitement they may occasion in your behalf. But after all, you will find them only holiday things, merely to be put on and taken off with the company attire. It is not the talk and excitement which you or your accomplishments may occasion that will stamp your real acceptance with your fellow-creatures, any more than it is the pelting rain of a thunder shower that fertilises and refreshes the earth during the heats of summer; but just as by the noiseless and imperceptible falling of dew or of blight the real growth or decay of vegetation is produced, so by the silent but continuous emanations which proceed from your innermost habits of temper and feeling, will you really and enduringly, although unconsciously, exert your allotted influence in your allotted sphere.

'But what influence can I, or do I wish to exert,' you will perhaps reply, 'beyond that of making myself pleasant and agreeable to my immediate friends and connexions?' To which I must answer, that the strongest influence you or any one else can exert, is not necessarily nor generally that which is designed or desired to be established over the minds of others; because, comparatively speaking, but few persons, whatever may be the import of their words and deeds, either design or desire that the real workings of their thoughts and feelings should have any influence; although these, as I have already affirmed, are silently doing the work of our actual influence over each other. Assertion, however, is no argument. Let me therefore attempt, upon simple and rational, not to say obvious grounds, to set before you how it happens that, with so much anxiety and carefulness to present nothing but what is agreeable to observation, and thereby to secure a potent and praiseworthy influence over their fellow-creatures, so few persons succeed in their intentions.

I should say, then, that they fail in exciting *sympathy*. We are so constituted by a merciful and wise dispensation of Providence, as to be incapable of sympathising with anything that is not true. 'Ah, would that this were indeed the case!' I fancy I hear some fond and anxious parent say. 'Would that the son of my hopes and tenderest affections were incapable of sympathising with things and people that are false and

frivolous; I had not then lost him from my house and heart!

But, sorrowing parent, it was not by sympathy with evil that you have lost your child; but because he yielded himself to that low and inferior side of his nature which is only capable of being influenced by low and inferior gratifications, and which is as destitute of the capacity of being acted upon by sympathy as the beasts of the field. Sympathy is a holy thing, and only awakes and responds to truth. Hence it must be placed in certain conditions before it can act at all. Those conditions are not to be found in the intercourse which is based on a unity of animal spirits; neither do they exist in crowded assemblies, platforms, or any of the multitudinous gatherings where people play at make-believe with one another, and expect nothing so little as to meet with a word of nature or of truth; but they are to be found in the domestic and social circle, where intimate interests, like the friendly beams of the sun on the plants of the earth, assist in developing the interior character. It is here that the intercourse of human beings should awaken sympathy.

I say it should do so; for it is manifestly the design of Providence that a being so highly gifted as man, with sensibilities to beauty and truth, and with the faculty of speech to enable him to diffuse his impressions, should spread around him an influence with which his associates may sympathise and be refreshed; and where the moral feelings are in their right and healthy state, they do thus awaken the response in other minds which we call sympathy; but where they are not in their proper condition, they fail of exciting the pleasant emotion of sympathy; and their influence, instead of breaking forth into the outward manifestation of kindly, cheering, and affectionate intercourse, acts silently and inwardly, and for the most part unfavourably. Not always, however, are we to conclude that this is the case; for there may be a great deal of amiability and genuine kindness of heart concealed under the most invincible reserve; but assuredly the valuable part of the character will be no secret to those who are in constant and familiar habits of intercourse with such an individual: and that is the point of view from which we are considering the case, as being in fact the only point from which it concerns us to consider everything that bears upon conduct and happiness; for, let us be what we may in saloons and drawing-rooms, our actual state and its influence is established at home; and so true is this, that it has passed into a proverb, that 'you can never tell what people are till you come to live with them.' Would you, then, know what is your opinion of others, you will find, as occasions occur for developing it, that it is not formed so much upon what they have consciously and voluntarily exhibited of themselves, as upon what they have concealed; and that by far the most influential of the sentiments with which they have inspired you, are those which have been gradually growing in your mind, without any design or effort either on your part or on theirs to produce them; nay, that those silent and secret sentiments are sometimes of such a kind, that but for the circumstances which reveal them, you could not have credited their existence. Who is there that has made any way in life, but must occasionally have experienced the extreme difficulty of finding a really faithful and trustworthy person, when a service involving strong temptation to act dishonourably is to be depured? Yes, I must indeed repeat the query, my dear Mrs Fairmile, though you do so zealously repudiate the idea of any well-educated

high-minded person being at any time, or under any circumstances, inclined to act dishonourably. I will even put the case to yourself, and ask if you could name, in a moment, the individual whom you would send upon an errand to your writing-desk, with letters lying open therein that you were most particularly unwilling any eye but your own should look upon? Far be it from me to doubt whether you could find such a one: I only say you would have to consider a little about it; and this I will be bold to affirm respecting the persons whom you might possibly think trustworthy on such an occasion, that your confidence in them would not be founded so much on what you may have seen or heard of them, as on the quiet, gradual, and unconscious way in which your mind has sympathised with the good that was silently radiating its truth out of theirs. What have we then to do, but to sweep away from our minds the superficial and the artificial, not merely as wrong, but as useless? What you are, is the measure of your influence; and it is comfortable to the simple-minded and honest-intentioned to believe (as they most certainly may), that however strong the tide of human folly and corruption may for a time beat against them, even till they are ready to say, with one of old, 'Surely I have cleansed my heart in vain, and washed mine hands in innocency,' yet life, in its ever-open, ever-varying pages, has still a leaf to turn for them, wherein they will see recorded in their behalf a strong testimony to the power of that influence which waits upon reality.

AN INCIDENT OF CIVIL WAR.

About the middle of the month of June 1835, the city of Bilbao, in northern Spain, then held by a strong garrison of the Christino troops, was invested by the Carlist force under the immediate command of the celebrated Tomas Zumalacarrgui. The queen's troops were well supplied with provisions, arms, and all the munitions of war, and enjoyed, besides, an uninterrupted communication with the sea, which was little more than four miles distant, by the river Nervion, on the banks of which Bilbao is situated; whilst the appointments of the besieging army were so utterly wretched in every particular, that nothing but the strongly-urged personal request of Don Carlos himself induced Zumalacarrgui, much against the dictates of his own better judgment, to enter on the task at all.

The feeble operations of the besieging force had proceeded for about ten days—Zumalacarrgui having been removed to a distance, in consequence of a wound received on the second day of the siege, which ultimately caused his death—when, an hour after nightfall, a young man, enveloped in a large cloak, underneath which he wore the uniform of a Carlist officer, entered the grounds adjoining an elegant mansion situated close to the sea-shore, on the opposite bank of the river to that occupied by the forces of Don Carlos. The officer was the only son, indeed the only child, of Don Ricardo Silva, the proprietor of the house and grounds. At the breaking out of the civil war, he had taken up arms as a volunteer in the Carlist cause, and at an early period had been rewarded for his gallantry and zeal with a commission. From that time circumstances had not permitted him to revisit his parental home until now, when, the regiment to which he was attached forming a part of the force investing Bilbao, he gladly availed himself of what he deemed a favourable opportunity for that purpose. Before leaving the Carlist camp, he made inquiry of a soldier named

Murito, serving in the ranks of his own battalion—who had deserted from the Christino garrison at the commencement of the siege, and who might be supposed to be tolerably well acquainted with the habits of the queen's troops in the locality—as to the danger he was likely to incur of falling in with any of them on that side of the river, which was occupied by them exclusively. The man assured him that, even previous to the investment of the place, the troops were not allowed to remain without the gates after sunset on any pretext; and that he might proceed after that hour to his father's residence, and return in perfect safety, provided his stay was not prolonged beyond sunrise on the following morning. Relying on this assurance, therefore, Lieutenant Silva had proceeded on foot along the river on that side occupied by the Carlists, until he had arrived opposite his father's mansion, when, hailing a fisherman, he was ferried across, and in a few minutes more was sheltered beneath the parental roof.

On the warmth of the greeting which welcomed him, after an absence of years, during which he had been exposed to all the vicissitudes of a cruel and exterminating warfare, we need not dwell. Under such circumstances, it will be readily conceived that by the little party, composed of the young man and his parents, the lapse of time was unheeded; minutes and hours flew swiftly by. Midnight had long been past; but as the lieutenant proposed starting on his return by daybreak, beyond which time it would be imprudent for him to remain on the Christino side of the river, none thought of retiring to rest. It wanted still some hours of dawn, when, during a momentary pause in the conversation, a distant tinkling sound, borne on the night wind, caused the youth to start from his seat and throw open the casement, which looked upon the lawn in front of the mansion. A moment of breathless suspense followed, then a freshening of the breeze, and with it a renewal of the sound, which his practised ear now readily distinguished as the ringing of hoofs and the clank of cavalry equipments. Such sounds heard on *this* side of the river plainly told him that the enemy was at hand, and needed not the additional evidence to that effect which was furnished in another minute by the sight of the lance-flags and shakos, the shape of which, sharply defined and relieved against the bright moonlit sky, bespoke the appearance of a Christino squadron. At the same time they left the high road, and entering the grounds of Don Ricardo, advanced at a rapid pace towards the house; thus rendering their intention, however mysterious the source of their information, but too obvious—the arrest of the Carlist officer.

Lieutenant Silva and his parents were too well acquainted with the atrocious and unrelenting system of extermination which characterised the proceedings of the belligerent parties in the Carlist war, not to know that arrest under such circumstances was synonymous with death; that should a Christino prison once close upon him, it would open only to conduct him to a bloody grave. Paralysed by the unexpected appearance of the foe, the alarmed group stood for a few seconds in a state of indecision. The young soldier was the first to recover presence of mind. Extinguishing the lights which stood on the table, he announced his intention of descending into the Fiend's Fishpond, whence, after the withdrawal of the Christinos, he could be easily extricated, and ferried across the river. The Fiend's Fishpond was a frightful pit in the garden immediately behind the mansion, similar in form to a draw-well, and about twenty feet in diameter, produced apparently by some convulsion of nature, and deriving its singular appellation from some wild legend having its origin in the superstition of the neighbouring peasantry. Being situated within a few yards of the shore, a subterraneous communication existed between it and the sea, which had never indeed been explored, but the existence of which was evident from the fact, that the water in the Fishpond rose and fell with the tide. To a distance

of several fathoms below the surface of the earth, the sides of the pit were straight and smooth as a wall; but it had been ascertained that, at a considerable depth, a projecting ledge of rock, a couple of feet in breadth, ran round its entire circumference, which at low water was left completely bare, and on which, at such times, one might sit or stand in safety for some hours—it being again submerged by the rising of the water to the depth of three or four fathoms, according to the state of the tide, whether spring or neap. When crossing the river from the Carlist side, the young man had observed that the tide was rapidly falling; and knowing, from the interval that had elapsed, that it must be now about low water, he prepared at once for the descent. This was an achievement which, however frightful to look upon, was in reality not attended with any excessive danger to one of steady nerves, when properly assisted from above; his ultimate safety, of course, depending on his being withdrawn before the rising of the tide. In fact, young Silva had more than once performed the feat in his boyish days, and now felt no hesitation in resorting to it again as the only means of escape from a remorseless and unsparing enemy. In a much shorter time, therefore, from the first alarm, than we have taken to describe the spot, he stood with his agitated father at the mouth of the black and gaping chasm, from which distinctly ascended the hoarse bellowing of the vexed torrent far below, as it rushed through the concealed outlet to the sea. A stout rope secured round his middle, the young man let himself cautiously over the edge; the remainder of the cord being wound round the trunk of a fruit tree, whilst Don Ricardo firmly grasped the extremity, 'paying it out' by degrees. After the lapse of a few anxious minutes, the Don felt the strain relax, a proof that the young man had reached his resting-place; then the vibration of the cord announced that he had cast it off; and then a shout from below conveyed the signal to withdraw it. The only approach for horsemen through the grounds being very circuitous, Don Ricardo was enabled to reach the house and take his seat in the drawing-room before the dragoons pulled up at the door.

A dozen of their number instantly dismounted, and surrounded the house, whilst their officer knocked loudly for admittance. The door having been opened by Don Ricardo in person—the domestics having long before retired to rest, as it was not deemed prudent to inform them of the presence of the young man—the Christino leader recognised him at once as evidently the proprietor of the mansion.

'You keep late hours, Don Ricardo Silva,' he commented. 'May I take the liberty of inquiring whether you have had any visitors this evening?'

'My family is a small one, captain,' replied Don Ricardo, endeavouring to disguise his anxiety under a feint smile; 'and in the present disturbed state of affairs, we never have any visitors beyond our own circle.'

'If I mistake not,' said the other, 'you have a son among the rebels in the pay of Don Carlos. May I ask, without giving offence, when you heard from him last?'

'The last letter I received from him,' replied the father, 'is dated several months back.'

'Strange,' observed the Christino, 'that I should happen to be so much better informed about him than yourself! Now, were I to venture a guess as to his whereabouts, I should say he was at this moment beneath this very roof.'

Don Ricardo vehemently, and indeed truly, denied the fact of his presence *beneath the roof*; but, as may be supposed, his protestations met with little credit. A guard was placed over him and his lady in the apartment in which they had been sitting; the domestics were summoned, and put under similar restraint in another; and the remainder of the dragoons were ordered to dismount and search the house.

An hour subsequently, when every nook and cranny of the building, with the out-offices and garden, had

been ransacked—of course fruitlessly—the commander of the Christino party again entered the apartment in which the Don and his lady were detained, and informed them, that as it was evident the young man had made his escape before the queen's troops had reached the house, it became his duty to convey them both to Bilbao, to render an account for having harboured and connived at the escape of a rebel. This was a blow which they had never anticipated, and for which they were wholly unprepared. None but themselves being privy to the fact of the young man's concealment in the Fiend's Fishpond, to convey them to Bilbao, and leave him to await the rising of the tide, would be to doom him to certain death. Even as it was, the latest period at which he could be withdrawn with life was approaching with fearful rapidity. Horrified at the prospect, the anguished mother shrieked and fainted; whilst the stout-hearted Don himself could not so control his emotions as to prevent the officer from discovering that some deeper influence was at work than the mere dread of the inconvenience to which they would themselves be exposed, trifling as it must prove in the absence of all positive evidence that young Silva had really been there at all. This of course but confirmed him in his previous intention of taking them to Bilbao; for which place, accordingly, the entire party, including the almost broken-hearted parents, started in a short time afterwards.

As our object is not to describe feelings, but to record facts, we shall not dwell upon the sufferings of Don Ricardo and his lady throughout that dreadful night. The reader can readily imagine how at one moment they would almost resolve to risk all, and reveal the fact, and, rescuing their child from the horrors of the frightful grave into which he had been lowered by his father's hand, procure for him, at all events, the respite of an hour, and the privilege to look once more, before he died, on the light of the sun; and how, at the next, they would determine to confide him to the bounty of that Providence who holds the waters in the hollow of His hand, and bow in submission to His will, rather than become themselves the instruments in revealing the place of his concealment, and betraying him into the hands of men whose 'tender mercies were cruel.' Let it suffice to say, that when, towards the close of the following day, they were led forth from the prison in Bilbao, in which they had been immured, and informed they were at liberty to return to their mansion, the locks of the gentleman, which, though he had passed the middle age, on the previous evening had been black and glossy as the raven's wing, were white as if the snows of seventy years had descended on his head—the lady was an idiot.

Neither need we expatiate on the feelings of young Silva, as he beheld—if indeed such an expression be correct as applied to his sensations amid the thick darkness which reigned eternally within the frightful recesses of that horrid cavern—the gradual approaches of apparently inevitable death; the rising waters gradually ascending to the level of the ledge on which he stood—to his knees; his hips; his middle; his armpits. Conscious by this time that something extraordinary had occurred to prevent his parents from effecting his release, all hope of life had faded, and what he deemed a last prayer to Heaven was quivering on his lips, when a loud shout from the mouth of the pit drove the blood, which had begun to stagnate round his heart, again like lightning through his veins. Prompt as the echo was his reply; and the next moment the cord from above struck the water within reach of his arm. With all the despatch which his numbed fingers would permit, he fastened it around him, and announcing his readiness by another shrill cry, was drawn in safety to the top.

He learned, on inquiry, that a neighbouring peasant, tempted by the luscious fruits with which the trees in Don Ricardo's garden were loaded, had, on the very night in question, ventured on a predatory excursion

against them: and was actually employed in filling a bag with his spoils, when he was alarmed by the entrance of the young man and his father, as related, on the appearance of the Christino cavalry. Taking refuge in a clump of flowering shrubs, he had been an unseen observer of the young man's descent into the Fishpond, and of all the subsequent occurrences. Readily comprehending the entire affair, the honest fellow watched the dragoons clear of the grounds, and knowing that not a moment more was to be lost, procured a rope, and hastened again to the spot, when the result was as we have already described. He now related to young Silva the substance of a singular conversation which, as he lay concealed, he had overheard between the Christino commander and his subordinate officer. In reply to some inquiry of the latter concerning the authority of his information with reference to the visit of the Carlist officer, 'Oh,' said the superior in a significant tone, 'my intelligence must be authentic, since I have had it from on high.'

'What!' exclaimed the subaltern laughingly; 'have you got a correspondent in heaven?'

'Why, not exactly,' was the reply; 'my correspondent is yet a resident on earth, and yet I receive his communications literally from the clouds. At another time, however, I may give you further information concerning my celestial informant. At present, I am not at liberty.'

The peasant who related this strange conversation discovered nothing in it beyond an unmeaning jocularity bordering on profanity; but Silva, who, during his seclusion, had naturally been speculating on the probable channel through which the Christinos had obtained information of his presence, conceived it to convey much more than met the ear, and to want but a certain key to explain the import of its mysterious allusions. A few minutes afterwards, he found lying on the floor of the hall what a little reflection led him to regard as furnishing the key which he required. This was nothing more than a scrap of paper, less than the palm of a man's hand, greatly crumpled, as if it had been rolled up and thrust into a small space, much soiled, and slightly burned, on which was written, in characters almost illegible, from the treatment it had undergone—'Silva, lieutenant, — battalion Carlist infantry, will spend to-night at his father's house on the river side, close to the shore. Sergeant — knows the spot, and can guide a party thither.' Having read this important document, which had been accidentally dropped by the Christino officer, and examined its appearance attentively, noting the burn, he raised it to his nose, when it decidedly smelled of gunpowder. He immediately crossed the river, and in another hour was safe within the Carlist lines, when his first act was to wait on the colonel of his battalion, recount the events of the night, and acquaint him with the suspicions he had formed.

It is necessary to state here that Silva's battalion was posted on a steep height immediately overlooking, indeed overhanging, Bilbao, and that so closely, that it terminated on the side next the city in a perpendicular cliff, which actually formed part of the wall bounding the military ground appropriated to the use of the queen's garrison in the city; so that any object thrown from the top would necessarily, after a descent of between three and four hundred feet, fall within the limits of the beleaguered town. On the table-land at the top of this dizzy height a Carlist sentry was regularly stationed, whose chief business was to observe the movements of the Christino troops below, and report accordingly to his superiors. It had been remarked, that so inveterate was the hostility of the man Murito — of whom mention has been already made as having, at an early period of the siege, deserted from the garrison — towards his former comrades, that invariably, on being relieved from his guard, he proceeded to the edge of the cliff and discharged his musket at the Christinos beneath, the great height of the precipice precluding all danger from a return of the fire. Lieutenant Silva

remembered having made inquiry of this man concerning the safety of the road adjoining his father's residence, and felt convinced that no other individual in the Carlist camp was acquainted with his intention of proceeding thither at all.

Nothing further of importance transpired that day. Towards the close of the next, it happened to be Murito's turn again to mount guard at the top of the cliff. As the hour which would terminate his guard approached, Lieutenant Silva and his colonel appeared sauntering along the platform, and shortly after the relief arrived. The customary form having been gone through, the fresh sentry took his post, and Murito was about to advance, as usual, to have a shot at his friends below. To his surprise the non-commissioned officer of the guard seized his musket, and at the same moment he found himself in the iron grasp of the men. The charge of his musket was drawn upon the spot, when it was discovered that, instead of the blank end of the cartridge, the ball had been bitten off in loading; whilst, rammed down over the wadding, was found a slip of paper, containing the words, in the handwriting of Murito—'Zumalacarregrui is dead: the siege must soon be raised if the garrison hold out.' This discovery fully vindicated the justice of the suspicions which Silva had formed concerning the mysterious allusions of the Christiano officer to his intelligence received 'from on high,' and the information communicated to him 'from the clouds.' Silva inquired whether he should order the man to the guardhouse to undergo his trial by court-martial; but the sergeant bluntly suggested to his commander the propriety of ordering out a firing party on the spot, and bringing the matter to a summary conclusion.

'Your suggestion is the better of the two, sergeant,' replied the colonel, smiling grimly. 'I shall adopt neither, however, but make the fellow the bearer of his own correspondence. Death by the bullet is the fate of brave men and true soldiers, and ammunition is not so plenty that I can afford to waste a cartridge on a traitor. Pin the paper to the scoundrel's breast,' he shouted, 'and pitch him over to convey it to his friends below.'

The blood of Silva ran cold at this terrible doom, and he attempted a remonstrance on behalf of the miserable culprit; but the colonel was inflexible. The men to whom the order was given were seldom troubled with scruples; and if they had been, the treachery of a comrade would have effectually silenced them. The paper was actually pinned to the breast of the terror-palsied wretch; he was lifted from the ground, and carried to the edge of the cliff by half-a-dozen pairs of sinewy arms. The Christiano sentry at the foot of the precipice was startled by a piercing shriek, as of one in mortal agony, in the upper air—then followed a swift rushing sound, and then a mass of lifeless humanity lay at his feet.

Years elapsed ere the restoration of tranquillity permitted the young Carlist officer again to visit his parental home. In the interval, all that medical skill could effect had been resorted to for the restoration of Donna Silva to her proper mind; but the occurrences of one fearful night appeared to have driven reason from its throne for ever. On the arrival of her son, however, it was resolved by the medical advisers, with Don Ricardo's consent, to try the effect of his abrupt appearance in her presence, all other resources having failed. On his introduction to the room in which she sat, her countenance was bent towards the ground, and she seemed utterly regardless of the presence of a stranger. He addressed her: she started to her feet at the first accents of the voice which she had deemed choked for ever amid the rushing waters of the Fiend's Fishpond. She gazed upon him—the pallid cheek glowed again—the vacant, lack-lustre eye flashed with the light of intellect—with a wild scream of delight she bounded toward him, clasped him in her arms, and sunk upon his bosom. Her embrace was long. The medical

attendant at length raised her head. 'She has fainted,' whispered her son. 'She is dead!' solemnly replied her husband. And so it was. The struggle had been too great; and her gentle spirit had passed away to the place where 'the wicked cease from troubling, and the weary are at rest.'

FLOWER-WORSHIP.

A SUPERSTITIOUS veneration for particular flowers—in other words, flower-worship—is an ancient, and, in some respects, a poetical variety of the depraved systems of religious homage into which certain of the human family have fallen. It is to be traced ages back in the religious observances of the Hindoos, and among the more enlightened Chinese: it formed an important part of the mysteries of Egyptian idolatry; and it is remarkable that the past and present monuments of the Mexicans exhibit, and with great prominence, the same feature; while at an earlier period than the present, certain flowers were regarded even by some Europeans with a degree of veneration only too closely approximating the more declared feeling of flower-worship. There is a love for these beautiful creations innate in the constitution of the human being, and participated in equally by civilised and savage men. Their exquisite attributes of painting and perfume address themselves directly to our more refined feelings, while they have a tendency to direct upwards to the God that made them: the grievous error lay in not stopping short before these feelings became idolatry. It will be easily conjectured that no temperate region was the parent of the superstition. It arose in those warmer latitudes where the vegetable world has been endowed with a vigour of growth, and gorgeousness of apparel, of which austerer climates are ignorant. Its aspect indeed is most imposing, and, to be fully realised, must be beheld. In the few exiles which pass an artificial existence in our stoves, we are supplied with some faint and feeble types of the vegetable glories of the tropics; and even these will produce an impression not soon effaced from any cultivated mind. But there, where the Indian, penetrating the hot, damp jungles of his forests, suddenly comes upon a great, glowing, wonderfully-formed and tinged orchid, squatting like some animated being upon a shaggy trunk, or where the Hindoo paddles across a blue lake, literally paved with lotus-flowers, it is not a violent supposition that the spectacle will impress him with feelings akin to awe. The next step is not difficult to be foreseen. As flower-worship took its origin, so, alas! it retains its existence, only among the most ignorant of the human family. Perhaps the singularity of the subject, coupled with the brevity of our notice of it, may be an apology, if one is requisite, for its introduction in these pages.

Humboldt and Bonpland, in their splendid work on *Equinoctial Plants*, give an account of a very curious tree called by the Mexicans by the dreadful title of the *Macpalxochiquaukitl*!—which signifies *hand, flower, tree*. Its botanical title is almost as long, but is a trifle more euphonious—the *Cheirostemon platanoideus*. There existed only one specimen of this sacred tree in all Mexico, at least to the knowledge of the Mexicans; and this circumstance, added to the really remarkable aspect of the flowers, appears to have won for it the veneration of the Indian population. From the centre of the flower there springs a columnar tube, which may be supposed to represent an arm and wrist; and this then breaks into five stamens, coloured blood-red, and disposed after a manner not very dissimilar to the arrangement of the fingers and thumb of the human hand. The very points of these vegetable fingers are curved, and somewhat resemble the formidable ungulated talons with which painters delight to ornament the hands of witches and demons. These parts of the flower are of a considerable size, and project in a menacing manner some distance above the petals. It may easily, therefore, be conceived that a

high and noble-looking tree—for such it is—laden with flowers of such marvellous configuration, brandishing aloft, in fact, a thousand gory hands, was an object likely to excite in no ordinary degree the superstitions, and even the terrors, of the ignorant. The tree was worshipped by thousands; it was believed to be the only specimen in the world of its kind; and the opinion was common that any attempt to propagate it would prove abortive. A great number of seeds was procured by our travellers, planted, and watched over with the most sedulous care, but not one of them succeeded. So great, say they, was the veneration paid to it by the Indians, and so eagerly were the precious flowers thereof sought after, that they were frequently plucked long before their expansion; and the tree was consequently never suffered to ripen its fruit. In spite, however, of the firmest convictions of the indivisibility of this tree—the *Manitas*, as it is commonly called—it has been propagated by cuttings, some of which are at this moment thriving in some of the larger stoves of our modern collectors. The Messrs Loddiges were, and for aught we know to the contrary, are still possessed of a remarkably fine and healthy specimen. In Lyon's 'Journal of a Residence in Mexico,' he mentions having seen this famous tree, and confirms all that has been above written concerning it, adding, that as if to make the resemblance to a hand complete, the points of the fingers are terminated by processes resembling claws! Whilst the resemblance to the human hand was recognised in this instance, it would have been most strange had the remarkable race of mimics—the orchids—escaped observation or veneration. These plants, which have no parallel in nature for singularity, beauty, and fragrance, and which, in some of their species, imitate the most wonderful diversity of objects, are held in high veneration by the Mexicans. The Queen of the Orchids especially is inestimably prized; and others receive a subordinate measure of respect. Those who have access to Mr Bateman's splendid work on the Orchidaceae of Mexico and Guatemala, will find there several interesting particulars relating to this subject. In other countries, orchids have been objects of veneration.

The famed lotus-flower has a world-wide reputation for sanctity. It is not clear whether it belonged to the water-lily tribe, or to the *Nelumbiaceae*, or whether the lotus of one nation may not have belonged to one, and that of another to the other, of these tribes. The *Nelumbium* is a splendid water-flower, and is found floating in the pools and ditches of Asia, and in the Nile: it yields a nut which is supposed to be analogous with the sacred bean of the ancients. The flowers of both tribes are glorious objects—some are blue, white, yellow, rose-coloured; and they appear lovely in the extreme when resting on the bosom of the wave. The flower was worshipped alike in Egypt, taking a place in the mysteries of Isis and Osiris, as in India in those of Brahma. The sculptural remains of ancient Egypt abound with the sacred plant in every stage of its development, the flowers and fruit being represented with the utmost accuracy. Among the Hindoos it was considered an emblem of the world, and the flower was looked upon as the cradle of Brahma. It was used to decorate the temples of their idols, and laid as a most acceptable votive offering upon their altars. Sir George Staunton writes—'The Chinese always held this plant in such high value, that at length they regarded it as sacred. That character, however, has not limited it to useless or ornamental purposes. Their ponds, to the extent of many acres, are covered with it, and exhibit a very beautiful appearance when in flower.'* When Sir William Jones was on one occasion at dinner on the borders of the Ganges, desiring to examine the sacred flower, he despatched some of his people to procure him a specimen; it was brought to him, and immediately all his

Indian attendants fell on their faces and paid adoration to it.

The Malays have a more sordid flower-worship—they adore an imaginary flower of gold. They believe that there grows upon their sacred fig-tree a little flower of the most pure gold. It is a parasite, and opens and blossoms, they say, but once, and has the property of bringing vast wealth to its possessor. Thus much may at least be said of it—the flowers are golden, as far as colour goes. Loureiro, a writer on the Flora of Cochin China, says, that while he was resident in that empire, a large bunch of these priceless flowers was found by some fortunate person growing upon one of those sacred trees. Instantly he betook himself with his spoil to the emperor, at whose feet he deposited the treasure; for which, from being a common soldier, he was at once promoted to the highest rank, the emperor believing himself now possessed of infallible assurance of boundless wealth and happiness.

Perhaps, to take a final example nearer home, the Passion-flower, as nearly as could be, received homage from the fervent superstitions of the early discoverers of the new world. It was first found in the Brazils, and very soon the marvels which its discoverers pretended to behold in it became famous throughout Christendom. Its name is suggestive of the solemn reality it was romantically supposed to typify. As it became common, it lost its sacredness, and has the bare vestige of it now left in its name. Without multiplying examples, this may suffice to direct the reader's attention to an interesting, but to every right mind a sad and painful, subject of thought.

THE RIVER AMAZON.

'The country of the Amazon,' says Mr Edwards, 'is the garden of the world, possessing every requisite for a vast population and an extended commerce. It is also one of the healthiest of regions; and thousands who annually die of diseases incident to the climates of the north, might here find health and long life.* This river is the largest in the world. From a distance of about 200 miles from the Pacific, it continues navigable to its mouth in the Atlantic, 3000 miles by the course of the stream; and including its branches, it waters an area of 2,100,000 square miles, comprising one-third part of South America. The aggregate navigable length of this immense ramification of waters is said to be from 40,000 to 50,000 miles. The province of Pará alone, comprehending the most important part of the Amazon, contains an area of nearly a million square miles, with the most productive soil in the world, and an agreeable temperature, though under a vertical sun. This, Mr Edwards tells us, is owing to several causes. 'The days are but twelve hours long, and the earth does not become so intensely heated as where they are sixteen. The vast surface of water constantly cools the air by its evaporation, and removes the irksome dryness that in temperate regions renders a less degree of heat insupportable. And finally, the constant winds blowing from the sea refresh and invigorate the system.'

'I know not,' says Sir William Temple, 'whether there may be anything in the climate of Brazil more propitious to health than in other countries; for, besides what was observed among the natives upon the first European discoveries, I remember Don Francisco de Mello, a Portugal ambassador in England, told me it was frequent in his country for men spent with age or other decays, so as they could not hope for above a year or two of life, to ship themselves away in a Brazil fleet, and upon their arrival there, to go on to a great length, sometimes of twenty or thirty years, or more, by the force of that vigour they received with that remove.

* Embassy to China.

* A Voyage up the River Amazon, including a Residence at Pará. By William H. Edwards. London: Murray.

Whether such an effect might grow from the air or the fruits of that climate, or by approaching nearer the sun, which is the fountain of life and heat, when their natural heat was so far decayed, or whether the piecing out of an old man's life were worth the pains, I cannot say.' This is more true, Mr Edwards says, of the climate of Pará than of that of any other part of Brazil. The riches of this fine country embrace all the most valuable productions of the tropics; and the melancholy prejudices which elsewhere separate so effectually the working-classes (who must in such a climate be blacks) from the others, are here almost unfelt. 'Brazilian slavery, as it is, is little more than slavery in name. Prejudice against colour is scarcely known, and no white thinks less of his wife because her ancestors came from over the water. Half the officers of the government and of the army are of mingled blood; and padres, and lawyers, and doctors, of the intensest hue, are none the less esteemed. The educated blacks are just as talented and just as gentlemanly as the whites, and in repeated instances we received favours from them which we were happy to acknowledge.' What, then, renders Pará a poor and thinly-peopled territory, with land free of cost at the command of the immigrant; ground easily cleared; a fertile soil producing in extraordinary abundance sugar, rice, coffee, anatto, cotton, cocoa, gums, and drugs; and the general price of living marvellously low? The causes may be found in the legal disabilities under which settlers labour—dishonest officials, a debased currency, high import duties, and burdens upon exports which neutralise both the beneficence of nature and the industry of man. 'There is scarcely a product raised in the two countries in which Brazil could not undersell the United States in every market of the world, were it not for this tax. Its cotton and rice, even during the past year, have been shipped from Pará to New York; its tobacco is preferable to the best Virginian, and can be raised in inexhaustible quantities.' In a word, Pará is a province of the vast Brazilian empire, which is falling to pieces through its own weight.

A visit to such a country cannot fail to be interesting, and the fact is proved by a readable book upon the subject, such as the one before us, having been dashed off by a sportsman author, who does not describe very well, who does not philosophise at all, and whose knowledge of science is confined to the nomenclature of ornithology. Notwithstanding these drawbacks, the book is readable, as we shall proceed to prove, by transferring to our columns some of its morpoux of instruction or entertainment. The author is an American, who left New York for Pará upon an excursion of pleasure and curiosity.

The lower classes throughout the province live chiefly upon farinha, and a dried and salted fish called pericu. The plant producing the farinha is known by us as *cassava*. 'The stalk is tall and slender, and is divided into short joints, each one of which, when placed in the ground, takes root, and becomes a separate plant. The leaves are palmated, with six and seven lobes. The tubers are shaped much like sweet potatoes, and are a foot or more in length. They are divested of their thick rind, and grated upon stones, after which the mass is placed in a slender bag of rattan six feet in length; to this a large stone is appended, and the consequent extension producing a contraction of the sides, the juice is expressed. The juice is said to be poisonous, but is highly volatile. The last operation is the drying, which is effected in large iron pans, the preparation being constantly stirred. When finished, it is called farinha, or flour, and is of a white or brown colour, according to the care taken. In appearance it resembles dried crumbs of bread. It is packed in loose baskets lined with palm-leaves, and in the bulk of eighty pounds, or an *alquier*. Farinha is the substitute for bread and for vegetables. The Indians and blacks eat vast quantities of it, and its swelling in the stomach produces that distension observable in the children.' The fish is thus

noticed. 'Not long after noon, we stopped at a house where a number of Indians were collected about a pericu, which they had just caught. This was the fish whose dried slabs had been our main diet for the last few weeks, and we embraced the opportunity to take a good look at so useful a species. He was about six feet long, with a large head and wide mouth; and his thick scales, large as dollars, were beautifully shaded with flesh colour. These fish often attain greater size, and at certain seasons are very abundant, especially in the lakes. They are taken with lances, cut into slabs of half an inch thickness, and dried in the sun after being properly salted. It is as great a blessing to the province of Pará as cod or herring to other countries, constituting the main diet of three-fourths of the people.'

The living of another class of society is more varied. 'At six in the morning coffee was brought into our room, and the day was considered as fairly commenced. We then took our guns, and found amusement in the woods until nearly eleven, which was the hour for breakfast. At this meal we never had coffee or tea, and rarely any vegetable excepting rice; but rich soups, and dishes of turtle, meat, fish, and peixe boi, in several forms of preparation, loaded the table. The Brazilian method of cooking becomes very agreeable when one has conquered his repugnance to a slight flavour of garlic and the turtle-oil used in every dish. The desert consisted of oranges, pacoas, and preserves. Puddings, unless of tapioca, are seldom seen, and pastry never, out of the city. Water was brought, if we asked for it; but the usual drink was a light Lisbon wine. The first movement upon taking our places at the table, was for each to make a pile of salt and peppers upon his plate, which, mashed and liquefied by a little caldo or gravy, was in a condition to receive the meat. A bowl of caldo in the centre, filled with farinha, whence every one could help himself with his own spoon, was always present. The remainder of the day we spent in preserving our birds, or, if convenient, in again visiting the forest. The dinner-hour was between six and seven, and that meal was substantially the same as breakfast.' The following picture of a country-house, in which much entertainment is to be had by all comers, is interesting. 'This was the first decidedly Brazilian country-house that we had visited, and a description of it may not be uninteresting. It was of one storey, covering a large area, and distinguished in front by a deep veranda. The frame of the house was of upright beams, crossed by small poles, well fastened together by withes of sapaw. A thick coat of clay entirely covered this both within and without, hardened by exposure into stone. The floors were of the same hard material; and in front of the hammocks were spread broad reed-mats, answering well the purpose of carpets. Few and small windows were necessary, as the inmates of the house passed most of the day in the open air, or in the veranda, where hammocks were suspended for lounging, or for the daily siesta. The roof was of palm thatch, beautifully made, like basket-work in neatness, and enduring for years. The dining-table stood in the back veranda, and long benches were placed by its sides as seats. Back of the house, and entirely distinct, was a covered shed used for the kitchen and other purposes. Any number of little negroes, of all ages and sizes, and all naked, were running about, clustering around the table as we ate, watching every motion with eyes expressive of fun and frolic, and as comfortably at home as could well be imagined. Pigs, dogs, chickens, and ducks assumed the same privilege, notwithstanding the zealous efforts of one little negro, who seemed to have them in his especial charge.'

Such settlements, as may be supposed, occur only here and there in the midst of a wild and partially-known country. 'The whole region north of the Amazon is watered by numberless rivers, very many of which are still unexplored. It is a sort of bugbear country, where cannibal Indians and ferocious animals abound to the destruction of travellers. This portion of Brazil has

always been fancy's peculiar domain, and even now, all kinds of little El Dorados lie scattered far far through the forest, where the gold and the diamonds are guarded by thrice horrible Cerberus. Upon the river-banks are Indians, watching the unwary stranger with bended bow and poisoned arrow upon the string. Some tribes, most provident, keep large pens akin to sheepfolds, where the late enthusiastic traveller awaits his doom as in the cave of Polyphemus. As if these obstructions were not enough, huge nondescript animals add their terrors; and the tormented sufferer makes costly vows, that, if he ever escapes, he will not again venture into such an infernal country, even were the ground plated with gold, and the dew-drops priceless diamonds. Some naturalist Frenchman, or unbelieving German, long before the memory of the present generation, ventured upon some inviting stream, and you hear of his undoubted fate as though your informant had seen the catastrophe. In instances related to us, no one seemed to allow that one might die in the course of nature while upon an exploring expedition, or that he might have had the good fortune to have succeeded, and to have penetrated to the other side. The natives, so far as our author knew them, do not appear to be a very interesting people, although the Indian girls are, with hardly an exception, pretty. One of their odd customs seems to be occasionally adopted by the European masters of their country. 'We were struck, at Brava, by the appearance of some Portuguese boys, whose teeth had been sharpened in the Indian manner. The custom is quite fashionable among that class who come over seeking their fortunes, they evidently considering it as a sort of naturalisation. The blade of a knife or razor is laid across the edge of the tooth, and by a slight blow and dexterous turn a piece is chipped off on either side. All the front teeth, above and below, are thus served; and they give a person a very odd, and, to a stranger, a very disagreeable appearance. For some days after the operation is performed, the patient is unable to eat or drink without severe pain; but soon the teeth lose their sensitiveness, and then seem to decay no faster than the others.' One of the weapons of these Indians is the curious and formidable blowing-cane. 'This is eight or ten feet in length, two inches in diameter at the larger end, and gradually tapering to less than an inch at the other extremity. It is usually formed by two grooved pieces of wood, fastened together by a winding of rattan, and carefully pitched. The bore is less than half an inch in diameter. The arrow for this cane is a splint of a palm one foot in length, sharpened at one end to a delicate point, and at the other wound with the silky tree-cotton to the size of the tube. The point of this is dipped in poison, and slightly cut around, that, when striking an object, it may break by its own weight, leaving the point in the wound.'

The following reference to another species of natives is more full and distinct than is usual with our author. 'The turtles are a still greater blessing to the dwellers upon the upper rivers. In the early part of the dry season these animals ascend the Amazon, probably from the sea, and assemble upon the sandy islands and beaches left dry by the retreating waters in the Japura and other tributaries. They deposit their eggs in the sand; and at this season all the people, for hundreds of miles round about, resort to the river-banks as regularly as to a fair. The eggs are collected into montarias or other proper receptacles, and broken. The oil floating upon the surface is skimmed off with the valves of the large shells found in the river, and is poured into pots, each holding about six gallons. It is computed that a turtle lays one hundred and fifty eggs in a season. Twelve thousand eggs make one pot of oil, and six thousand pots are annually sent from the most noted localities. Consequently seventy-two millions of eggs are destroyed, which require four hundred and eighty thousand turtles to produce them. And yet but a small proportion of the whole number of eggs are broken. When fifty days

have expired, the young cover the ground, and march in millions to the water, where swarms of enemies more destructive than man await their coming. Every branch of the Amazon is resorted to, more or less, in the same manner; and the whole number of turtles is beyond all conjecture. Those upon the Madeira are little molested, on account of the unhealthiness of the locality in which they breed. They are said to be of a different and smaller variety from those upon the Amazon. We received a different variety still from the Branco, and there may be many more yet undistinguished. The turtles are turned upon their backs when found upon the shore, picked up at leisure, and carried to different places upon the river. Frequently they are kept the year round in pens properly constructed, and one such that we saw at Villa Nova contained nearly one hundred. During the summer months they constitute a great proportion of the food of the people; but when we consider their vast numbers, a long period must elapse before they sensibly diminish. Their average weight when taken is from fifty to seventy-five pounds, but many are much larger. Where they go after the breeding season no one knows, for they are never observed descending the river; but from below Pará, more or less, are seen ascending every season. They are mostly caught at this time in the lakes of clear water which so plentifully skirt either shore, and generally are taken with lances or small harpoons as they are sleeping on the surface. But the Muras have a way of capturing them peculiar to themselves—shooting them with arrows from a little distance, the arrow being so elevated, that, in falling, it strikes and penetrates the shell. In this even long practice can scarcely make perfect; and fifty arrows may be shot at the unconscious sleeper before he is secured.'

We now give an anecdote of a parrot that is worth all the rest of the natural history in the volume. 'Where we stopped next morning, the 14th, the whole region had been overflowed upon our ascent. Now the waters had fallen three feet, and the land was high and dry, and covered by a beautiful forest. While at this place, extraordinary noises from a flock of parrots at a little distance attracted our attention. At one instant all was hushed; then broke forth a perfect Babel of screams, suggestive of the clamour of a flock of crows and jays about a helpless owl. It might be that the parrots had beleaguered one of these sun-blinded enemies, or perhaps the assembly had met to canvass some momentous point—the overbearing conduct of the araras, or the growing insolence of the paroquets. Guns in hand, we crept silently towards them, and soon discovered the cause of the excitement. Conspicuously mounted upon a tree-top stood a large green parrot, while around him, upon adjacent branches, were collected a host of his compeers. There was a pause. "Oh Jesu—u!" came down from the tree-top, and a burst of imitative shrieks and vociferous applause followed. "Ha, ha, ha—a!" and Poll rolled his head, and doubled up his body, quite beside himself with laughter. Tumultuous applause and encores. "Ha, ha, ha, Papaguyri—a!" and he spread his wings, and began to dance on his perch with emphasis. The effect upon the auditory was prodigious, and all sorts of rapturous contortions were testifying their intelligence, when some suspicious eye spied our hiding-place, and the affrighted birds hurried off, their borrowed notes of joy ludicrously changed to natural cries of alarm. Complacent Poll! he had escaped from confinement, and with his stock of Portuguese was founding a new school among the parrots.'

The traveller found the parrots with which he had freighted his boat on the return somewhat troublesome creatures. 'We longed to know what sort of arrangements Noah made for his parrots. Thus far ours had been left pretty much to their own discretion, and the necessity for an immediate "setting up of family government" was hourly more urgent. The macaw, no-wise contented with his elevation, had climbed down,

and was perpetually quarrelling with a pair of green parrots, and all the time so hoarsely screaming, that we were tempted to twist his neck. The parrots had to have a pitched battle over every ear of corn, and both they and the macaw had repeatedly flown into the water, where they but narrowly escaped a grave. There were two green paroquets, and one odd one, prettiest of all, with a yellow top, and they could not agree any better than their elders. Yellow-top prided himself on his strength, and considered himself as good as a dozen green ones; while they resented his impudence, and scolded away in ear-piercing tones that made the cabin an inferno. At other times they all three banded together, and, trotting about deck, insulted the parrots with their impertinences. When a flock of their relations passed over, the whole family set up a scream which might have been heard by all the birds within a league; and if a duck flew by, which was very often, our geese would call in tones like a trumpet, and the guan would shrilly whistle. When we came to the shore, we were obliged to shut up our protégés in the tolda, or they were sure to scramble up the nearest limb, or fly into the water, and swim for the bank. Really it would have troubled a Job, but we could see no relief. At length the 'family government' was set up. 'As the first overture thereto, a rope was crossed a few times in the tolda. Upon this the arara and the parrots were placed, with the understanding that they might look out of the door as much as they pleased, and be invited thence at regular hours to their meals, but that further liberties were inadmissible and unattainable; so there they sat, scarcely knowing whether to laugh or cry. The paroquets were stationed at the afterpart of the cabin, and the change which had come over one of the green ones from Barra was amusing. She had been the wildest and crossiest little body on board, always resenting favours, and biting kindly hands. But since the lately-received young ones had been put with her, she had assumed all the watchfulness of a mother, feeding them, taking hold of their bills, and shaking them up to promote digestion, and generally keeping them in decent order. She had no more time to gad about deck, but, soberly inclined, with the feathers of her head erect and matronly, she stuck to her corner, and minded her own business. Meanwhile Yellow-top looked on with the calm dignity of a gentleman of family.'

EDUCATION OF IDIOTS.

THE account we were able to present some months ago of the methods pursued for educating juvenile idiots at the Bicêtre, Paris, has led to numerous inquiries on the subject. From various parts of the country, we have received letters from parents, whose hapless fate it is to have a child weak in intellect. The writers of these letters have our warmest sympathy: we would, if we could, gladly alleviate their misfortune. Nor are we without hopes that some of them at least, by pursuing certain plans, may have the unspeakable satisfaction of seeing their mentally-defective offspring endowed with an increased measure of intelligence. As every little piece of information on the methods of training children of this unfortunate class seems to be eagerly received, we shall endeavour to present a brief and explicit analysis of the various means employed to produce, in these forlorn creatures, results at once surprising and gratifying. As the simplicity, practicability, and success of the system becomes better known, it is fondly hoped that the benevolent portion of the community may be moved with a desire to establish in this country similar institutions to those which are now effecting so much benefit in France, Germany, and Switzerland.*

* A few days after the above was committed to paper, intelligence reached us that an institution had already been opened by a

Although somewhat derogatory to the office of tuition, yet for practical purposes, and for the sake of clearness, it may be as well to treat of the school-room in the light of a manufactory, in which certain moral agencies are brought into successive operation, so as to work out, refine, and render serviceable these rude specimens of human nature. And first as respects the raw material. It may be said to be presented to our notice in various degrees of inferiority; marked, however, by general characteristics, consisting chiefly in the absence of certain properties which are considered indicative of a natural and fully-formed mental organisation. Taken in the most inferior degree, sensibility appears to be at such a low ebb, that the ordinary appetites necessary to the preservation of life are not felt, and no traces whatever of the higher endowments are at all discoverable. Fortunately, the aggregate amount of cases belonging to this, the lowest order of idiots, is very small. Tracing development upwards from this lowest degree, we arrive at a point somewhat in advance, but still very greatly below the natural standard. It is now ascertained, that among the general population of the country there are a very considerable number belonging to this body of idiots. With them the instinctive propensities are in active operation, the organs of sense are tolerably perfect, but there exists little or no appreciation of objects presented to them; the guiding powers, intellectual and moral, are entirely absent, and consequently the instinctive appetites are uncontrolled and irregular. Proceeding still higher, we arrive at a class who have the capacity to acquire some imperfect idea of whatever comes within the range of their observation, and have some faint notions of duty. They are able to imitate, in the performance of the simplest occupations, those who are placed in authority over them; but, from want of due tuition, they are suffered to pass through life without experiencing the enjoyments and benefits derivable from that systematic cultivation of the intellectual and moral faculties of which they are capable.

Thus the sensations and perceptions of idiots may be said to be confined within certain limits more or less narrow and circumscribed; some having an organisation so low and imperfect, that to all outward appearances they do not stand in the moral scale much higher than the more sagacious of the lower animals; whereas others are endowed with that amount of faculty which raises them to the confines of a well-known class of persons denominated in ordinary conversation silly, or feeble-minded.

Some idea of the proportionate number of persons born with these various degrees of deficiency may be formed, when we state that in England and Wales it is computed that in the workhouses alone there are no fewer than four thousand. These being, generally speaking, the idiots belonging only to one grade in society, the total number must necessarily be very great. In the mere consideration of numbers, we should also take notice of individuals not congenitally defective, but who, soon after birth, have been attacked with some affection or other disturbing the function of the cerebral organ. Many of these present similar phenomena to those observed in the naturally idiotic, and require similar treat-

few ladies at Bath. An opportunity of paying a visit to this admirable establishment presenting itself about the same time, we had the gratification of finding, that although so lately set on foot, very great progress had been made with the pupils, among some of whom peculiar difficulties had been successfully surmounted by the discretion and sincere earnestness of those who have, by devoting their time and energies to the task, set a laudable example to the benevolent in other parts of the country.

ment, subject, however, to certain regulations, which we hope to be able to touch on in the sequel. For the present, we desire to confine the attention of the reader to the consideration of the steps calculated to elevate and improve the creature imperfectly developed at birth.

We refrain from the contemplation, in all its bearings, of the evil tendency arising out of the present condition of such parties both to themselves and society at large. As we wish our remarks to be confined to the training of the truly idiotic, we also pass by the consideration of the state of that large class of feeble-minded persons—the inmates of workhouses and prisons.

It has, until within a very few years, been deemed useless to devote any attention to the idiot beyond providing him with animal comforts or necessities, and taking such care of him as to insure his safety and health. It never was imagined that aught else could be done for him with any chance of benefit. Most persons would have laughed at the idea of attempting the education of any one destitute of ordinary faculties. It is only now beginning to be seen that much may be accomplished by developing and quickening, by various means, the imperfect faculties possessed by these unfortunate beings. The idiot, created with senses perfectly formed, and capable of transmitting impressions, but with a brain incapable of receiving and recording them, sees, feels, and hears, but does not understand. The main object of the kind of education referred to is to overcome this (to speak in familiar language) numbness of the brain. It is accomplished by judicious exercise of the bodily powers, by the application of appropriate stimuli to each organ of sense; and it is the systematic and graduated arrangement of these, as well as the application of them in different degrees of intensity, which constitutes the basis of the system.

Most idiotic children are wayward, inattentive to habits of decency, and addicted to various vicious propensities. In conducting a system of training, therefore, the first efforts should be so directed as to encounter and overcome these disgusting peculiarities by appropriate means, which will be readily suggested to the mind of the devoted tutor. When this first step in the task of reformation is accomplished, the attention of the pupil is to a certain extent brought into operation, and some degree of obedience is obtained. At the same time that means are directed to this desirable end, attempts should be made to overcome the incessant restlessness and automatic movements observable in most cases of idiocy. The child should be placed on a low chair, while the tutor, taking one directly opposite, brings his knees in contact with those of his pupil. The hands should then be gently grasped, placed on the knees, and kept in this position a longer or shorter time according to the condition and temper of the patient. By following this plan day after day, a degree of control over the irregular action of the muscles is created, and an amount of repose is produced favourable to future impressions. As soon as this capability of quiescence is, by frequent practice, fully confirmed, attempts should be made to regulate muscular action. This is accomplished by causing the pupil to assume various attitudes; as, for instance, to stand, to sit, to place the feet in different positions, walk to time, hold up first one hand, then the other, use dumb-bells, lift and handle objects. In performing these exercises, the tutor should stand before the pupil, and should assume the various positions, so as to produce not only a voluntary and regular muscular action, but also excite and cultivate the faculty of imitation in the pupil.

The above course of practice is applicable to restless cases; but there are some idiots in whom an opposite condition is observable. Little or no tendency to muscular action is manifested, and they would, if permitted,

remain their whole lives listless, inactive, the joints ultimately becoming rigid, and the once improvable creature ending his days in a state of helpless decrepitude. Judicious regimen, gentle frictions, and passive motion of the limbs, followed by suitable gymnastic and entertaining exercises, will in general be productive of increased power and disposition to motion.

Several expedients may be adopted with a view of attempting to generate in these subjects a capacity of moving the limbs in subjection to, as well as independently of, the will. Such, for instance, as causing the pupil to grasp a fixed object with the hands, so as to aid in the support of the body. This exercise can be practised with most advantage when a small and suitable ladder is employed. It should be placed against the wall, and the hands brought so as to grasp one of the bars situated at such a distance that the feet just rest on the floor. By causing the pupil to support himself in this manner, first on that side of the ladder usually ascended, then on the opposite side, the tendency to crouch and sink down is diminished, and he ultimately acquires a capability of standing in the erect posture. As soon as this is accomplished, he should, by the assistance of the tutor, be made to stand with one leg on the margin of a step, so that the other remains free and without obstruction. A heavy shoe being placed on this foot, the limb should be gently swung backward and forward, until, by the repetition of the exercise, he has become capable of accomplishing this motion through his own efforts. In a similar manner the arms may be brought into action by means of dumb-bells; and lastly, by causing alternate motions of the legs, and placing various objects in the fingers, the faculties of walking and using the hands are acquired.

We may here remark, that whilst exciting and regulating muscular action, as well as cultivating the faculty of imitation, it will be desirable to repress any tendency to grimace or uncouth sounds, by placing a finger on the lips whenever such unmeaning actions emanate from the pupil.

The utmost patience in performing these exercises is absolutely necessary on the part of the instructor, and probably, after many wearying days, he may begin to dread a failure; but the recollection of the small share of capacity in the object under tuition, will assure him that the cultivation of it is an undertaking which must necessarily require much time and untiring efforts to arrive at satisfactory results.

As soon as the pupil has acquired a degree of control over the voluntary muscles, the various organs of sense should be suitably stimulated and exercised, so that they may ultimately become capable of conveying to the mind some idea of the properties and relations of external objects. The means by which this end is effected are simple and easily applied; but in order that they may be effective, the impressions should, in the first instance, be made as distinct as possible, so as to excite, in the strongest degree, the particular sense under cultivation. A systematic application of objects having opposite properties should accordingly be made to each organ of sense. Thus, for instance, in order to exercise the sense of touch, the hand should be alternately applied to surfaces very rough and very smooth, as well as placed in water heated to a bearable degree in one vessel, and then in another containing very cold water. As respects the sense of taste, the opposites—bitter, sweet; hot, cold; savoury and insipid—will serve the purpose of bringing into activity the gustatory nerves.

During the application of these different stimulants of sense, the appropriate word should be repeated by the tutor—thus, rough, smooth; hot, cold, &c.—so as to impress the mind of the pupil with the name given to the various properties of matter, as well as stimulate the individual sense brought into action.

In a future number, we hope to communicate further information respecting the combined influence of agents

on the senses, as well as the cultivation of the moral powers, and the means employed to impart instruction in various handicrafts.

THE CONVICT'S DAUGHTER.

— 'I know that all men hate my father;
And therefore, Javan, must his daughter's love—
Her dutiful, her deep, her fervent love—
Make up to his forlorn and desolate heart
The forfeited affections of his kind.'—MILMAN.

The following narrative is borrowed from the interesting work of M. Maurice Alhoy on the convict prisons of France:—

'It is now some years,' says this writer, 'since I passed several months in the town of Rochefort. It became my daily habit to walk in the gloomy avenues of the public garden, and there I used to watch the convicts as they worked in pairs, carrying heavy burdens, and gladly purchasing, by the performance of the most laborious tasks, the favour of being allowed to escape for a few hours from the pestilential atmosphere of the prison. I had remarked a young girl who passed before me several times, casting an anxious and longing look towards the building in which the ropeworks were carried on. The young girl wore the Vendean costume. She seated herself upon a bench under the trees, and remained apparently lost in thought. I approached and recognised her. I had seen her the preceding evening at the house of the gatekeeper, and had then been informed of the object of her journey. The young girl was engaged to be married, and her father was in the convict prison. Eutrope, the peasant to whom she was betrothed, was acquainted with the guilt of his future father-in-law, for the same village had been their home. He was conscious how much he might lose in the esteem of others by marrying the daughter of a convict; but Tiennette was beloved, and Eutrope's affection for her made him shut his eyes to the possibility that any painful result might arise from their union.

'He wished to marry the companion of his childhood; but he desired that this father, who in the eyes of the law was dead, who had no longer any right over his daughter, and whose remembrance it was well to banish, should no more be spoken of. Tiennette loved her father, and the contempt with which others regarded the author of her days, only redoubled the fond affection of his daughter. She was desirous that he should sign her marriage-contract, and bestow upon her a father's blessing. Eutrope had long realised this wish of Tiennette; he still objected to the step she proposed to take; and it was with an unwilling heart he undertook with her the journey to Rochefort. Eutrope was a well-looking youth, with frank and open manners, and of a prepossessing appearance. It was not long before he joined us, after making some purchases which had detained him for a time from his betrothed.

'I took upon myself to interpret to him the wishes of Tiennette. I told Eutrope that a father is never guilty in the eyes of his daughter; that no laws, judges, or juries can unloose the ties of nature; and that the filial piety of Tiennette ought to be considered by him as a precious pledge of the virtues of his future wife. The girl did not speak, but her eyes were fastened on the countenance of Eutrope. She watched its every movement, as if to gather from them his acquiescence in her desire. Eutrope listened to me with his eyes fixed upon the ground. When I had done speaking, he made me no reply, offered no objection, but took the arm of Tiennette within his own, and together the young couple turned their steps towards the prison. I followed them, and the poor girl, who seemed to consider my presence as useful in confirming the vacillating resolutions of her lover, encouraged me by her looks to remain with them. We found on our arrival that the aged convict had been ill for some days; he was no longer in the prison, but had been conveyed to the

hospital. We silently traversed the long court, and mounted the staircase. When we reached the entrance of the wards, the young girl trembled violently, her cheeks became deadly pale, and her heart seemed to sink within her. Eutrope and Tiennette were permitted to approach the prisoner's bed; but I was refused admittance by the turnkey, and I could only see from a distance the remainder of this touching scene. At the foot of the convict's bed stood Eutrope, whilst Tiennette approached her father with an expression of fearfulness which she vainly strove to conceal. He raised his languid head, turned his dimmed eye upon his child, and a faint smile passed over his sunburnt countenance. The turnkey who had introduced the two young people into the ward, remained gazing upon the scene; a good Sister of Charity supported the sick man; he took the pen which was handed him, glanced over the marriage-contract, which had been prepared beforehand, and wrote beneath it his dishonoured name. Then stretching towards Tiennette his wasted arms, he clasped her to his bosom. The movement he made in doing so shook his chain, one link of which rested in the hand of Eutrope, who looked at it with a bewildered stare; whilst another rustled against the dress of Tiennette, whose tears fell upon the rusty iron. The head of the dying man soon sunk once more upon his pillow. Tiennette took advantage of this moment to glide her trembling hand furtively under the coverlid. The turnkey had that instant turned to lead the way out of the room, and the anxious glance she fixed upon him betrayed to me alone the poor girl's secret offering to her father. Eutrope, who seemed ill at ease, made a sign to Tiennette, and they both went slowly out, with downcast looks. When they had reached the foot of the staircase which led to the wards, the young girl said to Eutrope, "The step which we have now taken will bring us a blessing." They then entered together the chapel of the Civil Hospital, offered up a short prayer, bade me farewell, and mounted a little cart, which bore them back to their native village.

'Yes, God will bless thee, poor maiden, who didst not forsake the author of thy days, nor think that his guilt had broken every tie which subsisted between thee and him. Thy children will pay to thy virtue the dutiful homage with which thou hast not feared to honour a guilty father.'

THE ROMANCE OF IRISH POVERTY.

In last number, we gave a picture of Irish manners sixty years ago, and we are now presented with one drawn from personal observation in the present day.* Between the two, strikingly different as they are, there seems a strange connection. In the one, the gentry are abetted in their worst vices by the peasantry; and in the other, the lower classes, while generally reformed themselves, are represented as being despised and oppressed by their former idols, and yet licking the foot that spurns them. But we are inclined to think that Mrs Nicholson, in the occasional parallels she draws between the two ranks of society, works under the influence of a foregone conclusion. She visited Ireland for the purpose of inquiring into the condition of the poor, and the amount of their wrongs—not to speculate on the causes of the poverty, and trace out the injustice to its source; and accordingly the rich or the titled appeared to her to be all cold-hearted tyrants; and the destitute to be a body of miserable, pious, ignorant—angels. That there was some considerable prejudice on her part, or some unfortunate peculiarity of temper, is evident from the nature of the accusation she most frequently brings against the gentry

* Ireland's Welcome to the Stranger: or Excursions through Ireland in 1844 and 1845, for the Purpose of Personally Investigating the Condition of the Poor. By A. Nicholson, of New York, London: Gilpin.

—not merely want of kindness and politeness to a foreigner and a gentlewoman, but downright insolence and brutality. This will not be believed anywhere, and least of all in Ireland; and yet we are of opinion that Mrs Nicholson writes not one syllable which she does not conscientiously imagine to be true. She is evidently a right-hearted, though a wrong-headed woman; and the narrative she gives of her patient, though often penniless wanderings, hungry and weary, heart-sore and foot-sore, is often affecting in its simplicity and good faith.

It will be observed that her investigations of the condition of the poor were made *before* the failure of the potato crop; and yet her pictures are so appalling, that it is impossible to conceive a 'lower' in this 'lowest deep' of degradation and despair. Such shadows we have no intention to transfer to our pages; but there is one bit of misery, so strangely enlivened by a gleam of sunlight, that it is difficult to know how to class it. This is the portrait of Happy Molly. 'The next day I was to leave for Urlingford, and the lady of the house where I stopped said, "You must see an old woman we have in our cellar; she's the wonder of us all. She sleeps on a handful of straw, upon some narrow boards, a few inches from the floor, without pillow or any covering but a thin piece of a blanket and the clothes she wears through the day. She goes to mass at five in the morning with a saucepan, and fills it with holy water, which she offers to every friend she meets, telling them it will insure good luck through the day, and then sprinkles it about her room." At this moment Molly, unobserved, stole softly upon us. When I met her laughing eye, and still more laughing face, I could not refrain from laughing too. Her cheeks were red, as though the bloom of sixteen rested upon them; her hair was white, yet her countenance was full of vivacity. She looked the "American lady" full in the face, and pressing my hand, said, "Welcome, welcome; good luck, good luck to ye, mavourneen! Come into my place, and see how comfortable I am fixed." We followed to Happy Molly's cellar; five or six stone steps led us into a dark enclosure, with a stone floor, which contained all that Happy Molly said she needed.

"Where do you sleep, Molly?"

"Taking me by the arm, she pointed to the corner behind the fireplace—"Here! here! and look, here is my blanket" (which was but a thin piece of flannel); "and here, you see, is an old petticoat, which the woman where I stopped pulled out of my box, and tore it in pieces, ma'am, because I couldn't pay two pennies for my rent; and then, ye see, ma'am, I came here; and, praise God, they be so kind; oh, I couldn't tell ye how kind!"

"Where's your pillow, Molly?"

"Oh, I want no pillow, ma'am, and I sleep so warm."

"And where are your children, Molly?"

"Some of them gone to God, and some of them gone abroad, I don't know where; I never sees them. They forgets their ould mother. I nursed six, and one for a lady in Dublin. I never gave them any milk from the cow."

"Had you a cow, Molly?"

"A cow! and four too; and a good husband."

"And you are happy now, Molly?"

"And why shouldn't I be? I have good friends, and enough to eat; a comfortable room, and good bed."

"Where do you get your food?"

"Oh, up and down, ma'am."

"She did not beg; but all who knew her, when they saw her, would ask, "Well, Molly, have you had anything to-day?" If not, a bit was given her. She is very cleanly, and always healthy. When I was leaving, I stepped down to say "good-by." She was sewing on a bench at the foot of the stone steps, and when she found I was going, she seized my hand and kissed it, saying, "Good luck, good luck, American lady—the good God will let us meet in heaven."

'God surely "tempers the winds to the shorn lamb" in Ireland. Such unheard-of sufferings as poor Erin has endured, has drawn out all kinds of character except the very worst.'

This gaiety has frequently been mentioned as a remarkable trait in Irish character; but another instance of it, cited by our authoress, is still more melancholy than the light-heartedness of Happy Molly. 'When I returned to the doctor's, I found among his beneficiaries a pale young girl of nineteen, interesting in her manners, who had come there with threatening symptoms of a decline. She possessed all the Irish vivacity; and though with a severe cough and husky voice, yet she was always in a cheerful mood; and her lively song and merry laugh told you that her heart was buoyant, though pain often held her eyes waking most of the night. Her voice was sweet as the harp, and often, when I heard it at a distance, could not persuade myself but it was a flute. She had stored her memory with the songs of her country, and her company was always acceptable among her class on account of this acquirement, as well as the power of mimicry, which she eminently possessed. She would screen herself from sight behind some curtain, and go through a play, performing every part, and sing with the voice of a man or a woman, as the case might require. One night she had been amusing us in this way, when she appeared from behind the screen, and a marble-like paleness was over her face. I said to her, "I fear you have injured yourself?" She answered not, but sat down and sung "The Soldier's Grave" in so pathetic a manner that I wished myself away. They were sounds I had heard in my native country, but never so touching; because the voice that made them was so young, and probably soon would be hushed in death. Even now, while writing, I hear her sweet voice humming a tune in the chamber where she sits alone in the dark. She is of humble birth, and her mother is a widow, and she has had no assistance of education to raise her above the poorest and most ignorant peasant; yet nature has struggled, or rather genius, through many difficulties, and placed her where, even now, she appears to better advantage than many who have been tolerably educated; but the flower is apparently drooping, and must soon fall from the stem. Yet she will laugh and sing on, even when those about her are weeping at her premature decay. Last evening, a dancing-master came in with a little son, each of them having a fiddle, and the music and dancing commenced. Mary (for that is the invalid's name) was asked to dance, and complied; and with much ease and grace performed her part. This, no doubt, she would not hesitate to do while her feet could move, did she know there was but a week between her and the grave. From childhood she has been taught to practise it, till it is interwoven in her very nature, and has become part and parcel of herself.' It is not stated what was the fate of poor Mary; but there can be little doubt that

'Ainsi qu' Ophélie, par le fleuve entraînée,
Elle est morte en cueillant des fleurs.'

But another Mary is, to our thinking, the gem of the book. The traveller being disappointed in a remittance, was compelled to make a long journey on foot, living on scanty meals of potatoes, and sleeping at night in the wretched cabins of the peasantry. Her funds were at length reduced to a few pence; but she was on the way to a rich man's house, to which she had been directed by a friend. 'It was a sad night; a small parasol was a miserable defence against the furious wind and pelting rain; and yet I felt more composed and less shrinking than I do now while writing it. I had not the least anxiety. I neither knew nor cared what was before me. I saw a faint light in a cabin-window some perches from the road, and felt my way to it, and inquired the distance to the castle. "A short half mile; but ye'll be destroyed in the storm. Ye had better stop a bit." Telling them I must go on,

they stood in the cabin-door till I had reached the path, and, as well as I could, I made my way forward.' Arrived at 'the castle,' she met, as was usual with her at such places, with neglect or rudeness, and was compelled to find her way back through the storm to the humble cabin. 'Mary now had enough to do to make the stranger comfortable; a pile of dry turf was added, lighting up a whitewashed cabin, and white-scoured stools, table, and cupboard, which amply compensated for every other inconvenience. She had nothing but the potato and turnip, and "Sure ye can't ate that?"

"Put on the pot," said Will; "it's better than nothin' to her cowl'd and wet stomach." When the potatoes and turnips were boiled, they were mashed together, some milk and salt added, put upon a glistening plate, a clean bright cloth spread upon the deal table, and Mary sat down, groaning at the "strangeness of the master, and the miserable supper of the bidable woman."

"And where will you sleep, Mary?" asked the guest. "Do not let me turn you from your bed."

"And that you want. I'll find the comfortable place for my bones." I was led to the bedroom, and in this floorless cabin what did I there see? A nice bedstead, a clean covering, two soft flannel blankets, and linen sheets, white and glossy with starch, and curtains about the bed as white as bleaching could make them. The feathers were stirred in a narrow compass, to make the bed softer, so that but one could have room in it, and in this I was put; then a clean flannel was heated by the fire, and put about my shoulders, another about my feet, "to take the cowl'd and pain out of my wairy bones."

'When Mary had finished putting the covering snugly about me, she placed the curtains closely around the bed, and softly went to the kitchen hearth. The door she left open, and I could see what passed there. She crept to a stool, and kneeling down, she prayed. Yes, unlettered as she was, I believe she prayed; and I believe God heard that prayer. She arose, and leaning her face upon her hands, she sat, gently swinging her body, now and then looking towards my bed, and waited till she thought me to be asleep. Then putting her cloak about her, she crept stealthily into my room, and peeped through the curtain. Seeing my eyes closed, she carefully put the drapery together, and crawled behind me upon the naked bed-frame—for she had put the bed all under me—and in a few moments this unsophisticated, practical, humble Christian was asleep. She did not intend I should know she was there; and why? Lest I should think she had made sacrifices for me. Was this doing her good works to be seen of men? Did I sleep? Not much. Gratitude to the kind Mary, and, more than all, gratitude to God, that he had brought me to see, in this day's and night's adventure, the practical import of the parable of the good Samaritan, kept me waking.'

With the following sketch of a seminary of learning in Connemara we must conclude:—"We next called at a cabin, where a number of children had collected, to whom we gave books. Finding they attended a school near, we entered the school-room, and may I never see the like again! In one corner was a pile of potatoes, kept from rolling down by stones, on which the ragged, bare-footed children were seated. In another corner was a pile of cart-wheels, which were used for the same purpose; and in the middle of the room was a circular hole made in the ground for the turf-fire. Not a window, chair, or bench could be seen. The pupils, with scarcely a book, looked more like children who had sheltered themselves there in a fright, to escape the fury of a mad animal, or the tomahawk of some yelling savage, than those who had assembled for the benefit of the light of science. This was a Connemara school, and it was all they could do. I had seen, sprinkled all over Ireland, schools in miserable cabins, where were huddled from forty to seventy in a dark room without a chimney; but they had benches to sit upon, and their school-room was upon the

wayside, while this one was in a wet backyard. Those parents who are able, pay a penny a-week; those who are not, pay nothing; while the wealthiest among them pay half-a-crown a-quarter. I saw many schools of this kind, where the child takes a piece of turf under his arm, and goes two miles, and sometimes three, without breakfast. In many parts of the south, and among the mountains, they could eat but once in the day from Christmas to the next harvest, and this meal is generally from two till three o'clock.'

THE SLAVE TRADE.

THE following information on the present position of the slave trade, collected from a number of parliamentary reports, appears in a London newspaper (the Globe):—

'We gather from this mass of papers, that the progress yet made towards the suppression of the slave trade by force is very small. The trade is now, apparently, carried on principally for the supply of the Brazilian demand. There the force of popular opinion, and the weakness of the government, combine to render futile all attempts to oppose any effectual opposition to the landing and sale of the slaves when they arrive. The sole check to the trade is found in the risk of capture on or near the African coast. After the loss of several vessels in succession, the dealers are for a while unwilling to speculate. But the arrival of one or two cargoes in safety revives their hopes, and the traffic is renewed with all its former vigour. During the war in China, the British force cruising for the capture of slavers was reduced. The slave trade then increased very considerably. When the war was over, and the cruising squadron was strengthened, it declined. The year 1845, in particular, was a bad one for the Brazilian slave-dealers. But in January 1846, two vessels succeeded in reaching Bahia with their cargoes in safety, and landed, one 818, and the other—a yacht of fifty-one tons—160 slaves. In March, the brig *Tres Amigos* landed at the same port 1350 slaves; and a few days afterwards the yacht *Amelia*, 169 tons, landed 346 more. Much of this success undoubtedly arose from the failure of Mr Hamilton, in December 1845, to obtain a new treaty with the Brazilian government, and the subsequent neglect of the authorities to do anything whatever to discourage the trade. Its immediate result is told in a despatch from our consul at Bahia, dated 4th May 1846. He says—"In consequence of the capture of ten or twelve vessels from this port during the past year, the slave dealers were much dispirited; and some of the principal ones had commenced breaking up their establishments on the coast. The arrival alluded to (that of the *Tres Amigos*) has, however, caused a reaction. Six vessels have again been fitted out for this detestable traffic, two of which have already sailed."

'In the three months ending 30th of June 1846, five vessels fitted as slavers left Bahia in ballast, and three arrived, and landed 1260 slaves. Before the 30th September, five more vessels landed, at the same port, 1878 slaves; and several were sent out fitted for the trade. Our consul, writing in September, says—"Every facility is now given for the landing of slaves in all parts of the province, and even within the precincts of this city. As no effort is made by the authorities to put a stop to this proceeding, it gives an additional impetus to the slave dealers to fit out a greater number of vessels for the express purpose of bringing slaves to this place. The number of vessels now returned is double that of the preceding quarter."

'The returns from Rio afford no information as to the number of slaves landed there in 1846. At Pará, it appears that the slaves form but a small proportion of the coloured population, and that a very few had recently been brought there. At Paraíba, also, the trade prevailed only to a very limited extent. From Pernambuco, the British consul, writing in April 1846, says—"For the last eighteen months no vessel has safely landed a full cargo of slaves from Cape St Roque to the Rio San Francisco; they have invariably, in part or whole, been seized and appropriated to themselves or friends, by the government officer at the different districts." The British commissioner, however, estimated the total illicit importation of African slaves into Brazil, in 1845, at 16,000, or less by nearly 3000 than in the year before. The actual number imported in 1846 was probably not far from twice that number.

'Besides the Brazilian ports, the chief markets for fresh importations of African slaves are in Cuba and Porto Rico. Early in 1846 Mr Bulwer obtained from the Spanish government a promise to forbid the connivance of their colonial governors in the trade; and, accordingly, since May in that year, O'Donnell, the captain-general of Cuba, has been acting under orders to discourage the landing of slaves, and to afford us all requisite facilities for preventing their importation. There is abundant reason for believing that such obedience as he gives to these orders is much against his will; and there is a strong party in the island always prepared to assist him in evading or neglecting them. So also at Porto Rico, the governor declares, that as the trade is now unlawful, he will not permit it to be carried on; but there is little reliance to be placed upon his ability to prevent it, even though we admit the sincerity of his desire to do so.

'The owners of the ships and cargoes taken in the slave trade are almost invariably Spaniards, Portuguese, or Brazilians. Italians are sometimes met with among the crews. The vessels are very frequently of American origin, chosen for their sailing qualities, and for the cheapness of their materials. American seamen have been found in slavers, but there is generally evidence of their having been entrapped. They are engaged in American ports before the transfer of the vessel to the slave-dealer, and before her destiny is known; and when they arrive on the coast of Africa, are driven to choose between being left there to shift for themselves, and coming home with the risk of capture. The American flag is frequently used to cover the vessel through the preliminary proceedings, and down even to the moment of putting the slaves on board; and for this reason—the United States not allowing a right to search vessels so covered to any cruisers except her own—the risk of detection and stoppage is thus altogether avoided, unless an American vessel of war happen to be in the neighbourhood.'

FACTS FOR THE CURIOUS.

It is mentioned by the 'Gardener's Chronicle' that pine-apples have this summer been grown and ripened in the open air in Devonshire. The plants employed in the experiment were of different varieties, had never been subjected to fire-heat at any time, and were not exposed to the air till after they had blossomed, and the fruit had set. It thus appears that so tender a plant as the pine-apple may be enabled to bear full exposure to the air of May, June, and July, in this climate, by a little judicious management. In this instance, the cold winds were kept off by mounds raised around the plants; a sufficiency of earth-heat was obtained by sinking the pots in leaves still capable of fermentation; and a genial night atmosphere was obtained by covering the sloping sides of the mounds with a black substance (charred grass), which absorbed the solar heat during the day, and gave it off gradually after nightfall.

Professor Erdmann of Dorpat, who is travelling in the south of Russia, has just discovered, in the neighbourhood of Odessa, a great many skeletons and fossil bones of animals not now inhabiting this region of the globe. Among them are remains of elephants and rhinoceroses, creatures whose habitats are strictly tropical, and which could not now exist even in the most genial districts of Europe. The bones were found immediately under a calcareous deposit of recent origin; thus proving that at no very distant date, geologically speaking, Europe was peopled with huge pachyderms, similar to those luxuriating in the swamps and jungles of India and Africa.

Experiment has already subjected man and a number of the lower animals to the process of etherisation, and all have been found alike to yield to the influence of the potent vapour. Insensibility to pain, or a suspension of nervous irritability, has been the result in every case—the degree of insensibility varying according to constitutional differences, and according to the amount and continuance of the inhalation of the vapour. Not satisfied with these experiments, philosophers have more recently pushed their inquiries into the vegetable kingdom, and have found that etherisation produces analogous effects on plants—destroying the irritability, or so-called sensibility, of such members as the stamens of the common barberry, and the leaves of the sensitive plant and Venus' fly-trap, which are well known to be highly susceptible of contact. As in the case of animals, the plants recover their irritability on exposure to the atmosphere.

From the year 1829 to 1834, the average importation of barilla into this country amounted to 12,600 tons. Now, however, this ash is scarcely to be met with in the market—nearly the whole of the soda consumed in the manufacture of soap, and for other purposes, being obtained from common salt, through the agency of sulphuric acid. The united quantity of soda-ash and soda annually manufactured is calculated to exceed seven times the largest importation of barilla ever made in one year; and this increased consumption is due to the repeal of the salt duty, and to the improvements that have been effected in the preparation of sulphuric acid.

Professor Schönbein, the inventor of the celebrated gun-cotton, is said to have discovered a curious and valuable substitute for glass. It consists of pulp of common paper, made transparent, by causing it to undergo a certain transformation, which the professor calls *catalytic*. With this paper, made water-proof, is manufactured perfectly transparent window-panes, vases, and bottles, which will not be easily fractured.

The most extensive *masonry* structure is undoubtedly the great Chinese wall. It is 24 feet high, and 10 feet wide, and reaches to the extent of from 2000 to 2400 miles, over mountains, precipices, and rivers, up to the sea on one side, and the inaccessible mountains of Thibet on the other. The Chinese truly call it one of their wonders of the world—as the stones used for its construction, if placed one beside the other, would suffice to encompass the whole circumference of the globe. The entire history of this construction is wrapt in similar obscurity with that of the Pyramids of Egypt.

It is a well-known fact, that the young of the eel ascend the rivers they frequent in countless multitudes in March and April, and remain there during the summer. 'I have known them,' says Mr Couch of Penzance, 'ascend a small stream for a short distance, when they have been obstructed by a waterfall of about twenty feet high; and yet, on examining the wet moss on the rocks over which the water fell, the eels may be found tortuously winding their way to the stream above. If a stream, from the dryness of the summer, be reduced in size, the eels will quit it, and travel through the wet grass in search of another. I have kept eels,' he continues, 'in confinement, in large basins, but they have generally effected their escape by night, which is their favourite time for moving. Their mode of escaping is remarkable. They commence by throwing their tail over the edge of the vessel; and that organ being a prehensile one, they then lift themselves over, and so escape by their usual tortuous motion.'

The poor diamond, it seems, has been recently undergoing another set of cruel and degrading experiments. At the Oxford meeting of the British Association, Dr Faraday exhibited some diamonds which he had received from M. Dumas, which had, by the action of intense heat, been converted into coke. In one case, the heat of the flame of oxide of carbon and oxygen had been used; in another, the oxyhydrogen flame; and in the third, the galvanic arc of flame from a Bunsen battery of one hundred pairs. In the last case, the diamond was perfectly converted into a piece of coke; and in the others, the fusion and carbonaceous formation were evident. There is still, however, this consolation for the royal gem—that these Goliaths of chemistry have not yet been able to convert 'vulgar charcoal' into reputable diamond; and yet who can say that some of them may not, against next gathering of the savans, exhibit artificial diamonds by the hundredweight?

Like most countries composed of calcareous materials, and which have been visited by successive earthquakes, Syria abounds in caves, stalactitical formations, deep recesses in the limestone, and dizzy ravines spanned by natural arches. Near the source of the Nahr-el-kebf is a natural bridge, considered, and deservedly so, the greatest curiosity in the country. It is called by the natives Djem-el-Khadjer, and is of the following dimensions:—Span 180 feet; height from the water to the summit 160 feet; breadth of the roadway 140 feet; and depth of the keystone 20 feet.

The assertion that the mud in some of the North American lakes exercises an attractive or magnetic influence on the boats sailing above it, is thus corroborated by Sir A. Mackenzie:—At the portage of Matreos, on Ross Lake, the water is only three or four feet deep, and the bottom is muddy. I have often plunged into it a pole twelve feet long, with as much ease as if I merely plunged it into the

water. Nevertheless, this sort of mud has a sort of magical effect upon the boats, which is such, that the paddles can with difficulty urge them on. I have been assured that loaded boats have often been in danger of sinking, and could only be extricated by being towed by lighter boats. As for myself, I have never been in danger of foundering; but I have several times had great difficulty in passing the spot with six stout rowers, whose utmost efforts could scarcely overcome the attraction of the mud. A similar phenomenon is observed on the Lake Sagmaga, where it is with difficulty that a loaded boat is made to advance; but fortunately the spot is only about four hundred yards over.

Column for Young People.

JUVENILE SYMPATHISERS.

ABOUT twelve months ago, Elihu Burritt, in one of his beautiful 'Olive-leaves,' related a circumstance, the particulars of which we will make our young friends acquainted with, because we feel assured it will not only interest them, but show the benefits which may arise from the sympathies of children being rightly directed, and prove that the ardour of their warm hearts is not cooled by many waters, nor their feelings confined within the imaginary lines of latitude.

Whilst the great advocate for peace was travelling through our land on his errand of love, he was one evening overtaken by a heavy shower. The day had been fine; but, as is not unfrequently the case in England, the sky became suddenly overcast. The pedestrian was passing through a richly-cultivated district, where nature and art had united to render the spot a perfect paradise, and he was for a time lost in the contemplation of its beauties; but the heavy drops, as they pattered on his shoulders, awoke him from his poetical reverie, and suggested the convenience of a shelter. An open gate stood near, which seemed to invite his entrance, and his ear now for the first time recognised the familiar sound of the anvil. Its monotonous clink had before mingled with the song of the bird, the bleating of sheep, the ripple of the stream, and the many pleasant sounds which gave life and harmony to the scene. But how were his feelings changed on entering that humble shed! not because it spoke of indigence and toil, for he did not look upon the necessity for exertion as an evil in itself: his sympathies were drawn out by the ignorance and disease which he saw prevailing there, from too early and too close application to labour. The occupants of this narrow shed were a man in the meridian of life, and a boy about nine years of age. They had stood there, side by side, for years. The father's earnings being insufficient for the wants of his family, he had been obliged to take his child almost from his mother's arms, and place him on the cold stone on which he then stood. It had at first been placed there that he might reach his father's block, to assist in making nails, and the necessity for its use had continued as he advanced in years; for the unhealthy employment, and that cold, damp stone, had chilled his young blood, stopped his growth, and nipped the buds from his spirit. Dear young reader, you who are surrounded by home comforts, think, in your hours of relaxation and leisure, that hundreds of children, perhaps in your own town, are exposed to a similar fate—that thousands are led from the cradle to the factory or workshop, without time to gain physical strength from exercise, or opportunity for mental culture. But to return to my story. That heart which was so intent on the establishment of national peace and good-will, could not overlook individual suffering, and he strove to awaken the sympathies of the American children for the poor English boy; nor did he find this a difficult task. Their hearts leaped, as it were, across the Atlantic, to assist the unhappy stranger. Mr Burritt proposed that they should raise a subscription to send the lad to school. This proposition was joyfully acceded to, and no less than one thousand half-dimes* were sent over for the purpose. The 23d of last December was a cold, damp day; the morning in London was foggy; but it gave place to what is called a Scotch mist, which would wet an Englishman to the skin, and, we doubt not, have a similar effect on an American; but be that as it may, the generous almoner undertook a journey of fifteen miles on foot, in order to convey the precious gift. We wish that our young friends could have seen the little fel-

low, as he stood in a tailor's shop, viewing his own deformed figure arrayed in a new suit of clothes, which he was told had been sent him by the children of a country of which, perhaps, he had never heard, or at least knew as little of as of the inhabitants of the moon, and was further informed that they had paid for him to be sent to school. Oh, it would have been a fine subject for a painter, if he could have caught the bewildered, yet grateful and happy expression of the little English boy, and the benevolent, we might say heavenly, smile of his kind-hearted American friend.

The boy's individual improvement is not the only benefit arising from this charitable action. It is probable that he will make an effort to spread the seeds of knowledge he is receiving; and his young benefactors, having carried out the principles of universal brotherhood in early youth, will be stimulated to further exertion as they advance in life. And will not our young British friends respond to this feeling? Will not their warm hearts suggest means of usefulness, which would show their generosity, and at the same time acknowledge those claims of brotherhood?

BLEACHING.

The operation by which the natural colours of substances are discharged, and they become white or colourless. Bleaching may be performed either by natural means, as exposure to light, air, and moisture, or by chemical agents, as chlorine, chloride of lime, sulphurous acid, &c. In many of the processes adopted for this purpose, both methods are combined. The most important application of the art of bleaching in the United Kingdom is in the manufacture of textile fabrics. The celerity with which this is performed in the most perfect manner, and the trifling expense thereby incurred, contributes, in no small degree, towards inducing that preference universally shown to the productions of the looms of Great Britain. Cotton, from its original whiteness, and little attraction for colouring matter, is more easily bleached than most other substances. On the old plan, it is first well washed in warm water, to remove the weaver's paste or dressing; then 'bucked' (boiled) in a weak alkaline ley; and after being well washed, is spread out upon the grass, or bleaching-ground, and freely exposed to the joint action of light, air, and moisture. The operation of bucking and exposure is repeated as often as necessary, when the goods are 'soured' or immersed in water acidulated with sulphuric acid; after which they receive a thorough washing in clean water, and are dried. From the length of the exposure upon the bleaching-ground, this method has been found to injure the texture of the cloth, and, from the number of operations required, necessarily becomes expensive, and produces considerable delay; it has therefore very generally given place to the improved system of chemical bleaching, by means of chloride of lime. In this method, after the first operation of washing and bucking, as in the common process, the cotton is submitted to the action of weak solutions of chloride of lime, and afterwards passed through soured water, when it has only to be thoroughly washed and dried. Linen is bleached in a similar way to cotton, but the operation is more troublesome, from its greater affinity for colouring matter. Wool is first exposed to the joint action of fullers' earth and soap, in the fulling-mill, to remove adherent grease and dirt; and is then well washed and dried, when it is usually found sufficiently white for the purposes of the dyer; but should the slight yellow tint it retains prove objectionable, it is run through water tinged blue with indigo, or it is exposed to the fumes of burning sulphur. The latter method gives it a harsh feel, which is best removed by a bath of soap and water; but this will reproduce its previous yellowishness. Silk is bleached by boiling it in white soap and water, to remove the natural yellow varnish that covers it; after which it is subjected to repeated rinsings. Articles that are required to be very white, as gloves, stockings, &c. are also submitted to the action of sulphurous acid, or the fumes of burning sulphur. Straw is also bleached by the fumes of sulphur; hence arises the sulphurous smell emitted by new straw-hats and bonnets. They may, however, be bleached in a much better manner by the use of a little oxalic acid, or chloride of lime. Old rags, for the manufacture of paper and paper pulp, are generally bleached with chlorine. Printed books, engravings, &c. may be whitened by first subjecting them to the action of weak chloride of lime-water; next, to water soured with sul-

* A half-dime is value twopence-halfpenny of English coin.

phuric acid; and, lastly, to pure water, to remove any adhering acid or chlorine.—*Pharmaceutical Times.*

VALUE OF EXAMPLE.

The poor woman who, with a scanty wardrobe, is ever neat and clean in her person, amid various and trying duties; is patient, gentle, and affectionate in her domestic relations; with small funds is economical and judicious in her household management—as presenting every day a practical exposition of some of the least lessons in life—may be a greater benefactor of her kind than the woman of fortune, though she may scatter a tithe of a large fortune in alms. The poor man, whose regularity and propriety of conduct co-operate with such a woman, and shows his fellow-workmen or townsmen what temperance, industry, manly tenderness, and superiority to low and sensual temptation can effect in endearing a home, which, like the green spot that the traveller finds in the desert, is bright even amid the gloom of poverty, and sweet even amid all the surrounding bitterness—such a man does good as well as the most eloquent speaker that ever spoke, and the most eloquent writer that ever wrote. If there were a few patriarchs of the people, women as well as men (if I may be excused for admitting the former to a patriarchy), their influence would soon be sensibly felt.—*Mrs Leman Grinstead.*

PROGRESS OF LITERATURE AND SCIENCE.

A progress in these must be accompanied by progressive changes in our social and political institutions. That they have not arrived at perfection, the slightest glance at the misery around us is all that is requisite to prove. The supposition that they will not be subject to changes, would imply either that while other kinds of knowledge are daily advancing, the science of social happiness was as complete as the nature of the subject allowed, and therefore susceptible of no improvement; or that the happiness of communities admitted of no addition, their misery of no diminution, from the most thorough insight into the various causes which produced them. The history of every country proves that a knowledge of these causes is one of the most difficult of acquisitions; that on no subject is man more easily deluded, less capable of extensive views, guilty of grosser mistakes, and yet more inveterately pertinacious in thinking himself infallible. Nor is there any subject on which the correction of an apparently small error has teemed with such important benefits to the world.—*Pursuit of Truth.*

TALENT, ACQUIRED AND NATURAL.

As it is in the body, so it is in the mind—practice makes it what it is; and most even of those excellencies which are looked on as natural endowments, will be found, when examined into more narrowly, to be the product of exercise, and to be raised to that pitch only by repeated actions. Some men are remarked for pleasantness in raillery, others for apoloques and apposite diverting stories. This is apt to be taken for the effect of pure nature, and that the rather because it is not got by rules; and those who excel in either of them never purposely set themselves to the study of it as an art to be learnt. But yet it is true that at first some lucky hit which took with somebody, and gained him commendation, encouraged him to try again, inclined his thoughts and endeavours that way, till at last he insensibly got a faculty in it without perceiving how; and that is attributed wholly to nature, which was much more the effect of use and practice.—*Locke.*

PLEASURES OF THE IMAGINATION.

As we ought not to make the gratification of our external senses the main end of life, so neither ought we to indulge our taste for the more refined pleasures—those called the pleasures of imagination—without some bounds. The cultivation of a taste for propriety, beauty, and sublimity, in objects natural or artificial, particularly for the pleasures of music, painting, and poetry, is very proper in younger life, as it serves to draw off the attention from gross animal gratifications, and to bring us a step farther into intellectual life, so as to lay a foundation for higher attainments. But if we stop here, and devote our whole time, and all our faculties, to these objects, we shall certainly fall short of the proper end of life.—*Priestley.*

FLATTERY.

Wherever there is flattery, there is always a fool in the case: if the parasite be detected, it falls to his share; if he be not, to his whom he deludes.

LINES

ADDRESSED TO THE PARTY PROCEEDING ON THE TRACK
OF DR LEICHHARDT, THE AUSTRALIAN EXPLORER.

BY R. LYND, ESQ.

Ye who prepare with pilgrim feet
Your long and doubtful path to wend,
If, whitening on the waste, ye meet
The relics of my murdered friend—
His bones with reverence ye shall bear
To where some mountain streamlet flows;
There, by its mossy bank, prepare
The pillow of his long repose.

It shall be by a stream whose tides
Are drunk by birds of every wing;
Where every lovelier flower abides
The earliest waking touch of spring!
Oh meet that he—(who so carest
All-beauteous Nature's varied charms)—
That he, her martyred son, should rest
Within his mother's fondest arms!

When ye have made his narrow bed,
And laid the good man's ashes there,
Ye shall kneel down around the dead,
And wait upon your God in prayer.
What though no reverend man be near,
No anthem pour its solemn breath,
No holy walls invest his bier
With all the hallowed pomp of death!

Yet humble minds shall find the grace,
Devoutly bowed upon the sod,
To call that blessing round the place
Which consecrates the soil to God.
And ye the wilderness shall tell
How, faithful to the hopes of men,
The Mighty Power he served so well,
Shall breathe upon his bones again!

When ye your gracious task have done,
Heap not the rock above his dust!
The Angel of the Lord alone
Shall guard the ashes of the just!
But ye shall heed, with pious care,
The memory of that spot to keep;
And note the marks that guide me where
My virtuous friend is laid to sleep!

For oh, bethink—in other times
(And be those happier times at hand),
When science, like the smile of God,
Came brightening o'er that weary land—
How will her pilgrims hail the power,
Beneath the drooping myrtle's gloom,
To sit at eve, and mourn an hour,
And pluck a leaf on Leichhardt's tomb!*

—From *Dr Lang's Cookland.*

* The report of Dr Leichhardt's death proved to be erroneous.

ANECDOTE FOR MOTHERS.

The late Queen Charlotte was exceedingly fond of needlework, and was solicitous that the princesses should excel in the same amusing art. In the room in which her majesty used to sit with her family were some cane-bottomed chairs, and when playing about, the princesses were taught the stitches on this rude canvas. As they grew older, a portion of each day was spent in this employment; and, with their royal mother as their companion and instructor, they became accomplished needlewomen.—*Miss Lambert.*

NOTICE.

We gladly mention that the school at Swindon, remarked upon in the leading article of No. 167, is different from the one established in the new village by the Great Western Railway Company. We learn that this seminary is conducted on enlightened principles, and is under the care of an able teacher, handsomely salaried by the Company.

APPROPRIATION.

WHILE all declare the utility of competition, it is not less true that every one will, if he can, exclude competition in his own case. The trading world is full of efforts to attain to the dealing in some article which others may not meddle with. Patents are eagerly sought for—in a vast proportion of cases, not in the spirit of invention, and with a simple regard to the just and natural remuneration of peculiar merits, but with a purely trading view to the comfort of an exemption from this same admired principle of competition. Authors have never yet thought of any mode of remuneration for their merits and their toils, but a right of dealing in their wares in the manner of a monopoly. In his practice, the individual submits to competition as an evil which he cannot avoid, even while he is theoretically advocating it as the life and spirit of business. We are all, it would appear, monopolists in our hearts.

This is because we naturally start with the narrowest kind of self-love. The efforts to monopolise are the relics of the first instinctive philosophy under which mankind acts. To come to acknowledge the abstract value of a free competition, is a step forward in social morality; and this is the point that seems now to be attained. While such, however, is the hopeful state we are in with regard to industrial courses, there are appearances as if the fruits of industry were subjected to a contrary rule of progress; for never before were rights of all kinds more rigidly enforced than now; never were the claims of property more exigent or unrelenting. It would even seem as if the very sense of property were becoming keener among men. One very noticeable operation of this spirit at the present moment, is towards the exclusion of the public from many ways and haunts hitherto open to them. Is there a path through a field, or by a river side, which has been a common good for ages, an effort is made to appropriate it. Is there a piece of waste ground on which villagers have heretofore pastured animals without control, it can scarcely be saved from the gripe of some co-terminous proprietor, who affects to consider it in its present state as a nuisance. Waters in which men and boys used to fish without hindrance, are now staked off by the owners of the banks for their own pleasure. Even Highland wildernesses fifty miles wide, which some time ago could hardly be considered as property, seeing that they were of scarcely any use, are now proclaimed as sacred from the foot of human visitors, because the deer might thereby be disturbed, and deer produce a sporting rent. The tendency is to put walls and doors, locks and keys, upon every bit of the surface, for the benefit of the few, and to the exclusion of the many. And this is done in various ways, furtive and otherwise. Unfortunately, it is a policy too

apt to be successful, as the vagueness of a public right has but small force against the intensity of a particular claim. And thus the poor public is hustled in time out of every place it can have any pleasure in frequenting, till at length nothing is left for it but the artificial scenery of the streets, and dusty roads enclosed by monotonous walls, reared as if with the intention to exclude even a passing view of the landscape.

We are not among those who would throw unreserved blame upon the owners of the soil for every example of such conduct, seeing well how our social progress is always making property more and more valuable, how the progress of taste is always making it more susceptible of injury, and how natural it is for any one who possesses a thing, to seek to protect and to improve it. We would only, with all possible impartiality, present a few considerations which may tend to promote a good understanding on this subject between proprietors and the public. It seems but fair to remind the former that, if inconvenience be felt from rights of passage, it is a subtraction from the value of neighbouring property which existed when that property was acquired. Proprietors have no right, otherwise than by purchase, to improve their grounds by the abolition of such alleged inconveniences. If they do so, they undoubtedly make a positive encroachment on the rights of other parties, and are thus guilty of a very gross form of that very offence from which they are prone to profess being sufferers. This is not sufficiently kept in view in those cases where popular resistance is made to the claims of proprietors. A gentleman builds a wall and gate to prevent the public from passing through his grounds. A spirited member of the public breaks down the obstruction. It seems a violent act—and shall a gentleman not have a title to protect his own grounds from intrusion? The fact is, the gentleman is not merely protecting his grounds; he is himself committing an aggression upon a piece of property—the walk—which belonged to the public. The public is as well entitled to break down the wall, as it would be to remove a load of furniture which had been awkwardly left upon a thoroughfare, to the obstruction of passage. It is like killing in self-defence. If damages are to be mentioned in the case, they ought to be damages from the builder of the wall for the trouble he had given those who removed it.

There is often a misapprehension of the true nature of property in the minds of those who seek to improve it in this manner at the expense of the public, or who are disposed to use it in a jealousy exclusive manner. The fact is, that it is the public which makes property, seeing that it is entirely the creation of a sanction and a protection extended by the mass to the individual, on an understanding that it is for the general benefit that things should, as it were, belong to individuals. There is no-

thing else in the matter; and the moment that the commonwealth should see it to be not for its interest that property should belong to individuals, there will be no property in our common acception of the term. Now, if it be the wish of any to preserve the present arrangement, which, on the whole, and relatively, is a good one, it should be his study to act as much as possible in such a way regarding his property, as may make it a source of no inconvenience to his fellow-creatures, but rather the reverse. Every movement towards the making it more exclusive or more aggressive, every occasion on which it interferes with great public interests, or becomes in anyway a grievance or an impediment, must tend to impair that sanction without which it dies. On the other hand, where it is used and maintained in a liberal spirit, the contentment of the commonwealth with its present posture must be promoted, and its permanency in that degree insured. Amidst the many movements of our time, it cannot be said that there is any regarding the holding of property. Alterations in that department seem as if they would be amongst the latest births of human progress. It would, therefore, be absurd to speak thus in the way of menace, or for any one to dream that such is our purpose. We merely wish—and this, we think, is within our legitimate province—to awaken just feelings on the subject in those who are blessed with large possessions. We would wish them to be inspired with reverence for their fellow-creatures, as the creators of property in their persons, and to become disposed to share the blessing as far as the simplest regard to useful ends will permit. Let them, above all, abstain from making the extent or position of their territories a source of trouble or annoyance to the community, as also from tightening restrictions, so as to deprive the public of any privileges which they have hitherto enjoyed.

The public is at the same time bound to exercise its rights, and to use such graces as may be generously extended to it, in a manner as inoffensive as possible. In the case of a right of passage through open grounds, it is only fitting that care should be taken to avoid injury to growing crops, to trees, and to enclosures, so that proprietors and tenants may have nothing to complain of. Justice and good-feeling alike make this demand. If a kindly concession has been made by a proprietor to the public, the simplest regard to good manners renders similar care necessary. Before, indeed, we can expect any liberality from proprietors, it is necessary that the public should learn to act with delicacy and conscientiousness towards that class. Prudence would even counsel that, for the preservation of what it has a right to, the public ought to cultivate a reverence for the property which may be concerned, abstaining from all injury to the minutest object in field or shrubbery—a course which a right-minded person would feel to be as necessary for the maintenance of his self-respect, as for the keeping up of a good understanding with the owners of the soil.

To return, in conclusion, to the general principle, it would be well to keep more in remembrance than we generally do, a source which property has somewhat higher than even the sanction of the republic. Petty man walks over his grounds, and says to himself, 'Behold, all this is mine!' forgetting the true Owner, and that landlords are, after all, but a succession of tenants. He devises and frames some piece of curious material, from which he expects to derive advantage, and says, 'Behold, I made this, and it is mine!' forgetting whence came the gifts which enabled him to accomplish his

work, and that we are all of us but as tools in the hands of the Great Workman. A livelier sense of these truths might dispose us to consider property as not rightly used, unless when devoted to the highest purposes of humanity, since these purposes are God's, and we only deserve His benefits when we work His will.

THE LOST PORTRAIT.

BY MRS CROWE.

'*Ecoutez!*—listen!' said Monsieur Herbois to his companion; 'there is that divine voice again!'

'*Mais c'est une voix d'enfant!*—it is a child!' returned Monsieur Michelet.

'Yes, it is the voice of a child; but what a voice!' exclaimed Herbois, standing still, and holding the other by the arm, in order to arrest his steps also; 'so pure, so sweet, and even so steady; and what a perfect intonation! Did you ever hear anything so enchanting?'

'It is very remarkable, certainly, for a child,' replied Michelet. 'It proceeds from this cottage; let us go round to the door and inquire about her.'

'*Doucement!*—softly! Come this way a bit,' said Herbois, laying his finger on his lip, and drawing his friend in an opposite direction.

The cottage from which this sweet voice proceeded stood alone in a valley of the Apennines, not far from the town of Spoleto; and the two strangers, who had approached it from behind, now retreated the way they had come. 'The truth is,' continued Herbois, 'it was to hear that voice I sent for you from Rome.'

'Then I think you might let me hear a little more of it,' replied Michelet.

'I hope we shall hear a good deal more of it,' answered Herbois with a mysterious nod of the head. 'What do you say to carrying her off with us to Paris?'

'With all my heart,' replied Michelet; 'that voice, well cultivated, will be a fortune. What friends has she? Will they give her up?'

'That is the difficulty,' answered Herbois; 'and here it is I want your assistance. You must know that it was about three months since, on my way to Naples, that I first heard that voice. The day was cold, and whilst they were waiting for the horses at Spoleto, I had walked forwards to warm myself; when suddenly, as I passed near this spot, my ears were arrested by these delicious tones. For some minutes I stood transfixed with delight and surprise; and as I was instantly struck with the immense advantages to be derived from the possession of the child, I was about to enter the cottage for the purpose of making inquiries, and opening a negotiation, when the vetturino overtook me, and I was obliged to continue my journey. On my arrival at Naples, however, I wrote to old Martinelli, who, by the by, has given up teaching, and retired to end his days at Spoleto; which he left, some sixty years ago, a beggar boy without shoes or stockings, in order to make his livelihood by singing through the streets. Well, I wrote requesting him to make inquiries about the girl and her friends, and to find out on what terms they would give her up; not doubting, from their apparently mean circumstances, that they would be willing enough to resign her on such an advantageous speculation. But I had reckoned without my host.'

'You offered a sum down?'

'I offered a hundred crowns; at least I authorised Martinelli to do so, if he thought fit. But it appears that the grandfather of the girl had once before received an application of the same kind, and had rejected it with such indignation, that Martinelli said it would be of no use in the world to think of it: the old man being in the first place devotedly fond of the child; and in the next, having, for some family reasons, an insuperable objection to her going on the stage.'

'How are we to get her, then?' returned Michelet.

'There's no way but stealing her that I know of,' returned Herbois.

'Stealing her!' echoed the other, looking rather grave.

'It's all for her own good, you know,' answered Herbois. 'Isn't it much better that that beautiful voice should be cultivated, and that she should make her fortune, and the fortunes of her family too, than that she should languish here for the rest of her life in poverty and obscurity?'

'Well, perhaps it is,' answered Michelet, whose notions of right and wrong were apt to be a little confused as well as those of his friend. In short, they were both *entrepreneurs* for the French opera, and as their ideas ran but in one channel, they did very honestly believe that no destiny could equal that of a *prima donna* in the great European theatres.

Finding, as he had expected, that his friend threatened no very vigorous opposition to his nefarious project, Herbois now set about explaining to him the plan he had formed for its execution. Whilst they are discussing this question, we will introduce our readers to the inhabitants of the cottage.

Giuseppe Marabini was the possessor of a small vineyard which had been in his family, and descended from father to son, for several generations. He was thus a proprietor, and raised somewhat above the degree of a peasant, although the produce of this little patrimony was not sufficient to exempt him from a necessity for the closest economy. Fortunately, however, he had no numerous family to provide for; one little girl being the only fruit of his union with Paula Batta, a young girl of the village, who brought him no dowry but a good temper, a pretty face, and a very sweet voice; which last qualification was not the least of her attractions to Giuseppe; and it was much to the satisfaction of both parents that they found the young Paulina had inherited this endowment. The child sang like a nightingale, and being also very pretty, she was the delight of her father and mother. By the time she was fifteen, these attractions, combined with the additional one of her being the heiress of the little vineyard, had brought half the young peasants of the neighbourhood to her feet. But Paulina did not care for them, and was in no hurry to be married; indeed she frequently declared to her young companions that she did not mean to marry at all, for she was quite sure she should never be so happy as she was with her father and mother; and she remained inexorably fixed in this opinion till she was nearly sixteen, when the arrival of Marco Melloni, her cousin, entirely changed her views on the subject. Marco was the son of her mother's sister, Teresa, and had quitted home at an early age in the quality of page to a lady of rank. He had since risen to some higher grade of service; and, the family he then lived with being at Rome, he had taken the opportunity of visiting his relations.

Marco was a very different person from the suitors that Paulina had found it so easy to reject. He had seen the world; his manners and conversation were quite polished and fashionable; he talked of Paris, and Vienna, and London; of concerts, operas, and balls; and, moreover, he wore very fine clothes: and Paulina soon began to perceive that her inexorable resolution to lead a single life had been somewhat prematurely announced.

The gallant Marco of course fell in love with his pretty cousin, and when, at the end of his fortnight's holiday, he returned to Rome, he carried with him her promise to become his wife on his next visit, provided her father and mother did not object to the match; which, however grieved to lose their daughter, they did not think they had any good grounds for doing. So their consent being gained, and everything arranged, Marco returned to claim his bride before his master and mistress quitted Rome; and then carried her off with him to the north.

Now, unfortunately, although Paulina sang like an angel, she could not so much as write her name; so that the separation between herself and her parents was

entire. For the first few months, indeed, Marco occasionally wrote them a line to say they were well; and in one of his letters he mentioned that the count, his master, was so charmed with Paulina's fine voice, that he had undertaken to provide her with lessons in singing, which pleased and flattered the good people very much. Gradually, however, this little link between the parents and their child dropt; and many a sigh and tear it cost the former, that, owing to the travelling propensities of Marco's employers, they had no means of gaining intelligence of her, even through the intervention of the scribes to be found at Spoleto: they did not know where to address a letter. Some years had passed in this state of uncertainty and privation, when one day the *vetturino*, who was weekly in the habit of passing that way, drew up his horses at their door, and handed out of the coach a lady extremely elegant in her appearance and attire, but apparently in very bad health. He then lifted out a child, and having set it and their luggage down at the door, he mounted his seat and drove away again; whilst Paula and Giuseppe stood at the window watching these unusual proceedings, and wondering what was to come next. A mistake it was of course; for what could so fine a lady want with them?

Meanwhile, the stranger having watched the carriage till it had passed a corner, and was out of sight, turned towards the door, which was open, and entered the house; whereupon the two old people, half in hope and half in fear, advanced to meet her; and when she lifted her veil, they saw it was their daughter; but so faded, so changed, so sad, that whether to rejoice or weep, as they embraced her, they knew not. For her part, poor soul, tears were the only expression that she was capable of, or which suited her mingled feelings of joy and grief; and without being able to utter a word, she sank into a chair, and shed them freely; whilst the child, with wonder painted in its large dark eyes, stood staring at the scene.

As soon as the parents had recovered from their surprise, they gave their daughter the tenderest welcome, and sought by every means in their power to relieve her mental afflictions, and minister to her bodily comforts. But poor Paulina had returned with ruined health, and 'a broken and contrite heart;' and the only consolation she seemed capable of receiving, was the promise made by her parents to take charge of her child, and devote themselves to its welfare. 'Let her live with you, father: if she must marry, if she will marry, let it be to some one here on the spot: never let her leave her home: and, above all things, if she should inherit a voice—I fear she will, for she sings already—never let it be cultivated! Let her sing to please you, let her voice echo amongst her native hills; but oh, never, never within the walls of a theatre!' Such were her constant prayers and injunctions from the day she arrived till the day she breathed her last breath in their arms, which was just three months after they had seen her descend from the coach at their door. From that moment Nina—so the little girl was called—became the darling of their hearts. They brought her up in the same simple way in which they had brought up her mother; indeed they knew of no other. She helped to do the house work, and to tend the vines; and although inheriting more than her mother's beauty, and a voice almost unparalleled in sweetness and power, she could neither read nor write. They had already fixed their eyes on a young peasant of the neighbourhood to be her husband, when she was old enough; which would be in five years from the period at which our story commences, for she was now between ten and eleven years of age.

'Wife, wife!' said Giuseppe, as he approached the cottage an evening or two after the conversation between Herbois and Michelet, 'why are you sitting out so late? Nina, you should make your grandmother go to bed; you know she is not well.'

'Grandmother wouldn't,' answered Nina. 'I did ask her.'

'The cool air is so pleasant,' said Paula, rising with her husband's assistance; 'and I don't think I shall enjoy it many more evenings, for I grow weaker and weaker.'

'The more reason for your not sitting out in the chill,' returned Giuseppe. 'Come along in.' And almost angry at her imprudence, he led her into the house.

'The only thing that concerns me,' said Paula, after a pause, 'is to think how you will be able to take care of Nina when I am gone.'

'What do you mean?' said Giuseppe impatiently; for although he feared that Paula was really very ill, he could not bear to have his apprehensions confirmed.

'She is now approaching an age in which she will want me more than ever, just as I am going to be taken from her,' continued Paula.

'I'll go and call her in,' said Giuseppe, looking towards the window, through which, although it was dark, they could see Nina leaning over the railing that separated their little garden from the road, whilst her sweet voice resounded in their ears as she chanted her evening hymn to the Virgin.

'Leave her a little; she is very well where she is, and she likes to be out of doors; besides, I meant to speak to you about her, husband, for you must prepare yourself for what is to happen. I know I cannot live long; and therefore, much to the distress of the old man, Paula entered into the subject of her own approaching decease, giving him her directions and advice with regard to the future management of their beloved grandchild.

'Hark!' said he in the course of the conversation; 'who can that be playing the flute so charmingly?'

'It's beautiful!' said Paula, who loved music as well as her husband.

'Listen, grandmother! Listen!' cried Nina, running up to the door.

'Yes, my child, we hear,' returned Paula. 'I only hope her love of music may not lead her into any mischief,' she continued. 'That scapegrace Pietro—I suppose that is his flute—is endeavouring to make up to her; but you must not let him; and then, resuming the former subject, she entered at length into her views of what would be best for the happiness of their beloved charge. 'It's time she was in now, though,' said she when the conversation was concluded. 'You had better call her.'

'Nina!' cried Giuseppe, going to the door; 'Nina, child, come in. Why do you stay out so late?' But Nina did not answer.

'She is gone after that flute: it's Pietro's flute, depend on it; and he has enticed her out that he may whisper nonsense into her young ears. I don't like that lad. Hark! I hear a carriage; I hope the child is not out in the road.'

'I'll go and fetch her in,' said Giuseppe, proceeding towards the gate; but as she was not there, he opened it, and went upon the road. It being now so dark that he could not see above a yard or two on either side, he stood still and called, but Nina did not answer. Then he walked a little one way, and a little the other, still calling 'Nina! Nina!' but still no Nina answered; upon which he re-entered the house to fetch his stick; and whilst he and his wife vowed vengeance against Pietro for enticing the child away, he directed his steps towards the cottage inhabited by that gay deceiver's mother, whither he did not doubt she was gone, as she had occasionally done before, bewitched by Pietro's musical accomplishments.

But, alas! Nina was not there; nor had it been Pietro's flute they had heard, that was clear, for the boy was lying in bed with a hurt leg. Who, then, was the musician that had enticed her away? Nobody could tell. The old man passed the night in seeking her all round the neighbourhood; Paula passed it in tears and prayers. Vain tears—vain prayers! Nina was seen in the valley no more! All that could be learned was, that the vetturino, who knew her well by sight, from so

often passing the door, had seen a carriage with post-horses near Florence, in which sat two gentlemen and a little boy, whose face struck him as bearing a remarkable resemblance to Nina. The child seemed to know him too, for he had started up and put his head out of the window; but the gentlemen pulled him back, and drew up the glass. The man promised to make inquiries when he returned to Florence; but he could learn nothing: so many strangers visited that city, that the impression made by each was too evanescent to be retained.

For some weeks after this cruel misfortune, Paula languished betwixt life and death, and then expired, bidding Giuseppe never to resign his search after their lost darling. 'Seek her in the great cities,' said she; 'they have stolen her for her voice.' When she was dead, and Giuseppe had laid her in the earth, he sold his cottage and his vineyard, and with the proceeds in his pocket, he set out with a wallet on his back, and a stick in his hand, to traverse the earth in search of his grandchild.

Seven years had elapsed—Pietro was married, and had two children; the cottage where these scenes had transpired was pulled down; the vineyard was a vineyard no longer; and the sorrows and distresses of their former owners had become a tradition in the neighbourhood, when one day a stranger arrived to inquire for Giuseppe Marabini. But no one could give him any intelligence: Giuseppe had gone away, nobody knew whither, and had never been heard of since his departure. But although these worthy people could give no intelligence themselves, they were not the less desirous of obtaining some from the traveller. They wanted to know whence he came, who sent him, and whether he could tell them what had become of Nina. But it was in vain they surrounded and questioned him; he evidently came to make inquiries, not to answer them; and not a word could they extract to satisfy their curiosity. When they were assured of the hopelessness of their endeavours, they drew aside from him, in order to discuss the question by themselves, whilst he mounted his horse, and rode away as he came.

On that very same day, a poor old man was treading heavily and sadly along the road between Dover and London. His clothes were worn and shabby, his tall spare figure was bowed by age and sorrow, his face was thin and wan, and his long white hair fell almost to his shoulders; he helped himself along by the aid of a stick, and under his arm he carried an old violin, which he ever and anon stopped to play when he arrived at a farmhouse or a village. Gradually toiling on from day to day, he at length reached the metropolis; and as he could not speak a word of English, and was at a loss in what direction to seek a lodging, he set himself down upon a door-step to rest and deliberate; and after a little while, in hopes of attracting the attention of the charitable, he commenced playing on his instrument. Presently a window was thrown up above his head, and two fair young faces looked out.

'That is the very Tarantella I have been longing for!' exclaimed one.

'It's the very same that Miss Dallas played, I declare,' cried the other. 'Oh, what fun! Now we'll get it; and she shall have the pleasure of hearing us play it the very next time we meet.'

'How delightfully savage she will be, after tossing up her head, and telling us she never gave copies!' said the first; whereupon, having called to the old man not to go away, they rang the bell, and desired the servant to take him into the dining-room.

'We want you to give us the music of that Tarantella,' said they to him; 'of course we will pay you for it.'

'Perdonal!' said the old man, shaking his head.

'Ah—you are a foreigner?' said they, addressing him in French, which he understood enough to comprehend them; and on learning what they wanted, he said he

should be too happy to oblige them, if they could take down the music from his playing it—for to write it himself he was unable, as he only played by ear.

This was accordingly done, and when finished, they thanked him, and offered him five shillings in remuneration. But poor as he was, the gallantry of the old foreigner recoiled from being paid for this little service; and bowing respectfully, he told them he was too happy to oblige their signorinas, and that he required no other reward than the pleasure.

'How unlike an Englishman!' said one of the ladies.

'An Englishman would have held the two half-crowns in the palm of his hand, and looked at them with an air of astonishment and disappointment, as if he could not conceive what we meant by offering him so little,' said the other; and this trifling trait of character having interested them in favour of the poor stranger, they proceeded to make some further inquiries as to his situation.

'Then you travel about, and support yourself by your violin?'

'Si, signora,' answered the old man.

'And have you never been in London before?'

'Never,' he replied.

'Then how will you find yourself food, or a lodging, when you can speak no English?'

The old man said he did not know, but he had encountered great difficulties before, and he hoped God would protect him still.

'I wonder if Thomas could recommend him to a lodging,' said one of the ladies; 'let us inquire if he is at home.'

Thomas, who was their brother's groom, said he could get him a lodging in the Mews, where his master's horse stood, if he could pay for it. Without referring to the stranger on the subject, the young ladies said they would be answerable for the rent for a month at any rate; agreeing that they owed him as much as that for the music. So having desired the groom to give him something to eat below, the poor foreigner, after partaking of some bread and cheese, was conducted to the house of Thomas's acquaintance, and introduced into a more tidy room than he would probably have had the luck to discover for himself.

Mrs Hudson was a laundress, and a widow with one son, a scapegrace, on whom she doted to her own and his great injury; for she had indulged him most injudiciously in his childhood; and now that he was grown up, she sacrificed the fruits of her laborious industry to supply the idle and dissipated habits her former weakness had engendered.

George Hudson was a fine young man too, in spite of his faults: he was handsome, good-natured, lively, and really fond of his mother in his heart: but then he was so thoughtless and extravagant, so destitute of any fixed principles, and so often led astray by worthless companions, that he was always getting into scrapes and difficulties. However, the agreeable qualities he possessed rendered him a great favourite with the young women of his acquaintance; and amongst the rest, had won him the heart of a cousin of his own, called Lucy Watson, who lived in the capacity of housemaid in a baronet's family. Now, it happened about this time that Lucy's master, Sir Henry Massey, was about to be married; and it was arranged that, on the day of the wedding, after the bride and bridegroom had left London, the servants were to celebrate the joyful event by a ball, to which each should invite his own friends and relations. So Lucy of course invited George and his mother; and George begged leave to bring his friend Jack Pearson, a capital fellow, and a very good dancer.

Great were the preparations above stairs and below for this grand occasion; and great was the excitement and expectation on the part both of the entertainers and their visitors; whilst good Mrs Hudson, who by this time had become much attached to the poor foreigner, her lodger, thought it such a pity that he should not be

happy as well as the rest, that she persuaded Lucy to extend her invitation to him, on the plea that his violin would be a valuable acquisition to the party. So, after making some demur about the shabbiness of his clothes, the old man having consented to accompany them, they all four repaired to Grosvenor Street, where they found a large party already assembled in the servants' hall.

As the poor stranger really played a great deal better than the musician they had engaged for the occasion, he was extremely well received, and made very welcome; whilst his lame attempts at English contributed much to the hilarity of the party, many of whom could not conceive why he should prefer calling the candle a *chandelle*, or the chair a *chaise*; Joey, the stable-boy, taking particular pains to correct his parts of speech, and make him comprehend that a *chaise* 'was quite another sort of bob, what took'd a horse to drawing of it!' Altogether, the evening passed away gaily enough, and everybody went home well pleased.

'It was capital fun, wasn't it, old boy?' said George to the stranger on the following morning; and the foreigner, perceiving that an assent was expected, smiled, and said '*Oui, oui!*'

This passed whilst they were taking a later breakfast than usual, and George fell to expatiating on Jack Pearson's capital dancing: he was so glad he had taken him; he was much the best dancer there; and so forth; when the eulogium was suddenly interrupted by some very unexpected visitors—no less a person than Sir Henry Massey's house-steward, accompanied by two extremely suspicious-looking strangers.

'I am sorry to interrupt you,' said Mr Terry, as they all rose to receive him; 'but a very unpleasant circumstance has occurred. An article of value has disappeared; a miniature of my lady set in diamonds, which was brought yesterday from the jeweller's just after the carriage had driven away; and which, intending to forward by the mail, I had unfortunately brought down to the steward's room.'

'And what do you suppose is become of it?' inquired George, looking as he felt quite unconcerned in the matter.

'Somebody must have laid hands on it, I am afraid,' returned Terry; 'most of the company were in and out of that room taking refreshments in the course of the evening, you know.'

'And you are come to see if we have got it, I suppose?' answered George laughing. 'Well, come on, my boy. Here am I; search me if you like!'

Mrs Hudson also, though somewhat mortified at the implied suspicion, offered to be searched, and to conduct the officers over her small Louse; whilst the foreigner, who understood nothing of what was going on, remained standing in silence.

'We must search the old man too,' said Mr Terry to the officers.

'Comment!' said he, making some resistance as they took hold of him.

'He does not know what it means, poor man,' said Mrs Hudson. 'Never mind, mounseer,' she added, clapping the old man on the back to encourage him; 'it's all right.'

'Hallo! what have we got here?' exclaimed Townshend, one of the officers, as he opened a small box which he had found in the foreigner's bosom, and drew from it the miniature of a beautiful young girl in the dress of an Italian peasant.

'Bless my soul!' exclaimed Terry, snatching at it; 'but where are the diamonds?—where is the setting?' for the picture, which was somewhat faded and defaced, was without any setting whatever.

'Is that it?' asked Townshend.

'It must be it, though I should hardly have known it again,' returned the steward. 'What have you done with the setting?—where are the diamonds?' said he, addressing the old man sharply.

'Perdona!' said the foreigner; 'what he say?'

But he had not English enough to comprehend their explanations; so, greatly to his own perplexity, and the grief and dismay of Mrs Hudson, they handed him off straightway to the police-office, George going with them to 'see the fun.'

On being interrogated there in French, and informed of what he was accused, he laughed at them, and said that the miniature was the portrait of his own daughter, which she herself had given him; a fact which the magistrate asserted to be highly improbable, as it was evidently the production of a first-rate artist.

'It was nevertheless true,' the old man said; and, moreover, it had been handsomely set in gold; though necessity had obliged him to part with the setting for bread. On being asked how the daughter of so poor a man should have had a portrait that must have cost at least thirty or forty guineas, he answered that his daughter, who was now dead, had once been rich. 'She was,' said he, 'a singer at the Italian opera in Paris; and that portrait was taken of her in the costume she had worn in her native village.'

To all this, however, Terry, when it was interpreted to him, answered that the miniature was beyond all doubt the one they had lost; 'for,' said he, 'supposing it possible that the dress were similar, it is quite impossible that the face should be the same. Now, although this portrait is sadly altered and spoiled since yesterday, which, I suppose, has been done on purpose, yet it is certainly my lady's likeness.'

Upon this the old man was committed, much to his own amazement and indignation; and what concerned him still more was, that they took the picture from him. But although they had got the thief and the miniature, the gold and the diamonds were not forthcoming; nor could all their threats and intreaties induce the old man to confess what he had done with them; and to that effect, with great lamentations and contrition for his own carelessness, Terry wrote to the baronet. The picture, he said, was retained by the magistrate, or he would have sent it.

On receiving this unwelcome intelligence, Sir Henry, who was no farther off than Brighton, came up to London; but when shown the miniature, he was infinitely more puzzled than Terry had been. He saw differences imperceptible to the steward.

'It is most extraordinary!' said he; 'it is the same, and yet it is not the same! Let us send for the artist, and hear what he says.'

The artist said it was the most incomprehensible thing he ever saw; it was not the picture he had painted; it was the work of a French artist, he was certain; and it must either be a portrait of the same lady, or her sister. Had she a sister?

'She never had a sister,' said Sir Henry; 'but nothing is more probable than that some French artist may have taken Lady Massey's likeness; but the singularity is, that it should be precisely in that costume! Besides, I never heard her say that she had sat for her picture.'

'And how should it be in the possession of this old beggar?' said the artist.

'Let us send for him and ask him,' said Sir Henry. So the old foreigner was brought to the office, and being introduced into the magistrate's private room, he found himself alone with two strange gentlemen, who began to interrogate him in French; with much more civility, however, than had been practised towards him before.

'You say this is the portrait of your daughter, I understand?'

'Si, signor.'

'Pray, can you tell me where it was painted, and by whom?'

'A Paris, par Le Roy.'

'I thought so,' said the artist.

'And your daughter was a singer at the French opera?' said Sir Henry.

'Si, signor.'

'May I inquire her name?'

'Paulina Melloni.'

'Paulina Melloni! Indeed! Are you the father of Paulina Melloni?'

'Si, signor; that is to say, I was. *E morta!*' he added with a heavy sigh, 'Paulina Melloni is dead.'

'She was a great loss to the stage when she withdrew from it,' said Sir Henry. 'Pray, take a chair;' for he was passionately fond of music, and he was beginning to feel an interest in the father of one of his favourite singers. 'But I am sorry to see the father of Paulina reduced to such extremities; what has brought you so low?'

'Ah! that would be a long story,' returned the old man, 'which the signor would not care to be troubled with. Paulina left a daughter—a dear child—an angel of beauty like herself; and with a voice! Ah, signori, if you had ever heard that voice! Paulina's was fine; but if you had once heard my Nina's!—'

'Whose?' cried Sir Henry, starting from his seat. 'Did you say Nina?'

'Si, signor,' answered the old man, stepping forward and looking eagerly in his face. 'Nina Marabini; for though her real name was Melloni, so we always called her.'

'Then you are her grandfather, Giuseppe?' said Sir Henry.

'I am,' returned the old man, dropping into a seat, and almost fainting from agitation; 'where—where is my child?'

'Your Nina is my wife, good friend,' said Sir Henry, giving him his hand kindly; 'and glad she will be to see her grandfather. We sent to Spoleto to inquire for you; and only last week I received a letter from my agent, saying you had long left it.'

We need not attempt to paint the joy of the meeting that ensued between the old man and his darling; and it is scarcely necessary to explain, that the same fancy for being painted in the becoming costume they had formerly worn had influenced both the young women, and so occasioned the resemblance between the pictures, and the subsequent happy discovery. Nina, who had been enticed out of the garden by Michelet's inimitable flute-playing, and carried off to be educated for the stage, had never known her mother's name, nor had she been acquainted with the fact of her having been an opera-singer—poor Paulina's sad experience, whatever it was, had given birth to the desire that her child should be kept in ignorance of these circumstances. Nina found herself the property of two strangers, who treated her kindly enough, whilst they had her taught to read and write, and procured her the first instructions in singing and music, to which nearly all her time was devoted. At first she had grieved very much at the separation from her grandfather and grandmother, which, however, she was told had been effected in that manner with their entire concurrence and approbation, in order to spare the pain of parting; and that, by and by, she would see them again. Young memories are short, and young tears soon dried. Nina delighted in music, and her joy in it ere long consoled her; and as she worked *con amore*, she became in due time a most accomplished singer. When the period arrived that she was to be produced, her master, who was very proud of her, gave a select soirée, to which he invited a few distinguished persons to hear her, amongst whom was Sir Henry Massey, who happened to be at that time in Paris. Her extreme resemblance to the lost favourite Paulina Melloni, whom many of the company remembered, struck every one, Sir Henry, who was a man of five-and-thirty, amongst the rest; and what with looking at her whilst this subject was discussed, and what with hearing her sing, he contrived to lose his heart to the *debutante*; and having refunded to Herbolis the cost of her education, instead of appearing on the stage, she became Lady Massey.

As for the miniature and the diamonds, they had, by a very ingenious process, become the temporary pro-

party of that capital dancer, Jack Pearson, on the evening of the ball. They were traced to him, and recovered; after which experience of his attractive qualities, George not only forswore his acquaintance, but made some very vigorous efforts at self-reform, which, after various alternations and relapses, terminated ultimately, to the infinite joy of his mother, in a very satisfactory degree of amendment in his own character and conduct.

EVERY-DAY ENTOMOLOGY.

THE APHIS FAMILY.

In studying this family of insects, we turn from the direct to the indirect plagues of the human race. The *Culicides* will pierce and exasperate, but the *Aphides* can devastate and destroy. At present, the aphid family is a particularly popular tribe of insects, and we hear of nothing but *vastators*, turnip aphides, grass aphides, &c.; in fact, there is an aphid mania. Whilst these little creatures are setting the world in a panic—whether needlessly or not, is not our present business—it may be both interesting and instructive to devote a little space to their natural history.

The aphides are all minute in size; they are soft in structure, and have oval bodies, with small heads. They have four wings, long slender legs, apparently too fragile to support the well-conditioned bodies they uphold; and they are provided with a very curious beak, called the *rostrum*, or *haustellum*, which consists of a delicate semi-transparent tube, at the end of which is an opening so minute, as to defy detection with an ordinary microscope, but capable of being demonstrated by pressure, when a droplet of fluid will appear at the orifice. In some, this sucking apparatus is considerably longer than the body of the insect; and when not in use, is carried underneath it, and projects some distance beyond, turning up like a sort of tail. There are many species belonging to the family which exhibit a great variety in their external aspect. Some are transparent green insects, which have all the appearance of winged pieces of vegetation, so perfectly do they correspond in colour with the hue of the young shoots upon which they prey. To this it is owing that their presence is frequently only first observed when the plants droop, and wear an unhealthy appearance from their attacks. Some are black, others brown, citron-coloured, or even white, or of the colour of bronze. They appear to change their hues occasionally with the nature of the juices upon which they feed. In the month of August, if we examine some of our rose-trees, we shall find several of the aphides preying upon them of a pale rose colour, although, in the previous months, their colour was green. Some have a flat dead colour; others glisten like animated drops of brown varnish: some are more gaily painted; and others prettily marked in green and black. Several are sure to attract notice by their being clothed in a white woolly robe, by means of which they are wafted through the air almost as lightly as the thistle-down. The *Aphis lanigera* is thus adorned: it is the too familiar 'apple blight'; and communicates to the trees it infests that hoary aspect which all have beheld them wear, particularly toward the end of the summer, when white cottony flakes are seen waving from the branches. The aphides live in an imperfect society, and seem happy in the fellowship they mutually enjoy; but it is the fellowship of eating and drinking alone. Like all gluttons, they have a great aversion to locomotion: they love to eat and drink, and live generally on the very spot where good food is to be found; and, like gluttons still, it is not uncommon for them to meet with their fate upon the very scene of their festivities.

These few general particulars have reference to the perfect insects: much interest attaches to the earlier history of the aphides. It is curious that these insects produce eggs in the autumn, but are viviparous—that is, produce their young alive—during the summer. The

eggs remain undeveloped through the winter—generally sealed to some plant, or sheltered in some safe recess—and in the spring the perfect insects come forth from them; these perfect insects then go on, not to produce ova, but to bring forth other insects as perfect as themselves, until autumn returns, when ova are once more produced, and safely stored up for the winter. Here, however, we open upon one of those striking passages in natural history in which the science of entomology especially abounds. If, during the month of November, one were to take the trouble to find and dig down to the nest of a yellow ant, common enough in our pastures—the *Formica flava*—he would most probably witness a scene which would amply repay the exercise. This ant is the nurse, the almost second parent, of the eggs of the aphides. In the autumn, when the eggs are deposited by the last generation of the aphides, they are collected by the ants, and carried by underground tunnels to their nests. Here they are carefully stored up in a proper apartment, and are treated with the tenderest care, and watched over with the most anxious jealousy and solicitude. The ants lick them with their tongues, and varnish them over with a peculiar liquid. If it is requisite to move them, they are carried most carefully between their mandibles; and on warm sunny days they are brought to the surface of the nest to get the benefit of the air, and are always carried down again as the chilly shades of evening close upon them. Why all this care? In the spring, the eggs are hatched, and female aphides come forth from them; and now the watchful toil of the foster-mother is all rewarded. The ants are to the female aphides—to use the expressive simile of Linnaeus—as their milch cows! Large flocks of these tiny kine are thus collected together in the ants' nests, and repay their owners in producing the sweet delicious fluid which everybody knows under its name of 'honey-dew.' This fluid is excreted by a peculiar apparatus in the abdomen of the aphid, and it may often be seen in drops upon the leaves of trees infested by them. 'Honey-dew' was once supposed to be a disease of the leaves themselves, and has been the subject of many foolish mistakes and superstitions. The above is the true source of this fluid; and it is sought after with the greatest avidity by the ants.

The insects thus produced are capable of giving birth to a progeny of live aphides, and are endowed with enormous fecundity. Reaumur watched one under a glass vessel, and found that, in a single day, it became the parent successively of twenty young, and without itself suffering any apparent diminution of size. In fact, he naively remarks, that when once this function comes into play, they seem to do nothing else. It is a remarkable fact, and one upon which much obscurity hangs, that these aphides are virgin mothers; and they will produce their young incessantly for eight or nine generations without alteration of condition in that particular. M. Bonnet instituted some most laborious experiments to decide the question, and was repeatedly a witness to this fact. On one occasion he states that the mother of ninety-five aphides never paired! The insect upon which he experimented was born before his eyes, and instantly isolated, so that the possibility of a mistake cannot exist. This striking anomaly in the history of the aphides caused, at its first announcement, the greatest sensation in the scientific world, and for a long period its truth was severely questioned: it now stands among the most surely-based facts in entomology, having its foundation on a number and variety of experiments equal to the importance of the occasion. Beyond a certain limit, this faculty ceases. It is curious that aphides of the other sex are not born until the autumn, when they fulfil their functions; ova are then produced, and our summer friends bid us farewell for the season.

Legion is the name of the aphides, for very many they are of a truth. It was a calculation of Reaumur, who seems to have had a sort of affection for this tribe of insects, that one aphid may be the mother of the vast

number of 5,904,900,000! Professor Owen more recently gives the following as an approximation to the actual numbers a single aphid may be the progenitor of: the *Aphis lanigera* produces each year ten viviparous broods, and one which is oviparous, and each generation averages one hundred individuals; consequently, by the tenth generation, a *quintillion* will have been produced! This wonderful fertility exceeds that of any known animal. It is this which makes the plague of aphides so severe an infliction upon a country. In a few short weeks, where there had been but a little regiment, there will stand up an exceedingly great army—an army in whose ranks millions take the place of hundreds. Occasionally, from unascertained causes, these armies will emigrate; and taking flight, will darken the air with their numbers. In White's 'Natural History of Selborne,' it is related that on a summer afternoon in 1785, the people of the village were visited with a dense shower of these insects. Those who were out of doors at the time were literally powdered over with their bodies, and the surrounding vegetation went into appropriate mourning, altering from green to black by reason of the multitudes which alighted upon it, so as to form a thick coat. In the autumn of 1834, a great flight of them was caught by a hurricane, and suddenly diffused over many parts of Belgium. In 1836, the inhabitants of Hull were seriously incommoded by a host of them loading the air in numbers so immense, as to fill the eyes, nose, and mouth of all who were in the open air at the time of their visit; but of this there are instances innumerable.

Some account of the destructive doings of this family of insects will be read with interest at the present moment. The *Aphis lanigera*, or 'apple blight,' is reported to have been brought into this country from America, and was traced by Sir Joseph Banks to an importation of young American apple-trees into some nursery-grounds in the vicinity of the metropolis. It soon spread, and laid waste thousands of trees, extending its ravages all over the kingdom, until, at the present time, there scarcely exists a locality in Great Britain which has not experienced the visitation of the scourge. This aphid is furnished with a most efficient instrument for its work, in a sharp penetrator contained in its rostrum, which will pierce even the tough bark of an apple-tree; a syringe-like apparatus then sucks up the vital juices, the part becomes covered with unsightly excrescences, the leaves curl up, wither, fall off, and the branch perishes altogether. On several occasions, this minute and pretty aphid has so nearly annihilated the apple crop, as to put a stop in some countries to the manufacture of cider; and while our orchards have been thus devastated, those on the continent have suffered in an equal ratio. The aphides also attack the more direct food of man, and sustenance of beasts, with equally fatal effects. Many kinds fall upon wheat, oats, and barley, and are particularly obnoxious to pease, of which it is related by Messrs Kirby and Spence that, in one year, the actual crop was only equal to the seed sown, in consequence of their attacks, and the fields were given up to swine, as the produce was not worth the harvesting. In 1810, they caused so great a dearth of the same food, as to make it impossible to procure a sufficient supply for the consumption of the navy. Those who know anything of the appearance of a bean crop, must often have noticed the top, as it were, covered with soot; this appearance is due to the 'collier' aphid—a little black fellow, who does a vast deal of mischief in his way. Singularly enough, aphides have been found inside codling-apples. In the 'Entomological Magazine' is an account of this curious circumstance. On cutting open one of the apples, a whole troop of them was discovered in its centre, and a number of other codlings were found tenanted in the same manner. After the very closest examination, no aperture could be discovered by which the insects could have entered; and they all speedily died on exposure to air. The bare mention of the ill-boding words, 'the fly,' is suffi-

cient to send a panic to the very heart of the hop-growing community—the insect is the *Aphis humuli*. It attacks the most luxuriant hop-vines, and rapidly multiplies in astonishing numbers; the plants droop; and unless the insects quit them, or are destroyed, frequently the entire crop perishes. Sometimes a thousand aphides may be counted on a single leaf. It is a fact that the annual variations in the hop-duty, the principal part of which is attributable to this insignificant insect, amount occasionally to a deficiency of £200,000; and it has been estimated that the entire extent of the damage sometimes amounts in value to three millions!

Where they do not devastate, the aphides frequently annoy us seriously by the disfiguring consequences of their attacks upon our plants. The occasionally pimpled appearance of our currant leaves will be found to be caused by a crowd of aphides, which, on the under surface of the leaf, will be seen hard at work, as usual, draining away the life-sap of the unfortunate member. Others may be found, writes Reaumur, growing upon the shoots of the lime-tree, and causing them to twist into a complete spiral. This is a great advantage to the invaders; for by such contraction the leaves of the twig are brought together into a sort of bunch, and thus form a pleasant harbour, well protected from sun and shower, in which they feast unmolested. The aphides infesting the elm roll up the leaves in the form of a spiral shell, and are thus secure, generally speaking, from the attacks of many of their enemies. Some of the curious things called gall-nuts are produced by the labours of aphides. In the month of June, very pretty ones may be found on the leaves of the poplar. They are formed by a little aphid, clothed in a shaggy garment of the whitest wool: settling upon the leaf-stalk, it pierces it; and as the sap exudes, it hardens, and becomes converted into a fleshy little chamber of vegetable tissue, in which the tiny labourer lives and bears its progeny. By and by, a colony of small flocks of wool—for so they appear—creep from the nest, and set up business on their own account. The Chinese use a certain gall-nut, formed by aphides, for communicating a brilliant crimson dye to silk. The aphides which infest the fir-tree often cause the most remarkable excrescences, some of which are like fruit, flowers, or moss.

It is a comfort to know that the aphides have their destroyers. The lady-bird, whose burning house and 'children at home' excite the sympathy of our juvenile friends, commits a most salutary havoc among these little gluttons; and like a wolf in a sheepfold, it kills those whom it cannot devour. It has often proved the hop-growers' best, though much abused, and shamefully persecuted, friend. It is not very long since that the parish engines, and several private ones, with a great store of tobacco-water, were called upon to do battle against an unusual flight of these poor insects, in utter ignorance of the real services and entire harmlessness of the unhappy creatures they were destroying. If our 'Every-day Entomology' can get a hearing among those who fell into this mistake, the lady-birds will be somewhat indebted to us for the result. The larvae of the syrphids are fearful enemies of the aphides. They are hatched from eggs artfully placed in the very middle of a flock of these insects, and thus the larva awakes to its existence with thousands of its prey immediately around it. The aphides, with characteristic stolidity, creep about in the most stupid manner into the very embrace of their foe. The larva seizes one of them, pierces it with a three-pronged dart, draws it into its mouth, pumps out its juices, and casts the dry carcase contemptuously aside when it has drained all. This is the work of an instant when the larva is hungry; and Reaumur beheld one devour twenty aphides in less than twenty minutes. They penetrate wherever their prey is found; nor is curled-up leaf, nor sheltered bower, nor vegetable home, always an efficient protective against their incursions. The larva of the *Heimerobius* also wages a fierce warfare with them; and seizing them by its long, crooked, perforated mandibles,

rapidly sucks out their vital fluids. There are also several kinds of aphidivorous flies, such as *Scava riberii*, *Pyrastris*, &c. which occasionally make their appearance in vast flights upon our sea-coasts, and appear hanging in the rear of flights of aphides.

We may perhaps be expected to say a word, while treating of the family, upon the aphid which has been supposed by some to be the cause of the present disease in the potato crop; and we are the more disposed to do so, because great ignorance prevails upon the subject—an ignorance we regret to see even in a portion of the press. The aphid is named by Mr Smee the *Vastator*, by others the *A. pestilens*. Mr Smee has laid down a chain of laws, which he believes to regulate the ravages of the aphides, to many of which, as they are merely statements of well-known facts, the fullest assent may be given; but they are made to lead to the most erroneous conclusions, when it is asserted that the potato disease is a direct consequence of the attacks of aphides. The *vastator* is no new aphid; it has been known and described many years ago, and is a very common insect upon decaying plants. The theory is, moreover, entirely negatived by the fact, that diseased stalks are to be found in abundance without a trace of the aphides upon them. Entomology is taught no new thing in being told that aphides are attacking all sorts of vegetables; their omnivorousness was on record long before the outbreak of the potato disease; but it is new to learn—and the fact, if it be such, should be well proved first—that that peculiar and most remarkable disorganisation of tissues and fluids which marks the potato disease, can be the result of the labours of sucking insects. Were 'gangrene,' as it is called, the consequence of the attacks of aphides, and transmissible from generation to generation, our beans, and pease, and hops, and many of our flowers, would have long since perished out of our hands. We state, therefore, our definite belief, that the aphid family is entirely innocent of the present charge against them; and with the more confidence, because it is in entire harmony with, to our personal knowledge, the private and declared sentiments of the most eminent entomologists of the present day.

THE SCOTCH COLONY OF OTAGO.

A REMARKABLE plan of colonisation has just been brought under public notice in Scotland.

Everybody is aware that New Zealand, consisting of three islands in the Southern Ocean, is one of the finest countries in the world as respects soil, climate, natural productions, and suitableness for supporting a large civilised community—a country worthy of becoming the Great Britain of the Southern Hemisphere. This fine country, however, has from various causes been hitherto ill adapted for immigration. It was occupied at first by a company of settlers without the sanction of their government, which recognised New Zealand as an independent state, and at length assumed the sovereignty with reluctance. Even after this step, much time was wasted in discussing the proprietary rights of the chiefs, till, through neglect and misconception, the country was driven into a petty war between the natives and Europeans, which disturbed everything, and almost ruined the reputation of the colony at home.

It was an association for colonising on a great scale, called the New Zealand Company, whose grievances were neither few nor small, which at length brought the subject under the review of parliament; and to avert consequences damaging to the character of one of his colleagues, Sir Robert Peel, with much magnanimity, acknowledged that there had been serious blunders in the whole line of policy pursued, and promised that every proper amendment should be made. Since that

time, one thing after another has been set to rights; the New Zealand Company has been put in a position to fulfil its intentions and engagements; and by the latest accounts, the miserable claims of the natives—the source of much of their enmity and strife—have been settled by the payment of a few thousand pounds. With an intelligent governor, and a garrison of two thousand soldiers, no new disturbance is likely to break the peace of the colony.

New Zealand, thus rescued from mismanagement, and with its liberties guaranteed by acts of parliament, now stands in interesting relationship to the home country.* It forms a field for immigration more favourable, we believe, than almost any other crown colony, and we may soon expect to hear of its becoming a scene of thriving industry and comfort. It would, nevertheless, fail in realising this expectation if emigration were left to be conducted on the hap-hazard principle which has latterly been pursued. Here a little explanation is desirable. About the middle of the seventeenth century, the principal North American colonies were founded by Sir George Calvert, Lord Baltimore, and others, by patents from the crown. These patents gave a very extensive authority, and, in effect, permitted the patentees to colonise districts with hosts of persons from the mother country as circumstances appeared to direct. The patentee was a kind of petty sovereign, while the colonists under him formed the elements of a nation, to whom were assured the privileges of British subjects. All these colonies were ultimately successful. They had at first serious difficulties to contend with, such as the clearing of the forest, and fights with their Indian neighbours; but in the end they got over all obstacles, and history shows with what a masculine spirit they wrested an acknowledgment of independence from the crown of these realms. Since that era, colonisation has been one of the lost arts. Instead of a nobleman, like Baltimore, or a hero, like Penn, leading out great bodies of men to the wilderness, and constructing from the first an epitome of British society—gentlemen, scholars, teachers, merchants, tradesmen, agriculturists, mechanics, and labourers—it has been the practice for a poor struggling class of individuals to emigrate in detached families, and these being without friends or leaders, have usually had to endure many hardships. Besides the discomforts which too commonly attend this species of emigration, colonists are scattered over a very wide district of country, and society amongst them is of slow and feeble growth. An attempt to colonise on something like the old method is now to be made, the main difference being, that instead of a nobleman with a patent, there is to be a company with a charter. One of the old usages in colonising was the establishing a provision for religious instruction, according to a distinct form of belief—one was a Church of England, another was a Puritan, a third was a Roman Catholic colony; and it is worth while mentioning, in passing, that Lord Baltimore's Roman Catholic colony of Maryland was the province in which toleration and shelter were first given to persons not of the legalised religion. There is no doubt something invidious in favouring one sect beyond all others, yet, as respects colonising, the practice is not without its recommendations. It forms an inducement for a large body of individuals to band together on a

* The following acts of parliament deserve attention:—Act 9-10 Vict., cap. 103, and Orders in Council, whereby representative government, on a liberal scale, is awarded to New Zealand, together with municipal charters for local purposes; and the jurisdiction under these charters will in each case extend over the whole territory of the particular settlement. Act 9-10 Vict., cap. 382, and charters, constituting the New Zealand Company a colonising body. Act 10-11 Vict., cap. 112, and the agreement concluded on 14th May 1847, whereby the future colonisation of New Zealand is to be the joint operation of the Crown and the Company, and that harmony of action which had hitherto been desiderated is thoroughly secured. With such titles, individual property and possession on the part of settlers are equally secure as any in Great Britain; whilst the liberties and privileges of British subjects are also secured to them as colonists.

basis of common sympathy. The assurance that, on landing, the emigrant will find the whole machinery of his favourite religious and secular instruction in operation, cannot but prove a strong temptation to break loose from old associations at home. Without imitating the general intolerance of the American colonisers, the New Zealand Company proposes to carry out the principle of denominational settlements. Having acquired by its charter vast tracts of land, it offers to deal with parties for erecting colonies of a particular religious denomination. In this manner it has arranged to plant a settlement in connection with the Church of England, and also one in connection with the Free Church of Scotland, the latter being a numerous body of Presbyterians, occupying the position of dissenters from the national church. It is of this last-mentioned settlement we propose to speak. We draw attention to it on no sectarian grounds, but solely from a wish to give as correct an idea as possible of what will probably be one of the most interesting movements of the day.

The district apportioned to this Scotch colony is situated in the Middle Island of New Zealand, near its southern extremity, south latitude 45 degrees 40 minutes to 46 degrees 20 minutes. It comprises 400,000 acres of land, and is called Otago; such, we suppose, being the name given to the spot by the natives. The capital of Otago is to be called Dunedin, that being the Celtic name for Edinburgh, and therefore appropriate. The locality of the proposed settlement is between eight and nine hundred miles from the scene of the disturbances, which took place near the northern end of the Northern Island. It is believed that there are no more than one thousand natives in the whole of the Middle Island; and in the large district of Otago, there are only about fifty men, women, and children in all, none of whom are likely to give any offence. The settlement has a coast line of from fifty to sixty miles in length, lying between the mouth of Otago harbour and a headland called the Nuggetts. It extends an average distance inland of seven miles, to the foot of a low mountain range. The land is fertile, and untimbered, but with an adequate supply of wood. The most remarkable feature in the district is the great facility of internal water communication. Its surface is diversified by several streams and lagoons, to which the land has easy slopes. The basin called Otago Harbour is a fine land-locked sheet of water, fourteen miles in length, of which the lower half, being seven miles long, has a depth of from six to fifteen fathoms water, and the upper half from two to three fathoms. Vessels may sail up to and unload at the quay. At the upper end of the lower harbour is placed the Port Tower, with five fathoms water close in-shore;* and further on, at the head of the basin, is the site of Dunedin, sheltered by an amphitheatre of green and wooded hills. 'Outside the boundary of Otago, to the westward,' says Colonel Wakefield in a letter to the secretary of the New Zealand Company, 'there is an extensive tract of pasture-land, boundless to the view, untrodden by the foot of man, and affording abundant food for sheep and cattle during the whole year, with the exception of a few weeks in winter, when the uplands are covered with snow, during which time the plains and valleys yield a more abundant herbage than in the heats of summer.' Speaking of the climate of the district, Mr Munro, in the 'New Zealand Journal,' observes—'On the large plain, the climate appears to be a good deal like our own. The weather, while we lay at Otago, was most beautiful. (It was the end of April, answering to October in Europe.) The sky, a great part of the time, was without a cloud; and not a breeze ruffled the surface of the water, which reflected the surrounding wooded slopes, and every sea-bird that floated upon it, with mirror-like accuracy. For some hours after sunrise, the woods resounded with the rich and infinitely-varied notes of

thousands of this and other songsters. I never heard anything like it before in any part of New Zealand. It completely agreed with Captain Cook's description of the music of the wooded banks of Queen Charlotte's Sound. During this fine weather we amused ourselves by boating about, and visiting different parts of the harbour. Though everywhere beautiful, its scenery is all alike, steep wooded banks, with projecting rocky promontories, enclosing those beautiful little bays with sandy beaches, so characteristic of New Zealand.'

The district appears to be suitable for agriculture; pasturage, including the growth of wool; and the supply of furniture woods of great hardness and beauty. The coast is already a resort of whale fishers; and in various parts of the country, coal has been found in abundance cropping out on the surface. With these objects of enterprise before them, and with an unrivalled climate overhead, the colonists will have little to fear. Of course, in the case of those who commence operations, there will be some roughnesses to encounter, and a little time must elapse before the settlement assumes a substantial aspect. But it is the design of the projectors to get things into shape as speedily as possible. The colony is to embrace certain varieties of property, corresponding to different classes of persons, each of whom will betake himself to the pursuit most suitable to his capital and tastes.

The New Zealand Company is the seller of the lands, and the party who transfers emigrants to the colony. No one, however, is accepted who is not recommended through the agency of the 'Lay Association of the Free Church.' This is a body of respectable individuals, whose head-quarters are in Edinburgh (5, George Street) and in Glasgow (3, West Nile Street); and governed by arrangements sanctioned and approved by the General Assembly of their communion. A person, therefore, who inclines to become a settler in Otago, requires to apply to a secretary of the association at either of the above places; if approved of, he makes a deposit, the receipt for which places him in connection with the New Zealand Company. Looking over the pamphlets issued by the Association, we observed that priority in choosing allotments of land will be determined by ballot at the Company's house in London (9, Broad Street Buildings), in presence of the directors. The allotments differ in dimensions and character. Of the 400,000 acres of which the settlement is composed, the quantity first operated on is to consist of 144,600 acres. These are to be divided into 2400 properties; and each property is to consist of 60½ acres, divided into three allotments—namely, a town lot of a quarter of an acre, a suburban lot of ten acres, and a rural allotment of fifty acres.

The 2400 properties are to be appropriated in the following manner:—2000 properties, or 120,500 acres, for sale to private individuals; 100 properties, or 602½ acres, for the estate to be purchased by the local municipal government; 100 properties, or 602½ acres, for the estate to be purchased by the trustees for religious and educational uses; and 200 properties, or 12,050 acres, for the estate to be purchased by the New Zealand Company. The price of the land is to be fixed, in the first instance, at forty shillings an acre, or £120, 10s. a property; to be charged on the estates of the municipal government, of the trustees for religious and educational uses, and of the New Zealand Company, in the same manner as on the 2000 properties intended for sale to private individuals; and the purchase-money, £1289,200, to be appropriated as follows, namely:—

'Emigration and supply of labour (three-eighths),	£ 1,108,450
Civil uses, to be administered by the Company—namely, surveys and other expenses of founding the settlement, roads, bridges, and other improvements, including steam if hereafter deemed expedient, and if the requisite funds be found available (two-eighths),	72,380
Religious and educational uses, to be administered by trustees (one-eighth),	36,150
The New Zealand Company, on account of its capital and risk (two-eighths),	72,300

* This is peculiar to Otago harbour, no other in New Zealand having the same advantage.

'From the sum of L.36,150 to be assigned to the trustees of religious and educational uses, will be defrayed L.12,050, the price of the 6025 acres to be purchased as the estate of that trust. In like manner, out of the sum of L.72,300 to be assigned to the New Zealand Company, will be defrayed L.24,100, the price of the 12,050 acres to be purchased by the Company as its estate.'

It will be perceived that the Company engages not only to carry the emigrant purchaser of land to Otago, but to send also a supply of labourers, free, by which means capitalists will be enabled at once to hire such assistants as they may require. We trust that no small degree of care will be exercised in adapting the supply of labourers to the demand for their services, and are glad to learn that means will be effectually adopted for preventing all kinds of gambling in town or other lots of land.

Only one thing more requires a word of explanation. Although avowedly a colony in connection with the Free Church, Otago is open to all classes of religionists. Every respectable man, no matter what be his creed, is received as a brother; but all of course go with the understanding, that the religious ordinances and educational establishments of this Presbyterian body are alone to be guaranteed support from the fund set aside for purposes of this nature. If Episcopalians, for example, join in forming the settlement, they must look to themselves for means of religious and secular instruction suitable to their own feelings. By this arrangement, it is expected (perhaps too confidently) that all wrangling about division of funds for churches and schools—such as have vexed society in the northern settlements of New Zealand—will be effectually prevented. Without pronouncing any opinion on the merits of the plan proposed, we shall watch its development with interest, but not without the expectation, that when New Zealand becomes extensively and densely peopled, much broader schemes of social organisation will predominate. Whatever be the future views of the colonists in this respect, the enterprise in the meanwhile, with all its peculiarities, cannot be looked on with indifference. Afforded every desirable means of carrying out their own notions, and secured the invaluable privilege of self-government, we shall see whether a body of Scotamen can realise the opinions formed of their perseverance, love of order, and sagacity. The first body of settlers, we are told, are expected to leave the Clyde some time in October, headed by Captain William Cargill, the recognised agent of the Company for Otago, and who, on landing, will act as justice of peace till the municipal government is formed. The day of departure of the expedition will be an interesting one for Scotland.—Who will not, in the language of the old blazon, wish that 'God may send the good ship to its destined port?'

GARRET BYRNE.

It is impossible to have any personal experience of the miseries of war, without earnestly longing for that period when swords shall be beat 'into ploughshares, and spears into pruning-hooks; when 'nation shall not lift up sword against nation, neither shall they learn war any more.

The pages of history have made us all familiar with the evils entailed by national quarrels upon the population of those countries which unhappily became the scene of strife and bloodshed; but however affecting such a picture may be, the 'multitude of sad groups' in it are wont to distract us; so that it may be well for us sometimes to detach a single figure from the mass, and to consider it in its own individual misery. Thus may we be able to obtain a glance behind the scenes, instead of always fixing our eye on 'the pomp and circumstance of glorious war,' until we become too much dazzled to view it in all its true aspects.

A striking instance of the vicissitudes of life arising

from civil war, occurs in the life of Garret Byrne, one of the leaders of the Irish rebellion in '98, a scion of the princely house of that name—a house ever unfriendly to English domination in Ireland. The following reminiscences of Byrne are communicated by one who happened to cross his path at two of the most remarkable periods of his life.

It was in the year 1798: the Irish insurgents had been defeated at the battle of Vinegar Hill: Wexford was taken, and multitudes of the wretched people had been either slain or hanged.* It might have been reasonably expected that, after such a series of disasters, the rebellion would speedily have terminated; but the landing of the French force under Humbert revived the hopes of the disaffected, whose spirits were, however, soon after depressed by the capture of the French troops at Ballinamuck on the 8th of September.

Notwithstanding the continued successes of the royal party, a considerable body of rebels still held out in the fastnesses of the Wicklow mountains, where they were headed by Garret Byrne and Holt. The command of a considerable force of British light troops was committed to Sir John Moore, one of our best generals, who was seconded by General the Marquis of Huntly. They encamped among the Wicklow mountains; and although operating day and night, were unable to bring the opposing force to action. At this period, a well known barrister and member of the Irish parliament, Mr Dodds, waited on Lord Cornwallis, and offered to go himself into the rebel camp, and, if his lordship permitted, to propose to the insurgents terms of surrender. Lord Cornwallis, with his usual humanity, gladly acceded to the proposal, and ordered the writer of this to accompany Mr Dodds to the camp of Sir John Moore, giving him power and instructions to cause the suspension of all military operations in that quarter until the effect of Mr Dodds's mission might be ascertained.

Mr Dodds and myself left Dublin on horseback, and rode through a beautiful country to the Glen of Imaal, a picturesque spot, where Sir John Moore's corps were encamped. We arrived towards evening; and on entering the general's tent, found a large party assembled after dinner. The Marquis of Huntly was one of the party. At his right hand sat, to my surprise, the noted Garret Byrne, the commander of the rebel army in the Wicklow mountains, who had only a few hours before surrendered himself to Sir John Moore. This Byrne was a remarkably tall and handsome man, whose house and property were in view of the tent wherein we sat; for in olden time his ancestors had been chieftains of part of that mountainous country, and his family still possessed estates in the most wild and romantic portion of Wicklow. Garret Byrne, with the characteristic *insouciance* of his race, appeared as jovial and unconcerned as if nothing extraordinary had happened to him, and he seemed heartily to enjoy the old Celtic music of the bagpipe, which was performed by a Highlander in full national costume, standing behind the Marquis of Huntly's chair. It was a striking scene. Our gallant generals, surrounded by their staff, and entertaining one of their foes with true British courtesy, in the very heart of those mountains which had once been the birthright of his ancestors, and where he was now a captive, forgetting for a moment his country's woes amid the joyous excitement of wine and song. When the party broke up, I entered more fully with Sir John Moore into the object of our visit. He then told me we had just come in time, as he had all things prepared for a general attack that night on the quarters of the rebels. Mr Dodds was permitted to enter alone into the rebel camp, now commanded by Holt; and the issue was, the surrender of the insurgents at discretion.

The next day, Garret Byrne and Holt were transmitted to Dublin, to await the decision of the lord-

* It was the fate of the writer to see six gentlemen hanged at this time on one gallows on the bridge of Wexford.

lieutenant, the rebel army having previously laid down their arms. The lives of these leaders of the insurrection were spared by the leniency of Lord Cornwallis; but his lordship seeing that, in the present unsettled state of Ireland, it would be imprudent to allow such men to remain in the country, determined that Byrne should be exiled for life from the British dominions, and Holt transported for a certain number of years to Australia. The latter decree was put into execution; and Holt, after the expiration of his sentence, returned home enriched by his industry as a farmer in that country, and built a house at Kingstown, where he died at a good old age.

Nearly thirty years after this period, the writer happened to be residing at Caen, the capital of Normandy; and walking one day on the heights above the town, he saw a door opening into a garden, through which there was a beautiful view of the surrounding neighbourhood. An old man on crutches was leaning against the wall, basking in the winter's sun. He perceived me looking through the door, and kindly accosted me, saying, 'Sir, if you desire to see the finest view here, pray walk into this garden, which belongs to my cottage.' I thanked him, and took advantage of his offer. On leaving the garden, the old man, looking earnestly upon me, said, 'Sir, I think that you and I have met before this: were you, sir, ever in the Wicklow mountains?' I replied, 'Yes, during the rebellion, with Sir John Moore.' He rejoined, 'I think, sir, you were in the tent the day on which I surrendered to that general—I am Garret Byrne.'

I immediately recognised the figure and features of the man. He was the ruin of a fine specimen of humanity. He immediately began to relate to me many circumstances connected with that period. He said his estate had been confiscated to the crown; that he became a beggar; and being exiled from his country, he passed to the continent, and after some time, entered the Austrian service as a soldier. After seven years, he was promoted to a commission in that service, but at the end of the war, was reduced, and was now wending his way towards England, with some faint hopes that the British government might give him a small pension to save him from starvation; but his exertions in this matter were hitherto unsuccessful. I thought that an application to the government, from one who was an eye-witness to the wretched condition of the poor man, might probably succeed, and wrote accordingly to Sir Herbert Taylor, then in office about the court, intreating that he might make application to the proper authorities for some trifling aid for Garret Byrne; but unfortunately, Sir Herbert Taylor replied that government could not, with propriety, aid any man who had been so prominently engaged in the rebellion of '98. I, however, made his case known to some English gentlemen then residing at Caen, who kindly made a collection to meet his present wants, and we had the satisfaction of seeing the poor fellow settled in a comfortable boarding-house. Sitting one day with Garret Byrne, he showed me a number of letters he had received from Lord Cornwallis, the Marquis of Huntly, and Sir John Moore, in reply to applications he had made to save the life of his brother, who had been taken prisoner at the battle of Arklow, and sentenced to die as a rebel. His exertions to save his unfortunate brother were without effect: he was hanged, according to the sentence of a court-martial.

One of the gentlemen who had taken a friendly interest in his situation, having one day inquired if there was any little comfort which he wished for, Garret Byrne replied he would be 'very glad to have a bottle of Burgundy'—an answer most characteristic of his race; for even in time of extreme want, the 'ould families' of Ireland too often retain their luxurious tastes and habits of reckless expenditure.

Soon after this period I left Caen, and inquiring about Byrne some time afterwards, learnt that the poor fellow, falling into bad health, was obliged to take re-

fuge in the public hospital at Caen, where, after lingering some time, he died penniless and friendless.

Thus closed the life of one of the last of the princely family of Byrne, and a leader in the '98.'

THE SELF-TORMENTORS.

THERE is no situation in life for which candidates will not be found to offer themselves, no matter how degrading or disgusting it may be; and it is indeed most fortunate that there are those whose habits and tastes are not too refined for occupations which to others would be absolutely appalling, for thus no department is left unfilled: the hangman is never sought in vain; the scavenger spends his days amidst the filth of the streets, and does not hold himself one whit the worse; butchers are not loath to slay; and surgeons perform amputations *con amore*. The acquirement of the means of subsistence stimulates all, and thus the business of the world is conducted with undeviating completeness. But there is a class of human beings, and no inconsiderable one, who devote themselves to hardships, and submit to privations, from motives wholly apart from the desire to earn a livelihood. This is the class of the self-tormentors. Some of the most extraordinary examples of these are to be found among the Fakirs, who, from their strange tenets respecting the Deity, and the sacrifices which they think pleasing to him, inflict the most severe tortures on themselves. Some of them make a vow to continue for life in one posture; others carry a weary load, or drag a heavy chain, from which they have vowed never to disengage themselves. Some have doomed themselves to crawl upon their hands and knees for a term of years; and others roll their bodies along the ground, from the shores of the Indus to the banks of the Ganges. Some have condemned themselves to swing before a slow fire for the remainder of their days; while others suspend themselves with their heads downwards, exposed to the fiercest flames. Many of the Hindoo fanatics, pledged by a religious vow, are to be found at the villages where the ceremony of swinging is observed at stated times. It is thus contrived: in the centre of an area a pole of from twenty to thirty feet high is erected, on which a long horizontal beam is fixed, with a rope run over a pulley at the extremity; to this rope an iron hook is fastened, which being run through the integuments of the swinging devotee, he is suspended high in the air, a spectacle of admiration to the assembled multitude, who testify their approbation by the loudest acclamations: the more violently he swings himself round, the more vehement is the applause: the flesh often gives way, and the unfortunate performer is released by a precipitate fall, very frequently at the expense of a broken limb. The voluntary sacrifice of the Hindoo widows to the flames is too well known to need any description of the ceremony here. There are many devotees, who, in the very prime of life, anxious to propitiate the Deity, resolve to bury themselves alive—no trifling sacrifice for those who might, in the ordinary course of nature, look for a long term of years. On the day appointed for the sacrifice, crowds assemble, a circular pit in which a man can stand upright is then dug, into which the self-devoted victim descends; the earth is then thrown over him, until he is completely covered; a massive tomb is immediately erected over the spot, where sacred rites are performed, and garlands of flowers are offered at stated intervals, in memory of the holy man who has sealed his devotion by this act of self-immolation.

The self-inflicted cruelties which take place at the festival in honour of Siva, a Hindoo god, appear almost incredible. The Hindoos who are to be the principal actors at the ceremonies, have assumed the name of Sunnyassis, and gone through some preparations for ten or fifteen days before the exhibition begins. On the first day of the festival, they fling themselves from a bamboo stage, which has three resting-places: the highest is twenty feet from the ground: bags of straw,

stuck with iron spikes, have been placed underneath to receive them: however, the spikes are so arranged, that they generally fall down, instead of entering the body; it sometimes, however, happens otherwise, and many persons have been killed and wounded by them. In some villages, several of these stages are erected, and two or three hundred have cast themselves on the spikes in the course of one day. On the third day of the festival there is a large fire made, opposite to the temple of Siva; and when the burned wood has been formed into a great mass, one of the chief Sunnyassis flattens it a little with a bunch of canes which he holds, and walks over it with his feet bare; the rest of the Sunnyassis then spread the fire about, and walk over it, and dance upon it, and throw the burning embers into the air and at each other. This pastime over, the next morning is appropriated to the work of piercing the sides and tongues. It is thus described by Mr Ward, who went to Kalcceghatu, in company with two or three friends, in the year 1806, to witness the rites. 'We arrived,' he says, 'about five o'clock in the morning. We overtook numerous companies who were proceeding thither, having with them drums and other instruments of music, also spits, canes, and different articles to pierce their tongues and sides. Some, with tinkling rings on their ankles, were dancing as they passed along, while others rent the air with the sounds of their filthy songs. As we entered the village where the temple of this great goddess is situated, the crowds were so great, that we could with difficulty get our vehicles along, and at last were completely blocked up. We then alighted, and went among the crowd: but who can describe a scene like this? Here, men of all ages, who intended to have their tongues pierced or their sides bored, were bringing garlands of flowers to hang round their necks or tie round their heads. There, others were carrying their offerings to the goddess. Above the heads of the crowd were seen nothing but the feathers belonging to the great drums, and the instruments of torture which each victim was carrying in his hand. These wretched slaves of superstition were distinguished from others by the quantity of oil rubbed on their bodies, and by streaks and dots of mud all over them. Some of the chief men belonging to each company were covered with ashes, or dressed in a most fantastic manner, like the fool among mountebanks.' He goes on to describe the operation of piercing the tongue. 'We went into the temple-yard, where two or three blacksmiths had begun the work of piercing the tongues and boring the sides of these infatuated disciples of Siva. The first man seemed reluctant to hold out his tongue; but the blacksmith, rubbing it with something like flour, and having a piece of cloth betwixt his fingers, laid firm hold, dragged it out, and placing his lancet under it, in the middle, pierced it through, and let the fellow go. The next person whose tongue we saw cut directed the blacksmith to cut it on a contrary side, as it had already been cut twice. This man seemed to go through the business of having his tongue slit with perfect sang-froid. The company of natives were entirely unmoved; and the blacksmith, pocketing the trifling fee given by each for whom he did this favour, laughed at the sport. I could not help asking whether they were not punishing these men for lying. After seeing the operation performed on one or two more, we went to another group, where they were boring the sides. The first we saw undergoing this operation was a boy, who might be twelve or thirteen years old, and who had been brought thither by his elder brother to submit to this cruelty. A thread, rubbed with clarified butter, was drawn through the skin on each side, with a kind of lancet having an eye like a needle. He did not flinch, but hung by his hands over the shoulders of his brother. I asked a man who had just had his sides bored why he did this. He said he had made a vow to Kallee at a time of dangerous illness, and was now performing this vow; a bystander added, it was an act of holiness or merit. Passing from this group, we saw

a man dancing backwards and forwards, with two canes run through his sides as thick as a man's little finger. In returning to Calcutta, we saw many with things of different thicknesses thrust through their sides and tongues, and several with the pointed handles of iron shovels, containing fire, sticking in their sides. Into this fire, every now and then, they threw Indian pitch, which for the moment blazed very high. I saw one man whose singular mode of self-torture struck me much: his breast, arms, and other parts of his body were entirely covered with pins, as thick as nails or packing-needles. This is called *vanu-phora* (that is, piercing with arrows). The person had made a vow to Siva thus to pierce his body, praying the god to remove some evil from him. Some Sunnyassis at this festival put swords through the holes in their tongues, others spears, others thick pieces of round iron, which they call arrows; many, as a bravado, put other things through their tongues, as living snakes, bamboos, ramrods, &c. On the evening of this day some Sunnyassis pierce the skin of their foreheads, and place a rod of iron in it, as a socket, and on this rod fasten a lamp, which is kept burning all night.' Such are a few of the self-inflicted tortures borne by those who think that by such the wrath of the cruel deity to whom they do homage can only be appeased. The details of bodily torments inflicted by the victims themselves to propitiate his favour are so numerous, that they might fill volumes; but these limits are too brief to allow of a more extended notice of them; and for the present, we will turn our attention to other self-tormentors, who are actuated by motives of a totally different nature. Such are impostors, whose livelihood depends on the alms of the charitable, who maim and disfigure themselves that they may make a more forcible appeal to compassion. It is no uncommon practice with them to drive needles into their flesh, thus to produce swelling and inflammation, which can be displayed on fitting opportunities, and turned to profit.

There was an unfortunate young woman, a patient in Richmond Hospital, Dublin, who had to undergo amputation of the arm, it was so dreadfully diseased from needles in the flesh. She afterwards confessed that she had herself forced them into her hand and arm. Four hundred needles were extracted from different parts of the body of a woman named Rachel Herz, of Copenhagen; they had reduced her to the most frightful state. It was afterwards discovered that she had herself inserted them purposely. There are others, equally impostors, who have been known to undergo the most acute bodily anguish without flinching, impelled to it by having grown weary of the way of life in which they are engaged, and pining for a return to home and friends. Deception, under any exigency or temptation whatever, is to be held in abhorrence; but certainly a touch of pity must mingle with the feelings with which we regard it under such circumstances. The hardships which the soldier and the sailor are called on to endure, and the separation from home and kindred, must teach us to look with compassion while we blame; and the tortures which they so unhesitatingly undergo, tell a melancholy tale of wearisome existence, and of heart-yearnings after early scenes, that may well suggest to the reflecting mind a hope that some improvement in the mode by which their services are procured, and the regulations by which they are governed, may make such guilt, if not impossible, at least of comparatively rare occurrence. With the desire of being declared unfit for service, they have been known to inflict the most serious injuries upon their sight, and to mutilate themselves in a frightful manner; sometimes cutting off one or more of their fingers, pretending that accident had produced the mischief. A woman in Dublin actually made a livelihood by selling to the recruits a mixture of soft soap and lime, which, on being applied as she directed, produced ulcers. Soldiers, anxious to be free, have been known to make an incision in the leg, into which a copper

coin has been inserted, and then bound up. So common was the practice among the patients in the military hospitals of tampering with their sore legs, to prevent their cure, in the hope of procuring discharges from the army, that the surgeons were frequently obliged to seal the bandages with which they bound them; but this has not always succeeded, as the men often force pins and needles through the bandages, so that at last a box, with lock and key, was found necessary to keep the leg confined, so that it could not be got at till the surgeon went to dress it. Soldiers have often broken their front teeth, to render it impossible for them to bite the cartridges. A deserter who had been arrested and put into jail, in the year 1811, submitted to remain in a state of apparent insensibility from the 5th of April to the 8th of July; everything to rouse him that could be thought of was tried, but in vain; he took no nourishment but a little that he sucked through his teeth, as his jaw was fixed, and could not be opened. The medical people, supposing there was some injury in the head, determined on an operation. The scalp was removed, that an examination might take place. So little did he appear sensible of pain, that a very slight groan was the only sign of feeling which he gave. His case was considered hopeless; he was discharged, and sent home to his father. A day or two after, he was seen thatching a hayrick!

There is a still more extraordinary class of self-tormentors to be found in those who are not excited by a mistaken zeal, or who have no chance of restoration to some cherished object, or loathing of some forced pursuit; but who, as it were, for a mere whim, or a sudden pique, consign themselves to lasting privations and torments, more difficult, perhaps, to be borne than bodily pain, because more enduring, and to the observance of which they adhere with a constancy worthy of a better calling. Miss Mary Lydia Lucrine is mentioned in 'Dodsley's Annual Register' for 1778, as 'a maiden lady of genteel fortune, who lived in Oxford Street, London.' She had been disappointed in love, and made a vow, in consequence thereof, never to see the light of the sun again. Accordingly, the windows of her apartment were closely shut up, and her vow was never broken. Another lady, under similar circumstances, and condemning herself in like manner, is mentioned in the same volume. She, like Mary Lydia, was disappointed in her matrimonial prospects, and vowed to live shut up from the light of the sun; however, very wisely, she made herself some slight amends, by occasionally indulging herself with the light of a lamp or candle, but she never admitted the rays of the sun into her presence again. From the same authority, in the volume for 1777, we also find the following curious account of the mistress of Beau Nash, in the notices of deaths:—'Died at Bishop's-view, her native place, near Warminster, in Wilts, Juliana Papjoy, in the sixty-seventh year of her age. In her youth she had been the mistress of the famous Nash of Bath, and after her separation from him, she took to a very uncommon way of life; her principal residence she took up in a large hollow tree, now standing, within a mile of Warminster, on a lock of straw, resolving never more to lie in a bed; and she was as good as her word, for she made that tree her habitation for between thirty and forty years, unless when she made short peregrinations to Bath, Bristol, and the gentlemen's houses adjacent; she then lay in some barn or outhouse.' Not more agreeable was the abode selected by a man who lived in Dunstall in Suffolk; he might be seen of a day seated on a chair reading the newspaper, in a large cage, which was placed in the middle of the town, and in which he had lived for upwards of thirty-four years, never quitting it. He resisted all the intreaties of his friends, who endeavoured to persuade him to change his residence; and, true to the character of a genuine self-tormentor, he never left his strange dwelling-place. The cage was just large enough for him to live in, and in all respects but size was like the common cages sold for birds.

Ill success in love affairs appears to be the most frequent cause of extraordinary vows. Poor John Baker of Channing, in the county of Kent, who was born in the year 1700, was but a labourer. It was his misfortune to fall in love at the early age of sixteen, and she he loved 'proved untrue,' whereupon John bound himself by a solemn vow never to take off his clothes, or to go to bed, till he should regain the affections of his mistress—a felicity to which, alas! he never attained; but, in accordance with his vow, he never took off his clothes, or rested himself in a bed, for the rest of his life, which lasted for forty years. He never slept but in a chair or on the ground. The neighbours used kindly to put a patch upon his clothes when they saw that it was required, so that at the time of his death his coat was entirely composed of patches of every shade and hue. Even in this hasty sketch it is marvellous to see what torments have been voluntarily endured, what bodily anguish and what cruel privations have been perseveringly borne. But many as have devoted themselves to these tortures, there is a much larger class of self-tormentors than those already noticed; and that is, those tormentors who make the torturing of their minds the great object of life. Among them, the excitement attendant on a spectacle which is to draw down the applause of an admiring crowd does not allure to the pursuit; the domestic circle is the favourite scene of its unostentatious display. They cannot boast of the desperate intrepidity with which the poor Hindoo casts himself under the wheels of the car of Juggernaut, or the profound serenity with which the Fakir holds up his arm, without motion, till it dies and withers away, nor of the patient exertion of the devotee who rolls himself along from the shores of the Indus to the banks of the Ganges, nor of the careless tranquillity with which the Sunnyassi swings himself upon his hook. Happy, indeed, would it be if, like those who maim and excoriate their bodies, or who live apart in the hollows of trees, or in the cages hung up in the public streets, the mental self-tormentors kept their sufferings to themselves: but those who cannot be *happy without a misery*, are too generous not to share their enjoyment with their friends and nearest of kin; for it may be observed, that those who suffer from imaginary injuries and grievances, draw more largely on those about them for sympathy than those who labour under real affliction. The pangs of the self-tormentor are many and sharp, and produce a constant state of effervescing agony. The forecasting of evil, and all the petty annoyances of piques, and affronts, and misconceptions, which one word might set right; and the mistrust of friendship, and the doubts of love, and all the nameless little caprices, and suspicions, and jealousies, and estrangements, and unreasonable exactions which they engender, if to be touched on, would require a chapter, and a long chapter, to themselves. In very truth, they are of too grave a cast, and the cause of too much discomfort and unhappiness, to be longer dwelt on in a spirit of lenity.

THE CHASE.

It was, as nearly as I can recollect, about the year 1806 that I left Carthage, supercargo of a schooner—a regular clipper, with a freight of dollars and cochineal, for the Danish island of St Thomas. In consequence of the war, the ocean was crowded with British cruisers on the look-out for an enemy; go where you would, you were certain of being overhauled by an English man-of-war, and that not in the most ceremonious manner. The commanders were not always scrupulous in determining between friends and foes; and it often happened, if a valuable cargo were in question, or if the captain of the cruiser had been worked into a fit of ill-humour by a warm chase, that neutral vessels were seized, and condemned as lawful prizes: and a species of marine logic was employed to justify this peremptory mode of appropriation, for which there was no redress.

Our captain and crew were all blacks: Baptiste, the

former, was a negro of herculean frame, with a spirit to match—prompt and fearless in action, considerate and firm in command. The men yielded him implicit obedience; they performed their duties with alacrity; and a merrier set of fellows I never sailed with. Knowing the vigilance and suspicion of the English cruisers, I felt more than usually anxious about my charge, and, with my telescope under my arm, passed nearly the whole of the time, day and night, upon deck. For some days, nothing beyond the ordinary incidents of a sea-voyage occurred to claim our attention; the breeze blew so steadily, that it left the men at leisure to amuse themselves with dances and songs on the fore-castle, with a musical accompaniment formed by beating their hands together, and slapping their thighs. The schooner proved herself a genuine clipper, for she flew through the water as though she felt the necessity for speed, cleaving the waves as they rose before her sharp prow with the ease and grace of a bird. Fast as we sailed, however, the dolphins and flying-fish kept pace with us; the former sported under our cutwater, and dived from side to side under the keel, showing their glistening sides as they darted to the surface. The breeze was of that sort so delightful in the tropics—singing merrily among the cordage, tempering the scorching rays of the sun, fringing the tops of the dark-blue swells with a streak of white foam, and producing a feeling of exhilaration difficult to be described, but which, when once experienced, enables us to understand the fascinating influence of a sea-life upon those of a roving disposition.

It was fortunate for us, in more respects than one, that we had such a breeze; for the weather was so intensely hot, that I found it impossible to wear shoes, and walked barefoot up and down the deck, which was kept wet by the spray that rained over us as our vessel dashed into a wave higher than usual. I kept a man at the mast-head constantly on the look-out; and to relieve my anxiety, as well as to insure his vigilance, hailed him three or four times in the course of an hour. We had been out five or six days, when, one morning just as the redness in the eastern sky was rendering distant objects dimly visible, and, overcome with fatigue, I was about to turn in for a few hours while the captain took my place, the watch at the mast-head sang out, 'Sail ho!'

'Whereaway?' I hastily inquired, as, alighting the telescope round my neck, I sprang into the rigging.

'Away on the weather bow,' was the answer.

I was soon on the cross-trees, and with the glass made out the stranger to be a square-rigged vessel. I at once felt certain of her being an English man-of-war, and hailing the captain, he mounted to my side. His opinion, after a long gaze at the unwelcome object, coincided with my own; and after a pause, during which he seemed to be revolving the chances in his mind, he said, 'What shall we do?'

'Do, Baptiste,' I answered; 'it is vexatious to lose ground, but there is no help; we must run for it.'

We lost no time in descending to the deck, the yards were braced round, and every inch of canvas spread that our masts and spars would bear, and away we went on a slant, as little as possible out of our course, and hoping to escape the watchful eyes of the Englishman. For a short time our manœuvre appeared to be successful; but as the sun rose higher above the horizon, the light reflected from our topsails betrayed us to the cruiser, for we saw her alter her course, and make sail directly in our track. Our negro captain looked over the schooner's side, and rubbed his hands in high glee as he noted her speed. 'Courage, Baptiste,' I cried, 'we have the heels of him; he has not caught us yet; neither shall he, if this wind holds.'

We edged off a little, to bring the wind more on our quarter; the clipper obeyed the impulse, and dashed through the water with a velocity that left a long white streak in her wake. The stranger, however, was well handled; every stitch of canvas was spread, and though for a time the issue appeared doubtful, yet her hull

gradually rose into view. Another look through the telescope showed her to be a frigate, a discovery that gave us at once to understand that we should not easily shake her off. It was an exciting moment: the blacks were collected on the fore-castle, gesticulating vehemently as they watched the pursuing ship, and discussed the probabilities of dropping her. Baptiste and I paced the little quarter-deck in silence, except when a higher swell, showing us the stranger more distinctly, elicited an observation as to the distance between us. That she neared us, there was no longer room to doubt; and Baptiste ran his eyes over the schooner's sails, and seemed to find relief in ordering the men to take another pull at the braces, which were already strained almost to the breaking point.

Another anxious half hour passed, during which the cruiser came nearer and nearer. At first, I was at a loss to account for her advantage, but a moment's consideration showed me that the breeze, as often happens in the tropics, was slowly rising from the surface of the water, and the frigate's sails being so much loftier than ours, retained a hold upon it which we had lost. Gradually the white curling waves subsided into long-drawn swells, on which our vessel rolled uneasily, while the sails at times flapped lazily against the mast as the breeze still ascended. Meantime the frigate held on her course, her topsails distended with the wind: we hoisted Danish colours; but as soon as she came within range, a jet of smoke issued from her bow-port, followed by the report of a gun and the whistling of a shot as it flew over us. Resistance was out of the question; but I little relished the idea of giving up quietly a valuable cargo, the rather that, being under neutral colours, we ought to have been exempt from molestation: but, as before observed, sea morality at that day was not over-nice. We took no notice of the gun, and kept our colours flying and sails flapping, when another shot whizzed past, cutting the halliards of our mainsail, which immediately fell in cumbrous folds to the deck. 'Clipper ahoy,' hailed a voice through a speaking-trumpet from the deck of the frigate; 'what schooner's that?'

Seizing one of the shrouds, I leapt to the top of the bulwarks, and shouted in reply—'The Lively, from Carthage to St Thomas. What ship's that?'

'His Majesty's frigate Scorpion,' was the hoarse answer; 'send your boat on board.'

'Ay, ay, sir.' I was not, however, so well disposed to obey the order as my rejoinder might have seemed to warrant, and resolved to delay by every means in our power. The quarter-deck and shrouds of the cruiser were crowded with spectators watching our movements: I, however, turned the fall of the mainsail to account; and as it lay in a heap on our quarter, made a show of bustle in clearing it away to get at the tackles by which our boat was to be lowered, but in reality doing as little as possible. When at last the boat and tackles were clear, the oars were missing, and some time was passed in searching for them before they were brought up from below. Another shot was sent from the impatient frigate to quicken our movements; and no further excuse for delay presenting itself, the men took their seats in the boat, and I was stepping reluctantly into the stern-sheets, when a slight breath of air shook our sails, which were yet hanging loose, and the schooner moved almost imperceptibly ahead. Instantly my resolution was taken: I knew that, with a light wind, we were more than a match for the frigate. 'Baptiste,' I cried, 'we shall beat him yet: tumble in, men; tumble in: bend on a new halliard, up mainsail, and away!'

The negroes obeyed with a glad shout; and in less time than it would take to describe, our mainsail again displayed its broad surface. I was not mistaken; the light breeze held, and pushed us rapidly through the water. The frigate's sails, which had been brailed up as soon as she came within hail, were hastily dropped; but the wind was too light to produce any advantageous effect upon her heavy mass; while we were slipping quietly away, as if by magic. A perfect fury seemed

to take possession of those on board the cruiser : shot after shot was hurled after us with marvellous rapidity ; fortunately not one struck us ; and after a brief period of suspense, not unmingled with a little generous excitement, we were out of her reach.

We kept the same course until sunset, when only the upper sails of the frigate were visible. As night came on, the breeze again freshened, which placed the chances once more in her favour ; but as soon as darkness hid us from her, we altered our course, and steered for our destination, not sorry to get rid of the tormentor. Mutual congratulations followed : the black crew were in the highest spirits ; and as they had behaved well, an extra allowance of grog was served out to them. They made a rhyme of the incident, and danced till a late hour as they sang—

'Scorpion wit' him long sting,
No catch de lily, Lively ting.'

Baptiste and I, though less noisy in our demonstrations of satisfaction, were not less sincere and hearty. But while congratulating each other on our escape, we were not unmindful of the means to secure our advantage : the same vigilant look-out was maintained as at the commencement of the voyage ; but we saw nothing to excite further apprehensions ; and at the end of three days, arrived at St Thomas. A week later, while I was transacting business with Mr King, the British consul, the Scorpion sailed into the harbour. The captain came on shore, and entering the office where we were seated, began to relate, with considerable warmth, the story of a troublesome chase which he had had after a fellow who, after all, contrived to give him the slip. I had already informed the consul of the circumstance. Turning to the captain, he said, smiling, as he pointed to me, 'This is the gentleman, sir, that you chased.' The other, at first, was incredulous ; but the sight of the lively at anchor in the port convinced him. When he could no longer doubt, he said in a haughty tone, 'Twas well for you, sir, that you got away, for I had made up my mind to make a prize of your vessel, and give you a couple of dozen into the bargain, for the trouble you gave us.'

'Fortune of war, captain,' I replied ; 'you may have better luck next time.' But in my subsequent voyages I never saw anything more of the Scorpion. I now commit to paper this little episode in a busy life, by way of illustrating the utility of promptitude and determination even in apparently hopeless circumstances. There are few persons to whom the lesson will not be useful, if they are only capable of applying it.

PLEBEIAN HEROISM.

A great inundation having taken place in the north of Italy, owing to an excessive fall of snow in the Alps, followed by a speedy thaw, the river Adige carried off a bridge near Vienna, except the middle part, on which was the house of the toll-gatherer or porter, and who, with his whole family, thus remained imprisoned by the waves, and in momentary danger of destruction. They were discovered from the banks stretching forth their hands, screaming, and imploring succour, while fragments of this remaining arch were continually dropping into the water. In this extreme danger, a nobleman, who was present, a Count Pulverini, I think, held out a purse of one hundred sequins as a reward to any adventurer who would take a boat and deliver this unhappy family. But the risk was so great of being borne down by the rapidity of the stream, of being dashed against the fragment of the bridge, or of being crushed by the falling stones, that not one in the vast number of spectators had courage enough to attempt such an exploit. A peasant passing along was informed of the proposed reward. Immediately jumping into a boat, he, by strength of oars, gained the middle of the river, brought the boat under the pile, and the whole family safely descended by means of a rope. 'Courage!' cried he ; 'now you are safe.' By a still more strenuous effort, and great strength of arm, he brought the boat and the family to shore. 'Brave fellow!' exclaimed the count, handing the

purse to him, 'here is the promised recompense.' 'I shall never expose my life for money,' answered the peasant. 'My labour is a sufficient livelihood for myself, my wife, and children. Give the purse to this poor family which has lost all.'—[We are indebted to Horace Walpole for the preservation of this beautiful incident. He would have been entitled to much more of our gratitude, had he evinced the same anxiety to preserve the name of the illustrious peasant, as he has shown with regard to that of the nobleman who offered the reward. But the title and the gold had fully greater charms for him than the name of an obscure labourer.]—*My Note-Book*.

INSTINCTS.

HEAVEN gave the bee desire for sweets,
Nor heaven denies her flowers ;
The thirsty land for moisture waits,
Nor heaven withholds its showers.
No sooner are the babe's alarms
To mother's ears express'd,
He finds a shelter in her arms,
His solace at her breast.

Nor are the instincts of the heart
Less subjects of heaven's care ;
Nor would it sympathies impart,
Merely to perish there.
The heart that yearns for kindred mind
To share its bliss or pain—
That knows to love—shall surely find
A heart that loves again.

—*My Dream Book*.

WATER.

A large portion of this planet is covered by the waters of the ocean, of lakes, and rivers. Water forms the best means of communication between remote parts of the earth. It is in every respect of the utmost importance to the animal and vegetable kingdom ; and indeed it is indispensable in all the great phenomena of the inorganic world. The peculiarities of saltiness or freshness in water are dependent upon its solvent powers. The waters of the ocean are salt, from holding dissolved in it various saline compounds, which it receives in part from, and imparts to, the marine plants. Perfectly pure water is without taste ; even the pleasant character of freshly-drawn spring water is due to the admixture of carbonic acid. It is chemically composed of two volumes of hydrogen gas—the lightest body known, and highly inflammable—united with one volume of oxygen, which is a powerful supporter of combustion. By weight, one part of hydrogen is united with eight of oxygen, or in 100 parts of water we find 88.9 oxygen and 11.1 of hydrogen gas. That two such bodies should unite to furnish the most refreshing beverage, and indeed the only natural beverage, for man and animals, is one of the extraordinary facts of science. Hydrogen will not support life—we cannot breathe it and live ; and oxygen would over-stimulate the organic system ; but united, they form that drink for a drop of which the fevered monarch would yield his diadem, and the deprivation of which is one of the most horrid calamities which can be inflicted upon animals. Water appears as the antagonist principle to fire, and the ravages of the latter are quenched by the assuaging powers of the former ; yet a mixture of oxygen and hydrogen gases in the exact proportion in which they form water, explodes with the utmost violence on the contact of flame—such is the remarkable difference between a merely mechanical mixture and a chemical combination.—*R. Hunt in Pharmaceutical Times*.

PARADOXICAL PEOPLE.

Those who have pushed their inquiries much farther than the common systems of their times, and have rendered familiar to their own minds the intermediate steps by which they have been led to their conclusions, are too apt to conceive other men to be in the same situation with themselves ; and when they mean to instruct, are mortified to find that they are only regarded as paradoxical and visionary.

HOME-MADE WISDOM.

WHILE sailing lately down the Thames in a steamboat, my attention was deeply engaged by the manner in which the captain from the paddle-box, looking straight before him, conveyed by different motions of his hand, to the man at the wheel behind, the signals by which he was to steer through the intricate maze of vessels which crowd the river in that particular part from London Bridge nearly down to Woolwich. Now the hand went gently—now it quivered quietly; and ever as it moved, an answering movement was returned by the watchful guider of the vessel. 'How clever all this is!' thought I; 'and how well it demonstrates the value of the simplest of the human faculties, and the respectability that may arise to the humblest of us, by merely doing well whatever his allotted position and circumstances require him to do!' Those two men know nothing of Greek or Latin; they care not a fig for the fine arts of poetry, painting, or music; and yet, by the right exercise of their intellectual powers at the right time and place, they are preventing a hundred and more of their fellow-creatures from smashing, or being smashed, to pieces.

'But this is only homely wisdom after all,' said something within me, which, if called by its proper name, I think would be Pride. Be that as it may, I would not yield the point to my interior opponent, but stoutly contended that this homely wisdom was a very valuable thing—as most home-made articles are—and, in many instances, greatly preferable to such as are of foreign manufacture. 'Have we not home-made bread, and home-brewed beer, and home-made wines?' said I—though, to be sure, these last are somewhat questionable on the score of their superiority. We will class them, therefore, with home-made accomplishments, and allow that both may probably be procured to greater advantage elsewhere; but for every-day use, and every-day consumption, home-made wisdom and home-made bread are far better than any other. 'But what do you mean by home-made wisdom?' inquires my possibly puzzled reader. By home-made wisdom I mean the cultivation of those daily small exercises of good sense which comprise the doing of whatever we have to do in the best possible way—that is, with order, quietness, and in the right time and manner. 'I don't want anything else but the sight of such a drawer as that, to be quite sure of the character of the owner of it,' I once heard a clever old lady say, as she opened the table-drawer of one of her daughters, who was by no means wanting in ability, but sadly deficient in that useful domestic part of wisdom which consists in putting things in their proper places. The unceasing exercise of her mother's largely-developed organ of order required their being put out of sight, that they might not be swept away as

with a besom; but her own love of ease instinctively guiding her to thrust them into the nearest receptacle, a most curious chaos was every now and then revealed, when anything committed to her keeping had to be searched for, which was often the case; as, having no proper and allotted place for anything, of course she could never remember where any missing article was to be found. 'Take care of the pence,' says the practical economist; and in like manner, 'Take care of small occasions of acting prudently,' says the practical moralist; for as it is by the saving of the pence that the individual becomes rich, so is it by the minding what he is about, and not disposing of it with a careless 'What does it matter?' that he becomes wise.

In fact, almost every human being receives two educations: the one from the guardians of his youth, the other from the circumstances of life; and beyond all comparison, the last will be found the most influential and important; for in many instances it is the only education in *realities* which the mind receives, the first process being often little more than stereotyping it with the same set of notions and prejudices which had been engraven upon the faculties of its instructors. When this is the case, the pupil becomes the tool and puppet, rather than the judicious user and improver, of the particular circumstances in which his lot may be cast, and nothing but dwarfishness of thought and pursuit can be looked for as the result; but where the spirit is allowed to expand its wings, and feel its powers, and is judiciously helped, rather than decidedly driven, in its course, there is assuredly an innate sense of truth within its mysterious depths, which, like the needle to the pole, will indicate at all times where the point of *right* in everything is to be found. Now the observing and obeying this point of right seems to me to form the essence of home-made wisdom. Depend upon it, that, could we unroof the houses, and peep, like Asmodeus, into the domestic details of our fellow-mortals, we should find that the chief part of the discomfort we might encounter would be owing not so much to any great faults or extreme delinquencies, as to a course of careless inobservance of those small right things, in their small right way, which the circumstances of every day render necessary to be done in every well-ordered family. I have known a wrangle of an hour long set a-going by the simple circumstance of the fire being suffered to go out in the dining-room, the mistress of the house in the meanwhile *taking it for granted* that somebody or other would have seen after it.

And, by the way, this taking things for granted is a fruitful source of mistake and misery in the business of human life, and a procedure never to be allowed by plain practical wisdom. Take nothing for granted; and, especially all young and newly-married ladies,

never venture to take it for granted that you may safely leave the care of the parlour fire to the housemaid, and the dinner to the cook, and the appointments of the table to whom it may concern; but let a nicely-swept hearth—if not of your own doing, at least under your own superintendence—and a nicely-cooked dinner, and a clean tablecloth on the table, and a neat dress upon yourself, and a smile upon your face, be amongst the daily right things which you present as a welcome to your husband on his return home. Do not forget to take care of the key of the sideboard, and avoid having to hunt all over the house for it when the dinner is on the table. Know also where to find in a moment paper, pens, ink, sealing-wax, and especially the sheet of brown paper and piece of packthread, which are sure to be wanted to do up a parcel, and, generally speaking, are sure never to be found whenever they are wanted. Eschew most devoutly, if you wish to be happy, all satirical jests upon the fume and fret with which your husband deplores that he never can find what he wants; for there are few small miseries more trying than not to know where to turn for a bit of twine to finish a package for which the carrier perhaps is waiting. Never suffer yourself to say, therefore, as I have heard said in such an emergency, and that, too, with a smile, which seemed like an insult upon suffering, ‘*My dear, do you suppose I carry brown paper and packthread in my pocket?*’ but if you have been indiscreet enough to overlook the homely wisdom of attending to the ‘trifles that make the sum of human things,’ take a lesson out of circumstances, and be the better for it. Nothing teaches like circumstances, fresh and flowing from the moment. They illustrate the path of life with living models; and wise is he who, as he travels along, secures the one which suits his case, and treasures it in his innermost studio for future use.

But the misfortune is, that persons in general are not alive to the value and power of this sort of teaching: they are apt to think that it is only by chance or accident that things happen so and so; whereas there are no such things as chance or accident in the daily routine by which people shape their conduct, and are what they are. It is by no chance or accident that drawers are always in disorder; that keys are mislaid; that paper and packthread are never to be found; and that there is not such a thing in the house as a nail or a hammer. There is a homely proverb which says, ‘You may see from a little what a great deal means;’ and as the old lady remarked at the sight of her daughter’s disordered drawer, that she wanted nothing else to judge of the owner’s character, so an acute observer of human nature will want nothing more than a glance at the way in which the small details of their every-day life are managed, to draw a pretty correct inference of the judgment and good sense of the ruling powers in any household; for like is linked to like throughout the whole chain of human actions; and that which we are in our common and ordinary works and ways, that, for the most part, we shall be found to be in everything. How great a part of wisdom is it, therefore, to watch over our mode of dealing with what we call trifles; and how essential that we should sedulously guard against that haste and impatience of nature which would lead us to scamper through them as though they were nothing, and told for nothing in the affairs of life! Tell for nothing indeed! As well may you suppose that the fractions in arithmetic tell for nothing, and expect to bring out a sum right when you have tossed the farthings overboard.

It is inconceivable, indeed, how much we all lose from not properly observing and understanding the power and truth that reside in small things; and the deep, perhaps I might venture to say, the holy lessons, that are to be derived from submitting to their influence. For instance, what so common an occurrence, especially in early life, as the waste of time, labour, and money, in the prosecution of some object which is at last thought not worth the pains that have been bestowed

upon it, and which is then thrown by unfinished? ‘What does it matter?’ is the usual solatium for all the loss that may have accompanied the process; and thus the business is easily settled. But suppose that, instead of this easy off-hand way of disposing of the case, it were used as a means of self-discipline; suppose that the interior bias of the mind to the point of right were regarded, might we not expect it to be in a direction that would guide to the completion of the undertaking?—might we not anticipate that the voice of something wiser and better than the eager impulses of impatient nature, would speak out of the small occasion some great and useful truths?—might not the hasty scrambler after novelty be arrested and instructed by a still, calm pointing of the inward monitor to the duty of resisting and denying that haste to throw off what is disagreeable, which, when traced to its root, will be found the fruitful parent of most of the misdoings of mankind?

‘Take time, that we may have done the sooner,’ was the saying of some wise minister of state; and the counsel is applicable to all times, and all occasions that call for human conduct. Whatever you have to do, give to the deed its due measure of time and attention. It has a claim upon both, and cannot be completed without receiving its rights. ‘But such a trifle as this!’ exclaims some young lady, who is knitting a mystic web of more apparent beauty than use. ‘You would not have me to be devoted heart and soul to the performance of such an act as this?’ If it be right for you to do it at all, my fair young friend, I would have it done in the best possible way. Remember that *that* is the gist of my argument—the doing as well as we can whatever we have to do; and that this it is which constitutes the home-made wisdom whose cause I am advocating. It seems, indeed, but a homely theme; but homely themes are commonly those which the most nearly concern us, and respecting which we require the most earnestly and constantly to be reminded; for it is the secret and solitary influence of individual habits, and not the gathered notions, and set speeches, and varnished courtesies, that are exhibited in assemblies, and put into books, that are the great rulers of our destiny. I do not care much what a person may say or write; tell me how he acts by his fire-side. All the fine things people exhibit out of doors, are generally put on and taken off with their clothes. Their serenities, and gentilities, and suavities, at dinner and evening parties, are mere matter of moonshine, compared to the silent certainty with which their daily and hourly habits of action are fixing them in their proper place in the universe, and causing them in and from that place to diffuse either comfort or discomfort around them. And how much of this comfort or discomfort depends, as I have endeavoured to demonstrate, upon the exercise of plain practical good sense! We may do without many things, but we cannot do without that: for as in material things, so is it in morale—we might do very well without the silks and satins that decorate the shop-windows in Regent Street, but we should be at a loss without the screws, and nails, and ropes, and packthreads of the dingy-looking shops in the City. Even so in human character. The most splendid accomplishments are not of a thousandth part so much use to their possessor, as the habit of exercising a little humble silent patience, and prudence, and self-control. The one is like a dress for high days and holidays, the other is for every-day use, and the oftener it is worn, the longer it lasts; and it will be found, I believe, upon experience, that there are few things more fitted to procure us this serviceable habit than a quiet steady attention to the minute matters, which, obscure and unimportant as they seem, will prove at last to make up the chief part of our allotted portion in life’s history. How, in point of fact, is self-control ever to be acquired, if we accustom ourselves to throw away occasions and opportunities for its exercise, by considering the small circumstances of life as unworthy of our attention, and beneath our dignity to use as means of moral improvement? Good habits, and indeed habits of any kind, are things of

growth and gradation; but with this distinction, that the good are of far slower and more difficult development than the bad—the one wanting the care and culture of flowers, the other springing up pretty much like weeds. If you have been careless of some valuable seed, and failed to place it in favourable conditions to receive advantageously the contingencies of showers, and winds, and sunshine, can you look for the blooming flower at the right season? In like manner, if you have disposed of every means of subduing the haste of nature, by saying, 'What does it matter?' and thought this and the other thing too trivial to be worth an effort, do you expect that anything so valuable, and requiring such constant care and cultivation, as a principle of self-control, will have been growing in your mind of itself? Everything is important, everything matters, to the individual who is in earnest after self-improvement, and who stands upon the watch to discover, and to discern, and rightly use an opportunity for forming and establishing his principles of conduct; for nothing can be properly said to be a man's own but his principles. In everything else he has but a transitory right. His life, his health, his property, are his but for a time, and may or may not be so used as to prove amongst the number of his blessings; but principles are things of immortality, whose results stretch forth beyond the regions of time and sense. His principles, then, are his only realities; and to be built upon them, is to inhabit the wise man's house, against which the storms and tempests of life may vehemently beat, but can never overthrow it, 'because it is founded upon a rock.'

THE FISHERMAN OF THE DANUBE.

SOME five-and-twenty years ago, there stood on the shores of the Danube, at no great distance from the town of Siliustria, a small and miserable mud hut, surrounded on all sides by a dreary swamp, and inundated during the greater part of the year by the swelling waters of that gigantic river. So dismal was the prospect all around—with the sky shrouded in a dense, cold mist, the huge sluggish stream, wide and lifeless as an inland lake, and the far-off Balkan mountains, robed in their eternal snows—that it seemed scarcely possible any human being could support existence in an abode so utterly devoid of all that gives a charm to life. Yet there, year after year, dwelt Michail the fisherman, with Yauco his son, never dreaming that they might have been justified in complaining of their destiny, or seeking its amelioration. Perhaps they could even have talked eloquently of their pleasures, and trembled lest their joys should be taken from them, like those who dwell in lands where pleasure is a business, and present enjoyment the main object of life; for we carry within us, go where we will, a powerful capacity for happiness, which will feed itself on the scantiest materials. It might be a curious experiment to strip some child of luxury of all the external aids he deems absolutely necessary to make life endurable, and leave him to find how much, from the very constitution of his human frame, there will be left him richly to enjoy. Good health, good conscience, and liberty to breathe the free fresh air—thus blest, a man need envy none of those who hold the kingdoms of the earth in vassalship. But the poor fisherman and his son could not even boast of these advantages. During many months, their limbs were palsied with the agues that rose from the pestilential marsh around, and the atmosphere they breathed was yet more poisonous.

At the period of which we speak, Bulgaria, as well as the other principalities adjacent to it, were exclusively under the dominion of the Turks. It was not until the year 1828 that the Russians made any important inroads into these provinces, although they had captured the town of Ibrail some time before. In a country where the main system is despotic, the prosperity of the several districts must depend entirely on the individual character of the governor who is placed

over them; and the inhabitants of the vast pashalic to which Michail belonged were the victims, rather than the subjects, of as tyrannous and rapacious a prince as ever was produced even from amongst the minions of the seraglio, to whom these important posts were usually assigned. The abuse of power amongst men—the sharers of one common humanity, the slaves of one common death—is a strange phenomenon, and never was it exhibited in more revolting colours than during the reign of the pasha then in authority. He seemed to have a singular capacity for causing his tyranny to be felt by the lowest of his subjects. On Michail and Yauco, however, it fell with peculiar severity. They belonged to a class still existing in those provinces, and held in great odium by the Turks. They were by descent Hungarians; and their forefathers had exchanged, as unwilling emigrants, the sway of Charles V. of Germany for that of Solymán the emperor of the East. The lapse of time had failed to efface their national peculiarities, either morally or physically; and though all traces of the Christian creed had been lost amongst them, they repulsed that of Mohammed with an indomitable contempt, which was perhaps one cause of the antipathy which his followers cherished against them.

Whatever might be the cause, there was no amount of oppression and cruelty to which the fisherman and his son were not subjected as appertaining to this outlawed race; but the effect of such treatment on each was very different, for their characters exhibited a singular contrast. Michail had certainly nothing attractive in his disposition; he was a poor, timid, narrow-minded man, possessed of an inordinate selfishness, which is the especial vice of beings of that stamp, and waking only to energy and courage when goaded by the instinct of self-preservation, or the desire to gratify some petty vindictiveness. We do not know what he might have been had the sunshine of prosperity drawn forth the better impulses of his nature, like fragrance from the flowers; but persecution such as he continually underwent, cannot fail to be as oil to the flame of all evil passions and low propensities. The discipline of the bastinado made him servile, and basely hypocritical; for even while he abhorred his oppressors, he crouched in the dust before the meanest of them; and the terror of the bowstring had the power, as we shall see, to deaden within him all natural affection. Yauco, his only child, was a totally different person. His mother had been a Servian, and from her race he had inherited not only their lofty stature and strength of limb, but also their fine bold independent spirit and daring bravery. He was himself of a proud rebellious temper; and from the first dawn of intellect, his spirit revolted against the heavy yoke that was laid upon them. The curb was strained too tight to be resisted. He knew, like other slaves, that death alone could break it; but there was in him much of the uncontrolled fierceness of the savage—for such, indeed, he might be called, who had never stirred beyond that marshy wilderness—and at times the instinctive demand of his whole being for that liberty which is man's birthright, caused him to break out into wild and reckless acts of defiance, which placed both his own and his father's life in jeopardy but too often. For this cause, Michail, cowardly and mean as he was, allowed his heart to be darkened and blighted with a daily-increasing hate for his only son. It was indeed a cruel, unnatural sentiment in a father's breast, and in actual fact it was false. Such a feeling cannot, in reality, obtain possession of a parent, although he may believe in it, and act accordingly; but the dread which haunted him night and day, that Yauco would at last proceed to some such act of open rebellion as should draw down the extreme vengeance of death upon them both, so imbittered him against his son, that this miserable cabin, which the pure light of precious human love might well have brightened, was rendered yet more dreary and dark by continual dissension and strife.

Of late, a great change had taken place in the domestic habits of this pair. The great bodily strength

and well-known courage of Yauco, which distinguished him so much amongst the thinly-scattered inhabitants of the marshes, rendered him a most valuable slave to the Turkish authorities; and the aga of the district was in the habit of sending him continually on every expedition which was required for the furtherance of the corn trade, so vigorously carried on in that country, or the yet more lucrative traffic in leeches, gathered on the Silistrian plains. It was said that some of his exploits—when with his single hand he slew the wild buffalo, or daringly dived through the muddy waters in pursuit of the formidable cobbler-fish—had even reached the ears of the pasha himself, then resident at the fortress of Silistria; and that, with a little of the fawning and cringing which Michail would so readily have bestowed, the young fisherman might have entered into the immediate service of the prince. He was, however, much more disposed to resist the authority to which he was already subject; and it was with a feeling of positive relief that the unnatural father saw him, on this last occasion, set out for a much longer journey than he had yet undertaken, as during the period of his absence alone was he free from his constant and harassing fears lest the wrath of the aga, which had more than once been roused by symptoms of rebellion, should at last break forth in all its terrible power. Yauco was sent to Pesth with a cargo of grain, and remained there some time, to receive the merchandise which was given him in exchange. When he returned to his home, he was a changed man: his character had undergone a singular transformation; and he made it evident, in every word and deed, that a new principle was working within him. No one could know what new creed had become the moral guide of his existence, but all might see that he had advanced the first great step in intellectual improvement, and had established in his own mind a standard of right and wrong. The wayward, rebellious, violent man was now meek and gentle as a child, considerate, thoughtful for others, and uncomplainingly submissive to his Turkish masters; but when he saw the innocent oppressed, when the followers of the Prophet systematically broke through the laws of nature and of conscience, then, with all his noble courage unabated, and passionate ardour tempered now with judgment, he defended the wronged, and resisted the evil, showing well that he would rather be torn by wild horses than depart one iota from the principles by which he now was hourly led. It was not, as may be supposed, with impunity that Yauco denounced the crimes of those who held over him the power of life and death; and that he yet lived to be the bane and terror of his father's existence, was owing solely to the energy and conscientiousness with which he performed whatever amount of toil they imposed upon him. Michail, however, half-crazed by his cowardly fears, now acted towards him as though he held him in abhorrence; and even while he respected his generous and obedient son, and in his heart of hearts loved him still unconsciously, so utterly was he enthralled by a slavish dread of death and torture, that there was perhaps nothing he so much desired as that his only child should depart from his sight for ever, and leave him free to drag on his miserable servile existence uninfluenced by the dangers of others, and with the one hope of prolonging his days by hypocritical flatteries and submission. Yauco bore all his reproaches and cruel treatment without a murmur; only there stole gradually into his mild eyes a look of patient resignation which was ill suited to his years, for it told now in the summer of his days, in his manhood's prime and strength, that the darkness of his own sad heart made his young life a weary and a painful load.

One evening the fisherman and his son stood on the banks of the river, watching the floating piece of wood which indicated where their nets were laid, and by whose movements they could judge if they were filling well. Each held in his hand a long pole, which he required to draw his prize on shore; and in case it should become entangled among the uprooted trees and

bushes, that the force of the inundations often sent reeling past them, a little curiously-shaped boat was moored close at hand. No sound was heard but the roaring of the buffaloes far off, or the cries of the pelicans among the islands of reeds; while the sleepy river flowed past them at so sluggish a pace, that the movement was scarcely perceptible. Gradually, however, there came drifting towards them, on the slow noiseless current, an object which at once forcibly arrested their attention. It required no second glance to perceive that it was the body of a man; and it was a sad thing to see one of the helpless dead, who, after the weariness and the disappointments, and the bitterness of life, have indeed so good a claim to their allotted rest, thus deprived of it, to all outward appearance at least, as it lay tossed from side to side by every eddy in the stream, and knocked to and fro by the floating trees; but as it drew nearer, another peculiarity in its appearance presented itself—the arms were crossed in seeming submission—but in actual fact they were tightly bound to the breast with a strong cord—and a rope was in like manner twisted round the feet, so as to preclude any attempt on the part of the drowning man to save himself by swimming or otherwise. This was no unusual sight to the Bulgarian fisherman and his son: it was the favourite mode of punishment of the pasha of the day to have the criminal (too often a most innocent object of his malice) flung uninjured, but thus fatally bound and shackled, into the deep cold waters, there to undergo the unspeakable torture of gradually sinking and drowning without being able to make one effort for his life.* Yet though many a time Michail and Yauco had seen these hapless victims drifting past—often not yet dead, but filling the air with those piteous cries with which human nature reclaims in agony the life that is escaping from their breast, however bitter that existence may have been—yet, unheeded and unassisted, had they ever let them float on to their certain doom; for of all the crimes which can be committed against the authorities in Turkey, none is so certain to be avenged with death itself as the attempt to interfere with any public punishment; and even Yauco, rebellious as he was, had never dared to draw down so dreadful a fate on his father and himself by stretching out his hand to save them. This was, however, the first time since his return from Pesth that such an event had occurred; and instead of flying, as he used to do, into some deserted place, there to mourn that he was thus constrained to leave them to perish, he remained watching with eager anxiety the miserable being that came drifting towards them, silently struggling in death's last agonies.

'Father,' exclaimed Yauco suddenly, 'do you see that this unhappy wretch yet lives? I can distinguish it by his convulsive movements.'

'So much the worse for him,' replied Michail. 'But it matters little; he will journey swiftly with the swollen currents to-night, and the waves of the wild Black Sea will soon swallow him up.'

'Not so,' exclaimed Yauco vehemently; 'for he never shall reach that terrible ocean. I will, I must save him; and before his father, paralysed with amazement, had time to arrest him, he had cut the cable which moored the little boat, had leapt into it, and was rowing vigorously towards the drowning man. In a moment he had drawn him towards him with his long pole, and lifting the helpless burden into his bark, he returned to the shore. Michail had stood perfectly stupefied with rage at this daring deed; but at last finding words to express his terror and fury, he poured out a volley of reproaches on his unhappy son.

'Fool—madman!' he cried, 'what is it you do? What

* Lest any doubt should be entertained of the possibility of floating bound for any length of time, we deem it proper to state that, in Turkey, criminals treated in the manner described in the text actually maintain themselves alive in the water for no inconsiderable space, and sometimes do survive to be rescued by their relations.—Ed.

is it you dare to do? Throw back the wretch into the water without a moment's delay, if you would escape a father's bitterest curse. Are you mad?—or do you seek my death in your treacherous hate? We are lost if any one should see him now! Throw him down, thou wicked, unnatural son! and Michail himself would have dragged the victim from the boat to fling him back into the river, but Yauco drew off from the shore, so as to be out of his reach, and said in a steady but mournful voice, 'No, father, I will not let you accomplish this crime. As we would hope for a merciful death ourselves, let us show mercy this day. Any tyrant may take the life of a fellow-creature, but none under the heavens can restore it: to us it is given as a precious gift at least to preserve it. I beseech you refuse not my prayer, dear father. We may save this man, perhaps, without peril to ourselves, though surely that peril were sweet for a good deed done. None will visit our cabin to-night; we may hide him there, and to-morrow, it may be, he shall find means to escape.'

Michail looked at him, almost speechless with anger and terror, as the young man raised the victim on his arm, and proceeded to unbind his cords; and indeed the danger in which they were already placed was considerable, for any one passing must, under the penalty of his own life, have denounced such an act of rebellion against the pasha's authority. At last, advancing to the water's edge, he exclaimed in a voice hoarse with agitation, 'Listen, son more hateful to my sight than the bitterest enemy! Too long has my life been the sport of your caprice. To-day shall end the torments you have caused me so long. Choose, now, whether you will at once abandon that wretch to his doom; or go, if you dare to resist me still, go hence where you will, and let me never behold you again; for while I live, I will never own him for my son who has done such a deed of rebellion as this!'

'Father, it is a cruel choice,' said Yauco mournfully; 'but I dare not hesitate: I cannot be a murderer, and it may be as well that we should part. My presence has long been grievous to you, and now you will have rest to your soul! I will go, and if such is your command, to return no more.'

'Go, then!' shrieked the father, shaking in every limb as he suddenly saw a Turk appearing at a distance; 'go; take the criminal hence, or I am lost!'

Yauco instantly put the boat in motion; but he turned round, and cast one long look of tenderness on the poor selfish coward. 'May your years be many, my father!' he murmured gently; 'and may you never grieve for me one single hour, as I shall grieve for you all the days of my life.'

He then began to row swiftly up the river, to escape the observation of the man who was approaching; but just as he was about to disappear in the curve of the stream, Michail seemed for a moment to feel some return of natural affection, for he ran hastily along the bank after him, and called out, 'Yauco, think what you are doing. You are flying to certain death: you know that you cannot escape; and you will infallibly perish before the dawn of day.'

'Better to be the slain than the slayer,' said Yauco calmly. 'If the pasha himself now stood by your side, I would do as I have done.'

These resolute words restored to Michail all his panic and his rage. He responded to them with a bitter curse, which came to the unhappy son as the last words of the parent he loved; and as the boat passed from his sight, Michail returned exulting to his solitary home.

Night was closing in as the exiled son set out on his pilgrimage up the river, with the almost lifeless form of the poor criminal at his feet. His first care was the endeavour to restore animation; and as he lifted up the head, he recognised at once the features of a person most influential in the pasha's household, who till lately had been his principal favourite, and was consequently but too well known all over the country. This circumstance only increased the peril, or rather rendered more

certain the speedy destruction of the generous Yauco; for the facts of this man's disgrace and execution were too notorious to render it possible that he could escape being known everywhere, and on his deliverer must fall the full vengeance of the outraged authorities. Yauco thought it not impossible that the condemned, after an escape (in that country so miraculous), might himself be pardoned, and restored to the pasha's favour; for that prince, wayward and capricious, dealt the sentence of death around him so recklessly, that he often found reason to regret his haste, and anathematised those who had put his orders into execution. But Yauco was well aware that the fact of the victim's innocence would by no means diminish the enormity of his own crime in having saved him. He did not for one moment doubt what his own doom would be; yet not the less, as soon as he had succeeded in completely reviving his companion, did he begin to row vigorously in the direction of Silistria, in order, as speedily as possible, to advance beyond the district where he was personally known, that no portion of his punishment might be reflected back on the father who had driven him forth to perish. And it was with a quiet serenity that he thus conveyed himself into the midst of the danger; for he was now possessed of that calm—the deepest and the purest that can reign in a human breast—which, springing from a lofty principle, follows an utter renunciation of and sacrifice of self. The first dawn of day found the boat of the young fisherman nearly opposite to the fortress of Silistria; and, just as he had anticipated, he was speedily surrounded by the dependents of the pasha, who supposed that he had brought a cargo of leeches from the Bulgarian swamps, or some wonderful fish, as a bribe to the chief officer of the household. Their astonishment may be conceived when they perceived the disgraced favourite alive and well, whom the day before they had cast into the river bound hand and foot! The case was too extraordinary to be judged by any minor functionary, and the rescued criminal, with his deliverer, was instantly conducted to the palace, where they were at once brought into the presence of the pasha himself. This luxurious personage was in full enjoyment of his morning pipe—the most favourable hour for those who approached him, as they well knew; and so great was his amazement at beholding his former favourite thus brought alive from the dead, that he actually allowed him to speak, before, with a movement of the eyebrows, he should give the order to have his head taken off! The criminal was a wary and a dexterous man. He knew well how to deal with his master, for he had won his favour solely by flatteries and cunning; and now, flinging himself at his feet, he first cleared himself of the trivial imputed crime for which he had been punished, and proceeded to declare that it was his belief that he had been rescued by the Prophet from the jaws of death, and restored to his master's side, solely because Mohammed, having a special care for that prince, was determined he should not lose the most devoted and faithful among his servants! And, in short, he so worked on his vanity (a remarkably easy process amongst human beings of all classes), that the mollified pasha not only gave him his life, but restored him to his former position, much as Yauco had expected. It was now his turn to be judged, and he was at once condemned, unheard, to the bowstring; but it would have been an amount of ingratitude too base even for a Turk to exhibit, had the favourite permitted his generous deliverer to be led away to death without making an effort to save him; perhaps he felt, too, that it was with little peril to himself that he might plead for him in the first hour of his newly-acquired power. He at once detailed a cunningly-fabricated story, in which he asserted that Yauco, inspired by a profound admiration for the sublime and inaccessible pasha, had devised this extraordinary and perilous manner of gaining admittance to his presence, in order that he might earnestly pray to be taken into his more immediate service. The wily favourite extolled the young fisherman's good qua-

lities as though he had known him all his life; protested that such was his marvellous probity, that were the pasha to place him in guard over his treasure of Latakia tobacco, he would not even diminish the store by a handful; and finally, he besought his highness to lift up his eyes and note the commanding stature and great strength and vigour of this candidate for slavery, which would render him such a precious possession. The old Turk was so much moved by these pertinent observations, that instead of consigning Yauco to the hands of the executioner, he at once named him to an important post in his household, and then dismissed the whole party, utterly exhausted with the exertion of talking so much. Calmly and nobly as the young Bulgarian had prepared for death, in all the strength and pride of his manhood, it must be owned that his heart beat thick, and his sight grew dim, when the strong hope of life renewed rushed over his spirit; but he turned resolutely from the dreams and promises of a long futurity which seemed to rise for him from the certainty of his restored existence, for he knew and felt that he must henceforth walk as on the brink of a precipice. Yauco was no longer a man whose actions could be guided either by his own wishes or those of others; he had a high and steady principle, which he deemed it right to obey, and from which neither changing circumstance, nor his own self-interest, could turn him. He was firmly determined to yield the pasha all due submission, and to serve him with fidelity and zeal; but when he should be called upon, as he undoubtedly would be, sooner or later, in obeying his master's laws, to sin against those of his conscience, he was quietly resolved to exchange his obedience for death. For a time all went well: he was at once so active and so docile, so intelligent and so zealous, that he rose rapidly in the pasha's favour, and was advanced from one responsible post to another, till at last he found favour in the eyes of the pasha, to the perilous extent of exciting the jealousy of his other dependants. Even the favourite who owed him his life soon began to regret bitterly that his feelings had betrayed him into the rare instance of Turkish gratitude which we have recorded; and when he at last perceived that his whimsical lord was already reposing more confidence in Yauco than in himself, he determined as speedily as possible to take measures for repairing the mistake he had made in so heedlessly saving him from the bowstring. It was after the lapse of but a few months that the favourite, now quite restored to the peculiar prudence and foresight of a Moslem, went to hold a consultation with the pasha's doctor on the best and quietest mode of destroying the life which that functionary is expected in all countries to preserve. This person, who was a most vile little Armenian, was a far greater adept in dexterously relieving people of their troublesome neighbours than in removing their maladies; and when his visitor began to talk of poisons, and whether they were most palatable as administered in coffee, or inhaled in tobacco-smoke, he interrupted him by asking what he would give him if he devised a scheme by which the unconscious Yauco should be made, so to speak, to cut his own throat, and consummate his doom by his own rashness, without the necessity of his quondam friend incurring any risks. The favourite only answered by taking off a splendid ring, and handing it to his adviser. The Armenian placed it on his finger, and at once proceeded to detail his plan. 'You remember,' he said, 'the last time the pasha sent an expedition up to the mountains, with orders to burn the first village they came to, and bring back the young men and women as slaves?' The listener made a sign of assent. 'The night before the troop started,' continued the Armenian, 'I heard Yauco the Bulgarian talking to their chief; and what do you think he was saying? He was trying to persuade him to go to the pasha, and openly refuse to obey such a command!'

'What do you tell me?' exclaimed the favourite: 'you would throw dust in my eyes!'

'I tell you the truth. But listen to what followed. The captain of the troop told him he was mad, and asked him if he did not know that the pasha's own son would not live to finish such a sentence as that in his presence. Yauco said that he knew it; but he thought it better that one should die, than that hundreds of aged and infirm should perish in the flames; better that he should be tortured, than that so many poor creatures should become miserable slaves. Well, the other laughed at him, and the expedition took place; but, friend, they talk of another such very speedily. Nothing would be easier for you than to induce the pasha to order his favourite Yauco to take the command; Yauco would refuse; and then—'

'May you live for ever!' exclaimed his companion, starting up in the highest glee. 'It is a brave plot, good doctor, and if it succeeds, you shall have a rare bag of piastres!'

'I shall have my bag of piastres!' replied the other in a confident tone, and they separated to organise their iniquitous project.

Meanwhile, Michail dwelt friendless and alone in the home he had made so solitary for a time. So absorbed had he been by his slavish fears, that he could do nothing but rejoice in the relief from all dread which Yauco's absence afforded him; and he found that he was now to enjoy a double security; for not only did he, by the most abject submission, allay the suspicions which Yauco's conduct had so often excited, but gradually his very existence ceased to be remembered, or thought of at all. Those who had frequented his hut, either as friends or as enemies of his son, no longer thought of coming near him; and as he was not personally of a disposition to excite an interest in any one, he soon found himself abandoned to a solitude as safe as it was dismal.

It is inherent in human nature always to exaggerate present evils, whilst those that are gone by lose much of their real, and all their artificial gloom, as they retreat into the region of the rose-coloured past. Michail soon began to fancy the terrors he had suffered from his son's rashness and a trifling ill compared to the dreariness and joylessness of his present existence. The indestructible power of natural affection was stirring at his heart, too, in secret; and gradually the image of the son he had dealt by so cruelly began to haunt his lonely hours. At first, it was only in his dreams by night that the vision came to him; for by day he drove all such recollections from his mind. But in his troubled sleep he was perpetually visited by the appearance of his son—sometimes as he remembered him in his guileless, happy childhood, or as he had last seen him looking round on him with his long gaze of mournful tenderness. At length Michail had an attack of the terrible marsh fever, far more violent than he had ever before experienced; and then it was, in sickness and pain, unwatched and untended, that his heart yearned for the loving child whose unremitting care had often soothed him through the long sad nights; and with bitterest remorse he owned to himself that he would now have braved any danger to behold him once more in his embrace. In his delirium, when no one was at hand to give him the drop of water for which he craved, often did he shriek out in agony, thinking he beheld him dying or dead; but as the fever began to abate, his mind, weakened by illness, became entirely engrossed by one strong conviction—which seemed to have grown out of the very necessity he felt for believing it—that his son yet lived in spite of all, and would one day return to him. Again and again did he dream that he beheld his boat sweeping down the river towards him; and so convinced did he become that this bright vision was one day to be a reality, that as soon as his illness permitted, he crawled out daily to the river side to watch for the coming of the wished-for bark. The unhappy father had, in fact, become almost imbecile from the effects of the fever—a result which that species of malady often produces in those countries; and this belief in his son's speedy return was the only idea

which retained possession of his weakened intellect—thus becoming a kind of monomania. Day after day did the wan, haggard, decrepit old man take his station on the muddy bank of the giant stream, there to watch with never-wearying eyes the particular point where, sweeping round a rapid curve in the river, the current would first bear the boat into sight; and his repeated disappointments had no other effect than to convince him that each new day must indeed be the happy one which should restore to him his exiled child. One evening—just such an evening as that on which he had banished Yauco—his long expectant gaze was at last met by a sight precisely similar to that which on that fatal day had first drawn the attention of the father and son as they stood together. Now he stood alone; but his diseased imagination almost believed that Yauco was again by his side, as again the body of a criminal came floating down the stream, with its shackled feet, and hands bound down upon the breast! There was but one difference, and that was, that the victim was evidently dead long since; some merciful blow against a rock had probably terminated his sufferings, for he lay perfectly motionless, drifting about according to the caprice of the sportive waters. There was a sort of fascination in the gaze which the wretched father fixed on this passive traveller as the swift tide bore it on nearer and nearer to him, till at last a whirling eddy tossed up the corpse beneath his very feet. He bent down to look on the face; then a cry, terrible as the concentrated remorse of months could render it, burst from the lips of the miserable old man. The eyes, fixed, glassy, upturned, were the eyes of his once fair Yauco; the form, the features, were those of the brave son of whose murder he was virtually guilty! Conscience dealt him his own death-blow at the thought: he stretched out his hands towards the body that now was drifting away, and sunk down in convulsions on the ground; while the corpse of his victim, as though it had fulfilled its mission, passed on to seek its mighty sepulchre in the tempestuous breast of the deep Black Sea.

EARLY DAYS OF THE ROYAL SOCIETY.

If one would learn an instructive lesson of what upwards of a century and a-half have done for the progress of knowledge, and just perceptions of nature, it can scarcely be derived from a better source than the history of the Royal Society of London. With this view, it has been our amusement to take from the shelf a parcel of the early volumes of the Philosophical Transactions, and contrast them with a few of those published during the past four or five years. In so doing, we are not long in discovering that we place the child by the giant's side. To those who have the taste and the opportunity, we heartily commend this exercise; while, for our own part, we venture to offer, neither in an ill-natured, nor in a self-laudatory spirit, a few stray gleanings from the recorded gambols of the child-philosophers of those early days.

We may preface our desultory gatherings by mentioning that the Royal Society was instituted solely for the encouragement and advancement of physical and mathematical science. But it took origin in days when the disposition of the minds of philosophers was rather prone to the search for the wonderful. Prodiges and supernaturalities had long been in vogue: they were the ghosts and bugbears of the common mind; yet they left a bias even upon the minds of the learned, who were thus led into the most ludicrous errors. That was a period of dim uncertain light, when every object beheld was invested with an unreality of detail, and an exaggeration of outline; ours is the brighter daylight, less romantic, but more faithful. The early papers of those members of the Royal Society who contributed to the Philosophical Transactions, forcibly illustrate our position, and the volumes of this period present us with a jumble of science, blunders, singularities, and follies very droll to contemplate. These early papers have been severely

criticised, in a spirit with which we have no sympathy, by Sir John Hill, who published a bitter review of them in 1751. The 'Tatler' also utters this oblique satire at the scientific acquirements of the then members of the society:—'When I meet with a young fellow that is a humble admirer of the sciences, but more dull than the rest of the company, I conclude him to be a Fellow of the Royal Society.' Our own feeling is far different: with the eccentric Bishop Wilkins, and the indefatigable Mr Oldenburgh for their first secretaries, those who know the character of these unwearied rarity-seekers, must expect a certain mixture of trifling to be combined with the more solid portions of these volumes. This being also the character of the times, it was the imperfection inseparable from childhood. Let it not be forgotten, however, that the genius of Newton, Boyle, Hook, Flamsteed, and many more, illuminates these pages with rays of light, many of which have penetrated into, some probably beyond, our own era. It is right to add that, in 1750, the Royal Society disclaimed the Philosophical Transactions as its representative, and great care has since been taken to prevent the appearance of inferior articles. What blame there is for the faults of the first forty-seven volumes, has been laid on the shoulders of the unfortunate secretaries, rather unjustly in our estimation; but from the forty-eighth volume to the present period, these Transactions are among the noblest literary monuments to science our country can boast of.

But to our gleanings. The vagaries in natural history to be found in these early papers are very amusing: thus in one of the volumes we find what is denominated a *rectification* of the account of the salamander. Conceive our surprise in discovering it to be a narrative respecting a salamander brought by a virtuoso from the Indies, which, when cast into the fire, did actually swell and vomit forth a thick slimy matter which put out the neighbouring coals, and repeated this wonderful fire-extinguishing act many times for the space of two hours, so often as the coals rekindled! The migratory instinct has always proved too seductive a fancy to be resisted even by Fellows of the Royal Society; therefore are we solemnly assured that it is a thing most certain that, on the approach of winter, swallows do sink themselves into lakes, no otherwise than frogs; the venerable author adding, that it was customary to draw them out with a net, together with fishes, and to put them near the fire, when they revived! But this is not half florid enough for another writer, who ominously intimates his belief that the earth is accompanied by a hitherto undiscovered satellite, not very far off, to whose more hospitable clime our birds of passage direct their flight! Fossils proved a sad perplexity to the philosophers of that epoch. Three or four elaborate papers appeared upon this subject; but we scarcely expect credit for the extract which follows, although the articles can easily be referred to. The writer having discovered some curious substances in the rocks of the Mendip Hills, which he conceived to resemble plants, set about the investigation with great ardour, and in proper form comes to this decision upon their nature. These are rock-plants; they grow from fine clay; they are at first smooth, and by degrees become covered with knots; they have a soft pith, which is constantly refreshed by mineral steams and moisture rising through its roots. The free supply of moisture is of course more necessary to these plants than to those which grow above ground, since nature carries on her mineral generation with a stronger effort than the other. These stone-plants have true life and growth: as to that ridiculous opinion, that they were only parts of plants or animals petrified, 'it seems not to be grounded on any practical knowledge;' the principal objection to it was, that these productions were totally unlike any known species of either kingdom. Now for the author's theory: he says, that as we may see figures in snow, and discern landscapes in stones, and the exact resemblance of fern leaves in coals, all painted in pure caprice by the

hand of nature, so here she was creating in the same mood plants of stone. What a downfall is it for all these ingenuities to learn that the mysterious things in question were only a parcel of *nummulites*, one or two star-fishes, and some corallines! Another has a theory about fossils equally strange, possibly even more startling. He accounts thus for their formation:—The former occupants of these bodies lay upon the surface of the soil; the rain falling on them, dissolved their salts, and washed them down into the earth, where they again concreted, and resumed their original forms. This was a revival of a theory entertained long before by other philosophers, who accounted for ghosts by saying that the exhalations of the bodies of the dead resumed the form of the persons they proceeded from. We fear also that a Fellow of the Royal Society, and a member of the council, has to answer for the absurd delusion respecting barnacle-geese getting a firmer hold than ever not only on the minds of the vulgar, but on the belief of the learned. Sir Robert Moray undertook a journey into the northern parts of Scotland purposely to examine into the truth of the commonly-received account of the birth of geese from barnacles. He wrote a paper upon the subject on his return; and—will it be believed?—he positively asserts, without the smallest compunction, that in every barnacle he opened he found a perfect sea-fowl: the bill was like that of a goose; the head, neck, breast, wings, tail, and feet were like those of other water-fowl; the very feathers were perfectly formed, and were of a black colour! How it was possible that any man pretending to credit or learning could write such a palpable exaggeration, in a professedly philosophical journal, it is hard to conceive. This paper is contained in No. 137.

Many a traveller's tale finds acceptance in these pages. A Mr Glover, travelling in Virginia, gives a minute account of an apparition which astonished him as he was leisurely floating down the river. This was none other than a merman! a creature with a grim and terrible aspect, and a head and body like a man; but on diving, it flourished aloft—and here, we fear, other folk are flourishing also—a tail like that of a fish. Mr Glover's friend appears to have been an unlucky Indian bathing! Many equally veracious statements might be selected, had we space. Mr Oldenburgh himself, in criticising Kircher's work on China, quotes the tremendous tales of an elephant eating sugar-canes, and of their taking root in his interior; and of a boy who ate serpents with as much *gusto* as eels, with the mild remark, that these accounts seem to require confirmation.

These scientific records were remarkable also for being occasionally occupied with silly communications upon subjects widely different from their express objects. What would now be the perplexity of a reader of the Philosophical Transactions to find a paper bearing such a title as the following: 'A true and exact relation of the dismal and surprising effects of a terrible and unusual clap of thunder, with lightning, that fell upon the Trumball galley,' communicated by R. M., *kettle-drummer* to his majesty? Or to find next to some of Dr Faraday's electrical researches, 'A particular account of two monstrous pigs with human faces?' Or the relation concerning one Clark, a posture-master; which Clark, sure enough, was a wonderful man in his way, for he possessed the faculty of disjoining himself all over, and reducing a naturally well-made frame at pleasure to the condition of a complicated cripple. The article states, that he so imposed upon a celebrated surgeon, that the latter pronounced his case to be utterly hopeless; and that he often left the room, and returned so altered—humpbacked, deformed, and horribly distorted—as to draw forth a shower of alms from the company, who were ignorant of his being the same person. Or supposing we put the account of the way to kill rattlesnakes with a bunch of pennyroyal by the side of Professor Baden Powell's investigations on light, or Mr Airy's astronomical calculations; or, to contrast more kindred subjects, set side by side the marvellous history

of a calf with a strong thorax and Wharton Jones's microscopical investigations into the structure of the blood-corpuscule.

We see these incongruities now, but they beheld them not then; and it is far from rare to find the same volume contain some of the profound papers of Sir Isaac Newton, then plain Mr Newton, with some trivial account of a storm of hail which broke somebody's or a great many people's windows. Had it not been our attempt to condense this article, it would have been easy to have extended it by adducing many more instances illustrative of the feebleness which, in some respects, characterised the steps of philosophy in the middle and toward the close of the seventeenth century. The force of the contrast will not be weakened by leaving the subject here. While we look back in a sort of merry wonder, and congratulate ourselves on our present position of advancement, let us look forward with humility, anticipating the day when our own blemishes will appear as conspicuously puerile as those of ancestral philosophy to us.

EDINBURGH CONVIVIALIA.*

A GLIMPSE AT PAST TIMES.

TAVERN dissipation, now so rare amongst the respectable classes of the community, formerly prevailed in Edinburgh to an incredible extent, and engrossed the leisure hours of all professional men, scarcely excepting even the most stern and dignified. No rank, class, or profession, indeed, formed an exception to this rule. Nothing was so common in the morning as to meet men of high rank and official dignity reeling home from a cloze in the High Street, where they had spent the night in drinking. Nor was it unusual to find two or three of his majesty's most honourable Lords of Council and Session mounting the bench in the forenoon in a capulous state. A gentleman one night stepping into Johnnie Dowie's, opened a side door, and looking into the room, saw a sort of *agger* or heap of snoring lads upon the floor, illumined by the gleams of an expiring candle. 'Wha may thae be, Mr Dowie?' inquired the visitor. 'Oh,' quoth John, in his usual quiet way, 'just twa-three o' Sir Willie's drucken clerks!'—meaning the young gentlemen employed in Sir William Forbes's banking-house, whom, of all earthly mortals, one would have expected to be observers of the decencies.

To this testimony may be added that of all published works descriptive of Edinburgh during the last century. Even in the preceding century, if we are to believe Taylor the Water-poet, there was no superabundance of sobriety in the town. 'The worst thing,' says that sly humorist in his 'Journey' (1623), 'was, that wine and ale were so scarce, and the people such misers of it, that every night, before I went to bed, if any man had asked me a civil question, all the wit in my head could not have made him a sober answer.'

The *diurnal* of a Scottish judge of the beginning of the last century, which I have perused, presents a striking picture of the habits of men of business in that age. Hardly a night passes without some expense being incurred at taverns, not always of very good fame, where his lordship's associates on the bench were his boon companions in the debauch. One is at a loss to understand how men who drugged their understandings so habitually, could possess any share of vital faculty for the consideration or transaction of business, or how they contrived to make a decent appearance in the hours of duty. But however difficult to be accounted for, there seems no room to doubt that deep drinking was compatible in many instances with good business talents, and even application. Many living men connected with the Court of Session can yet look back to a juvenile period of their lives, when some of the ablest advocates and most esteemed judges were noted for their con-

* From 'Traditions of Edinburgh,' by R. Chambers; a new and much amended edition, just published.

vivial habits. For example, a famous counsel named Hay, who became a judge under the designation of Lord Newton, was equally remarkable as a Bacchanal and as a lawyer. He considered himself as only the better fitted for business, that he had previously imbibed six bottles of claret; and one of his clerks afterwards declared that the best paper he ever knew his lordship dictate, was done after a debauch where that amount of liquor had fallen to his share. It was of him that the famous story is told of a client calling for him one day at four o'clock, and being surprised to find him at dinner; when, on the client saying to the servant that he had understood five to be Mr Hay's dinner hour, 'Oh but, sir,' said the man, 'it is his *yesterday's dinner*!' M. Simond, who, in 1811, published a 'Tour in Scotland,' mentions his surprise on stepping one morning into the Parliament House to find, in the dignified capacity of a judge, and displaying all the gravity suitable to the character, the very gentleman with whom he had spent most of the preceding night in a fierce debauch. This judge was Lord Newton.

Contemporary with this learned lord was another of marvellous powers of drollery, of whom it is told, as a fact too notorious at the time to be concealed, that he was one Sunday morning, not long before church-time, found asleep amongst the paraphernalia of the sweeps, in a shed appropriated to the keeping of these articles, at the end of the Town-Guard-house in the High Street. His lordship, in staggering homeward alone from a tavern during the night, had tumbled into this place, where consciousness did not revisit him till next day. Of another group of clever, but over-convivial lawyers of that age, it is related that, having set to wine and cards on a Saturday evening, they were so cheated out of all sense of time, that the night passed before they thought of separating. Unless they are greatly belied, the people passing along Picardy Place next forenoon, on their way to church, were perplexed by seeing a door open, and three gentlemen issue forth, in all the disorder to be expected after a night of drunken vigils, while a fourth, in his dressing-gown, held the door in one hand and a lighted candle in the other, by way of showing them out!

Wine and business seem to have inextricably mingled in those days. Blackstone, as we all know, wrote his 'Commentaries' over port, and Sheridan his plays over sherry. There still lives (1847) a distinguished lawyer of the last century, and judge of the present, but now in retirement, who tells that, having one evening a hard case to master, he retired to his room, arranged his papers, and, by way of following an approved recipe of his day, caused a bottle of port, and another of sherry, to be placed for marginal reference beside them. The case, contrary to his expectation, proved extremely interesting, inasmuch that he became wholly absorbed in it. Nevertheless, after a few hours had passed, he was sensible of a strange dimness of vision, as if something had gone wrong with either his eyes, his spectacles, or the candles. Having rubbed the first two, and topped the third, all without effect, he rose to take a walk through the room. After this, his lordship has no recollection of anything which occurred, till he awoke a few hours thereafter on the floor, upon which, it would appear, he had tumbled. What concern the couple of half-empty bottles upon the table had had in bringing about this strange syncope, must be left to the ingenious imagination of the reader.

The *High Jinks* of Counsellor Pleydell, in 'Guy Mannering,' must have prepared many for these curious traits of a bypast age; and Scott has further illustrated the subject by telling, in his notes to that novel, an anecdote which he appears to have had upon excellent authority, respecting the elder President Dundas of Arniston, father of Lord Melville. 'It had been thought very desirable, while that distinguished lawyer was king's counsel, that his assistance should be obtained in drawing up an appeal case, which, as occasion for such writings then rarely occurred, was held to be a

matter of great nicety. The solicitor employed for the appellant, attended by my informant, acting as his clerk, went to the lord advocate's chambers in the Fishmarket Close, as I think. It was Saturday at noon, the court was just dismissed, the lord advocate had changed his dress, and booted himself, and his servant and horses were at the foot of the close, to carry him to Arniston. It was scarcely possible to get him to listen to a word respecting business. The wily agent, however, on pretence of asking one or two questions, which would not detain him half an hour, drew his lordship, who was no less an eminent bon-vivant than a lawyer of unequalled talent, to take a whet at a celebrated tavern, when the learned counsel became gradually involved in a spirited discussion of the law points of the case. At length it occurred to him that he might as well ride to Arniston in the cool of the evening. The horses were directed to be put into the stable, but not to be unsaddled. Dinner was ordered, the law was laid aside for a time, and the bottle circulated very freely. At nine o'clock at night, after he had been honouring Bacchus for so many hours, the lord advocate ordered his horses to be unsaddled—paper, pens, and ink, were brought—he began to dictate the appeal case, and continued at his task till four o'clock the next morning. By next day's post the solicitor sent the case to London—a *chef-d'œuvre* of its kind; and in which, my informant assured me, it was not necessary, on revision, to correct five words.'

It was not always that business and pleasure were so successfully united. It is related that an eminent lawyer, who was confined to his room by indisposition, having occasion for the attendance of his clerk at a late hour, in order to draw up a paper required on an emergency next morning, sent for and found him at his usual tavern. The man, though remarkable for the preservation of his faculties under severe application to the bottle, was on this night farther gone than usual. He was able, however, to proceed to his master's bedroom, and there take his seat at the desk with the appearance of a sufficiently collected mind, so that the learned counsel, imagining nothing more wrong than usual, began to dictate from his couch. This went on for two or three hours, till, the business being finished, the barrister drew his curtain—to behold *Jamie* lost in a profound sleep upon the table, with the paper still in virgin whiteness before him!

One of the most notable jolly fellows of the last age was James Balfour, an accountant, usually called *Singing Jamie Balfour*, on account of his fascinating qualities as a vocalist. There used to be a portrait of him in the Leith Golf-house, representing him in the act of commencing the favourite song of 'When I ha'e a saxpence under my thoom,' with the suitable attitude, and a merriness of countenance justifying the traditional account of the man. Of Jacobite leanings, he is said to have sung 'The wee German lairdie,' 'Awa, Whigs, awa,' and 'The sow's tail to Geordie,' with a degree of zest which there was no resisting.

Report speaks of this person as an amiable, upright, and able man; so clever in business matters, that he could do as much in one hour as another man in three; always eager to quench and arrest litigation, rather than to promote it; and consequently so much esteemed professionally, that he could get business whenever he chose to undertake it, which, however, he only did when he felt himself in need of money. Nature had given him a robust constitution, which enabled him to see out three sets of boon companions; but after all, gave way before he reached sixty. His custom, when anxious to repair the effects of intemperance, was to wash his head and hands in cold water; this, it is said, made him quite cool and collected almost immediately. Pleasure being so predominant an object in his life, it was thought surprising that at his death he was found in possession of some little money.

The powers of Balfour as a singer of the Scotch songs of all kinds, tender and humorous, are declared to have

been marvellous; and he had a happy gift of suiting them to occasions. Being a great peacemaker, he would often accomplish his purpose by introducing some ditty pat to the purpose, and thus dissolving all rancour in a hearty laugh. Like too many of our countrymen, he had a contempt for foreign music. One evening, in a company where an Italian vocalist of eminence was present, he professed to give a song in the manner of that country. Forth came a ridiculous cantata to the tune of Aiken Drum, beginning, 'There was a wife in Peebles,' which the wag executed with all the proper graces, shakes, and appogiaturas, making his friends almost expire with suppressed laughter at the contrast between the style of singing and the ideas conveyed in the song. At the conclusion, their mirth was doubled by the foreigner saying very simply, 'De musico be very fine, but I no understand de words.' A lady, who lived in the Parliament Close, told a friend of mine that she was awakened from her sleep one summer morning by a noise as of singing, when, going to the window to learn what was the matter, guess her surprise at seeing Jamie Balfour, and some of his boon companions (evidently fresh from their wonted orgies), singing *The king shall enjoy his own again*, on their knees, around King Charles's statue! One of Balfour's favourite haunts was a humble kind of tavern called *Jenny Ha's*, opposite to Queensberry House, where, it is said, Gay had boused during his short stay in Edinburgh, and to which it was customary for gentlemen to adjourn from dinner parties, in order to indulge in claret from the butt, free from the usual domestic restraints. Jamie's potations here were principally of what was called *cappie ale*—that is, ale in little wooden bowls—with wee thochts of brandy in it. But indeed no one could be less exclusive than he as to liquors. When he heard a bottle drawn in any house he happened to be in, and observed the cork to give an unusually smart report, he would call out, 'Lassie, gi'e me a glass o' that;' as knowing that, whatever it was, it must be good of its kind.

Sir Walter Scott says, in one of his droll little mis-sives to his printer Ballantyne, 'When the press does not follow me, I get on slowly and ill, and put myself in mind of Jamie Balfour, who could run when he could not stand still.' He here alludes to a matter of fact, which the following anecdote will illustrate:—Jamie, in going home late from a debauch, happened to tumble into the pit formed for the foundation of a house in James's Square. A gentleman passing heard his complaint, and going up to the spot, was intreated by our hero to help him out. 'What would be the use of helping you out,' said the by-passer, 'when you could not stand though you were out?' 'Very true, perhaps; yet if you help me up, I'll run you to the Tron Kirk for a bottle of claret.' Pleased with his humour, the gentleman placed him upon his feet, when instantly he set off for the Tron Church at a pace distancing all ordinary competition; and accordingly he won the race, though, at the conclusion, he had to sit down on the steps of the church, being quite unable to stand. After taking a minute or two to recover his breath—'Well, another race to Fortune's for another bottle of claret!' Off he went to the tavern in question, in the Stamp-Office Close; and this bet he gained also. The claret, probably with continuations, was discussed in Fortune's; and the end of the story is, that Balfour sent his new friend home in a chair, utterly done up, at an early hour in the morning.

It is hardly surprising that habits carried to such an extravagance amongst gentlemen should have in some small degree affected the fairer and purer part of creation also. It is an old story in Edinburgh, that three ladies had one night a merry-meeting in a tavern near the Cross, where they sat till a very late hour. Ascending at length to the street, they scarcely remembered where they were; but as it was good moonlight, they found little difficulty in walking along till they came to the Tron Church. Here, however, an obstacle occurred.

The moon, shining high in the south, threw the shadow of the steeple directly across the street from the one side to the other; and the ladies, being no more clear-sighted than they were clear-headed, mistook this for a broad and rapid river, which they would require to cross before making further way. In this delusion, they sat down upon the brink of the imaginary stream, deliberately took off their shoes and stockings, *killed* their lower garments, and proceeded to wade through to the opposite side; after which, resuming their shoes and stockings, they went on their way rejoicing, as before! Another anecdote (from an aged nobleman) exhibits the Bacchanalian powers of our ancestresses in a different light. During the rising of 1715, the officers of the crown in Edinburgh, having procured some important intelligence respecting the motions and intentions of the Jacobites, resolved upon despatching the same to London by a faithful courier. Of this the party whose interests would have been so materially affected got notice; and that evening, as the messenger (a man of rank) was going down the High Street, with the intention of mounting his horse in the Canongate, and immediately setting off, he met two tall handsome ladies, in full dress, and wearing black velvet masks, who accosted him with a very easy demeanour, and a winning sweetness of voice. Without hesitating as to the quality of these damsels, he instantly proposed to treat them with a pint of claret at a neighbouring tavern; but they said that, instead of accepting his kindness, they were quite willing to treat him, to his heart's content. They then adjourned to the tavern, and sitting down, the whole three drank plentifully, merrily, and long, so that the courier seemed at last to forget entirely the mission upon which he was sent, and the danger of the papers which he had about his person. After a pertinacious debauch of several hours, the luckless messenger was at length fairly drunk under the table; and it is needless to add, that the fair nymphs then proceeded to strip him of his papers, decamped, and were no more heard of; though it is but justice to the Scottish ladies of that period to say, that the robbers were generally believed at the time to be young men disguised in women's clothes.*

The custom which prevailed among ladies, as well as gentlemen, of resorting to what are called *oyster-cellars*, is in itself a striking indication of the state of manners during the last century. In winter, when the evening had set in, a party of the most fashionable people in town, collected by appointment, would adjourn in carriages to one of those abyses of darkness and comfort, called, in Edinburgh, *laigh shops*, where they proceeded to regale themselves with raw oysters and porter, arranged in huge dishes upon a coarse table, in a dingy room, lighted by tallow candles. The rudeness of the feast, and the vulgarity of the circumstances under which it took place, seem to have given a zest to its enjoyment, with which more refined banquets could not have been accompanied. One of the chief features of an oyster-cellar entertainment was, that full scope was given to the conversational powers of the company. Both ladies and gentlemen indulged, without restraint, in sallies the merriest and the wittiest; and a thousand remarks and jokes, which elsewhere would have been suppressed as improper, were here sanctified by the oddity of the scene, and appreciated by the most dignified and refined. After the table was cleared of the oysters and porter, it was customary to introduce brandy

* It was very common for Scotch ladies of rank, even till the middle of the last century, to wear black masks in walking abroad, or airing in a carriage; and for some gentlemen too, who were vain of their complexion. They were kept close to the face by means of a string, having a button of glass or precious stone at the end, which the lady held in her mouth. This practice, I understand, did not in the least interrupt the flow of tittle-tattle and scandal among the fair wearers.

We are told, in a curious paper in the *Edinburgh Magazine* for August 1817, that at the period above-mentioned, 'though it was a disgrace for ladies to be seen drunk, yet it was none to be a little intoxicated in good company.'

or rum-punch—according to the pleasure of the ladies—after which dancing took place; and when the female part of the assemblage thought proper to retire, the gentlemen again sat down, or adjourned to another tavern, to crown the pleasures of the evening with an unlimited debauch. It is not (1824) more than thirty years since the late Lord Melville, the Duchess of Gordon, and some other persons of distinction, who happened to meet in town after many years of absence, made up an oyster-cellar party, by way of a frolic, and devoted one winter evening to the revival of this almost forgotten entertainment of their youth.

It seems difficult to reconcile all these things with the staid and somewhat square-toed character which our country has obtained amongst her neighbours. The fact seems to be, that a kind of Laodicean principle is observable in Scotland, and we oscillate between a rigour of manners on the one hand, and a laxity on the other, which alternately acquire an apparent paramountcy. In the early part of the last century, rigour was in the ascendant; but not to the prevention of a respectable minority of the free-and-easy, who kept alive the flame of conviviality with no small degree of success. In the latter half of the century—a dissolute era all over civilised Europe—the minority became the majority, and the characteristic sobriety of the nation's manners was only traceable in certain portions of society. Now we are in a sober, perhaps tending to a rigorous, stage once more. In Edinburgh, seventy years ago, intemperance was the rule to such a degree, that exception could hardly be said to exist. Men appeared little in the drawing-room in those days; when they did, not unfrequently their company had better have been dispensed with. When a gentleman gave an entertainment, it was thought necessary that he should press the bottle as far as it could be made to go. A particularly good fellow would lock his outer-door, to prevent any guest of dyspeptic tendencies or sober inclinations from escaping. Some were so considerate as to provide shake-down beds for a general bivouac in a neighbouring apartment. When gentlemen were obliged to appear at assemblies where decency was enforced, they of course wore their best attire. This it was customary to change for something less liable to receive damage, ere going, as they usually did, to conclude the evening by a scene of conviviality. Drinking entered into everything. As Sir Alexander Boswell has observed—

'O'er draughts of wine the beau would moan his love,
'O'er draughts of wine the cit his bargain drove,
'O'er draughts of wine the writer penned the will,
And legal wisdom counselled o'er a gill.'

Then was the time when men, despising and neglecting the company of women, always so civilising in its influence, would yet half kill themselves with bumpers, in order, as the phrase went, to *save them*. Drinking to save the ladies is said to have originated with a catch-club, which issued tickets for gratuitous concerts. Many tickets with the names of ladies being prepared, one was taken up, and the name announced. Any member present was at liberty to toast the health of this lady in a bumper, and this insured her ticket being reserved for her use. If no one came forward to honour her name in this manner, the lady's chance was considered to be lost, and her ticket was thrown under the table. Whether from this origin or not, the practice is said to have ultimately had the following form. One gentleman would give out the name of some lady as the most beautiful object in creation, and, by way of attesting what he said, drink one bumper. Another champion would then enter the field, and offer to prove that a certain other lady, whom he named, was a great deal more beautiful than she just mentioned—supporting his assertion by drinking two bumpers. Then the other would rise up, declare this to be false, and, in proof of his original statement, as well as by way of turning the scale upon his opponent, drink four bumpers. Not deterred or repressed by this, the second man would reiterate, and conclude by drinking as much

as the challenger; who would again start up and drink eight bumpers; and so on, in geometrical progression, till one or other of the heroes fell under the table; when of course the fair Delia of the survivor was declared the queen supreme of beauty by all present. I have seen a sonnet addressed on the morning after such a scene of contention to the lady concerned, by the unsuccessful hero, whose brains appear to have been woefully muddled by the claret he had drunk in her behalf.

It was not merely in the evenings that taverns were then resorted to. There was a petty treat, called a 'meridian,' which no man of that day thought himself able to dispense with; and this was generally indulged in at a tavern. 'A cauld cock and a feather' was the metaphorical mode of calling for a glass of brandy and a bunch of raisins, which was the favourite regale of many. Others took a glass of whisky; some few a lunch. Scott very amusingly describes, from his own observation, the manner in which the affair of the meridian was gone about by the writers and clerks belonging to the Parliament House. 'If their proceedings were watched, they might be seen to turn fidgetty about the hour of noon, and exchange looks with each other from their separate desks, till at length some one of formal and dignified presence assumed the honour of leading the band; when away they went, threading the crowd like a string of wild-fowl, crossed the square or close, and following each other into the [John's] coffee-house, drank the meridian, which was placed ready at the bar. This they did day by day; and though they did not speak to each other, they seemed to attach a certain degree of sociability to performing the ceremony in company.'

All the shops in the town were then shut at eight o'clock; and from that hour till ten—when the drum of the Town-Guard announced at once a sort of license for the deluging of the streets with nuisances, and a warning of the inhabitants home to their beds—unrestrained scope was given to the delights of the table. No tradesman thought of going home to his family till after he had spent an hour or two at his club. This was universal and unfeeling. So lately as 1824, I knew something of an old-fashioned tradesman who nightly shut his shop at eight o'clock, and then adjourned with two old friends who called upon him at that hour to a quiet old public-house on the opposite side of the way, where they each drank precisely one bottle of Edinburgh ale, ate precisely one halfpenny roll, and got upon their legs precisely at the first stroke of ten o'clock.

SERVANTS' HALL IN A FRENCH CHATEAU.

BY AN ENGLISH OPERATIVE.

ONE bright morning during the present summer, I left Paris by the Orleans railway to visit a relative, living as nursery governess in the Château de Bretigny, some forty miles from the capital. The road passes through a pleasant country, now touching some sharp bend of the Seine, presently cutting across the slopes of a sunny vineyard, or skirting level corn-fields, and then passing within view of the solitary and famous ruin of the castle of Montlhéry, on a hill a mile to the right. The place of my destination is in a quiet rural district, about two miles from the station at which I left the train. On each side of the road, which was without hedges, stretched an uninterrupted succession of the little patches of cultivated ground so common in France, presenting a singular appearance to an English eye accustomed to see farms of five hundred or a thousand acres. In most of them, apple-trees were growing in the midst of the corn; and here and there the yellow expanse of wheat and barley was relieved by the patch of vines of some small proprietor. After passing through a dreary-looking village, I saw another equally unattractive in appearance about a mile beyond, above the thatched roofs of which rose the low square church tower. I walked

through the straggling streets of the latter without seeing any building that came up to my ideas of a château, and began to think I had mistaken the path, when, turning a corner, there stood before me at one side of the church a long low edifice of two storeys, possessing no pretensions whatever to architectural beauty or proportion, reminding one of the huge straggling inns in the south and west of England, ruined by the railway; once cheerful and busy, now weather-stained and melancholy. The windows, above as well as below, were protected by outside Venetian shutters, which, with the whole front of the building, were of a dingy white hue. The front door was to match, and in common with the windows, had rather the appearance of an accidental opening in the wall, than of an aperture designed for use. The house was separated from the road by a plot of grass, traversed by a rough sandy road that led to the door; and a few noble acacias rose high above the clumps of shrubs that bordered the road. The appearance of the building was so little in accordance with its name, that I inquired of a man who was passing if it were really the Château de Bretigny; and receiving an answer in the affirmative, I walked across the lawn, wondering at the absence of neatness and finish presenting so striking a contrast to country seats on this side the Channel.

The front door offered no means of communication with the interior; and I went to a side entrance which stood open, and passing along a passage running the whole length of the building, without meeting any one, knocked at a half-open door. 'Entrez,' said a voice; in obedience to which I entered the apartment, where a footman was preparing breakfast for the family. Having introduced myself, he replied, 'Ah, monsieur, madame votre cousine will be delighted to see you; you are the first friend that has called upon her from England in all the years she has lived here.' He ran away to summon her, while I looked round the apartment. The floor was of stone. In one corner, on a low shelf, was a knifeboard, on which the knives were being cleaned; a few chairs and stools, with seats of worsted-work, and one or two occasional tables, stood round by the walls of oaken wainscot; and the middle of the room was occupied by a round table, on which the preparations for breakfast were going on. No cups and saucers were to be seen; plates and knives and forks were placed for four; by the side of each plate stood a bottle of wine, a decanter of water, and a large drinking-glass. The eatables consisted of poultry, meat stewed with French beans, eggs, bread and butter, salad, and fruit. The polished panels of the walls were quite bare of pictures, and every other decoration, save muslin curtains to the windows, which looked out upon what I afterwards learned was called the 'Park;' but this also, notwithstanding its capabilities and fine trees, presented the same neglected appearance that I had remarked in front; similar to what we are accustomed to read of family establishments in Ireland. I was cogitating on the peculiarities which struck me, when Monsieur de Bretigny entered, and welcoming me to the château, expressed a hope that I should enjoy my visit. As he left the room, my cousin came in. After an interchange of the kind welcomes and warm wishes natural between relatives who meet for the first time, she led me away to the servants' hall to breakfast. It yet wanted an hour and a-half to the time of the morning meal for the household; but in consideration of my ride, some *café au lait*, such as can only be drunk in France, with bread, butter, and eggs, were placed before me. Monsieur de Bretigny himself brought me a bottle of wine, and a teaspoon and table-knife were fetched from the parlour for my use; nothing but large pewter-spoons and forks being allowed to the servants, who, when they eat eggs, use the flat end of the handles of these instruments, and at each meal produce large claspknives from their pocket. I was soon left alone, and at leisure to look about me. The room was of the most comfortable description: to all appearance the walls and ceiling had

not been whitewashed for a dozen years; there was no fireplace, and no means of warming it in winter; the window, a huge grated aperture, was placed so high, that only the tops of the trees were visible through it. Under the window stood a long narrow table, with a miscellaneous assemblage of seats on either side. A shallow tub, half-filled with water, and containing a number of bottles, stood under the opposite wall, serving as a cooler for the servants' wine—the allowance being a bottle for two days. At one end was fixed a stained and dingy dresser, on which were ranged a dozen or two of plates and dishes of the coarsest ware, a row of glass tumblers, and salt-cellar filled with gray salt. In consequence of the high tax upon the article in France, white salt is seldom seen on servants' tables, or in the houses of the poorer classes. When compared with the neat and comfortable arrangements at country seats in England, the difference was most striking.

Soon after the completion of my repast and my survey, a valet, or *domestique*, as they prefer to be called, came in to lay the cloth for the servants' breakfast—the hour for which, eleven o'clock, had arrived. The spoons, forks, and plates were quickly arranged; the bottles of wine, lifted from their bath, were duly marshalled; and then the bell was rung. First came the housekeeper or head-laundress, a good-humoured and portly dame, followed by the lady's-maid, the two men-servants, and the cook, a hale and hearty *garçon* of sixty-four, who had cooked all through Napoleon's campaigns in the service of one of his generals. The rear was brought up by an assistant laundress; a boy, whose chief business seemed to be to amuse himself; and last, my cousin, the governess. Cheerful salutations awaited me from all, as, with an interchange of lively *badinage*, they took their seats. The breakfast, of which I was only a spectator, comprised beef stewed with cabbage, some remains of cold meat, and a salad, with each one's portion of bread that had been taken from the closet beneath the dresser. The conversation, which never ceased, was intermingled with inquiries as to the mode in which servants live in England. As is usual throughout France, the most extravagant notions were entertained of the wealth of all classes on the British side of the Channel; and the inference was, that English servants were much better off than French servants. The chief topic, however, seemed to lie in the expression of regret at the absence of a joint of meat, with which to make a *roti* for dinner, and from which I was to have judged of the French *cuisine*. The butcher had brought meat early in the morning, but of so bad a quality, owing to the heat of the weather, that it was rejected. The cook started for the neighbouring village in quest of meat, but succeeded only in obtaining a few scraps of beef, which, however, as will afterwards appear, did good service.

Breakfast over, I walked about the grounds at the back of the house. At one side was an extensive plantation of oak, ash, and elm trees, through which many beautifully cool and shady paths led to a kiosk in one corner, commanding a view over the level fields in the neighbourhood, and of the hill on which stands the government telegraph, one of the series between Paris and Bordeaux. But the paths, though pleasant, were rough and overgrown with weeds, and the wood was suffering for want of thinning. At the opposite side of the grounds were large gardens, in which fruit, flowers, and vegetables were intermixed. I was at a loss to account for the want of order, the apparent non-appreciation of the beautiful in natural and artificial landscape, and the absence of a taste for rural pleasures. There were fertile grounds, an extensive estate, embracing many of the adjacent farms, ample wealth, but all deadened by the spirit of *laissez aller*. I afterwards found, however, that this is a characteristic of the châteaux of France. Among the plants that were new to me were two mallows: one similar in appearance to a standard rose, six feet high, growing with a tall straight stem; the other of the dwarf species, but with the pale-green leaves most exquisitely curled.

or *crispée*. The watering-pots, I observed, were all made of copper—a much more durable material than tin or zinc. One of them, the gardener informed me, he had himself used for thirty years; it had been in the service of his predecessor for a similar period, and he expected it to last the century. There was an abundant crop of melons, and every variety of fruit; but vegetables, constituting the chief food of the household, were most largely cultivated. The eye could not take in at one view the beds of sorrel, chickory, artichokes, cabbages, carrots, turnips, lettuce, and onions.

Seven o'clock struck while I was talking to the gardener: the bell rang for dinner; and the same party that had met to breakfast, assembled once more in the servants' hall. The cook still lamented the absence of *roti*: but he had made a delicious stew with his scraps of beef and various kinds of vegetables; and besides, there were a dish of new haricots with parsley sauce, a salad, and a large dish of currants, mixed with strawberries, for the dessert. On festival days, a better sort of wine than usual is allowed; and in honour of my visit, the *dame jeanne* (demi-john), filled to the neck, was placed upon the table. In the intervals of eating, the cook told us several amusing stories of his cooking campaigns under the Emperor in Germany and Spain, and twitted the under-domestique, who was from Brittany, on the uncouthness of his dialect. After dinner, I was conducted over the whole of the house: in addition to what I had already seen, there were the billiard and drawing rooms, the latter plainly furnished, and unprovided with any of those little elegant trifles which are considered the necessary complement of such apartments in England. Beyond these were the bath-room, and a boudoir, and other small apartments, occupied by the mother of Madame de Bretigny. I lost the pleasure of seeing these ladies, from their having gone to the coast for sea-bathing. In these little rooms there were several family portraits and books, chiefly of a religious character. Above were the sleeping apartments, the doors into which opened from the corridor that ran from one extremity of the building to the other. The whole of this upper floor was paved with hexagonal red tiles, polished with wax. The fitting-up of the bedrooms seemed to compensate for the nakedness below: they were furnished with well-filled bookcases, and a variety of furniture not usually seen in sleeping-rooms—ottomans, lounging-chairs, work-tables, &c.; and, as I was informed, the family pass most of their time in these apartments. There was not that variety of books which might have been expected, except in Monsieur de Bretigny's chamber. He had been an officer of engineers in Algiers, and had a selection of mathematical and philosophical works.

Once a-week the family spend a day at a neighbouring château. Friday is the fast-day; and on Sunday they attend the little church which stands half-hidden by the trees at the entrance of the grounds. This is the ordinary routine, interrupted occasionally by rides on horseback or drives in the family-coach into the neighbourhood, or by the arrival of visitors, and a residence of three months in the year, towards the end of the season, in Paris. During Lent, as my cousin informed me, she suffers so much from want of proper nourishment, as often to become seriously indisposed. It does not appear, however, that so much attention is paid to the real comfort of servants as in England. In France, they work harder, and have fewer intervals of repose, yet they seem to be lighter of heart, and to be more easily contented than their compeers in this country. At the château, the cook's wages are six hundred francs a-year: he prepares food, without any assistant, for the whole household; breakfast for the parlour at ten o'clock, for the servants at eleven; dinner for the parlour at five, for the servants at seven—two meals a-day being the rule, with a *gouter* or lunch in the interval. The servants may take their *gouter* when they please, from the portion of bread allotted to them. The head-footman (*premier domestique*) receives four hundred and fifty francs, with fifteen sous a-day additional during

the three months that he is with the family in Paris, and thirty francs for the annual cleaning of the house, which was going on at the time of my visit, in addition to which a New-Year's gift, a sort of retaining fee for good behaviour, the giving of which is general in France. Such servants, however, make themselves more generally useful than those of a similar class in England—they make the beds, and sweep and clean both the bed and sitting rooms. The one in question, it will be remembered, was cleaning knives on my arrival: in the winter, he assists the *second domestique* in bringing in firewood—a daily recurring and laborious task, as nothing but wood is burned in the large open fireplaces. The laundress is paid four hundred francs; she has the care of all the linen of the château, to keep it washed, repaired, and in perfect order—a post of some responsibility, as the linen in a French country-house is provided in the greatest abundance; so much so, that in some places they wash but twice in the year. At the château, washing-day comes once in two months. The washing is not done with hot water, as is considered essential in this country. On the day appointed, eighteen women come from the village, and carry the linen to the river, under the superintendence of Madame Leleu, the laundress. The first day's work is to *decrasser* (to loosen the dirt), which is done by dipping the linen into the river, rubbing with soap, and beating with a wooden instrument, similar in shape to a large battledore—a process which, although it may be destructive to the linen, has the effect of making it very clean. The second day's work is the *coulé*, in which the whole of the linen is soaked in water that has been passed through wood ashes. On the third day, the *rinçer*, or rinsing at the river, finishes the washing, when the whole is carefully dried, mended, and put away in the presses. The linen of the servants is included in this arrangement, and they are obliged to provide themselves with a sufficient quantity for proper cleanliness in the intervals of the wash.

The question often recurred to my mind, whether the contentment of the French arises from really moderate desires, or from a disposition to 'take it easy.' From what I saw in my rambles through the country, the latter seems to be the prevalent motive. It is, however, impossible not to be struck with the kind and conciliatory manner of the wealthy towards their dependents and inferiors in social privileges, from which a useful lesson might be learned. In the afternoon of the next day I took my departure to return to Paris, and received the *adieux* of the whole establishment, from Monsieur down to the garçon. I took off my hat to the housekeeper and lady's-maid, who were seated at an upper window; but a civil farewell was not in accordance with their notions. 'Attendez,' they said, 'nous allons descendre.' On coming down, the housekeeper continued, 'Ou ne part pas comme ça,' and presented each of her rosy cheeks in succession for a kiss: the lady's-maid followed her example: and with this characteristic adieu, I left the Château of Bretigny.

TURTLE CATCHING.

We are told by Pliny, in his Natural History, that the turtle is so large an animal, that its shell serves as a boat to the islanders of the Red Sea, and that a single one suffices for the roof of a dwelling-house. This, however, is not so enormous an exaggeration as one might suppose, since Dampier mentions a turtle that was four feet thick, and six feet from side to side. The shell of this magnificent animal was used as a boat, in which a child of nine or ten years of age embarked to join his father, who was then on board his ship, at a distance of a quarter of a mile. In 1752, a turtle was shipwrecked (supposing him to be his own vessel), and came on shore at Dieppe: he measured six feet long by four in width, and weighed nine quintals. Two years after, another animal of the same weight was captured in the Greek Archipelago, whose liver

sufficed for the abundant dinner of more than a hundred persons, while its fat weighed more than a hundred pounds. This creature, from a peculiarity in the flavour of its flesh, was supposed to have voyaged from South America, transported by the vast current which issues from the Gulf of Mexico, passes by the United States, and is even felt on the coasts of Great Britain.

There are four different species of marine turtle—the Green, the Hawk-billed, the Loggerhead, and the Trunk turtle. The first is the *aldermanic* turtle, well known to the epicures of the City; the second furnishes the article so valuable in commerce under the name of tortoise-shell; the third is a strong and fierce creature, which has been known to bite a thick walking-stick in two in an instant; the fourth is of an enormous size, and pouched like a pelican, and its shell and flesh are so soft, that 'one may push his finger into them,' as Audubon says, 'almost as into a lump of butter.'

The marine turtle inhabits the bottom of the sea, though probably at no great distance from the land, and there pastures, in these solitary depths, on algae and other sea-weeds. But in case of need, he is supposed to have recourse to animal food, being able to crush with his horny jaws the substance of fishes less monstrous than himself. He is not fond, apparently, of the flavour of fresh water, keeping at some distance from the mouths of rivers, except at a certain time of the year, when the eggs are to be buried in the sand. On this occasion the tribe seek the embouchure of the most considerable stream they can find, and there they are taken by their human enemies in the greatest numbers.

On nearing the shore, which is usually on a calm moonlight night, the turtle raises her head from the water to reconnoitre. If all is quiet, she emits a loud hissing sound, and landing upon the beach, creeps along the sand till she finds a feasible place. Here she again looks round, but this time in profound silence; and if convinced of her security, she sets to work to scoop out a hole in the sand with her hind-flippers, sometimes to the depth of more than two feet. The eggs are dropped one by one, it may be to the number of two hundred, and the loose sand then scraped over them in such a way, that a passer-by would not suspect the mystery. Although the eggs are deposited during the night, the turtle-hunters, when sure of the haunt, have little difficulty in falling in with stragglers, whom they have merely to turn on their backs, on which they lie helplessly till their captors have time to carry them off. This applies, however, only to the green species; for another kind, with rounder back, and more active movements, require to be anchored with a stone, if not killed on the spot.

A more wholesale mode of capture is to set nets in the water, with strong but wide meshes, along the place where they are expected to land; and when the animals are on their nightly journey to deposit their eggs, they are entangled by the head or paddles, and being thus prevented from rising to breathe, are drowned. The harpoon is a more sportsmanlike instrument of death. It has not the barb of the common harpoon; but when darted into the shell, when the victim rises to breathe, or is lying asleep on the surface, it remains fixed, like a nail driven into a board. A calm, still night is chosen for this purpose—the enemy having previously ascertained, by the fragments of sea-weeds scattered on the surface, the spot where their prey are peacefully pasturing beneath. The boat creeps to its work through the sluggish waters, with no other noise than the dip of the muffled oars; and the leader standing on the bow, harpoon in hand, and bending his eager eyes upon the water, makes signals how to steer, like the master of a steamer, without turning his head. A bubbling of the water by and by leads him to the spot where a turtle is about to rise; and as soon as the unhappy denizen of the deep, which cannot live without atmospheric air, shows himself above the surface, the iron messenger of fate flashes through the air, and quivers in his back.

Now commences a scene resembling, on a smaller scale, that presented by the struggles of a whale. The shaft of the harpoon is recovered by its thrower, and the point, which is attached by a rope to the bow of the boat, secures effectually the terrified animal, who, in his flight, may drag the whole cortège with him a considerable distance; but yields in the end, either dying of his wound, or suffocated in the water, from which he dares not, or cannot rise.

The following account, referring to these modes of fishing in Brazil, is given by Mr Edwards:—'The turtles are a still greater blessing to the dwellers upon the upper rivers. In the early part of the dry season these animals ascend the Amazon, probably from the sea, and assemble upon the sandy islands and beaches left dry by the retiring waters in the Japúra and other tributaries. They deposit their eggs in the sand, and at this season all the people, for hundreds of miles round about, resort to the river-banks as regularly as to a fair. The eggs are collected into montarias, or other proper receptacles, and broken. The oil floating upon the surface is skimmed off with the valves of the large shells found in the river, and is poured into pots, each holding about six gallons. It is computed that a turtle lays one hundred and fifty eggs in a season. Twelve thousand eggs make one pot of oil, and six thousand pots are annually sent from the most noted localities: consequently seventy-two millions of eggs are destroyed, which require four hundred and eighty thousand turtles to produce them. And yet but a small portion of the whole number of eggs are broken. When fifty days have expired, the young cover the ground, and march in millions to the water, where swarms of enemies more destructive than man await their coming. Every branch of the Amazon is resorted to, more or less, in the same manner; and the whole number of turtles is beyond all conjecture. Those upon the Madeira are little molested, on account of the unhealthiness of the locality in which they breed. They are said to be of a different and smaller variety from those upon the Amazon. We received a different variety still from the Branco, and there may be many more yet undistinguished. The turtles are turned upon their backs when found upon the shore, picked up at leisure, and carried to different places upon the river. Frequently they are kept the year round in pens properly constructed, and one such that we saw at Villa Nova contained nearly one hundred. During the summer months they constitute a great proportion of the food of the people; but when we consider their vast numbers, a long period must elapse before they sensibly diminish. Their average weight when taken is from fifty to seventy-five pounds, but many are much larger. Where they go after the breeding season no one knows, for they are never observed descending the river; but from below Pará, more or less are seen ascending every season. They are mostly caught at this time in the lakes of clear water which so plentifully skirt either shore, and generally are taken with lances or small harpoons as they are sleeping on the surface. But the Muras have a way of capturing them peculiar to themselves; shooting them with arrows from a little distance, the arrow being so elevated, that in falling, it strikes and penetrates the shell. In this, even long practice can scarcely make perfect; and fifty arrows may be shot at the unconscious sleeper before he is secured.'

The muscular power of the turtle is so great, that, when unwounded, he is a first-rate tug. A rather curious proof of this was received, in the year 1696, by a slave, who was fishing alone in his little canoe off the island of Martinique. The man fell in with an immense turtle lying fast asleep on the surface of the water; and conceiving that he had stumbled upon a prize, he drew near cautiously, and passed the boat's painter, with a running knot, round one of the creature's flippers. The sleeper awoke, and seeing something near him that was not an honest-looking turtle like himself, he took to flight, drawing canoe and man in his wake, without

seeming to feel that he had any burden at all. The slave was nothing daunted by a proceeding which he of course had expected, and he sat very quietly in the stern of his skiff, steering with his paddle, and hoping every now and then that the turtle was getting tired, or was near the drowning. But the courser, whose services he had thus treacherously impressed, was restive, and in one of his vagaries the canoe was capsized. This was too common an accident to be thought anything of; and after some trouble, he righted his boat, and took his seat in her as before, but with the loss of paddle, knife, fishing-lines—everything, in short, it had contained. Having now no paddle to steer with, he was at the mercy of circumstances, and the capsize occurred again, again, and again, the turtle always taking advantage of his fare being engaged in turning up the canoe to rest himself on the surface of the water, and get into wind for a new career.

On they skimmed along the liquid plain, till the sudden night of the tropics came down upon that desert sea, and the slave found himself whirling in the dark at the tail of what must now have seemed a marine demon. The sun rose again upon his fate, and seemed to lend fresh vigour to his ravisher. Fain would he have dispensed with the services he had of his own will enlisted; but without paddle, without knife, he felt himself even too happy in being able to cling to the boat at all. On, therefore, they hurried, on a journey that seemed to have no end, and which was diversified only by the occasional capsize of the canoe, and the simultaneous halt and refreshment of the turtle. Incredible as it may appear, the second night arrived, and was passed in the same manner; and it was not till the next morning that the animal exhibited symptoms of weariness and stupefaction, and allowed himself to be stranded on a shoal. The slave by this time was half dead with hunger, thirst, and fatigue; but yet he had energy enough left to kill his enemy, and feast on his spoils.

In Dr Lang's recent account of north-eastern Australia, we have the following description of the mode of capturing turtles in Moreton Bay:—'The greatest excitement prevails in hunting the turtle (for it can scarcely be called fishing), black natives being always of the party, and uniformly the principal performers. The deepest silence must prevail; and if the slightest noise is made by any European of the party, the natives, who assume the direction of affairs, frown the offender into silence. They are constantly looking all around them for the game, and their keen eye detects the turtle in the deep water when invisible to Europeans. Suddenly, and without intimation of any kind, one of them leaps over the gunwale of the boat, and dives down in the deep water between the oars, and perhaps, after an interval of three minutes, reappears on the surface with a large turtle. As soon as he appears with his prey, three or four other black fellows leap overboard to his assistance, and the helpless creature is immediately transferred into the boat. A black fellow has in this way not unfrequently brought up a turtle weighing five hundredweight. Great personal courage, as well as great agility, is required in this hazardous employment, the black fellows being frequently wounded by the powerful stroke of the animal's flippers.'

In the Indian Ocean, the plan is somewhat different. When Mr Darwin visited Keeling, one of the lagoon islands of coral formation, he had an opportunity of witnessing the sport, which appears to afford a still more picturesque and exciting scene. 'The shallow, clear, and still water of the lagoon,' he tells us, 'resting in its greater part on white sand, is, when illumined by a vertical sun, of the most vivid green.' It is girdled round by a line of snow-white breakers from the darkly-heaving waters of the ocean; while the strips of land, forming the island circle, are crowned by the level tops of the cocoa-nut trees. On the inner side of the circle, a white calcareous beach slopes into the lagoon, contrasting strangely with the rocky coast without, that

receives the ceaseless roll of the sea—as strangely as the lagoon itself with that wild and seemingly illimitable ocean in the midst of which it sleeps so tranquilly. The channels that lead from the sea into the lagoon are frequented by turtles, and are so clear, and comparatively so shallow, that the white sand at the bottom is distinctly visible. When the animal, therefore, dives on seeing its pursuers, the latter have no difficulty in ascertaining the spot where it will reappear to breathe; and a native, standing on the bow of the boat, watches eagerly the event, stooping forward over the water like a bird of prey.

Presently, the huge creature, which cannot live in the element where he has his being, rises to the surface in search of vital air; and on the instant, the hunter springs from the boat, dashes upon the back of his prey, and clasps his arms round his neck. Away goes the terrified turtle, ridden by this man of the sea. He cannot sink, or there would soon be an end of the contest. His head, in the steady grasp of his enemy, is directed upwards; and away therefore he rushes, over the clear smooth surface of the water—over the white sands below where he had lain so lately basking in the light—over his algae fields where he was wont to browse in peace and happiness. And away with him goes the rider, rejoicing in the race of which he knows the issue, and yelling with excitement caught from the motion, the clear air, the waving woods, the azure sky, the cool water, as green and bright as liquid emerald. But by degrees the animal becomes more and more feeble. Unable to contend with the unimaginable fate that has befallen him, he knows not why or how, he at length ceases to fly, and lies like a log upon the sea, and in due time is transferred to the boat, which has followed tranquilly their headlong career.

Such are the various modes of capturing turtles. We little think, when seeing a porter staggering along the streets of London with one of those ponderous, lazy-looking creatures on his shoulders—and still less, when quietly indulging in a plate of turtle-soup, with a bottle of iced-punch by our side—of the history of wild vicissitude and romantic adventure therewith connected!

CURIOSITIES OF ARITHMETIC.

AN eastern prince was so much delighted with the game of chess, which had been devised for his amusement, that he desired the inventor to name his own reward. The philosopher, however, was too modest to seize the opportunity of enriching himself: he merely begged of his royal master a grain of corn for each square on the chess table, doubling the number in proceeding from the first to the sixty-fourth square. The king, honouring his moderation, made no scruple of consenting to the demand; but on his treasurer making the necessary calculations, he was somewhat surprised to find that he had engaged to give away the impossible quantity of 87,076,425,546,692,656 grains of corn, equal to the whole contained in 16,384 towns, each having 1024 granaries of 174,762 measures each consisting of 32,768 grains.

The story of the horse-shoe is of the same kind, and, like the above, is usually met with in books of scientific recreation. A man selling a fine horse is to receive for it nothing more than the value of the twenty-fourth nail of the animal's shoes, supposing that the first nail is worth a farthing, the second two, and so on, doubling each time. The bargain is a tolerably good one, since the twenty-fourth nail at this rate proves to be worth £17,000.

Suppose that of all the prodigious number of eggs in a female herring, only 2000 come to maturity, and that each of them in its turn gives birth to the same number, half males, and half females. In the second year, we should have a family of 12,000,000; in the third, of 2,000,000,000; and in the eighth, the number would be expressed by the figure 2 followed by 24 ciphers. This number of herrings would not find room even if the

earth were turned into a globe of water, as its whole volume would furnish only about a square inch for each fish.

A sprig of henbane sometimes produces 50,000 grains; but if we take the average at 10,000, the number of sprigs in the eighth generation would be expressed by 1 followed by 16 ciphers. At this rate, it would take nearly the entire surface of the globe to contain all the henbane produced from a single plant in four years.

A sum of money invested at five per cent. compound interest, is doubled in fourteen years and some months, quadrupled in less than thirty years, octupled in less than forty-five years, and so on. From this it would appear that if a centime had been placed out at such interest, *pro bono publico*, in the year 800, when Charlemagne was crowned Emperor of the West, the 30,000,000 Frenchmen inhabiting the country at the revolution in 1830 would have enjoyed an income of 100,000,000,000 francs. Such arithmetically true, but economically impossible results of old deposits, are made the groundwork of some works of fiction; but writers of another class are obliged to attend to the obvious fact, that in order to effect such accumulation of capital, the business of the bankers and the wealth of the community would require to increase in the same proportion. Money does not breed spontaneously. The party to whom it is intrusted must use his funds in such a way as to enable him not only to pay the interest, but to derive a profit from the transaction.

A hundred pebbles were arranged in line, six feet apart, with a basket six feet ahead of the first pebble, in which a man, for a wager, was to place the stones one by one, in as little time as his comrade would take to walk from the Luxembourg to the château of Meudon and back again. The distance between these two points is 30,300 yards, or 60,600 going and returning; and this is the exact distance the stone-gatherer would have to walk by making a separate journey from the basket for each of his pebbles. But the latter would not only have to walk, but to stoop and rise again a hundred times; and, in effect, so great a hindrance was this, that he had only deposited his eighty-fifth stone by the time the other had completed his task.

The population of the globe is supposed to be under a thousand millions, or, according to M. Hassel, 937,855,000. If, then, says a French writer, all mankind were collected in one place, every four individuals occupying a square metre, the whole might be contained in a field ten miles square. Thus, generally speaking, the population of a country might be packed, without much squeezing, in its capital. But the mean idea this gives us of the number of the human race, is counterbalanced by its capability of extension. The new world is said to contain of productive land 4,000,000 square miles of middling quality, each capable of supporting two hundred inhabitants; and 6,000,000 of a better quality, capable of supporting five hundred persons. According to this calculation, the population of the new world, as peace and civilisation advance, may attain to the extent of 4,000,000,000. If we suppose the surface of the old world to be double that of America (and notwithstanding the comparative poverty of the land, this calculation may be accepted, if we say nothing of Australia and the various archipelagos), it would support 8,000,000,000; and thus the aggregate population of the entire globe might amount to 12,000,000,000, or twelve times the present number.

How many curious speculations suggest themselves here! What space will it take for the inhabitants of the earth to increase to twelve times their present number? Will such increase ever take place? Supposing the epoch to approach when 'the table is full,' what will be the condition of the then races of mankind? In what way, through what proximate causes, will the number of births adjust themselves to the number of deaths? Will war be once more resuscitated from the ashes of ages—for war must have been dead, to admit of the completion of the ranks of the species? Will

hatred, want, misery, follow as usual the footsteps of the destroyer, and the earth swallow up the children which her uncalculating instincts have produced?

But it is folly to perplex ourselves with inquiries upon subjects which are obviously beyond the grasp of the intellect. All we know with certainty is, that the human world has gone on for at least four thousand years, without attaining to more than one-twelfth part of its possible extent. Our knowledge is limited, and must always be so. Not to talk of the interior of the earth, which we can learn but little about from hammering upon its crust, we are each individually ignorant even of our fellow-beings on the surface. One of us may know something of plants, another something of insects, and so on; but the mind does not exist which is able to comprehend the organic world in its entirety. It is said that there are 100,000 species of vegetables, five or six times that number of insects, about 1200 of quadrupeds, 6800 of birds, and 1500 of reptiles. The sea we know almost as little about as we do of the interior of the earth; but as its bottom is at least double the extent of the surface of our continents and islands, we may roughly take the number of its species, animal and vegetable, as equal to that of the species which require atmospheric air. As for the microscopic world, there we are entirely lost; but in all probability it is as rich in species as the world that is cognisable to our ordinary senses. But if we take the entire number of species of organised beings at only 2,000,000, what human intellect is capable of studying them to any purpose? If a man gave himself up to the task as the business of his life, attending to the examination of each species but one minute, and working incessantly during ten hours in the day, he would not accomplish the cursory unreflecting survey in less than twenty years! These considerations should at least teach us humility; and for the rest, we may safely trust in the Creator of these unspeakable wonders, that His almighty hand will sustain the work which His omniscient wisdom conceived, and that the same power which originated the plan, will extend to its consummation.

THE WAKE OF THE ABSENT.

THU a dismal yew and cypress tall
Wave o'er the churchyard lone,
Where rest our friends and fathers all
Beneath the funeral stone.
In holy ground our kindred sleep—
Oh, early lost! o'er thee
No sorrowing friend shall ever weep,
No stranger bend the knee.
Mo chuma, lorn am I!
Hoarse dashing rolls the salt-sea wave
Over our perished darling's grave.

The winds, the sullen deep that tore,
His death-song chanted loud—
The weeds that line the cliffed shore
Were all his burial shroud.
Nor friendly wail and holy dirge,
And long lament of love;
Around him roared the angry surge,
The curlew screamed above;
Mo chuma, lorn am I!
My grief would turn to rapture now,
Could I but touch that pallid brow.

The stream-borne bubbles soonest burst
That earliest left the source—
The earliest buds are faded first
In nature's wonted course.
With guarded pace her seasons creep,
By slow decay expire;
The young alone the aged weep,
The son alone the sire.

Mo chuma, lorn am I
That death a backward course should hold,
To smite the young, and spare the old!

THE TENANT-RIGHT.

AN IRISH STORY.

BY MRS S. C. HALL.

'Sir, I advocate the tenant-right.'—*The Candidate.*

'You have a fine time of it among the quality, there's no denying it,' said Mary Connor to her foster-sister, Grace Kenny. 'You have, miss, a fine time of it; and why not? Sure it's your birthright, dear. You have as much right to the carriage as I have to the piggan,' she continued, lifting it up from the ground with a cheerful smile, and poising it upon her head with the grace of a Grecian nymph.

'But, Mary, why do you not come up to the big house, and be my own maid? My dear uncle lets me do just as I like. I might have twenty own maids if I wished. Bell will soon go away to be married; so do, Mary, come; surely I have a right to my foster-sister?'

'Every right in life, dear; next to my grandmother.'

'And, Phil——' added the young lady; 'but indeed, Mary, Phil is not worthy of you. My uncle says his land is very bad.'

'His honour could mighty aisy give him better,' replied the maiden; 'but that's nothing against Phil that I can see, though it may be against the land. Still, miss, dear, don't be evenin' Phil or any one else to me. I've plenty of time, and things will mend; it's a long lane that has no turning.'

Miss Kenny bade her foster-sister good-morning.

Mary Connor had a great deal of native grace and dignity in her carriage and manner; she was fully and beautifully formed, and her dark hair and eyes, combined with delicate features, spoke of her southern origin. She was, so to say, more ladylike than Grace—a laughing, mischievous, blue-eyed, round-nosed little person—but whose attractions were pronounced 'surpassing,' under the influence of ten thousand pounds. Not one in possession, and nine in prospective, but ten thousand in actual cash. Grace drove on, humming, 'My heart's my own;' while Mary, more thoughtful, walked slowly along the mountain-path that skirted Philip Boyle's farm. She was going for 'spring water' to the hill well; but instead of drawing the water at once when she arrived there, she set the piggan on the wall, and leaning against it, held the gate open with her hand.

'Is it for me you're waiting on the gate, darling?' exclaimed Philip joyfully, while he pressed her to his heart. 'Sure I'd have soon opened it, and you on the other side!'

'I like to meet you here,' she replied frankly and innocently. 'I like to meet you here, in the view of those old grand hills, and beside this well, where so many in old times got the sight of their eyes, and the

use of their limbs: it must be a holy place, for all that to be done in it.'

'I'm sure of that, Mary; and moreover and above, I've a way of thinking every place you are in to be holy.'

'I wonder did Miss Grace ever hear a purtier speech than that in her beautiful drawing-room?' said Mary laughing. 'But, Philip, what I wanted to talk to you about is the bit of land.'

The expression of Philip's face changed in a moment. 'It's sad to say it, Mary; but without help from the landlord, I can make no hand of the farm. I was a fool to take it; nothing but weed and shingle.'

'Can't you get a better? There's lands changing hands now.'

'No; it's as much as life's worth to take the bit of land from a poor man when there's not another bit to be had. It's like taking the breath out of his body. All the murder is about the bit of land, and hundreds upon hundreds of acres lying idle, darling. I don't mean barren rock, and deep bog, and bleak mountain, though something could be done with all of them if the landlords either *would* help or *could* help; but available land, that they can't cultivate themselves, and wont let any one else touch, except at a price they can't pay—creating the misery and starvation they complain of. Look at it one way or the other way, they're bad sort of landlords for a poor fellow to have anything to do with.'

'Miss Grace is very kind,' said Mary; 'she's always after me to go to the big house as her own maid.'

'You'll do no such thing, my Mary,' said her lover. 'Service is honourable and honest. I got rid of all my old ancient pride and prejudice at the Agricultural School; but there's no need for it. My heart's own darling!—I'll tell you what you'll do. I've got this blessed day a legacy of a hundred pounds!'

'A real whole hundred pounds!' repeated Mary in a tone of great delight, and blushing; for she guessed what would follow.

'Yes I have; and, darling, I'll *speak to the priest this evening*. I'll give up the farm: better do that than throw good money after what's gone. We'll pack up your grandmother, and go off to America.'

Mary turned pale. She had drawn water from that well ever since she could carry a noggin: she knew every mountain by name: every path, every flower, had a place in her abundant affections.

'Don't you think, Philip,' she said, 'it would be more like an Irishman to stick to your own country, and lay out your money in it, than in a land of strangers?'

'I love every blade of the sod,' he answered; 'God knows it; but as Ireland is managed, it hardly finds graves for the dead, much less food for the living!'

'As much as she is let to do, Philip; but if you, and the likes of you, with life and means, leave her, it's

worse she'll get instead of better. There's nothing staying on the next townland but creatures that haven't the passage-money to leave it. It's heaped up alive with beggars it is.'

'And so every spot of the island will be, unless we can have the bit of land at a paying price; unless the landlords here will do like the landlords elsewhere—give *tenant's right to tenant's labour*, and encourage the willing workman. I tell you how it is: my grandfather had no education; my father only a little; but I have had enough to make me discontented with the law—not so much of the land, but of the land's-lord.'

Mary did not understand this, but she knew Philip was a 'fine scholar.' She believed all he said was right; but her affections were with her own country. 'Philip,' she said, 'I will go to Miss Grace, and get her to speak for us—for you, I mean—and ask him to make an abatement in the rent, and help you to build a slated house. He's one that would always do more for interest than for justice; and if he thought you'd lay out the hundred pounds upon it'—

'You'll be a good farmer's wife, Mary, though you're a bad farmer,' said her lover. 'No, darling, it's no use; the land I've paid two guineas an acre for isn't worth five shillings. If indeed he'd let me, and half-a-dozen like me, the strip he once talked of, that's of no use in life to him but as a cover for game, then I'd be talking to him; but he won't, darling. It's hereafter Mr Kenny, and such as Mr Kenny, will be mourning, when they find the heart's blood, the bone and sinew of the country, has left it, and with nothing to the fore but those who had neither health, nor wealth, nor a good name to carry them where a man can have a fair day's wages for a fair day's work. Let us go, *avounneen deilish*, before poverty draws the marrow out of our bones; before we're wasted by fever or famine; before the carelessness—and it's more carelessness than cruelty that does it—of Mr Kenny makes me have a call to the combination, which I'd be long sorry for afterwards! I've clean hands now, thank God! of everything going, and a light heart, and strong limbs, and a dear little colleen that will make me a country wherever I go.'

Mary laughed and cried by turns. Philip was esteemed the handsomest and 'best learned' boy in the parish. She was an orphan girl, with the burden of an old grandmother, so wise, that in former times she would have been esteemed a witch or a fairy-woman. Certainly Miss Grace was her foster-sister, *that was* a great deal: but Philip might have had any girl he pleased long ago; and yet now, when a hundred pounds were added to his charms, he generously offered to marry her, and take her dear old grandmother with them to the new world.

'The new world!' What an *El Dorado* it was to poor Mary! and what an enormous sum that hundred pounds appeared; what ever should they do with it! The mountains whirled round during her homeward walk, and she hardly knew how to communicate the news to the feeble old woman, who sat within the chimney watching the boiling of the potatoes, and churning an old ditty to the monotonous accompaniment of her wheel. Mary was reproved for her long delay, but she did not mind that. The old dog put his cold nose on her foot, and a pang shot through her heart when she thought what should they do with the dog; but as Philip had so much money, perhaps they could take him also to America—that is, supposing they went—which they would be sure not to do, because Mr Kenny would not part with Philip: he would certainly let him

have a long lease of a good farm on his own terms: he never could part with Philip. Still, she would tell her grandmother: the old woman heard her to the end.

'Mary, *ma bouchal!*' she said, 'don't be feeding your heart, dear, with false music. Mr Kenny will do no such thing as you think—not he: he takes pride out of his wide domain and his fat cattle rather than out of a comfortable tenantry; and so did his father before him: it's a way the gentry have got of thinking, that it's grand to have a deal of waste land about their houses; and rather than get enough out of it to pay their debts (as they might easy do), they send their natural body-guard to foreign parts, where, I am tould, after much hard work, they are nearly as well off as, if they war well managed, they'd be in their own natural country. This is all well enough for the young; but, jewel Mary! the fox loves his ould earth, and the crow her ould nest. Go with him who loves you, Mary, and who proves his love; but I'll lay my bones in my own land, among my own people, beside your sweet mother, Mary, and my own ould husband. I'd just like to rise with them on the last day. I'd be lonely in my coffin, darling, if I wasn't under the same sod. My blessing will be about you all alike; it will come to you over the sea, jewel, every morning, on the first sunbeam, fresh and fasting—your ould granny's blessing! I'll never cross your good-luck, my blessed, blessed child!'

'Do you mind when my mother was dying?' inquired Mary.

'Do I mind the heavy trouble of my own heart?' was the reply.

'If you wish your mother's blessing to light you into Paradise,' she said, 'never leave your grandmother.' I'm not going to deny what God, who sees my heart, knows, that I love the very ground that Philip walks on. I have known him ever since I knew night from day. When I was too little to cross the brook going to school, *his* were the hands that carried me over: he would leave his place, the top of the top form, and hear me my A B C: for all that, my own dear only mother, and for twice as much as that, I'll never, never leave you—I'll do my best to keep Philip here.'

'Stop, Mary, and hear the wisdom of the white head: look at the thing both ways—for your own feelings, and against your own feelings. If you want to see a thing straight, *never sit always on the same side of the car*. I see a deal: the gentry, to put away some of the sin of neglecting their own people, have been setting the country a-fire with education, and now they wonder at its burning; they are giving the young knowledge, without the power to use it, and expect that when a man knows how to earn the bit of meat, and the cut of white bread, and where to earn it, he'll be as well content to stay with them on the *ould terms*, with the poor potato, and the fever, and the same sort of right a dog has to his kennel, and a pig to his sty, to repay him for the labour of building what is little else than his own grave. Darling, look, the sense of it is this: such as Squire Kenny want to keep on in the ould way—but the people have got before them; and so to get rid of the bother, they'll let them get out of the country. Don't gainsay Philip, dear; he'll never be content to go on with Squire Kenny on the ould plan, and, like many another, he'll get into trouble if he stays. The ould and the infant will stop in the place; but the law must change for the better, in more ways than one, before Ireland will be the home of the strong-headed, strong-

armed, educated peasant! But you're not heeding me, Mary, honey?

'I'd never forgive myself if, through staying for my sake, he got into any trouble,' said Mary; 'and it's hard to miss the face that smiled over my cradle.'

'Go with him, darling; every girl in the place will mind your ould granny, if it was only for your sake.'

'No, I'll never leave you: but where's the use of fretting, maybe he wout go?'

'Then he ought to go,' said the old woman firmly. 'Squire Kenny is not the right sort of landlord for such as he.'

That evening Mary went up to the big house, and craved audience of the young lady. Grace heard all she had to say with patience and sympathy.

'My uncle told me the other day,' she said, 'that if Philip chose to leave the farm, bad as it is, he could let it immediately at an increased rent.'

'There are some will take land whether they can pay for it or not,' answered Mary; 'but all I wanted to tell his honour is this, that maybe, as Philip was the son of an old tenant, and had improved so much, he'd let him have a few acres of fair land at a fair value. I want him to stop in the country; for indeed if he goes, the squire will lose an improving tenant.'

'And you a sweetheart.'

'No, miss, I would not,' replied Mary with her natural simplicity; 'the seas would be between us, to be sure, but we would be all the same, true to each other; and we're both young.'

Miss Grace promised to speak to her uncle, and to present both Philip and Mary to him the next morning, and let them tell their own tale.

Mr Kenny was the type of many of his class. That there are as good landlords in Ireland as in England, is unquestionably true; but, alas! they form the exceptions to the rule! There is no doubt that, though an educated people will exhibit less brute violence than a people uneducated, yet they will be more determined to obtain what their reason teaches them they have a right to possess. Mr Kenny never took into consideration the mental change that had been wrought in more persons than in Philip; nor could he, for the life of him, discover why the people were not as contented as they had been when he was a young man. Thinking this over, as he generally did after dinner, when he had drank a few tumblers of 'stiff punch,' he was not very likely to understand how such alterations were to be comprehended and met.

He was a careless man at all times, and in everything; good-natured and hospitable; always more ready to give a present than to pay a debt. In all things he belonged to the 'old school.'

Grace had been rather unfortunate in her diplomacy. She had lost her temper in the morning, and hardly recovered it during breakfast; but she trusted to Mary. Mary was a great favourite with the old squire, and she hoped her gentle smile would do more for Philip than Philip's eloquence would do for himself.

'So,' said Mr Kenny, 'you want more land, Philip?'

'If your honour would let me two or three acres of the fence farm at the same rate I have the hill ground, I'd work them well together; for I never was a gale behind with the rent for that barren place, where the crows don't think it worth their while to look for worms.'

'And in the fence farm, your honour,' put in Mary, 'my grandmother says there'd be pasture for a cow, or maybe two.'

'That land is worth five pounds an acre if it is worth a farthing,' said the squire; 'and I must get that for it, if I break it into small holdings.'

'I couldn't pay that for it, sir, at the best of times, and make anything by it to live,' answered Philip. 'I'd like to stop in the country if I could, your honour. If I can't, why, I must go where others have gone before me. I don't want to spend all my life labouring for potatoes and salt, and being as poor at the end as I was at the beginning of my days.'

'As good as you have been glad of that same, Philip; and what can a poor man want more? But I've a regard for you, and for my little friend there, whom it concerns; so, if you like three acres of the fence farm put on to the five on the hill, you can have it all round for three pounds an acre.'

'Is it three pounds an acre, sir, for what every man in the parish knows I have never cleared two for yet? only spent every farthing of the little my uncle the priest left in making it what it is. The day I took on me the three acres, in addition to what my father made, I may say, himself, there wasn't a fence that would keep out a bonneen, let alone a pig; not a gate, nor a drain; and I'm sure you might have counted the blades of the two first crops. I hope your honour will think of that before you put another pound on them acres.'

'But haven't I taken two pounds a-year off the fence farm?'

'To put it on the other, sir.'

'I don't want to let it,' said Mr Kenny; 'it's only out of regard to you I'd break my land at all. If you don't like my offer, stay as you are: or stop; I'll do this for you—pay me, say two pounds for the eight acres all round.'

Mary's heart beat, and Philip coloured.

'Two pounds for the eight acres all round,' continued Mr Kenny, 'and let the third pound stand over for three years or so, till you're better able to pay it.'

Mary's heart beat on, but Philip's countenance changed. 'Thank your honour,' he answered, 'but that would be getting into debt; yet maybe you'd give me a bit of a memorandum, if I left the place, you'd pay me for what I'd put upon it—a shed, or gates, or pigsties, or'—

'Whew—w—w!' interrupted the landlord; 'you're getting newfangled notions with a vengeance! It's the *tenant-right* you're after, is it? If you do not like my offer, stay as you are.'

'I can't do that either, your honour. I can't go on slaving the life out of my four bones for the bare bit I eat. If I hadn't means to go elsewhere, I must do it: if I hadn't education, I must do it; if'—

The landlord interrupted him by sending all species of education to the *bad* place, and cursing him for an ungrateful fellow, for thinking of taking his money away from the sod 'where he was bred, born, and reared.' 'But I do not care a farthing about it for my own sake; give me back the land, and you may go to the —! I can soon get tenants, and increased rent!'

'Your honour will get tenants enough: there's plenty would take on the running gale, and be glad to wear out the improvements I have made. I'll be heart-sorry to leave it,' he added, rubbing his hand round the edge of his hat, while poor Mary grew pale; 'but your honour wout lay out a penny with me on it, nor give me the *tenant's-right* over what I do. I've wattled and thatched the house, I've mended the windows, I've fenced the little garden, I've planted trees, I've drained, and manured'—

'And who asked you to do it?' inquired the landlord tauntingly. 'You're newfangled with green crops, and one thing or another, and not content to go on as your father did before you—*plain and easy*, honest man.'

'I am not content, sir, sure enough, to go on as my father did before me,' he replied; 'I own to that. I saw him go down as worn and strengthless to his grave at fifty, as a man ought, that had fair play in the world, at seventy—a fine, hale, hearty man he was, but worn out by hard work and fainting food'—

'And whisky,' added Mr Kenny.

'That had its claw on him too, I'll not deny it, sir: it seemed an easy way for a man to put the trouble off him, and then, like a false friend, it was sure to bring him into more; but that reproach is gone from us, sir, thank God! There's none gets drunk at all now, *barring the gentlemen!*'—The bolt was shot, and it was drawn by an impatient and impolitic hand; but, as Philip afterwards said to Mary, he could not stand that

reproach to his father from one who never remembered going quite himself sober to bed.

Mary put in her gentle voice, but too late: the crisis had come; angry words followed; Philip threw up the farm. 'In other countries,' he said, 'where a tenant's labour creates a tenant's right, you'd be forced, sir, to pay me back for the stock I leave you on it. Here I can't claim it, and I'd scorn to ask for what I've no call to. I took that land with the intention of giving, as I have done, my strength to it; and there it is, all the better, while I'm all the worse. The cow and the horse both died with me, and yet you'd give me no help; and if it hadn't been for the goodness of God, which sent me help to leave it, I'd have been tied to it in slavery for the rest of my days. If I had had it at a low but increasing rent, I might have made a home of it for myself, and a property for you. I'm clear of it now. You may get those on it who won't leave it as I have done; that's all I can say. I need not tell a gentleman of this country of the bad that's going, of the impossibility there is for him to know who has or has not to do with what is, I own, a disgrace to the people; but I do say, that when a gentleman finds an honest, hardworking man, who is able and willing to do justice to the bit of land, he ought to give him an honest man's hold upon it.'

'Don't vex the master; he's not used to be crossed that way,' whispered Mary.

'Let him go on,' said the angry squire; 'give him rope enough, and he'll soon hang himself!'

'Please God I will not, sir: there's enough said; you'll all wake up some day and see the land left without able-bodied honest men to till it; you'll cry out then in vain for those who have earned, and can keep, land of their own over the seas, to come and help yours to bring forth its fruits. God be with you, sir! I thought to have had some consideration from you, and not be forced to turn my back on my country.'

'Have nothing to do with him, Mary,' said Mr Kenny. 'I know a smart fellow to come in on his place: let him go!—a *colleen-das* like you has no call to leave her own country for a sweetheart—let him go!'

Philip became dark with rage. Mary tried to reply, but she could not; she burst into tears, and followed her lover out of the room.

As they descended the brow of the hill, the sunbeams were sporting over the very small farm Philip was about to resign for ever; even the sunshine failed to make it look prosperous. He had really done a great deal to it: it was tolerably fenced and drained, and additional time and additional labour would of course increase its value; but Philip knew that even then it would never be prosperous, nor would what he had done meet with consideration, much less justice. Moreover, he was a peace-loving man, and he feared being drawn into the combinations which have so completely baffled all the investigations of the law.

'It's cruel hard,' sobbed Mary, 'that he won't allow you a penny for what you've done; he'll get a higher rent from some that will never pay.'

Mary and Philip were unconscious of the blunder; but they understood the meaning. Mary saw that Philip was suffering; but he brightened his countenance, and talked of the 'hereafter,' urging her to go with him at once, and that he thought her grandmother would accompany them; but she knew better, and revered the feeling which caused the old woman to desire to leave her bones in her native land.

All the country cried shame on Mr Kenny. This was the fifth of the 'good odd stock' that he had let leave the place; and who had he got in their stead? That question remained to be answered.

Philip was a good specimen of what an improved education can effect for the Irish peasant. He felt that, however humble his position, as a man, he had a right to exert his strength, mental and bodily, for his own advantage; however much his feelings yearned towards 'the sod,' he knew that his little capital could be more advantageously employed elsewhere: not but that Ire-

land possessed every advantage that could be had elsewhere; but *free agency* was so completely a sound, and not a reality, that a humble, peace-loving, unalavish man, at all events in his district, had no chance of having a firmer hold on the *property he helped to make*, than had others of the property they helped to mar. 'Better times,' he was told, were coming; but as in his father's days they had not come, except, indeed, through the door so tardily opened by 'national education,' there was something to his healthy, self-thinking mind, even in this infancy of knowledge, very pleasant and independent in the idea that he might yet call a plot of *land—land!* that *Alpha and Omega* of Irish ambition!—his own.

There were far-away districts where such an advantage might in a degree be his; but his attachments were localised; they circled round the settlement of 'his own people;' and as Mr Kenny's short-sighted policy refused his honest and liberal offer, the cord was sundered, and he only desired to leave it as soon as possible. Mary was not the only one who regretted this determination on Philip's part. The young man, had he remained, would have found life itself unsafe, if he had not yielded to the influence of self-organised lawmakers; and this reconciled Mary to his departure, hard as it was to part with her betrothed.

'I thought to the last,' she said, 'the masher would come round; but I see he won't now; I see the hardness of his heart. He thinks poverty and misery is our birthright, and that we have no reason to go against it; that's what he thinks. He has looked so long at starvation, that he's grown used to it; and he'd think there'd be something going wrong, if he had no beggars on the road.'

'You're book-sworn, Mary,' interrupted her lover—'you're book-sworn to let me know when any change comes to your grandmother. In the sight of God you are my wife, and you mustn't think bad of any little present I send you home, because you'll want it all; and deny yourself nothing, avourneen. I'll wait true and patiently for you, jewel; and hard as the parting is, I'll not deny but I love you all the better for your duty to your parent; besides, I'll have all things settled for you, and maybe come home for you myself. The black poverty can't touch you, Mary; and don't go the path by the hill farm, when you go to see Miss Grace; it would only fret you, darling; but set a stout heart to the wind. I'm going out like an honest man; I owe nothing; and I shouldn't be ashamed to look a king in the face.'

This was all very brave; and, what was better, it was very true; but it could not prevent the mingling of many tears; and none flowed more abundantly than those of the poor old grandmother.

'I've seen fine heads laid low, and buried many a one years younger than myself, yet I'm to the fore still, and no good in me, Mary, darling!—only you're such an angel, I should think you wished the grave closed over me: but the great comfort of my life is thinking how we'll all rise together at the last day; and I couldn't leave the sight of the ould churchyard; I could not, avourneen.'

'And I could not leave you, darling grandmother,' was the reply; and after Philip's departure, Mary redoubled her attention to the aged woman, and did more in an hour than she need have done in a day; 'the work,' she said, 'kept the trouble off her heart.'

'Do anything but sing, my darling!' exclaimed her grandmother—'anything but sing! There's a sigh in your voice like the moan of the wind in a fir-tree, which makes me pray to God to hasten my journey, that you may be happy when I am gone.'

'So you are off, Philip, I suppose?' said Mr Kenny, as he met the emigrant on his road to Waterford.

The young man looked up courageously. 'I am, sir; and for all my hot words, sir, I've a kind heart to you and yours; and if I said anything that my father's son should not have said to your father's son, I hope your

honour will overlook it. It did not come from the heart, only from the necessity of the case; that was all, your honour.'

'I believe you,' was the gentleman's reply; 'but if you look at it, Philip, it is rather strange for such as you to take a hundred pounds, as I hear you do, away from your country and your natural protector, to employ it upon you know not what.'

'I know anyhow, sir, that if I stayed, I should employ it on what would never be my own. It's done now, and God be with your honour. See, sir'—and he laid his hand on the shoulder of the beautiful horse Mr Kenny rode—'I may never set eyes on you again; but take care who you let in on the land—promises grow no gold.' His voice faltered; his eyes filled with tears; he took off his hat, and held out his hand to the squire; it was kindly taken. 'I could say a deal more, sir, but you wouldn't heed me; and so take care who you let in on the land; promises grow no gold: and God be with you and Miss Grace!'

'He's a fine fellow to look at,' thought the squire, 'but a disturber—one of the *tenant's-right* men. No good will come of it. No good comes of letting the poor into one's secrets, or taking them out of their place.'

Things seemed to be going on pretty much as usual in the valley where Mary continued to reside with her grandmother, and yet they were changing every day. Many of the cottages in the village were in ruins; and Mary shared her old dog's and her own food with more than one half-starved cat and cur that lingered about the lonely places where they once had friends. The chapel on Sundays was filled; but there were few horses or cars waiting outside, where there used to be numbers, made 'sonsy' for the farmers' wives to ride in, by featherbeds, covered with gaudy quilts. The young men that lounged about the door and against the walls bore no likeness to the 'old stock,' and were careless, scampish-looking fellows, who more frequently handled a musket than a shillala. There were many white-headed old men; but the race of 'strong, young, small farmers,' who rode a good horse, and wore boots and corduroys, had disappeared. Altogether, there had been a sort of voluntary clearing; if that could be 'voluntary' which was compelled by circumstances and reason.

'Grace,' said Mr Kenny to his niece one morning, more than two years after Philip had left the country—'Grace, dear, I wish you would send for the glazier to put a pane of glass in the library window.'

'You forget, uncle,' replied Grace, 'that there is no glazier in Kennystown since young James Daly went to Canada. What a nice workman he was! He made my fern-house; but it is broken now, and there is no one to mend it.'

'Ha!' exclaimed the squire, 'the fellow wanted increased wages, and got talking of the value of time, so he was not fit for this country. Do you ride to-day?'

'How can I ride, uncle? That horrid new blacksmith, who took Whalan's old forge, has lamed my mare. I am sure I hate those new-comers. I cannot think why you did not encourage those to remain who worked so well. The resources of the country are dried up.'

'Whalan certainly was a capital workman, Grace; and I own I am sorry that the gentry all grumbled when he raised the price of shoeing horses. It had been fixed so long—ever since my grandfather's time—that I did not like a penny a-shoe put on: he might have raised it to three-halfpence.'

'Better that,' murmured Grace, 'than have half the horses in the country lamed by a botch, who does not mind his business either. He told my groom to-day he would attend to the mare when he had finished reading the paper. Whalan would never have sent such a message as that.'

'That is certain: those fellows grow so impudent.'

'Those who were born,' answered Grace, 'upon our

own land were never so. I do miss the old faces.' Tears were in Grace Kenny's eyes while she spoke.

'You are a fool, child,' said her uncle abruptly; 'they grew discontented, and wanted change.'

'They wanted their rights,' answered Grace firmly; 'they wanted to be paid according to the times—they wanted tenants' rights. And those new people, with all their fine promises, are far more likely to do us wrong than those who loved the spot whereon they were born; and who, despite all disagreements, would rather leave you than harm you.'

'You are a saucy girl to talk about what you do not understand; go and see if the hoops are put on the vat.'

'They are not,' she replied; 'there is not a cooper within five miles since Naylor went to Sydney; and the carpenter says he cannot see to your vat until he has finished the priest's fence. What a ready obliging fellow Dick Murphy was! He has sent his mother five pounds since he settled in Connecticut. It was a great pity, uncle, you quarrelled with Dick about the new gates.'

'They all grew so conceited, and so extortionate in their demands, that it was impossible to get on with them. I wish the times had remained as they were with all my heart.'

'Wishing wont make them what they were; and I wanted to speak to you, uncle, about the shearers. The two men you got cheap to shear the sheep this year have, I am told, taken almost as much skin as wool from the poor animals. You used to be so proud of your sheep-farming before Murphy went to Australia.'

'Grace, you are enough to drive one mad!'

'I could go on for an hour,' continued the positive girl. 'The dairymaid gave me warning this morning, because, she says, she can have better wages in Cheshire; and my own maid is going to marry the gardener, and go to Pennsylvania. He says you have been unkind to him, about some trees. We are all going wrong somehow; I am sure of that.'

'It's all the education, and fine learning, and politics,' said Mr Kenny; 'but that's not the worst of it. Here's a threatening letter about my notice to the rascal who took poor Philip's farm when he quitted it. He has never paid a farthing of rent, and racked to pieces the land that was just coming round.'

'Poor Philip!' repeated Grace: 'you should see his letters to Mary, and then you would not say "poor Philip." He is doing so well; and though things are dear, he says labour of all kind is so highly paid for, that it makes the things twenty per cent. cheaper than they are here! It is quite interesting to see Mary vibrating between the two great affections of her life. And she keeps her grandmother so clean: she carries her in her arms into the sun every morning, as if she were a baby, and attends her with so much tenderness. The old creature has lost the use of her limbs, but her feelings are as acute as ever. "I pray," she said to me, "to the Lord to take me, for I know I'm keeping them asunder. I can't see Mary's tears now, nor hear her sobs, for I'm both blind and deaf; but when she kissed me last night, I felt her cheek was wet, and I feel that she is much thinner than she was. I know her heart is withering away, but I can't help it. If I was fit to go, the Lord would take me."'

'Grace,' said her uncle, 'I have just told you I received a threatening letter, and instead of talking to me about it, you run concerning a foolish old woman and as foolish a girl.'

'Every one receives threatening letters who ask for rent,' replied Grace carelessly; 'I hear of them wherever I go. If your old people had remained with us—'

But Mr Kenny would hear no more; the theme was ungracious in his ears: he would not see where he had done foolishly; he only knew that he could not get his rents; that there was a combination against him; that those who would pay, dared not pay; and that others

would not. His nominal rent-roll, increased by the emigration of the old tenants, had almost ceased to be of value; but this did not prevent those (not a few) to whom he owed money insisting upon prompt payment for long, long standing debts. The network of the whole—owing and being owed—had got into tremendous confusion; and when his paroxysm of temper was over, and Grace saw how miserable the old man looked, she forgot all but him, and endeavoured to divert his anxiety by every means in her power. She saw there was no use in trying to convince him that it was better to receive five shillings than the *promise* of twenty. With a perfect relish for the enjoyment of existence, he did not see any reason why the 'lower orders' should have any enjoyment apart from labour; he could not perceive that the spirit of serfdom, so long in the ascendant, was passing away; and that though there must be grades in society—that, like the steps of a ladder, some must be high, some low—yet none could for the future press upon the other without disorganising and materially injuring the fitness of the whole. He was irritated because people were not content to be 'as their fathers were before them;' he made grievous laments over 'the good old times,' when claret and whisky were on draught in the gentleman's house; when the master could horsewhip the man, and the man would only twist his shoulders, and say, 'God be praised, sir, there's a power of strength in your arm!' when, to live free, any man who had a thousand pounds might 'split it into three halves,' and lend it upon mortgage, and whenever he called for the interest, be certain of two months' hospitality, with fishing and shooting into the bargain. He treasured up the memories of the past, and could not understand why the present generation differed from the last: he was one of those mentally blind men who would attempt to stem a torrent, not guide its course; he could not see that, whether the past were best or worst, it had vanished; and that however it may be honoured, it is but a memory—at best an example; that living beings have to do with the present, and not with the future: he was, as he often said himself, 'bothered entirely;' he regretted that Philip, and such as Philip, were gone; but he did not see why he should have given them what he considered a premium to remain. His father thought sixpence a-day good wages. Capital soldiers had been 'raised' on potatoes; then what could they want of better food? As to the fever, why, there always was fever more or less in Ireland: sure it wasn't worse than it had always been. Some people say, 'let well alone;' but Squire Kenny acted, 'let bad alone.' He could not think but those were insane who broached the *tenant's-right* to anything but labour: he had subscribed to an anti-slavery society once, but never thought of the white slaves he held in thrall at home; never thought of the effects of books, and steamboats, and railways, and newspapers; never bestowed an idea on *progress*; never, I believe, thought that the 'people had mind.' While so many things went on, he stood still.

Of all men, he thought he had no right to receive threatening letters. He was always generous to the poor, so he was; he gave in 'meal and malt;' he gave to the young and strong as well as to the old and feeble, and so encouraged beggary. 'He only asked his own'—his land was not let higher than other people's—'he was considerate.' How? He suffered 'the gale' to run on, and then seized on the improved land as a set-off to his debt. Custom, in his particular district, had sanctified this wicked practice into a law. It has passed now; it has gone down, steeped in blood, along with other tyrannies which have been swept away by the glorious thunder-voice of an indignant public; and yet Squire Kenny believed 'he only sought his own.' In the case of the tenant who had succeeded Philip, he had most certainly been badly treated; and his hardness to Philip was no excuse for the new man's delinquency: but so mysteriously are all the links of society

twisted together, that one wrong deed is the herald of others. Grace was not only more quick, but more strong-sighted than her uncle: she told him his only plan was to sell the estate; but he replied to this by saying, that even if he did, he should still be 'an incumbered beggar!' She sat alone in her chamber, the moonlight shining through the open window—the whole country steeped in that magic light which conceals defects and exaggerates beauties. She had left her uncle with his solicitor, and was accompanied by any rather than pleasant fancies; a low tap at the door, and Mary Connor entered. She stood without speaking for more than a minute.

'She's gone from me, Miss Grace! Went away this morning when the sun was brightest, just as a butterfly folds its wings, and dies on a flower! No more than that, miss—gone! Oh, then, I can hardly think it! I went out of the room, in the fancy that maybe she'd come to herself again when I came back; for never did I come into the place that she hadn't the kind word for me, and the wise word, and the good prayer. I ran for the priest, but he could not overtake her: was not that a sorry thing? But his reverence said she was always prepared. She's gone from me! and I think, maybe if I had taken more care of her, she'd have lasted longer. It seems unholy for me even to think of Philip, though she's gone. "Tell," she said, and she groping with her hands, "tell the squire my dream about the man that thought to treat the bull as if it was always a calf, and what it did to him." Oh, Miss Grace, she was greatly troubled about you and yours! May the Lord protect you! The good went fair and easy out of the place, but that won't be the way with those that's in it now! If the master distrains, I don't know what might not happen. Let him talk of it, miss, but not do it—at least while he's in the country. Oh to think how those that's gone would have stuck by the old stock, if they had only fair play!' The poor girl's sorrow was relieved by words and tears, and Grace insisted upon her accepting the shelter of their roof until she heard from Philip.

'I won't have you as a servant, Mary, but as a humble friend. When all is over, you must stay with me. Your grandmother will be laid in her people's grave; you have the consolation of knowing that you did your duty. I only hope I may do my duty to my old relative as well as you performed yours.'

Mary went to live with her foster-sister, and Grace frequently derived consolation from the straightforward, right-hearted opinions of Mary Connor. In the country, matters were growing worse instead of better. Mr Kenny became naturally more and more exasperated at the course of conduct pursued by the people. As his difficulties increased, his temper became worse; and he acted upon a system of aggravation and injustice, until he became cruel as well as careless. The country combined against him, and added fuel to the flame; while he attributed every wrong thing to others, not to himself.

Mary, as time passed on, spent a good many anxious hours watching 'the post,' wondering why Philip did not write. Despite her lover's caution, she cast many a glance at the hill farm: the trees Philip planted had been cut down; the gate hung on one hinge; the thatch had not been mended; the pigs had grubbed up the garden; the land, with the exception of the potato field, had returned to its sterility; the man who possessed it was *known* to be the most *actively* dangerous man in the district. But what of that? Who would give evidence against him? Who, if they saw him pocket the pistol with which he committed murder, would inform? He had at one time sought to win Mary's heart; but a woman who really loves, knows how to keep off all suitors but *the one*. There is a protection in devoted love which renders a maiden sacred even to the profligate, and Mary continued an especial object of admiration and interest to the new settlers of Kennys-town.

Irritated not only by the open defiance which met him when he demanded a portion of his rents, and driven to the verge of insanity by debts which he could not discharge, the old squire still said he had done nothing foolishly. It was deemed necessary to put bars to shutters that had grown worm-eaten without them; and the carpenter who did it was brought from a distance, under the protection of the police. The pistol took its place at the family table, on the master's right hand; and even in the daytime, he did not care to ride much beyond the avenue gate. The light-hearted cheerful Grace was changed into a sharp-featured, anxious-looking woman. The interest of her money was all they really had to subsist upon; for, luckily, neither her uncle nor herself could touch the principal until she completed her twenty-fifth year. She performed her duty, and she did not do it grudgingly; but it requires a great deal of patience, as well as purity of intention, to labour in the path of a duty upon which love never shines. It is bad training for a young heart to live with the age it cannot reverence; and circumstances had worn out the kindness that once distinguished the old squire. Moroseness succeeded goodness; the house of his ancestors was tumbling about his ears, and he had not wherewith to put it in repair; the new people were openly leagued against him; and those who remained of the old, were too feeble or too fearful to 'stand by the old master.'

One evening, Mary was slowly descending from 'watching the post;' the lad walked past the road leading to the avenue, and waved his stick, in token that he had nothing to bring. Her steps were slow; the hill-farm was mouldering away beneath her eyes; frequently she brushed away the tears with the back of her rough hand; the leaves which an autumn wind whirled from the few stunted trees that remained of the plantations were circling with the dust along her path; the thin stubble was decked with gaudy weeds, like paint on the cheek of withered beauty. There was a chill over the landscape; the rays of the setting-sun looked straight and hard, cut into lines of garish light, on the dark sky; the rushes that fringed the pools were brown and discoloured; a group of ragged boys were pelting half-a-dozen newly-plucked miserable geese, that had been groping in the mud for food; the rooks were cawing discontentedly on their homeward way; and the village of Kennystown sent up but little cheerful smoke to the heavens.

'It's so changed altogether,' muttered Mary to herself, 'that St Patrick would not know it! And they're fighting about who shall and who shan't go to the National School; and the master must go the wrong way in that too,' she sighed bitterly, and turned to look again to see perhaps if the post-boy was really out of sight; and as she did, she saw Lawrence Jones, who had taken Philip's farm, running towards her: he made her a sign to stop, but she immediately turned homeward: he overtook her.

'Mary,' he said—'Mary, when did you see your aunt beyant there?'

'Not these three weeks, Lawrence.'

'Well, she's got a heavy fit of sickness. I don't mean the sickness—not the fever—but a heavy turn of some kind; and she sent word to you to be sure to be up there this evening. Mind, this evening—to-morrow won't do.'

'And why won't to-morrow do? and why didn't whoever she sent come up with the word, and not give it to another?'

'Because he was going for the doctor.'

'Sure it's turning his back on the doctor he'd be if he'd come this way,' said the shrewd Mary.

'Why, girl alive! how sharp you are on us,' was the reply; 'hadn't he to go back after he left the message? And who knows but it's dead she'd be by to-morrow night; so do as you like—only maybe it's a heavy heart you'll have if you don't do my bidding. I've small reason,' he added carelessly, 'to care whether you do or not; only I'm a fool about you still, Mary.'

'And about everything else, or you'd never have that farm in the way it is,' she answered; and then, thinking perhaps she had been 'too sharp,' she added, 'thank you all the same; though my aunt was never much of an aunt to me, I'd be sorry she was to go, and I so near her, without my seeing her once more.'

'You'll go?' said Lawrence anxiously.

'I will,' she replied.

Mary equipped herself for a three miles' walk, and set out; yet more than once her 'heart,' as she called it, misgave her; more than once she paused and turned back; but 'it might be that her aunt was ill, and how unkind not to go near her!'

She resumed her path. When within sight of the cottage, through the twilight she saw a woman rolling up some cloth that had been put out to bleach. It was her aunt, who declared that 'glory be to God! she never was better in her life. What set her to inquire, who never looked the same road she was?' Mary told her. 'It's not going back you are without taking bit or sup with your own blood relations?' said the woman; 'sure you wouldn't think of such a thing as that? If you wont stop the night, it's early moon, the road is fine, and the country safe for such as you.'

There was something in her aunt's expression in 'for such as you,' that struck on Mary's ear like a warning. There was nothing in the words; they conveyed no new information; but they awoke a dormant anxiety; they revived a half-formed dread for those who had protected her in her time of trial: why should Lawrence wish to get her out of the house? She put out a good many leading questions, but her aunt had simply said the truth—the country was safe 'for such as her,' though it might not be safe for others; that was literally all. She ate cheerfully the potatoes and milk set before her with a taunting observation, 'that, to be sure, they were no food for one used to the run of the big house, where there was lashings of what wasn't always paid for.'

Mary roused at this sneer, which was unpalatable in proportion to its truth; and without waiting for many more words, she commenced her return. The corn-craik was running along the hedges, and the night-owl hooted as she passed the burial-place of her grandmother. It was the first time she had passed the grave without kneeling beside it; but she could not venture among the shadows which imagination conjured up, and superstition believed in. Presently she heard the sound of wheels, and the fast trotting of a horse. She felt very lonely, but turned down a new road which had been lately made, and led round the base of the hill which the old road crossed. The driver of the car called out to her to know which was the shortest of the two to Kennystown. She made no reply: he repeated the question: there was no answer. Mary attempted to rush to the car, but fainted in the attempt. The man sprang from his seat; he lifted her up; he unfastened her bonnet; in another moment he pressed her to his heart; he called upon her to awake by all the endearing names in the eloquent vocabulary of Irish love; that it was Philip, her own Philip, who called her; that he had come to take her to his new-made home; that they should never more be separated; never—never! It was the sudden feeling of all this, when his voice struck upon her heart, that overpowered her. In a few minutes she was seated by his side, weeping tears of thankfulness and joy: she assured him of a welcome at 'the big house,' and the horse was urged forward to its utmost speed. The avenue gate was open; the door of the lodge was open also. This startled her at the moment as strange; for of late, at night, the gate had been chained and padlocked. They drove on: the moon was shining forth in the queenliness of her glory; the house was within sight, but what a sight it was! A loud, long, ringing shriek told of violence and terror; men were struggling on the steps of the hall-door with the old squire; they forced him on his knees, but their intention was for a moment frustrated: a woman,

feeble in all but purpose, interposed: she clung around him with twining arms; more than once, in a brief space, they were separated, but again she flung herself between him and his murderers.

Philip did not lack courage, but it was Mary who urged the horse forward. Dreading the arrival of the police, the ruffians hurried to perpetrate their crime with increased violence. A clump of trees interposed between Mary and the view she had of the fearful struggle. They saw the light of firearms through the branches, and heard the report of more than one. Faster, faster they drove to the door, under shelter of the plantations, which in a degree concealed one end of the dwelling. The murderers had disappeared, and Grace was kneeling beside her uncle. It was impossible to tell which of the two was wounded, for Grace's hair and garments were dabbled with crimson.

'I do not know,' she said to Mary with terrible calmness—'I do not know how I am; but I know one of those who fired. I know *one*; and I know you, Philip. Uncle!' she said to the dying man—'uncle, Philip is come back to save you!'

'He cannot save me; but he should not have gone—he should not have gone! I am not fond of newfangled notions; but tell him,' he added, raising his head, though his glazed eyes told how little he could discern—'tell him he shall have the *tenant's-right* if he'll come back—the *tenant's-right*—if—he'll'—The old man's spirit passed away from the scene of his own mismanagement, and of the atrocity and blindness of those who, suffering more or less from the insufficiency of the law, take revenge in its place as their counsellor and protector, and brand their country in the eyes of the universe as a land that winks at murder, and harbours the assassin.

'I see he is dead!' said poor Grace, as she drew the old white head upon her lap: 'if he had not been dying, he never would have given in to the *tenant's-right*; it's the last thing the old landlords will yield. Oh, if you had been sooner!' she said to the police, who came crowding up from their station, which was sufficiently near to hear, as indeed they did, the report of the firearms: 'if you had been sooner! I know Lawrence Jones of the uphill farm; he fired the fatal shot; my poor uncle fell then! You are well revenged, Philip! Do not cry, Mary! No, I will not go in! I will remain where I am with my poor uncle!' and she rested her cheek upon his white hair with a tenderness which those who knew her best thought she had forgotten.

It is one of the beautiful properties of woman's nature, that she forgets the bad, and recalls the good, of those whom she has loved 'when they are no more seen.' And in after-times, Grace persuaded herself that her uncle was blameless. His was one among many deaths that have occurred from the same cause—murders which admit of no apology, but for which those who know the history of the past misrule and mal-administration of the laws do not find it difficult to account. No country can be greatly prosperous, or permanently safe, where justice is not administered with an even hand to rich and poor, high and low: the injustice of the one causes crime in the other.

Philip had been sufficiently long in the new world to look with horror on the conduct of those who concealed the murderer from the grasp of the law, and he found it necessary to hasten his bride's departure from Kennys-town. She paused on her journey by the old churchyard, to drop a few tears on the grave of the old master, and to say a last prayer over the green mound which covered the ashes of a beloved parent, to whom she had been so dutiful a child. Nor was she unmindful of the simple superstition of her country: counting amongst her greatest treasures a long tress of Miss Grace Kenny's hair, cut by a new pair of scissors from her head, when the moon was in its first quarter—alas! it was abundantly streaked with gray!—a slip of witch-hazel, a four-leaved shamrock, a sixpence carefully reunited (it had been broken between herself and Philip), and a handful of

the mould from the burial-place of her humble ancestors. 'If I die in foreign parts,' she said to her husband, 'this must be buried with me; but *maybe* we may return?'

'Please God!' he said, 'when the *TENANT'S-RIGHT* IS ESTABLISHED IN THE LAND!'

OCCASIONAL NOTES.

A MUNIFICENT BUT POSSIBLY USELESS REQUEST.

It may be observed, from advertisements in the newspapers, that a gentleman deceased left by his deed of settlement a considerable fund, to be applied by his trustees, at intervals of forty years from 1774, in the payment of two premiums for the best treatises on natural and revealed religion. 'The amount of the fund to be applied cannot be less at any period than L.1600, and, as nearly as can be ascertained, it will, on occasion of the next competition, be about L.2400. Three-fourths of the funds divisible at each period are appointed, by the terms of the bequest, to be paid to the author of the treatise which shall be found by the judges to possess the most merit; and the remaining fourth to the author of the treatise which, in the opinion of the judges, shall be next in merit to the former, after deducting therefrom the expense of printing and binding three hundred copies of each of the treatises, or of purchasing three hundred printed copies thereof, as the said trustees shall direct, to be distributed by them among such persons to whom they shall think the same will prove most useful, or in any other manner that they shall judge proper. The time allowed by the testators for the composition of the treatises for next competition extends to the 1st of January 1854.' Such are the terms of the announcement; it being further intimated that treatises for competition are to be sent to the agents of the trustees in Aberdeen.

No objection whatever can be taken to the principle of offering premiums for the best written treatises on subjects so important as natural and revealed religion; but to benefit the public by such treatises, it is not merely necessary to write them. Some years ago, the late Duke of Bridgewater bequeathed L.8000, to serve as a premium for the writing of a treatise on Natural Theology. His Grace's representatives subsequently called for eight several treatises on various sections of the subject, each to be rewarded by L.1000. The treatises were written, accepted, and paid for; but they cannot be said ever to have been made public in the proper sense of the word. The books were no doubt printed and issued, and to a certain extent they have been sold. Few people in England, however, know anything about them, or ever saw them. Issued in an expensive form, they could be purchased only by the wealthy—those to whom this species of literature was already familiar. The people at large—those who may be supposed to stand most in need of treatises of this nature—never cast eyes on them. As far as the general public are concerned, the 'Bridgewater Treatises' might about as well have never been in existence. A significant fact has, however, been reported; namely, that popular editions of these treatises have been published in the United States of America at a dollar per volume, and have consequently had an enormous sale; of course, as these do not circulate in Great Britain, their publicity is not a thing for which the duke's trustees can claim any thanks. It is to be hoped that the trustees of the Aberdeen bequest, before going farther, will consider whether it be within their power to prescribe the mode of publication of the treatises which are to be written under their auspices. As the sum of L.1800 or thereabouts is to be paid for one treatise, and L.600 for another, it appears not unreasonable to suggest that the respective authors should be held as relinquishing all claims to copyright, and that the publication of the works should be freely left to any one who might be pleased to undertake it as a matter of ordinary enterprise. If this were done, and if the works were possessed of merit, dozens of cheap editions would pour from the press, and the public would really be benefited by the bequest of the pious Aberdonian. If this is not done and if the issue of high-priced

volumes is alone proposed, the transaction must be viewed as of a private nature, of little or no interest to the masses, whose instruction and welfare may be presumed to have been contemplated by the testator.

AN ALDERMAN'S FAMILY SOLD TO PAY HIS DEBTS.

Among the many strange things told of slavery in the United States, we have heard of none more revolting, or more calculated to rouse sentiments of indignation, than what is conveyed in a paragraph which lately appeared in the 'Washington Patriot' newspaper. It is as follows:— 'We noticed a short time since the sudden disappearance from Charleston, South Carolina, of a certain alderman and bank-director, on account of debts he could not pay, and who was married to a mulatto woman, by whom he had six children. It turns out now that this mulatto woman was his slave, and consequently the six children are slaves also. The result is, the creditors of the absconding alderman have made arrangements to seize the wife and children, and sell them for her husband's and their father's debts.'

THE 1846 POTATO CALAMITY.

The privations endured by the poorer classes of Irish and Scotch Highlanders last winter and spring, in consequence of the failure in the potato crop, have enforced more than one valuable lesson. It has been shown, by evidence too conclusive to be disputed, that few things are more corrupting than the wholesale administration of charity—that no means more effectual could be devised for cultivating habits of idleness than the giving of money for nothing. In this word *nothing* we might include sham labour; for playing with a spade at a shilling-a-day is scarcely worthy of the name of industry. We will not refer to the many strange stories told of Irish road labourers and the local committees who superintended their operations; we prefer adverting to the less expected and equally strange manoeuvres of the supposedly destitute Highlanders.

To rescue this impoverished body of our countrymen, and keep them from universally dying of famine, the best authorities represented that a million of money at the very least would be necessary. Nothing like a million was subscribed. The sum got together amounted to no more than L.117,000; nor has all this been used. After the time has elapsed when the whole people were to have died of famine, only L.47,000 out of the L.117,000 has been distributed; yet none have died. It becomes evident that the number assumed to be in need of relief, as well as the amount of relief required, had been monstrously exaggerated. The report just published by the board affords a melancholy revelation of the low tone of independence in the minds of the Highlanders, yet not lower than was to be expected from the state of tutelage in which they have been reared. It appears that men left their work on railway cuttings in the Lowlands, and returned to their native Highland districts, in order to share in the distribution of meal furnished by the charity fund. An inspector states, that in one place he found that the entire local committee, with one exception, had placed *themselves* on the list of paupers. This was bad enough; but the following shows that the demoralisation was not confined to one place:—The Glasgow Board had found many of the Highland population unwilling to work, and the local committees had allowed those men who had left their work on the railways and returned home, to be again put upon the relief fund in their respective districts. They had likewise found that *not a little* of the supplies had been given to parties on the poor-roll; and in one case they had been compelled to strike off a large number of persons who had been transferred from the parochial fund, to that which had been raised for a special object by the liberality of their fellow-countrymen. One of the proprietors in Mull had stated that he had been obliged to send to Glasgow for thirty Irishmen to perform some work on his estate, from the unwillingness of the people in his vicinity to work; and in these circumstances, the Glasgow Board felt that proceedings should be altogether stopped, till some distinct and strict system was adopted by the Board with regard to these irregularities.

It is unnecessary to go farther. We are not disposed to speak severely of a people who have many claims on our sympathy, and who may be said to have been demoralised by a train of circumstances over which they could exert no proper control. The real subject for complaint is the existence of a population in a condition approaching so nearly to want and barbarism, and whom the benevolent would far more effectually serve by transferring to new fields of enterprise—some of the colonial possessions, for example—than by periodically doling out meal to save them from instant starvation. Now is the time, when the day of famine is past, to enter on schemes for averting a fresh crisis of calamity; and towards such schemes the money still on hand might very properly be devoted.

TREATMENT OF ROYALTY ON ITS PEREGRINATIONS.

When royalty appears in public in the Metropolis and its neighbourhood, it excites little remark. On venturing into the provinces, it is sure to be beset by staring crowds, officious 'authorities,' and intrusive 'gentlemen of the press,' so as to be utterly deprived of the enjoyment of privacy, however much *that* may be desired. While disposed to look leniently on harmless curiosity, and even to admit that there may be some good feeling mixed up with the case, we cannot but deprecate the usual manner of treating a royal party on its peregrinations. If the Queen, for example, wishes to stop at a particular place to see a few of the objects commonly inquired after by tourists, it seems a hardship that she should have to pay for this gratification the *tax* of the formal reception of sheriffs and magistrates, and listening to their commonplace addresses. It might be well for a magistrate to appear unobtrusively on such an occasion, merely to see that the convenience of her Majesty was secured in all respects—to do this, and never once attempt to attract notice to himself. But to come forward in the paraphernalia of robes, and the attendance of assessors and recorders—to occupy her Majesty's time with affairs the very opposite of what she obviously wishes to be engaged in—leaves us to infer that they aim only at their own glory and gratification; and such conduct must accordingly be condemned as a mere impertinence. The childishness of these fussy exhibitions is what strikes us with most wonder. How it should occur that at one moment we shall see a large town taking a lead in great moral and political movements, having for their object the elevation of the masses of mankind, and that at another it will be absorbed in the business of raising a triumphal arch, merely to commemorate the fact of the Queen having landed there on a hunting excursion, is what we cannot pretend to reconcile with any theory of human nature which we have ever entertained. Perhaps *provincialism*—holding this as involving the magnification of small affairs—the mere 'P. P., clerk-of-the-parish' spirit—is the right explanation of the fact in itself. We would hope that the extended intercourse produced by railway travelling will help to abolish this amongst other follies, and enable the mass of her Majesty's subjects to receive her, wherever she goes, with simple good-breeding, joined to a due regard for self-respect.

WILLM ON THE EDUCATION OF THE PEOPLE.

PROFESSOR NICHOI of Glasgow has performed a well-timed and every way valuable service to the country at the present moment, by publishing a translation of a continental work on education, together with a preliminary dissertation by himself.* For many reasons—among which it is sufficient to state the newness of our best minds to the subject—England has produced no work on education answering to the requirements of the era; and perhaps for ten years to come, she will be unable to produce such a work. But on the continent, the subject is more advanced with the abler class of men, many of whom have been brought into practical acquaintance with it

* W. Lang, Glasgow: Simpkin, Marshall, and Co. London.

by employment in the state system, now of some standing in both France and Prussia. Hence it is that M. Willm, who holds the situation of an inspector of schools in the department of the Rhine, produced in 1842 a treatise at once philosophical and practical, presenting, in wonderful condensation, such a view of the whole matter, as may be a guide to the most ignorant. Here is everything educational—from great principles deduced from the constitution of our being, down to the humblest details of the organization of a school. It is—we say emphatically and advisedly—the book for all who would wish to know what education ought to be, and may be in these better days. Every legislator, every journalist, every teacher, every enlightened person taking an interest in the subject, should possess this very comprehensive treatise.

The work is systematically arranged, without becoming thereby in the least formal. The first part states the *Principle and Object of Education in General*, coming finally, after the discussion of every dogma on the subject, to this—to develop the germs of mental power and disposition planted in us by the Creator, fitting men at once for their places in society, and their parts in 'the divine city which extends its shelter over all people, which embraces all time, and even reaches beyond it.' 'It should summon to light,' says our author, 'every germ of reason, of virtue, of greatness, which concur in constituting our true humanity, and sufficiently develop them to secure their victory over all opposing dispositions; so that, the thorns and necessities of life being inadequate to extinguish them, or give them a false direction, they may, on the contrary, be augmented and fortified by an unintermitting progress.'

'Man thirsts naturally after the good, the true, the beautiful, and the infinite; whence arise the moral sentiments, the love of truth and knowledge, the feeling of the beautiful, and the sentiment of religion; which, as they are developed, become the moral conscience, knowledge of the system of the universe, taste or susceptibility in regarding beauty, and religion. In these, by man's rational nature—that nature which is especially human, which distinguishes its possessor from the animals, and raises him above them, and by suitably nourishing these high dispositions, and inspiring man with the consciousness of what he may and ought to be—education places him in a condition to govern his animal nature, and make it subserve the grand ends of his existence. To be complete, then, education ought to be at once moral, intellectual, æsthetic, and religious; and since man is nothing without society, but, on the contrary, social by his nature, his education ought, at the same time, to be social and national. . . . *Moral* education, having for its object to inspire the sense and habit of charity, love of the good, the just, and the honourable; *intellectual* education, unfolding the universal order, nourishing the love of the true, and raising our mind by the spectacle of the wonders of external existence; *æsthetic* education, nourishing and guiding our sentiments of propriety, of the beautiful and the sublime; *religious* education, unfolding the idea of the Infinite, nourishing our fear of God, and faith in His providence; and lastly, *social* and *national* education, endeavouring to form the future citizen, to develop sociality, and our national sentiments. Each of these divisions demands a special kind of instruction and analogous exercises; there must be a moral instruction, an instruction wholly intellectual, an æsthetic instruction, a religious instruction, and a social and national instruction. These diverse kinds of instruction sup-

pose that wholly elementary teaching included in the programme of the primary schools; and they are afterwards completed by that other special instruction required for each individual in consideration of his special vocation or destiny. Thus education and instruction ought at first to be purely human, then national, then special and professional.'

This will show the wide principles on which M. Willm proceeds. The second part contains ample details of means and modes; the third is devoted to the means of training teachers. We cannot say we assent to every arrangement dictated by our author; but they bear, generally, the stamp of experience and sagacity, and, in a country unprovided with a national system, must be of vast utility. It would be tiresome to enter into the minor details of school-forming and teaching; but as a specimen of this part of the work, we may present M. Willm's section on social and national education. Let Britain be substituted for France, and it entirely answers our own case.

'The design,' he says, 'of this branch of education is to prepare children one day to become useful members of society, citizens, friendly to order, obedient to the laws, and devoted to their country. Inasmuch as these duties are imposed upon us by conscience, and consecrated by religion itself, social is included in moral education; but something more remains to be done than is accomplished by this. There is particular knowledge to be imparted on this subject, habits to be formed, and sentiments to be awakened, developed, and directed.'

'There is something too confined in the idea usually attached to the word patriotism. He alone is not the true patriot who, passionately loving his country, is ready to make any sacrifice for it, to shed his blood for its prosperity, its glory, and its liberty; but he also is a patriot who, knowing that order is the first condition of public liberty and happiness, and that order supposes obedience to the laws, religiously observes them, even although they may clash with his private interests or personal opinions. Socrates, refusing to save himself by flight from an unjust sentence, and carrying his respect for the laws of his country so far as to die for them, proved himself to be a greater patriot even than when he merited the reward of valour in the field of battle. The just and wise man, according to him, is he who faithfully observes the laws of man and of God.'

'This patriotism for law is the more meritorious that it is unostentatious; it is also on that account more difficult. To incline children to it, by making them understand its necessity, is the first duty of social education. There are many persons who, through ignorance, look upon taxes, especially on indirect ones, as a heavy, unjust burden, imposed by power rather than by necessity, and endeavour to evade them as much as possible. The people must be enlightened on this subject in the schools, and must be made to understand that tribute, including that of blood, is required for the life of the state.'

'Civil and political probity is much more rare than private probity, even in the middling and higher classes of society. Historians relate that formerly, in some free towns of Germany, each man was left to tax himself according to his means, and to deposit, with no other witness than his own conscience, his voluntary gifts in the public chest; and they add, that the state in general profited by this method of collecting the taxes. We are very far removed from these simple and primitive manners. To deceive the public

treasury, by eluding as much as possible indirect taxes, is not only considered pardonable, but even as justifiable; some even go so far as to applaud themselves for it. The people scarcely look upon smuggling, poaching, or forest robbery as crimes. It is known, likewise, how the electoral privileges of all kinds are exercised. Popular education has a serious mission to fulfil in all these respects. It has to teach the future citizens that the performance of the duties imposed on them by this title, can alone render them worthy to enjoy the invaluable privileges which our institutions and laws secure to every Frenchman.

'A thorough knowledge of these privileges, and institutions on which they are founded, might be given in all well-conducted elementary schools for boys, at the end of an abstract of the history of France. It is chiefly by this means that public education can become truly national. This branch of education doubtless presents great difficulties, and less evil would arise from neglecting it entirely, than from intrusting it to unskilful hands. But these difficulties cannot exempt popular education from an important duty; and we will see, when treating of instruction and normal schools, how it might be possible to provide for it without danger. The instances of devotion, and the noble deeds in which the history of France abounds, would also be an excellent means of instilling into the hearts of youth that sacred love of country to which all men are naturally inclined. To such accounts might be added an animated description of our beautiful country, to which nature has denied nothing that constitutes the true wealth of nations, and to which nothing is wanting to perfect happiness but the knowledge how to be happy, and an acknowledgment of the happiness it enjoys.

'To dispose our youth towards patriotism, to make them love France, and be ready to devote themselves for her in the hour of danger, it is not necessary to inspire them with hatred towards foreigners: education can be quite national, and quite French, without ceasing to be human. France is powerful enough to have no need of fortifying herself by hatred for other nations; and she may allow ancient prejudices to fall without being thereby weakened. In the books we place in the hands of our children, I would not imitate the example set in some parts of Germany, where patriotism seems to be made to consist principally in horror of the French name. Let a just war arise, and our soldiers will fight the enemy, inspired solely by a love of their country and by duty. To such declamations of hatred against foreigners, I am happy and proud to be able to oppose the noble words recently uttered by one of our most illustrious writers [De Lamartine]. "Patriotism is the first sentiment, the first duty of man, whom nature binds to his country before all things by the ties of family, and of nature, which is only the family enlarged. Why is it sweet to die for one's country? Because it is to die for more than ourself, for something divine, for the continuance, for the perpetuity of that immortal family which has brought us forth, and from which we have received our all. But there are two kinds of patriotism: there is one composed of the hatreds, prejudices, and gross antipathies, which nations, rendered brutal by governments interested in disuniting them, cherish against each other. This patriotism is cheap; all it requires is to be ignorant, to hate, and revile. There is another, which, whilst it loves its own country above everything, allows its sympathies to flow beyond the barriers of race, of language, or of territories, and regards the various nationalities as part of that great whole, of which the various nations are so many rays, but of which civilisation is the centre; it is the patriotism of religion, it is that of philosophers, it is that of the greatest men of the state, and it was that of the men of 1789."

Professor Nichol's preliminary dissertation may be described as an application of M. Willm's views to our own country—a brave and eloquent piece of writing, characterised by more closeness of texture than usually

marks his compositions. The striking part relates to the aspect of our religious systems towards education, and the late unhappy movement of the government towards the confirmation of every existing sectarian division. 'The uprooting of a social evil,' says Mr Nichol, 'may often be a task so serious, that no practical statesman will consider it prudent to undertake it; but the cases are exceedingly rare in which a just and enlarged view of expediency can authorise the establishment, with a view to good ends, of exceptionable means:—words the more needful to be applied, considering with what an air of self-complacency the expositor of the government views took it upon him to ridicule every one who so much as hoped to see a national system of education free from such divisions. Some of the learned professor's remarks on this subject appear to us animated by such purpose, and expressed in such terms, as at least must save them from offending those who, starting perhaps from a different point, have come to believe that they think differently. 'How far,' he says, 'ought our religious variations to interfere with the common or united education of the young, even in matters expressly religious? It is of essential importance that we discuss this subject not as sectarians, but as Christian men. Can it be possible, then—surrounded as we are by the noblest examples of worth and piety, limited to no church, confined within no special creed—can it be possible to evade the conclusion, that perhaps the most important elements of the Christian life are, after all, those grand sanctions which, for the most part, lie below our sectarian differences? How far, let me be permitted to ask, would these specialties of our separate churches interfere with our efforts to bring the young mind into submission to the wholly unmetaphysical teaching of Christ? Nay, to look deeper into the subject: what is the ultimate aim of all sects?—what the object of their apparatus of creeds and worship? Is it not, in so far as teaching is concerned, to reconcile the mercy of the Almighty with our ideas of His holiness? Is it not to present Him as infinitely pure, hateful of sin, and yet the merciful Father of the repentant wanderer? If any sectarian scheme whatsoever has reached, as its final result, conclusions—I don't say at variance with, but loftier in any sense than the lesson in our Lord's tale of the Prodigal, I confess they are unknown to me: and I earnestly appeal to those to whom the young generation is the dearest—to those conscientious parents who are thinking solely of their children's welfare—why these children might not be taught in common that exquisite representation of our relations with a holy and merciful God? It is true this is not the whole of the scheme of Christianity. It is, besides, a most profound philosophical or metaphysical system, and as such it is represented in our articles; but assuredly, our distinct duty to the child is, in the first place, to draw out his religious sentiments—to familiarise him with those grand intuitions on which that system rests—and certainly by no means to substitute a purely dogmatic teaching. We are verging, perhaps, on too logical an age. The un-resting energies around us—that excessive bustle of modern life—conduce to intellectual activity, but they are adverse to the sustenance of contemplation; and I should say, therefore, that it is a formal duty with the churches, acting for the highest interests of culture in our times, to address themselves powerfully to the development of the intuitions; in other words, to the inculcation of religion on the young mind, by that best method of the Gospels. It is right, indeed, that teaching should proceed further than this. Just as in the case of morals, when the scholar's intellect is ripe enough, he should be led into contact with those difficulties and contests whose record occupies the pages of ecclesiastical histories; and probably one good manner of presenting a view of these is by the form of catechisms. But the teaching of catechisms, in this view of the subject, must clearly belong to the category of special instruction, and therefore may be studied apart. I would fain appeal, on this question, to the powerful

and enlightened Church of England. The greatest of the reformed churches, it ought to be the most generous; and it requires only a few amendments in its practice to place it in the loftiest position yet ever held by any church—apart, namely, from all sectarianism—and as the acknowledged head of every great movement of civilisation.

EVERY-DAY ENTOMOLOGY.

THE WASP FAMILY.

POETS and essayists are in the habit of likening the wasp to fops of another genus, and *vice versâ*. This questionable sort of reputation these insects must ascribe to their splendid caparison, and to their apparently useless position in the world. The simile is more true in a more curious respect; for there are annual reunions of these glittering creatures, just as in the fashionable world—a fashionable season of a few months, and then all disperse again. The economy of the wasp family possesses considerable interest, and deserves far more attention than in our hostile state of feelings towards the race we are readily disposed to believe. It is only necessary that the real character of the tribe should be known, to remove at least the blot of laziness from it. That they are a set of bold, insolent, daring robbers, no one can deny; yet give them their due, and we shall admit that there is much in their habits deserving our admiration, and that even their audacious thefts have their redeeming points.

The general aspect of the *Vespidae*, or wasps, is sufficiently familiar to obviate the necessity of description. Their black and gold-painted bodies, their powerful mandibles, formidable stings, and their surface destitute of hairs, are present to the eye at the very mention of the word. The society consists of males, females, and neuters, each having their appropriate functions; but the males, on the whole, leading the quietest and least arduous lives. The females are the hardworking foundresses of the colony, and the neuters are wasps of all-work—robbing, fighting, defending, nursing, and building indifferently, and by turns. Their history commences most conveniently for our purposes in the spring. At the conclusion of the preceding summer, the males, after pairing, all died, and there remained but a few females behind of all the busy ranks which crowded the vespiary. These are awakened by the return of spring. The solitary wasp finds herself immediately summoned to active duties. She has to construct the carcass, and to excavate the earthwork, for her future people and city. Serious as is the task, she has to effect it all alone; not a single companion to cheer her hours of incessant toil, or to lighten her labour by a single load! Her energies are equal to the undertaking: she is to be seen buzzing about in the sunny mornings, looking out for a site. It is soon found: it is some dry, warm bank; and here she sets to her work. She perforates it, and forms a long circuitous tunnel, at the extremity of which she digs out a vault of considerable dimensions. This task is performed in no careless or slovenly manner; although every particle of rubbish which the little excavator tears from the walls of her cavern must be carried in her jaws, she does not leave it at the entrance, but voluntarily entails upon herself the vast additional labour of casting it away to some distance. Her design in so doing appears to be principally to avoid the risk of her cell being discovered by a heap of rubbish at the foot of the bank. After the labour of excavation is ended, the walls are to be plastered, and to this fresh duty she at once addresses herself. Surely every person has seen the nest of the wasp, and wondered at its exquisite and delicate architecture of celled paper? Behold the architect! The nest is really made of paper: it was for some time a puzzle to our philosophers. Reaumur appears first to have detected the wasp in the very act of this manufacture. He beheld her alight on a deal window-frame; and watching, saw her tear a bundle of

delicate hair-like fibres, about an inch in length, from it, bruising the woody fibre with her mandibles until it became like a fine lint. This is the material from which the papyraceous plaster is to be prepared. Flying away with it to her abode, it is there made into a proper consistence by the addition of her tenacious saliva; and when this part of the process is complete, it forms a fine, smooth, adhesive paste, precisely analogous to the product of our cumbersome and costly mechanism *papier maché*. Rolling it into a sort of pellet, she conveys it to the summit of the dome, plasters it on the wall, and spreads it out, by means of her legs and jaws, into a very thin lamina, which is veritable paper. Leaf after leaf must be added, until the whole cavity is thus papered or plastered over, and not with one coat alone; generally the insect lays down fifteen or sixteen, leaving spaces between each layer for the advantages of inward lightness and strength to her ceiling. Her labours do not end here. She has built the walls of the city, it remains for her to commence the edifices, and supply the population. She builds a terrace of hexagonal cells, of marvellous exactness, and suspends it by paper pillars from the roof of her texture. These terraces emulate in elegance and artistic skill, and far surpass in utility, the famous hanging gardens and terraces of the renowned city of old. A few hundred cells are thus constructed, and at length an interval of comparative repose awaits the labourer, while she proceeds to fulfil her more proper duties as a parent. Single-handed, she has laid the foundation of the vesp-polis, and has marked out the general design of its future buildings; but she must have further assistance before the city will be complete. The walls, at present bare and desolate, the palace empty and still, are soon to resound with the hum of life, and with the busy labours of a new generation. In the cells the insect deposits her ova, gluing them to the walls by an adhesive substance. These are soon hatched, they become larvæ, and are for some time entirely dependent upon their parent's exertions for their supply of food. She has to forage for this numerous and voracious progeny, and runs about from cell to cell with the utmost solicitude, while the grubs put forth their mouths, and are fed by her just as the 'callow brood' of a bird is fed. Most pleasing is it to observe the anxious mother keeping watch over her offspring, and apparently many a needless time popping her head into their snug cots, as if to see how they do, and to give a mouthful of food now and then to some tender young larva not yet big enough to put its head out to be fed! A few weeks slip by—a great change has come over the vespiary; it is replete with life; hundreds of workers have been born in the interim, and are now labouring might and main, with the empress at their head, to extend the buildings, and enlarge the city. When complete, a vespiary has been calculated to contain about fifteen or sixteen thousand cells, each of which is thrice a cradle; and therefore, in a single season, each nest will probably be the birthplace of full thirty thousand wasps.

Such is the birth and development of this insect colony—a lesson to states, and nations, and individuals, of the certain results of indomitable perseverance. Let us trace out its government and destinies. The empress—the protoplast of this interesting microcosm, the foundress of this bustling republic—is an exaggerated type of the duties of its female members. These are produced in comparatively small numbers; they perform the proper duties of wives and mothers; they stay at home, feed the children, and attend to the nurseries; they mostly perish before winter; but a few, more hardy than their fellows, endure its cold, and become the perpetrators of the race in the ensuing spring. The males, according to the younger Huber, are far more industrious than the male bees, or drones, but are less active by far than the neuters, or working-wasps. They have the peaceful occupation of scavenging the streets: they sweep the floors of the terraces and avenues, and diligently carry off every particle of rubbish. They also undertake the funerals of any

deceased companions, and speedily cast the dead bodies out of the vespiary. On the whole, they are useful members of the community; and they probably owe their permission to live to their diligence. The 'workers' are the most interesting class: they are smaller in size than either male or female wasps, but are wonderfully energetic, and indefatigably laborious. Some are builders and repairers of the breach; they receive a commission to make excursions for building materials; and returning home with their bundles of lint, set themselves to the repairs and extension of the city. Others are the commissariats: the issues of life at home are intimately connected with their expeditions. They roam over fields and meadows, frequently catching flies and weaker insects, and carrying the game home often with no inconsiderable difficulty. Dr Darwin says he once beheld a curious act of a wasp: it had caught a large fly, and in rising with it into the air, the breeze caught its wings, and nearly wrenched it from the wasp's clutches. The insect immediately alighted, and deliberately sawed off the wings of its victim, when it was able to carry it in safety away. There was a something nobler than instinct in this action; nor is it by any means an isolated example of insect sagacity. Others seek our orchards, select the ripest, sweetest fruits, suck their juices, and convey home the luscious treasure, of which but a small portion is for themselves. These foragers will even enter and rob beehives. Those that tarry at home, in every instance share the spoil. Our grocery stores, pastrycooks, and butchers' stalls, are equally attractive to the forager-wasps. Surely it is some palliation of the robbery to remember the claims of hungry kinsfolk, friends, and acquaintance, and little ones at home? There is no squabbling at their orderly meal-times; no fighting for the 'lion's share'; each expectant insect receives its due portion, and is content therewith. 'I have seen,' writes the fascinating observer Reaumur, 'a worker, after returning home with spoil, on entering the nest, quietly perch at the top and protrude a clear drop of fluid from its mouth. Several wasps drank together from this crystal drop until it was all swallowed; then the worker would cause a second, and sometimes a third drop to exude, the contents of which were distributed in peace to other wasps.' If we have any young readers of these entomological sketches, here is a lesson for them!

The mode of government is republican: there is no recognised head, as with the bees; yet an amount of even military discipline, and the utmost order, are to be found among the subjects. The good of the commonwealth seems to be the prevailing object of each insect. If the workers are building, each has its own spot, about an inch square, assigned to it, as the amount of work it is expected to execute. It was an interesting discovery of Mr Knight, that wasps also have sentinels. These are placed at the entrance of the vespiary; they run gently in and out of it, and give immediate notice of the approach of danger. To their communications alone does the community give heed; and on their giving the alarm, will issue in angry hosts to avenge the injury, and defend their home to the death. Sometimes, however, but rarely, intestine combats take place; and there are terrific duels between the workers, or between a worker and a male. This is a bad affair for the latter, as he has no sting: his fate is generally to die.

One of the most striking facts in the natural history of the Vespidae is the occurrence of an annual massacre in October. Then the vespiary is indeed a scene of horrible atrocities and profuse carnage. The wasps, whose affection for their young is generally remarkably strong, seem then to be possessed with frenzied rage against them. They cease to feed their larvæ: 'they do worse,' angrily writes Reaumur; 'the mothers become implacable murderers; they drag the helpless larvæ out of their cells, slay them, and scatter them outside the nest, strewing the very earth with their dead carcasses. There is no compunction: the massacre is universal.' A wise purpose is fulfilled by this apparent cruelty. The coming

winter would rapidly destroy, by a far more miserable death, all that are killed on this occasion; and it is a stroke of mercy to terminate their sufferings by a blow. The early frosts destroy the murderers themselves. The scene is now, in truth, altered; 'the populous city has become waste, and without inhabitant,' saving some one or two females, which spend the winter in the depths of the vespiary. The complicated galleries, cells, and hanging terraces, and the entire framework of the nest, are for ever vacated when the female leaves them in the spring; and this exquisite specimen of insect architecture is abandoned to the destroying influences of time and accident. These interesting features of the history of the Vespidae are full of subject-matter for our meditation and admiration, indicating, so clearly as they do, that the 'Hand that made them is divine'; yet all these marvellous sagacities, contrivances, governing principles, present us with but dim and broken reflections of the far-seeing Wisdom that created all things, 'and for whose pleasure they are and were created.'

A few more particulars will make the history of this family a little more complete. The preceding sketch has dealt only with the common wasp, *Vespa vulgaris*. The mason-wasp is a solitary insect, and builds its nest in sand and brick, being able, by means of its strong mandibles, to break off pieces of brick with ease, and to burrow to a considerable depth in its substance. It has the peculiarity of storing up ten or twelve green larvæ, as food for its own, and resorts to a curious contrivance to prevent them from moving out of its reach. The hornet, *Vespa crabro*, selects for its habitation commonly some decayed, hollow trunk, where, building its nest, it forms a tortuous gallery of entrance. The American farmers are said to make use of these nests to destroy domestic flies, hanging them up in their rooms, where they do not molest the family, but fall entirely upon the flies. Another species, the *Vespa Britannica*, forms a curious oval nest, sometimes to be seen hanging from the branches of trees. Others form elegant nests, like half-open flowers, with a platform of cells at the bottom. A foreign species constructs a beautiful nest, of a substance identical with the very finest card-board, suspending it, like a watch from a guard-chain, by a ring at the extremity of the bough, out of the reach of monkeys. Sometimes these nests grow to an enormous size. Mr Westwood states that the Zoological Society has one six feet long. A South American species of wasp imitates the bee, and is a collector of honey.

Bold as are the Vespidae, great as is their fecundity, they are mercifully kept in check. The ichneumon is their ferocious foe; in the West Indian islands they are the victims of a parasitic plant, which vegetates in their interior; man leagues his forces against them; and nature itself, in a deluging season or severe winter, destroys thousands, and prevents the plague becoming greater than we are able to bear.

PAPA'S TRIAL.

THE Boys put up a prayer to Jupiter, representing that they had long been subjected to a grievous rule on the part of their papas, who treated them rigorously at all times, and often punished them severely for light offences, while there was much reason to believe that papas in general were themselves no better than they should be. They therefore demanded permission to try a Papa before a court of Boys, as a step towards forming some sort of judgment as to the justice of this rule. Jupiter was pleased, in consequence, to issue a commission for that purpose.

A Papa being accordingly caught, a court was formed, over which George Plumb, a noted booby, presided as judge; while Tom Foxey, a youth notorious for never having whole clothes, or being out of a scrape, acted as prosecutor. That there might be at the same time perfect fairness, the prisoner was allowed to have for his counsel the most distinguished dux of the time and

place, Jack Smart by name. A jury, composed of a top class from an infant school, was duly impanelled.

Tom Foxey, in opening the proceedings, observed that the gentleman brought before them that day was not accused of any specific crime, unless the fact of his belonging to the tyrant class of papas might be so considered; in which case his guilt must be great indeed, seeing that he was an unusually extensive papa, in as far as he had ten children—six boys, and four girls. The object was to subject him to a trial of qualifications or pretensions, to ascertain if he were, from his own conduct and character, worthy to hold that absolute rule over certain of his fellow-creatures, usually called his family, which he claimed to do on the grounds of old use and wont. The time had been when an inquiry of this kind would have been held as an unnatural rebellion; but such times were now passed away. Everything was now questioned, everything had to stand and give an account of itself, and why should not the despotism of the paternal rule do the same? He did not believe there was any partiality shown in the selection of a subject for trial. The gentleman in the dock was a passable enough man in the world—a very fair specimen, he would say, of his class. He would now proceed, however, to bring forward evidence to display the actual lineaments of his character; after which it would be for the jury to say whether he was entitled to hold any kind of rule over his children or not.

Jack, the prisoner's eldest son, being sworn, deposed that his Papa was an exceedingly ignorant man, having entirely neglected his own learning in youth; yet he had all his children at study for twelve hours a-day, and punished them for failure in their lessons with even more severity than their masters. He scarcely ever went to church; but he caused all the young people to go with their mamma twice every Sunday, and rigorously enjoined the parson to keep them well up in the catechism; though he scarcely knew one question from another himself. He generally thrashed at the rate of two children a-day on an average, the offences being usually of the slightest kind—such as laughing at the governess's painted eyebrows, or wheedling something nice from the cook, to make up for the ultra plain fare which was assigned to them. Had heard it said that Papa once sold a horse as sound, which turned out to be broken in wind; the fact being the more deeply impressed on his memory, as that day Papa had whipped Bill within an inch of his life for denying that he had picked up a fallen apple in the garden. Papa was observed to be always most cross when he had been making most merry. For example, if he had been at an unusually boisterous party, where a vast quantity of wine was drunk, he was sure to come home with a very stern and defying countenance, and almost for certain would fall a-scolding both mamma and the children.

Dick, another son of the prisoner, confirmed all that Jack had said, with the addition, that Papa always beat them for rough words spoken among themselves, and yet would both swear and throw buttered toast at the servants, when the said toast was not done to his mind.

Tag, a tyger, lately in the employment of the prisoner, stated that master was liable to be irritated by trifles; such as a spot of dirt left on the outside of the carriage, or the emptiness of cruet at table. On these occasions he never failed to blow up missus, and then was sulky for all the rest of the evening. Master had been engaged in two duels, and was never out of law-suits, notwithstanding which, he beat his sons if they ever fought with each other. (*Sensation in the court.*) Had been obliged to leave the place, in consequence of suffering so much from master's temper.

Henry Baddely, Esq. knew the prisoner; had been his club acquaintance for many years; sometimes had transactions in business with him. Thought him much like other men—that is, he liked a good dinner, and plenty of wine after it; could not do without having

his own way at home; would take all fair advantages in business—that is, advantages not forbidden by the law or the code of honour; paid his debts when he could; was anxious to take all the pleasure out of life that was to be had, and thought the opera the finest thing in the world. Had once heard him speak of the duties of life, referring particularly to the propriety of his children never doing anything contrary to his will.

Here the case was closed for the prosecution.

Evidence on the defensive was then brought forward by the prisoner's counsel. And first his wife was called; whereupon Mr Foxey objected for the prosecution, that so near a connexion might not be adduced on that side, seeing that there was such a natural prepossession in such relations in behalf of any party under accusation. Mr Smart agreed to refer the point to the learned judge, who instantly decided that the lady might be heard, remarking, that the objection was founded entirely on a mistake; in fact, common observation showed that no one was ever found so extremely candid about one's faults as one's nearest relations.

The lady had been married twenty years—had some idea that her marriage had been a happy one, but could not be sure, in as far as she did not know what constituted a happy marriage. Her husband pursued his own course, and was much from home with his friends, while she attended to domestic matters. He seldom was in bad humour oftener than thrice a-week; in this state, sometimes scolded, sometimes sulked, oftener the latter. He never interfered about the children, except to thrash them when they did anything displeasing to him. Did not think him a bad father, because their neighbour Damsion had once broken his boy's arm in a passion, which *her* husband had never done. Believed that his grand motive for being severe with the boys, was his having been an exceedingly wild boy himself—he felt, from his own case, that one never could be too strict with young people. Did not know how it was, but the boys did not become any better under their father's discipline. He was aware they did not like him, but always thought it was because he did not chastise them enough. Things, therefore, always seemed to be getting worse. Was often sorry for the boys, but believed it to be all for their good, having been assured by her husband that there was something of the devil at the bottom of all boys' characters, and which required to be thrashed out of them.

The mother of the prisoner was also examined on this side. She knew that her son had been wild in youth, and was anxious that his boys should be better than himself. Thought, as their mother was chiefly concerned in their upbringing, there might be other causes than her son's conduct for their not giving satisfaction. Feared they were screened too much when they did wrong. It was impossible for any father, who only saw his children two or three times a-week, to be responsible for them, beyond punishing what he found positively wrong.

The evidence for the prisoner being now closed, Mr Foxey said it was unnecessary for him to occupy the court with long speeches. They had heard how the accused conducted himself in general. Constantly occupied with the pursuit of wealth or his own selfish pleasures, he had no time, as it did not appear he had any wish, to train his children aright. For all their consequent shortcomings, real or supposed, he could only lay on the lash. Was this justice to Young Ireland, or Young England or Scotland either? At the same time, every offence for which he punished his children, he was in the habit of continually committing in an aggravated form himself, thus adding hypocrisy to his other guilt. In short, it fully appeared, even from the evidence in his own defence, that he was a very bad person, who only could be called a Papa by courtesy. Mr Foxey was therefore fully of opinion that he had no true title to a sovereign rule over the young and rising members of society who happened to have been born in his household; and he craved judgment accordingly.

Mr Smart made some remarks on the other side, but almost as much as admitted that it was a bad case. He represented, however, amidst the smiles of the court, that there was something sacred in the title of Papa, however imperfectly the character might be fulfilled. He intreated the jury to think of this, ere they gave any verdict that might tend to derogate from parental authority. They ought also to be sure, before pronouncing unfavourably, how boys were to be kept in order, if anything should come between them and the salutary dread under which they now stood regarding fathers. A universal family anarchy might ensue, to the serious detriment of the republic. (*Laughter, which Mr Plumb instantly silenced.*)

The jury (to whom a service of rolls and butter had been handed in the middle of the proceedings) pronounced a verdict of unworthiness against Papa, without leaving the box.

The judge then addressed the prisoner in a very solemn manner. He had been duly tried, and found wanting. The evidence had been quite conclusive; the verdict arrived at instantly, without dispute. There could not be a doubt that Papa had been fully proved incompetent for the sacred function which he pretended to have an indefeasible right to exercise. 'I am sorry,' he said, 'that this court has no power beyond that of expressing its opinion. The prisoner must be immediately set at large, and allowed to resume that authority which he abuses. There is no help for it. All that can be done is, for our friends Jack, Dick, &c. henceforth to take their thrashings under protest.'

The court was then dissolved, with three groans for Papa, who retired evidently much crestfallen. The proceedings having been reported to Jupiter, were fully approved by that eminent divinity, who remarked that it was not now his custom to use his thunder against every petty offender, otherwise Papa might have had more pressing reason to repent of his delinquencies.

AFFECTATION.

AMONGST the whole number of Rochefoucauld's 'Maximes,' there is none more constantly verified by what we see in every-day life than this one—'On n'est jamais si ridicule par les qualités que l'on a que par celles que l'on affecte d'avoir.'—['People are never so ridiculous in consequence of qualities they really possess, as those of which they affect to have.'] If a thorough conviction of the truth of this maxim could by any means be impressed on every one to whom it is applicable, it would go a good way towards revolutionising the manners of half the population. But those to whom it is most applicable, are precisely those unthinking persons on whom all reasoning would be utterly wasted. There are, however, a very large number who have sense enough to see the truth, if they can only be induced to pay attention to it, and whose tendency to affected habits would be easily checked, if they could be made to see them in the same light as others do. Of the motives which regulate our ordinary life, there is none greater than the desire of our neighbour's respect, or fear of his ridicule. Wounded vanity or diminished self-respect is the bitterest and most unforgiving enemy you can raise up. A man may know that you *hate* him, and yet become your friend afterwards; but if he knows that you *despise* him, he is, and will be, your enemy for life. Now, of all the defects and infirmities under which a person labours from natural causes, or others over which he has had no control, there is none which brings the person into contempt. Sometimes, it is true, children and others may laugh at some of those mistakes or accidents occasioned by these things—as, for instance, at a deaf person's making an irrelevant answer to a question, &c.; but this is unaccompanied by the slightest particle of disrespect. But if the individual having these imperfections endeavours foolishly to conceal them, they become forthwith objects of ridicule. Now, nobody would attempt

this concealment, unless he imagined that he was gaining in respect by it; whereas the natural imperfections would never have raised a sneer, whilst the attempts at hiding them are just what people laugh at. But the great mass of the affected have no such excuse as the desire to cover over natural defects. These are generally purely gratuitous attempts to make one's self look very grand, or very handsome, or very wise; whilst every bystander is exclaiming, 'What an ass that fellow is making of himself!' It is really astonishing how quickly everything like showing off is detected. Insolent and vulgar people take a wicked pleasure in mortifying all such affected persons to their faces (and really sometimes they deserve it); whilst better-mannered spectators are quietly laughing 'in their sleeve.' Let us take a few examples in illustration. Perhaps one of the most frequent, though trifling causes of people making themselves ridiculous, is dress. Now, I have often thought it a great pity that the poorer classes (especially) cannot be convinced that they look every bit as 'respectable' in their every-day working clothes (*if clean*), as if dressed out in the gaudiest Sunday finery. And it is precisely their *over-doing* it on Sundays that marks out their want of good taste. There is something *dignified* in the appearance of a number of masons or carpenters, &c. going to their work, which cannot have a stronger contrast than in the tawdry finery—rings, gilt chains, pins, and nobody can tell what rubbish besides—with which the conceited shopman decks himself on Sundays, looking, nevertheless, stiff and ill at ease. The grand characteristic of gracefulness is to be quiet, easy, and natural. How many ladies are there in Great Britain who can *walk* gracefully? The reason of there being so few who do so, is, that they are not accustomed to it; it is not *natural* to them. Now, all the dancing-masters in existence can never make them do that gracefully which is not acquired naturally. Let them become as much *accustomed* to walking as the signoras of Spain, and they will do it as gracefully.

Again, take the tone of voice and accent as an example. If anything will sicken and disgust a man, it is the affected, mincing way in which some people choose to talk. It is perfectly nauseous. If these young jackanapes, who screw their words into all manner of diabolical shapes, could only feel how perfectly disgusting they were, it might induce them to drop it. With many it soon becomes such a confirmed habit, that they cannot again be taught to talk in a plain, straightforward, manly way. In the lower order of ladies' boarding-schools, and indeed too much everywhere, the same sickening mincing tone is often found. Some specimens I have heard, which make me feel sick even to think of them. Do, pray, good people, talk in your natural tone, if you don't wish to be utterly ridiculous and contemptible; for there is nothing which more inevitably marks a coxcomb and a fool than this same sentimental mealy-mouthedness. They fancy that it is 'aristocratic!' I have not the entrée at Devonshire House myself, but I would refer the men to the Houses of Lords and Commons, and the ladies to our Queen, believing in neither will they find any precedent for their fooleries. All travellers amongst the native Indians of America remark the gracefulness and dignity which characterise their actions. There is no reason why ours should not be the same. Only be natural, and you avoid most of what is ungraceful; and by being content with your own natural character and appearance, you will certainly escape that contemptuous ridicule which invariably falls on every species of Affectation.

GOOD AND BAD FORTUNE.

We are apt to ascribe our good or bad fortune only to our last action, and not to the many preceding; and we hear, when we inquire of ourselves, as when we ask echo, only the last words repeated.—*Jean Paul Richter.*

THE NEEDLE, PEN, AND SWORD.

[BY MRS L. H. SIGOURNEY.]

'WHAT hast thou seen, with thy shining eye,
Thou Needle, so subtle and keen?'

* * *

'I have lent to Beauty new power to reign
At bridal and courtly hall;
Or, wedded to Fashion, have helped to bind
Those gossamer links that the strongest mind
Have sometimes held in thrall.

I have drawn a drop, so round and red,
From the finger small and white,
Of the startled child, as she strove with care
Her doll to deck with some gewgaw rare,
But wept at my puncture bright.

I have gazed on the mother's patient brow,
As my utmost speed she plied,
To shield from Winter her children dear,
And the knell of midnight smote her ear,
While they slumbered at her side.

I have heard, in the hut of the pining poor,
The shivering inmate's sigh,
When faded the warmth of her last, faint brand,
As slow, from her cold and clammy hand,
She let me drop—to die!'

'What dost thou know, thou gray Goose Quill?'
And methought, with a spasm of pride,
It sprang from the inkstand, and fluttered in vain
Its nib to free from the ebon stain,
As it fervently replied:

'What do I know!—Let the lover tell,
When into his secret scroll
He poureth the breath of a magic lyre,
And traceth those mystical lines of fire
That move the maiden's soul.

What do I know!—The wife can say,
As the leaden seasons move,
And over the ocean's wildest way
A blessed missive doth wend its way,
Inspired by a husband's love.

Do ye doubt my power?—Of the statesman ask,
Who buffets Ambition's blast:
Of the convict, who shrinks in his cell of care;
A flourish of mine hath sent him there,
And locked his fetters fast;

And a flourish of mine can his prison open—
From the gallows its victim save;
Break off the treaty that kings have bound,
Make the oath of a nation an empty sound,
And to Liberty lead the slave.

Say, what were History, so wise and old,
And Science, that reads the sky,
Or how could Music its sweetness store,
Or Fancy and Faction their treasures pour,
Or what were Poesy's heaven-taught lore,
Should the Pen its aid deny?

Oh doubt, if ye will, that the rose is fair,
That the planets pursue their way;
Go, question the fires of the noontide sun,
Or the countless streams that to ocean run,
But ask no more what the Pen hath done.
And it scornfully turned away.

'What are thy deeds—thou fearful thing
By the lordly warrior's side?'
And the Sword answered, stern and slow,
'The hearthstone lone, and the orphan know,
And the pale and widowed bride.

The shriek and the shroud of the battle-crowd,
And the field that doth rock below;
The wolf that laps where the gash is red,
And the vulture that tears ere life hath fled,
And the prowling robber that stripes the dead,
And the foul hyena, know.

The rusted plough, and the seed unsown,
And the grass that doth rankly grow
O'er the rotting limb, and the blood-pool dark,
Ghastly Famine, that quenches life's lingering spark,
And the black-winged Pestilence, know.

Death, with the rush of his harpy brood,
Sad Earth, in her pang and throes,
Demons that riot in slaughter and crime,
And the throng of the souls sent before their time
To the bar of the Judgment, know.'

Then the terrible Sword to its sheath returned,
While the Needle sped on in peace;
But the Pen traced out, from a Book sublime,
The promise and pledge of that better time
When the warfare of earth shall cease.

—American newspaper.

PATERNAL DUTY.

The father who plunges into business so deeply that he has no leisure for domestic duties and pleasures, and whose only intercourse with his children consists in a brief and occasional word of authority, or a surly lamentation over their intolerable expensiveness, is equally to be pitied and to be blamed. What right has he to devote to other pursuits the time which God has allotted to his children? Nor is it any excuse to say that he cannot support his family in their present style of living without this effort. I ask, By what right can his family demand to live in a manner which requires him to neglect his most solemn and important duties? Nor is it an excuse to say that he wishes to leave them a competence. Is he under obligation to leave them that competence which he desires? Is it an advantage to them to be relieved from the necessity of labour? Besides, is money the only desirable bequest which a father can leave to his children? Surely well-cultivated intellects, hearts sensible to domestic affection; the love of parents, and brethren, and sisters; a taste for home pleasures; habits of order, regularity, and industry; a hatred of vice and vicious men; and a lively sensibility to the excellence of virtue—are as valuable a legacy as an inheritance of property—simple property, purchased by the loss of every habit which could render that property a blessing.—*Wayland's Moral Science.*

THE DOOM AND GUERDON OF THE SCHOOLMASTER.

There is neither fortune nor fame to be acquired in fulfilling the laborious task of the village schoolmaster. Doomed to a life of monotonous labour, sometimes requited with ingratitude and injustice, by ignorance, he will often be oppressed with melancholy, and perhaps sink under the weight of his thankless toil, if he do not seek strength and courage elsewhere than in the views of immediate and personal interest. He must be sustained and animated by a profound sense of the moral importance of his labours; he must learn to regard the austere pleasure of having served mankind, and secretly contributed to the public weal, as a price worthy of his exertions, which his conscience pays him. It is his glory to aspire to nothing above his obscure and laborious condition, to make unnumbered sacrifices for those who profit by him; to labour, in a word, for man, and wait for his reward from God.—*Guisot.*

A MAN.

The man whom I call deserving the name, is one whose thoughts and exertions are for others rather than himself, whose high purpose is adopted on just principles, and never abandoned while heaven and earth afford means of accomplishing it. He is one who will neither seek an indirect advantage by a specious road, nor take an evil path to secure a real good purpose.—*Sir Walter Scott.*

NOTE.

In an article in No. 189, on the East Smithfield Wash-houses, there is an indistinctness of expression regarding the clothes-drying apparatus, leading to a doubt as to the authorship of that invention. We take this opportunity of stating that the apparatus is a patented invention of Messrs Davison and Symington.

PRUDENCE.

NOTHING, perhaps, has occasioned greater confusion in morals than the custom of calling two contrarious things by the same name, and then distinguishing them by means of the part of speech called the adjective. Thus we hear of two kinds of glory—*false* and *true* glory: how beneficial might it have been to the real interests of mankind, had it been at once decided, on the highest authority, that false glory was no glory at all! It is common also to hear of a person called a false friend—nay, there is an old play so entitled—when, all the while, it is clear that the acquaintance intended by the phrase is the worst enemy that a man can have. In both instances, the adnoun 'false' is used to signify that which seems to be what it is not. It is equivalent to the term 'apparent,' and may be useful to lead us to distinguish that which 'appears' from that which 'is;' but this utility, it is manifest, befits the scholarly better than the popular mind. Now, in reference to things that, like glory and honour, are calculated to dazzle the imagination, it may be perhaps easy to account for the tendency that exists to confound the mere appearance and reality under one name; but the practice prevails in relation also to the humbler virtues. Thus, for instance, prudence has been brought into unmerited contempt by being associated with what is really its opposite, much to the injury of the greater number who, in the ordinary circumstances of life, have had daily need for its exercise. It has, in particular, fallen under the lash of Churchill the satirist, who writes of it in the most disdainful language—

'Prudence, of old a sacred term, implied
Virtue, with god-like Wisdom for her guide;
But now in general use is known to mean
The stalking-horse of Vice, and Folly's screen:
The sense perverted, we retain the name;
Hypocrisy and Prudence are the same.'

And he accompanies this description with an instance, in which, by the skilful practice of hypocrisy, a well-instructed student arrives, notwithstanding his secret vices, at the rank of a nobleman, as the reward of his presumed virtues. Such extreme cases, doubtless, have occurred; but in the vast majority of instances (such is the justice of Providence), the ordinary moral—the 'poetic justice,' as it is called—of the novel or drama has been practically illustrated. The hypocrite's success has generally been of a temporary character, and the villain, for the most part, has been at last shown in his true colours—stripped of his mask, and publicly exposed, to the satisfaction of all the parties whom he had previously deceived. What, then, becomes of the prudence so gratuitously supposed, all along, to have been exhibited in the deception? Not only has it

been false prudence, but the most stupid, because the most elaborate, imprudence—labour not only without profit, but with a fearful loss.

Let us grant the whole of Churchill's case, however: let us suppose the most perfect worldly success to accompany a long course of hypocrisy to its close; we should then have, with Dr Paley, to trace the expediency of such conduct into a future state, and there, proving it to be inexpedient in its eternal relations, contemplate a still more fatal, because utterly hopeless, disappointment. But leaving this view to the theologian, and confining the subject to the present visible dispensation, we demand to question the delinquent himself whether he has been prudently 'chary of his peace'—whether, in the secret chambers of his heart, he is as happy as he appears to the world to be? Oh no!—

— 'When the Night
Suspends this mortal coil; when Memory wakes;
When, for our past misdoings, Conscience takes
A deep revenge; when, by Reflection led,
She draws his curtains, and looks Comfort dead—
Let every Muse begone: in vain he turns,
And tries to pray for sleep; an *Ætna* burns,
A more than *Ætna*, in his coward breast,
And Guilt, with vengeance armed, forbids him rest:
Though soft as plumage from young Zephyr's wing,
His couch seems hard, and no relief can bring;
Hypocrisy has planted daggers there,
No good man can deserve, no brave man bear.'

The case can thus be sufficiently made out, even without referring to the rewards and punishments of another world. Virtue is ever, if we only look close enough at the facts, its own guerdon, and vice its own executioner.

We are the more anxious to vindicate the character of prudence, by restoring the proper meaning to its name, because the abuse of the title has led to practical evils. Individuals have been known to despise prudence as the most beggarly of the virtues, from a mistaken apprehension of its qualities. The more generously-disposed have witnessed the muck-worms of society depriving themselves of all rational enjoyment in the pursuit of gain, and they have reasonably questioned the value of possessions purchased at the expense of all that is dearest in the estimation of the wise and good. The sordidly-minded are guilty, unquestionably, of the most grievous mistake. Not seldom, by reason of their niggardliness, they sacrifice the purpose for which they labour. Where they should aim at winning, they care only for saving, and for want of a prudent expenditure, bring to nought an eligible and truly promising speculation. Marking such errors, but rather with the eyes of prejudice than of the understanding, some persons conclude at once against the utility of prudence, and read the text, 'there is who scattereth, and yet gathereth,' in a perverted sense.

Nothing will they save—nothing will they provide for—but, in their eagerness to enjoy, they scatter all, and gather nothing. Thus it is that against imprudence in one extreme (only because it goes by the name of 'prudence' with the unreflecting, though with the epithet 'false' prefixed by those who are somewhat wiser) they set up imprudence in the other, and thus get fatally confounded in the unsuspected *mêlée* of corresponding opposites.

But there is no such short cut to happiness; the spendthrift is as far off from felicity as the save-all. There is no safe refuge in either negation. The only security lies in a positive assertion and practical affirmation of the whole doctrine and discipline of prudence in its purity and truth. We must be honest in our homage, faithful to our conviction, and unequivocating in our testimony, both verbal and actual; we must be ready to undergo trials, to do battle, for it; we must maintain its cause against all opposition, whether it come in the insidious shape of a false prudence, or the more impudent, though less hypocritical, guise of open imprudence. Life is a warfare in which we must side with the good or evil; and just in proportion as we show indecision of character, we shall inevitably suffer. We may make speculative or grammatical mistakes in the appropriation of prefixes and adnouns, and delude ourselves into the notion that no harm will follow; but in the practical operation of the moral laws, such delusion is impossible. The error in the idea becomes at once the error in fact; and our whole conduct and character prove themselves to be tainted both in principle and action—in thought, word, and deed. Here we are dealing with nature in her higher manifestations, and subject to a code of rules, not written in a statute-book, but essentially imbedded in her hidden being, as the motive spring of her existence. The whole works with the certainty and effect of a well-constructed and carefully-regulated machine. It owns no allegiance to any external impulse, but goes forthright in its appointed channel, regardless of impediment, whether the latter be weaker or stronger, whether it shall destroy or be destroyed. It behoves us, therefore, most studiously to avoid error in the beginning, and before the machine is set in motion. Here truth in thought, truth in word, truth in deed, are especially desirable. To insure them, as regards our present theme, we must conceive the right idea of prudence, properly define her characteristics, arrive at an honest appreciation of her gifts and graces, and devote ourselves to her, as her faithful ministrants, in all her relations, social, intellectual, and moral.

Than prudence, thus contemplated, there is no higher wisdom. Such a prudence is co-mate with the loftiest wisdom. The prudential course of conduct inferred in these remarks, would commend itself as an illustration of the most elevated philosophy. It would be able to enlist in its favour the suffrages of the wisest in all times, the moralists of all climes. It would be at one with the most benevolent and beneficent impulses of the human heart, and at the same time insure the true interests of every individual who acted in obedience to its precepts. It has the promise both of this world and the next; and there is no conceivable condition of life in which we can safely dispense with its assistance. This virtue the ancients held in the greatest esteem. Not only the Hebrew proverbialists, but the Greek poets, have set forth its praises in some of their best works. The sublime fable of Prometheus has evident reference to it. One part of the moral of *Æschylus's*

admirable drama on this high argument, is to enforce the doctrine, that the exercise of prudence is as incumbent on the father of the gods as it is on inferior deities and men.

BY GOING THINGS.

THERE are many things which, in these 'fast,' 'go-ahead' days, may be justly said to be bygoing, in as far as they have fallen behind the fashion and requirements of the age—things slow, things *arrière*, things *roves*—which we must soon see no more. For all such things as were good in their day, I think there is no need for our seeing their going with indifference, even while we welcome those presumably better things which succeed them; nay, there are some which good-feeling will not allow us to take leave of without something like regret, and a wish at least to keep them bright and pleasant in the memory.

Does my reader remember the time when he was a child—a boy?—that time when a coach with four horses was his ideal of the *ne plus ultra* of locomotive speed? I do not ask whether he would desire to have that time forgotten—that precious season of his life, before the glorious brightness of boyhood faded

'Into the light of common day.'

There breathes not, we believe, 'a man with soul so dead,' as to wish to forget his boyhood. But let me ask him whether he would willingly forget the coach with four horses—that grand locomotive of his childhood, 'the mail?' Would he have this bygone quite bygone and forgotten? Answer, all ye British men, who fly along the railways of these isles at a speed that causes the winds to whisper together in astonishment! When the engine-whistle thrills through every nerve of your body—when the bell rings while you (poor belated wretch!) are still a quarter of a mile from the station—when you arrive panting, almost at the last gasp, with haste, and just in time to see the train going off—when you are carried, by mistake, fifty miles beyond your destination—when you are going through a very long, dark tunnel—when a grand crash takes place, and you damage yourself on your opposite neighbour by being precipitated into his chest—when these things occur, say, my candid countryman, does not a vision of a mail-coach, with four fine horses, sometimes come galloping across your brain? Do you not see the 'capital cattle' clearing the ground at a sufficiently rapid rate? Do you not catch a glimpse of the rosy faces of the coachman and guard; an echo of the notes which the latter sends out from his bugle? Do you not see those passengers who would become almost like friends to you before the journey is completed? The pleasant inns where you stop to change horses; the pleasanter ones where you stop to breakfast or to dine; rapidly, indeed, and for the most part standing—as the Jews eat the Pass-over—but still you are stopping, and you are dining: do you not see these things in imagination when enduring the inconveniences pertaining to our improved mode of travelling? for, alas! all sublunary improvements have their inconveniences. Surely, dear reader, be your shares in railways ever so many—be you a director of a dozen lines—be your philosophical and scientific devotion to steam and its wondrous powers ever so great—you cannot—no, you cannot surely say of a mail-coach, 'Away! dull remnant of a past state of things: rest for ever in a deserved oblivion!'

Having nothing particular to do in London this last

July 1847, I determined to run down to the coast and enjoy the luxury of sea-bathing, and a strong breezy row on the ocean. With Brighton, Dover, and the Isle of Wight I was familiar, and I therefore resolved to try Hastings, of the beauty of which I had heard much. Having ascertained that the railway to Hastings was completed, I consulted a map to examine the route. Here was ample matter for the exercise of our national talent for grumbling. The railway from London to Hastings was not *direct*. An Englishman, like a mad dog, loves to run in a straight line; and the idea of going round by Brighton became insupportable to me. To be more than three hours going from London to a place about sixty miles distant!—it was too bad—and I walked on down Parliament Street in a discontented mood, with a *Bradshaw* in one hand, and a map of Kent and Sussex in the other. Presently the clear notes of a key-bugle were borne to my ears; 'The Light of Other Days,' correctly and tastefully played, came swelling and dying through the street. Soon I distinguished the cheerful tramping of horses accompanying the music, and saw a well-loaded coach coming quickly along, finishing its journey in triumphant style, quite unabashed by the knowledge that it was slower than steam. There was something life-like, nay, *human*, about the whole affair. As it passed by me, I read the word 'Hastings' painted on the vehicle. 'So there is such a thing as a Hastings coach still existing,' thought I, and followed it mechanically. It stopped at the Golden Cross, and there the dusty but cheerful-looking passengers dismounted, and exchanged last words with each other. Their luggage was soon distributed by the energetic exertions of the guard, and each wended his way in a different direction; and the four horses were taken out—their day's work was done. I do not pretend to analyse the motive of my change of mind, but I suddenly took it into my head that I would go to Hastings outside the coach; and walking into the office, I booked the box-seat for the following morning. I went home to dinner, not quite sure that my determination was not very stupid. By half-past nine on the following morning I and my portmanteau arrived at the Golden Cross. An American friend came with me to see me off. The fact was, that he did not believe I should keep to my resolution of going by coach, but thought I should slink off to the railway terminus instead. He is one of those men who fear nothing so much as losing time on a journey; although *why* they are so anxious about saving it then, is astonishing to those who see them waste it recklessly on most other occasions.

'Well, good-by, S—,' said he, shaking hands with me. 'There is no accounting for tastes, you know, but I did not think yours was so antediluvian! You actually mean to be nine hours *doing* sixty miles?'

'No indeed,' I replied; 'I mean to spend nine hours in seeing some of the richest country in England. I am going not to *suffer* a journey, but to enjoy a drive.'

'But, my dear fellow, it's not to be compared to going in a first-class carriage by a fast train,' persisted my friend.

'I never thought of comparing them. They are two very unlike enjoyments. Thoughts of bygone days come over me as I look at that coach,' I continued, approaching it to watch some passengers ascend to the roof—a young woman and an old man. They took their seats behind the box.

'Well, well; but you know the old proverb, "Let bygones be bygones."'

'Yes, I remember the proverb, and I am going to turn it inside out, and to see how much it is worth in the present instance. So now good-by, D—; and when you write next to the people at Buffalo, tell them you have seen some curious monuments of antiquity in London; among others, the *Hastings* coach, and a man who was going to ride on it.'

We laughed and shook hands. I climbed to my seat beside the coachman, and in another minute we were going fast down Parliament Street to the tune of 'Off she Goes.' I experienced a strange sort of feeling in my new position, for the box-seat of an old-fashioned coach is not quite like a seat on the top of an omnibus. The machine itself which carried us along was quite hidden by the people, and the packages which covered it, and were suspended on all sides of it.

I had promised myself the study of two things in this expedition—the study of human nature, and the study of what landscape painters and lovers of the picturesque call *par excellence* 'nature.' The immortal Mr Fudge travelled in the dicky, that he

'Might more of men and manners see.'

I chose the box for the same reason; and I began my observations with the coachman. He was a florid, but decidedly handsome man of five-and-thirty; he looked a little like a *mauvais sujet*, but much more like a smart, good-natured fellow. His hat was put on in a jaunty style; he held a carnation by the stalk between his teeth, which was afterwards transferred to his button-hole. For the first few minutes he devoted himself entirely to his horses, for which he seemed to entertain a strong affection. At last he said, while he looked down curiously at the flank of his off-leader, 'We shall have a warm day, sir.'

As I supposed this observation was addressed to me, I replied to it. He then turned his head round, and said to the young woman who was seated behind him, 'I hope the old gentleman's settled comfortable, miss; and that you don't suffer no ill-convenience from that ere hamper?'

'No, I am much obliged to you,' she replied; 'we are quite comfortable.'

'Very good,' replied the coachman, pushing down one of his own coats; 'but just you put your feet upon that; it will do for a footstool, and then you'll sit a deal more comfortable.'

The young woman hesitated to apply the coat to such a purpose, but the coachman persisted. 'Bless you, it aint of no value; and if it was, I shouldn't mind it. I always do what I can to make ladies comfortable,' he added with a laugh. The young woman, with a little embarrassment, accepted the proffered courtesy in silence. I did not like to add to her embarrassment, and therefore turned away to look at the other passengers. The old man beside her with the hooked nose was her father. That young man next to him was a wide-awake, keen-eyed fellow, evidently an attorney's clerk, from his blue bag. What was he doing outside a Hastings coach? He could not be travelling for pleasure in July? It came out afterwards that he was going as far as Seven-Oaks, to take down the evidence of a bed-ridden man who was concerned in a breach-of-promise case. Next to him sat a smartly-dressed, middle-aged woman, with an abundance of baskets. It was a long time before she was settled to her satisfaction. First she put up her veil, then she pulled it down again; then she did the same by her parasol; finally, she took off her shawl, and declared that if she 'had had any idea how hot and dusty it was, she never would have consented to travel outside the coach; it would certainly lay her up for a week; she was not strong enough to bear such things,' &c. &c. My friend the coachman informed me in a whisper that 'the lady who was cutting it so uncommon fine was one of Lord ———'s housemaids going down to ——— Park.'

There was another person in front of the coach, and within my sphere of observation, who attracted me much. He sat on the other side of the young woman. This was a tall, thin, pale man of about five-and-twenty. His face had acquired by study, illness, abstinence, or deep sorrow, a refinement both as to outline and expression which was to my taste more pleasing than that which is inherited by many a descendant of the highest races in the land. Though evidently not of

gentle blood, and quite unpolished and inelegant in his bearing, there was a quiet self-respect, a melancholy modesty in his manner which was singular. From his black coat of coarse cloth and *priggish* cut, his white neckcloth tied in the vilest manner, I should have guessed him to be a dissenting preacher, even without the assistance of the tract which he held in his hand, and which he began to read as soon as we were off the stones.

The young woman had whispered something to the old man as soon as she saw the person I have last described, and before mounting the coach, the old man had taken off his hat respectfully to the minister. The latter shook hands with them both, and assisted them to ascend. Afterwards he seemed to forget them, and to be lost in his own reflections. But the young woman, though scarcely daring to look at him, seemed always to see what he was doing. The expression of mingled reverence and admiration was not without a tinge of a tenderer feeling as she regarded him. He was her spiritual pastor and master, a minister of the gospel, and the preacher at her chapel. Besides this, he was a saint—a learned man; and so kind and good, as to forget himself for any one who needed help. All this I read in the girl's face as she sat beside him.

Talk of the dangers of a red coat to a woman's heart! they are as nothing compared with those of a black one. Of twenty women, five will be attracted by a soldier, while the other fifteen will find more to love and admire in a clergyman. The soldier inspires a light fancy, which is soon cured; the clergyman a far deeper feeling. I watched all these persons, and conversed with them during the journey. The old man and his daughter, and the minister, were residents in Hastings; the others we parted with on our road. And what a road that was! If I wished to give a foreigner a true idea of rural comfort and agricultural wealth in England, and also to give him a sight of picturesque scenes peculiarly English, I would place him outside a coach, and send him from London to Hastings. The road lies through Lewisham, Bromley, Seven-Oaks; then it skirts a part of Knowle Park, giving 'beautiful bits' of its unrivalled sylvan scenery. Hereabouts the hop-gardens begin. From the tops of hills you get extensive views over Kent and Surrey, noting

'Many a village marked by little spire,'

and many a fair mansion

'Boomed high in tufted trees,'

with wide sweeps of corn-fields, hop-gardens, meadows, woods, and heaths. Many a snug homestead, or farm, is seen nestling in a hollow, and the labourer in the fields stops to stare up at the coach as it passes. On driving through a village, your eyes are feasted with the well-kept gardens before the cottage doors. Such roses and lilies, hollyoaks and sweet peas, clematis and honeysuckle, as I saw crammed within tiny gardens ten feet square! all as carefully tended as if the lady of the manor sent her own gardener to keep them in order. Then the cottages themselves were a treat to see—so clean, and neat, and cared for! The children not indeed so clean as their homes, but merry, rosy, and noisy. The coming of the coach was a daily cause of excitement, and the urchins roared after it as if it carried away their schoolmaster. The towns through which we passed, and the inns at which we changed horses, were such as no other country that I am acquainted with can boast. An English country town (not manufacturing), and an English inn (not a tavern or gin-palace), is to my mind a credit to the nation in every way—municipal, moral, æsthetical, ay, and even intellectual. I will answer for it, that any one English town, of the size of Tunbridge, for instance, will produce half-a-dozen persons fit to grace a literary drawing-room, or the pages of a magazine, as well as the same number culled from the same rank of persons in any one parish of London or Edinburgh. The country

round about Tunbridge is very fine, and it is still finer at Tunbridge Wells, which is about four miles off. Tunbridge Wells is apparently composed of new, and in many instances handsome stone houses, built for the accommodation of visitors. Its situation is peculiarly beautiful. After passing Tunbridge, I began to find that I was hungry. The succession of interesting scenes, and the amusing and clever conversation of the coachman touching the various places we passed, had given me an appetite; and when the coach stopped at Pemry to dine, I attacked a cold sirloin with right good-will. Here I entered into conversation with the young minister, and was struck with the justice and good sense of all he said. His account of Hastings and its environs pleased me much. It was evident that his feeling for the beauties of nature was not destroyed by his renunciation of the things of this world. I asked him if he could direct me to some quiet lodgings on my arrival in Hastings, as I particularly disliked remaining at an inn. After a moment's reflection, he looked earnestly at me, and replied, 'You observed the old man and his daughter who are our fellow-travellers? They are persons in reduced circumstances, and let part of their house. I lodge with them. I think they have more rooms to spare. I can only say that the house is very quiet, and that I find them very pleasant people to live with. They are true Christians, and belong to my congregation.' Saying which, he bent down his eyes, and then remained silent. I thanked him for his information, and resolved to speak to the daughter as soon as we reached Hastings. After taking our places again, I began to talk to her about Hastings, and the beautiful country we were passing; she answered in such a manner as to convince me that although she was obliged to ride outside a coach, her education would not have disgraced the owner of a carriage. When we came to Battle, she pointed out many beautiful things in that picturesque old town, and showed a knowledge of the history of the place which was, as I thought, extraordinary for a woman, until her father told me that he had devoted great part of his life to a study of the antiquities of Sussex, and that his daughter was born at Battle. The first sight of the sea, on our approach to Hastings, was at a distance of four miles from the coast. I could scarcely believe that we were already so near the end of our journey, or that I had been nearly nine hours on the road. The day had been lovely; neither too hot nor too cold. We had no rain, and not very much dust. During the last part of the ride, the only passengers in front were the old man and his daughter, their minister, and I; and our conversation having, as I said, turned upon the history of the locality, it became general. As the coach went along the road from St Leonard's to Hastings, which lies along the beach, I was absorbed in watching the waves, and allowed the others to talk without me. Presently the old man drew my attention, and said that he was sorry to part with me. I returned his kind speech by another; and then lowering my voice, so as not to be heard by our merry-hearted coachman, informed him that I should feel much obliged if he and his daughter would receive me as a lodger, since I had learned from the gentleman beside them that they wished to let part of their house. The affair was arranged in a minute. When the coach stopped at the Castle Hotel in Hastings, we four did not part, as fellow-passengers generally do, but we all walked together to old Mr C——'s house, near All-Saints' Church, and sat down to a plain dinner together. Mary C—— and her father are indeed 'pleasant persons to live with.' I have spent a fortnight here already, and as yet I feel no inclination to go away.

Now, dear reader, I have travelled on all the railways in England, and on many abroad, but not one has ever produced so very agreeable an acquaintance for me as this old-fashioned 'bygoing' coach. I cannot say that for all purposes a coach is best, but I am sure it is best if you wish to see the country through which you

pass, and learn something of the characters of your companions. Therefore, I say, be not the mail entirely despised—be it not parted from without at least the due tribute of a sigh.

THE GEOLOGY OF THE NIAGARA FALLS.

THESE Falls, which an American writer, with justifiable boldness, speaks of as the greatest wonder in the world, occur, as is well known, on the course of that stream which forms the outlet of the great chain of Canadian lakes. In passing from the Atlantic up this grand natural water-course, we first come to Lake Ontario, a sheet of water a hundred and seventy miles long, and bearing all the ordinary appearances of a sea. Between this lake and Lake Erie there is a connecting river of about thirty miles, usually called the Niagara River, though it is the same stream which, below Lake Ontario, bears the name of the St Lawrence. It is about the middle of this short river course that the Great Waterfall takes place. The arrangement of physical objects essential to the fall is simple, and easily understood. The river flows over a flat table-land, in a depression of which Lake Erie is situated. Where it flows from the lake, it is three hundred and thirty feet above Lake Ontario, which is about thirty miles distant. It is here a mile broad, with all the appearance of an arm of Lake Erie. After flowing about fifteen miles between low banks, and only descending as many feet, it comes to a series of rapids terminating in a precipice of about one hundred and sixty-five feet, down which it is precipitated into a narrow ravine, which extends for seven miles, and along which the waters make a comparatively rapid descent. The course of the river above the fall is occasionally three miles broad, and studded with low woody islands, one of which forms a considerable tract of land. Below the fall, all is changed, for the water then runs with turbid violence in a trough or groove, generally not more than four hundred yards broad, and in some places only about half that width. At Queenstown, again, having passed out of the elevated region, it once more assumes a slow and gentle course over an open country, and thus it continues till it joins Lake Ontario. The course of the Niagara River is north and south; the country on the east or right bank belongs to the United States; that on the west is part of Canada.

A vast volume of water, the drainage of a country thousands of miles in extent, pouring over a rock one hundred and sixty-five feet high, must needs constitute an object of uncommon sublimity in almost any circumstances. It is admitted that, if it took place amidst savage alpine scenery, its effect would be greatly increased. As it is, there are some external features not unworthy of the neighbourhood of so grand an object. The western shore is a cliff of about eighty feet above the top of the fall; the eastern shore is lower, but is finely wooded. The whole breadth of the river at the fall—eleven hundred yards, or nearly two-thirds of a mile, and forming the chord of an irregular arc—is divided by a low wooded island, called Goat Island, into two parts, the eastern of which is about three hundred and seventy-five yards in curvilinear length, constituting what is called the *American Fall*; while the western is about seven hundred yards in the same measurement, forming the more celebrated *Horse-Shoe Fall*, so called from its strikingly curved form. Level with the edge of this fall is a platform called *Table Rock*, projecting over the abyss below, and from which a fine view of the cataract is obtained. This rock seems much shattered, and likely soon to give way; yet young and headstrong persons will sometimes lay themselves prostrate on its front edge, and with extended hand cleave the torrent as it leaps down. One who has acted in this venturesome way says, 'The prodigious volume and indraught of the falling waters, the gushing spray, the bewildering noise of the cataract, your prostrate and impending attitude, and the tremor of the very rock on which you

lie, render the experiment in the highest degree shuddering.'

All beholders speak of the Niagara Falls in terms of the highest admiration, but with a strong sense of the impossibility of conveying by words an adequate idea of the grandeur of the scene. We take leave to quote a few descriptive passages from Mr Bouchette. 'The first object that meets the eye, after descending to the Table Rock, is the splendid gradation of swift rapids above the Falls; then white revolving clouds of mist, irregularly belched forth from the abyss, rush across the platform, enveloping the beholder; and as these are swept away by perpetually varying currents of air, he approaches nearer the verge of the rock, and beholds the whole length of the tremendous cataract. The loud shrill roar of the rapids is lost amidst the appalling thunders of the Falls, which give a real or imaginary tremulous motion to the earth, and seem to threaten a disruption of the projecting rock upon which we are standing. The view from this spot is extremely grand, and unspeakably sublime; but it is too near and overpowering to permit the spectator fully to appreciate the whole splendour of the scene. The summit of the bank, rising about one hundred feet above the Table Rock, affords a more comprehensive and advantageous view. This position is most commanding, and perhaps the point from whence the collective magnificence of the cataract can be seen with the greatest effect. According to the altitude of the sun, and the situation of the spectator, a distinct and bright iris is seen amidst the revolving columns of mist, that soar from the foaming chasm, and shroud the broad front of the gigantic flood. Both arches of the bow are seldom seen entirely elicited; but the inferior segment is perfect, and its prismatic hues are extremely glowing and vivid. The fragments of a plurality of rainbows are sometimes to be seen in various parts of the misty curtain of the Falls.

'The exploration of the inferior regions of the cataract is attended by some hazard and much difficulty; but the thirst for the romanesque and sublime has overcome all obstacles, and led the ardent youth, the dauntless traveller, and the philosopher, a perilous pilgrimage along the slippery margin of storming eddies, beneath impending rocks, amidst jarring elements, to the foot of the deluging torrents, and even to penetrate several feet behind the concave sheet of the headlong waters. It eminently requires fortitude and self-possession to make this progress. The rocks over which we advance are sharp, broken, and excessively slippery, owing to the perpetual moisture they acquire from the oozing crevices of the superincumbent cliffs and the spray, so that one inadvertent faux-pas might plunge a victim into the whirling and boiling vortex of the Falls. The danger is considerably increased by the terror arising from the stentorian thunders of the tumbling floods, that ever resound from side to side of the humid cavern, and seem to shake the firm rock to its foundation. The difficulty experienced in breathing, from the combined moisture and compression of the air, the impossibility of hearing or being heard, the dizziness produced by the falling waters, the dimly-discovered snakes and reptiles around, the whirl, the wind, the roar, all combine most powerfully to affect the soul, to overwhelm at once the senses and the imagination, and baffle all powers of description.

'Immediately at the base of the Falls, the raging waters are lashed into one thick mass of froth and foam of dazzling whiteness; but their surface farther down becomes comparatively still, though ever whirling and boiling, and exhibits a totally different appearance from that of any other part of the river. The labouring stream seems inwardly convulsed, heaving and throbbing in dark and bubbling whirlpools, as if it threatened every moment to eject some of the mystic terrors of the deep. This effect is ascribed by Professor Dwight of the United States to the reaction of the ascending

* Bouchette's *British Dominions in North America*, l. 143.

waters. Precipitated bodily to an extraordinary depth by their own prodigious gravity, and the force of their impulsion, and involving in them a quantity of fixed air, they reascend to the surface in a struggling career, checked by the weight of the superincumbent water.

'The noise of the Falls is truly grand, commanding, and majestic. . . . It is very variable in its loudness, being essentially influenced by the state of the atmosphere, the direction of the wind, and the position of the listener. It is sometimes scarcely audible within three or four miles; and at others it may be heard at York, on the opposite shores of Lake Ontario, a distance of forty-six miles.'

The configuration of the ground suggests a curious inference regarding the history of the Niagara Falls. The table-land—over the surface of which the river flows for fifteen miles, and through which its channel is cut for other seven to the depth of from two to three hundred feet—terminates at Queenstown in an abrupt cliff ranging east and west, and facing towards Lake Ontario. Below this point, the course of the stream is over a low flat country, with a very slight descent. The most superficial observers unavoidably contemplate the deep channel of seven miles as the work of the river itself; and the idea receives confirmation of the most decided kind from the fact, that the waterfall is continually, though slowly, wearing away the rock. The common belief of the country people therefore is, that the fall was originally at Queenstown, and will in time get back to Lake Erie, which will consequently be emptied, and become dry land.

Geologists have examined the district, and fully confirm these popular observations. Our countryman, Mr Lyell, has given it his especial attention; and in his 'Travels in North America,' has introduced some curious speculations on the subject. It appears, from the inquiries of Mr Hall, geologist for the state of New York, that the table-land is composed of nearly horizontal strata of the Silurian formation, the inclination being from Queenstown back to Lake Erie, at the rate of about twenty-five feet in a mile. It may be remarked that, the land being highest at the cliff above Queenstown, the fall must have been considerably more lofty and grand when at that point than it is at present. Indeed there is another circumstance to be here taken into account—namely, that the space over which the river now runs between the fall and Queenstown, would also be an addition to the height of the fall. We may therefore suppose it to have been at first upwards of three hundred feet high—a stupendous altitude for the descent of such a volume of water. What chiefly has tended to the wearing away of the channel, is the peculiar arrangement of the strata at this place. The superficial beds are a hard limestone, calculated to wear away very slowly; but underneath these are deep beds of soft shale, which rapidly yield to the force of the water. The river, pouring over the limestone, makes little impression upon it; but, falling upon the shale below, it readily makes a great abyss for the reception of its maddened waters, while the spray, driven by the wind against the wall behind, scoops out a recess in that direction, thus taking away the support of the limestone above, and preparing it for crumbling away in considerable masses. Such is actually the way in which the cataract recedes. There was a great fall of rock in 1815, and another in 1828, causing very considerable changes in the appearance of the falling waters. In the year before the one last mentioned, Captain Basil Hall conversed with a settler who had lived on the spot thirty-six years, and who had witnessed many such changes. In a country so recently settled, we have unfortunately very short and imperfect records to trust to; but it so happens that, so far back as 1697, a missionary called Father Hannepin published a drawing he had taken of the Falls, and from it we find that there was then a third fall, crossing the direction of the other two, and caused by the opposition of a rock which does not now exist. It was the belief of the old

person consulted by Hall, that the fall receded at the rate of a yard per annum, and this received the sanction of the son of Mr Bakewell, the well-known geologist. Mr Lyell, however, made such inquiries as satisfied him that one foot per annum was nearer the actual rate of the retrogression. The matter, after all, must depend very much upon the nature of the rock which forms the substratum at different points. In the early part of the process, the basis rock was of a harder kind, and the wearing would be slower accordingly, as it will in time be slower again, when the fall recedes beyond the point where the shale forms the base of the precipice. The obvious reason why the Falls assume a curved or horse-shoe form, is the fact, that the greatest volume of water is always in the centre of a stream, and this evidently leads to the great narrowing of the river channel from the fall downwards.

The greater elevation of the plateau towards the north, indicates that the above-fall portion of the river formerly occupied a higher bed. There remain actual memorials of this circumstance, in certain patches of a fluviatile alluvium, or river deposit, which are found close to the present fall, and in places farther down. A portion of this deposit rests upon Goat Island, at thirty-eight or forty feet above the top of the fall; a terrace-like portion is deposited on each side of the river, at an altitude so coincident as to show that they originally formed one uninterrupted bed. In this alluvium are found, united with remains of the extinct mastodon, shells of the genera *Unio*, *Cyclas*, *Planorbis*, and others usually found in fresh water, clearly proving that it is a river or lake deposit. Three similar terraces exist near by, at somewhat lower levels, indicating rests which the river made in the process of depression which necessarily accompanied that of recession. Mr Lyell extended this interesting class of observations, by discovering other patches of ancient river alluvium at two several places. They contained shells of the same genera. 'These facts,' he says, 'appear conclusive as to the former extension of a more elevated valley, four miles at least below the Falls; and at this point the old river-bed must have been so high, as to be capable of holding back the waters which covered all the patches of fluviatile sand and gravel, including that of Goat Island.' He adds, 'By exploring the banks of the Niagara above the Falls, I satisfied myself that if the river should continue to cut back the ravine still further southwards, it would leave here and there, near the verge of the precipice and its islands, strata of sand and loam, with fresh-water shells similar to those here described.'

Mr Lyell sees great difficulties in the way of coming even to an approximate conjecture as to the time that has elapsed since the cataract was at Queenstown; but remarks that, if the recession proceeds at an average rate of a foot per annum, a lapse of 35,000 years is implied for the whole process. Viewing the position of the strata, their coming to an escarpment at Queenstown, and their being partially covered, not only by the alluvial patches and terraces, but, below these, by a bed of drift, or ancient boulder clay, of marine origin, and referable to a time when ice prevailed more extensively over the land than now, he speculates on a succession of changes in the order in which he imagines they may have happened. 'The first event to which we must recur, is the superficial waste or denudation of the older stratified rocks, all of which have remained nearly undisturbed and horizontal from the eve of their formation beneath the sea to a comparatively modern period. That they were all of marine origin, is proved by their imbedded corals and shells. They at length emerged slowly, and portions of their edges were removed by the action of the waves and currents, by which cliffs were formed at successive heights, especially where hard limestones were incumbent on soft shales. After this denudation, the whole region was again gradually submerged, and this event took place during the glacial period. . . . The country was then buried under a load

of stratified and unstratified sand, gravel, and erratic blocks. . . . The period of the submergence was very modern, for the shells then inhabiting the ocean belonged, almost without exception, to species still living in high northern, and some of them in temperate latitudes. The next great change was the re-emergence of this country, consisting of the ancient denuded rocks, covered indiscriminately with modern marine drift. The upward movement by which this was accomplished was not sudden and instantaneous, but gradual and intermittent. The pauses by which it was interrupted are marked by ancient beach-lines, ridges, and terraces, found at different heights above the present lakes. . . .

'As soon as the table-land between Lakes Erie and Ontario emerged, and was laid dry, the river Niagara came into existence, the basin of Lake Ontario still continuing to form part of the sea. From that moment there was a cascade at Queenstown, of moderate height, which fell directly into the sea.' [Mr Lyell describes a series of minor cascades which would then be formed, as successive strata of different degrees of hardness came into exposure. The series of events from the submergence are all, he proceeds to say], 'so modern in the earth's history, as to belong to a period when the marine, the fluviatile, and terrestrial shells were the same, or nearly the same, as those now living. Yet if we fix our thoughts on any one portion of this period—on the lapse of time, for example, required for the recession of the Niagara from the escarpment to the Falls—how immeasurably great will its duration appear in comparison with the sum of years to which the annals of the human race are limited!'

JOHN KNOX'S HOUSE IN EDINBURGH.

[From the new edition of the 'Traditions of Edinburgh.']

In the Netherbow, the street receives a contraction from the advance of the houses on the north side, thus closing a species of parallelogram, of which the Luckenbooths formed the upper extremity—the market-place of our ancient city. The uppermost of the prominent houses—having of course two fronts meeting in a right angle, one fronting to the line of street, the other looking up the High Street—is pointed to by tradition as the residence or manse of John Knox, during his incumbency as minister of Edinburgh, from 1560 till (with few interruptions) his death in 1572. It is a picturesque building, of three above-ground floors, constructed of substantial ashler masonry, but on a somewhat small scale, and terminating in curious gables and masses of chimneys. A narrow door, right in the angle, gives access to a small room, which has long been occupied as a barber's shop, and which is lighted by one long window presented to the westward. This was the hall of the mansion in former times. Over the window and door is this legend, in an unusually old kind of lettering:—

LVFE · GOD · ABVVE · AL · AND · YI · NYCHTBOVR · [AS ·] YI · SELF ·

The word 'as' is obliterated. The words are, in modern English, simply the well-known Scriptural command, 'Love God above all, and thy neighbour as thyself.' Perched upon the corner above the door is a small effigy of the Reformer, preaching in a pulpit, and pointing with his right hand to a stone above his head in that direction, which presents in rude sculpture the sun bursting from clouds, with the name of the Deity inscribed on his disk in three languages—

Θ Ε Ο Σ
DEUS
GOD

Dr M'Crie, in his *Life of John Knox*, states that the Reformer, on commencing duty in Edinburgh at the conclusion of the struggles with the queen-regent, 'lodged in the house of David Forrest, a burgher of Edinburgh, from which he removed to the lodging which had belonged to Durie, abbot of Dunfermline.' The magis-

trates acted liberally towards their minister, giving him a salary of two hundred pounds Scottish money, and paying his house-rent for him, at the rate of fifteen merks yearly. In October 1561, they ordained the dean of guild, 'with al diligence, to mak ane warm studye of dailles to the minister, Johne Knox, within his house, aboue the hall of the same, with lyht and wyndokis thereunto, and all uther necessaris.' This study is generally supposed to have been a very small wooden projection, still seen on the front of the *first floor*. Close to it is a window in the angle of the building, from which Knox is said by tradition to have occasionally held forth to multitudes below.

The second floor, which is accessible by two narrow spiral stairs, one to the south, another to the west, contains a tolerably spacious room, with a ceiling ornamented by stucco mouldings, and a window presented to the westward. A partition has at one time divided this room from a narrow one towards the north, the ceiling of which is composed of the beams and flooring of the attic flat, all curiously painted with flower-work in an ancient taste. Two inferior rooms extend still farther to the northward. It is to be remarked that the wooden projection already spoken of extends up to this floor, so that there is here likewise a small room in front; it contains a fireplace, and a recess which might have been a cupboard or a library, besides two small windows. That this fireplace, this recess, and also the door by which the wooden chamber is entered from the decorated room, should all be formed in the front wall of the house, and with a necessary relation to the wooden projection, strikes one as difficult to reconcile with the idea of that projection being an afterthought; the appearances rather indicate the whole having been formed at once, as parts of one design. The attic floor exhibits strong oaken beams, but the flooring is in bad order.

In the lower part of the house there is a small room, said by tradition to have been used in times of difficulty for the purpose of baptising children; there is also a well to supply the house with water, besides a secret stair, represented as communicating subterraneously with a neighbouring alley.

From the size of this house, and the variety of accesses to it, it becomes tolerably certain that Knox could have only occupied a portion of it. The question arises, which part did he occupy? Probability seems decidedly in favour of the *first floor*—that containing the window from which he is traditionally said to have preached, and where his effigy appears. An authentic fact in the Reformer's life favours this supposition. When under danger from the hostility of the queen's party in the Castle—in the spring of 1571—'one evening a musket ball was fired in at his window, and lodged in the roof of the apartment in which he was sitting. It happened that he sat at the time in a different part of the room from that which he had been accustomed to occupy, otherwise the ball, from the direction it took, must have struck him.'—*M'Crie*. The second floor is too high to have admitted of a musket being fired in at one of the windows. A ball fired in at the ground-floor would not have struck the ceiling. The only feasible supposition in the case is, that the Reformer dwelt in the *first floor*, which was not beyond an assassin's aim, and yet at such a height, that a ball fired from the street would hit the ceiling.

[Some time ago we stated that this curious antique house was likely to be taken down to make way for a place of worship connected with the Free Church of Scotland. As we made some free remarks on the design at the time, we feel the more pleasure in now stating that a resolution has been come to to spare the building, the plan of the intended church being modified for the purpose. There was at all times, we understand, a wish to preserve so interesting a relic; but great fear was entertained lest this should be impossible, owing to the state of decay in which the house had been found by its new proprietors. A more rigid examination, under

an anxious desire to sustain it if possible, has now led to the adoption of the plan in question. Every effort will, we understand, be made to strengthen the building, so that it may long remain as a memorial of one of the most remarkable men whom our country has produced. We have no doubt that the feeling of gratitude which this excites in us towards the parties concerned will be general.]

REMARKABLE SCHOOL OF INDUSTRY.

SOME years ago, we gave our readers a sketch of the race of hereditary robbers and murderers in India called Thugs; and we have now the task, as strange as it is pleasing, of describing a series of measures by which, in the part of the country where the experiment has been tried, these preternatural monsters have been already converted into quiet and useful citizens. We are enabled to do this by the kindness of a stranger, who dates in July last from Jubbulpoor, in the Saugor and Nerbudda territory. He describes himself as 'a poor uneducated man, but one interested in his fellow-beings;' and he addresses himself to this Journal in gratitude for its efforts in the cause of human amelioration, and from his desire to take advantage of a circulation which is not confined to one country, or one hemisphere, in giving publicity to some important suggestions. He begins his communication by referring to our account of the Dundee School of Industry in March last, a perusal of which led him to suppose that we should be glad to have a sketch of a similar establishment in India, whose objects are not pilferers and beggars, but outlaws of nature as well as of man, who inherited from their ancestors, as their sole fortune and profession in the world, the trade of assassination!

Jubbulpoor, we may premise, is a town of about 20,000 inhabitants, and somewhat remarkable, even in India, for ignorance and superstition. Its neighbourhood was specially infested with Thugs and poisoners, and its citizens, to a man, were—and most of them are still—devout believers in the grossest species of sorcery. We mention this to show that the singular School of Industry we are to describe set out with no peculiar advantages of locality.

The grand difficulty that was at first found in the suppression of Thuggee, arose from the vast extent of the territory it pervaded, and the want of local courts for the special cognisance of that gigantic crime. Such tribunals were at length formed in the capital cities of various native princes, with our Residents for their judges; while at Jubbulpoor, Colonel Sleeman established himself, in 1836, as chief superintendent of the whole. Thanks to the energy of this meritorious officer, murder was now no longer permitted to traverse the country unchecked. Upwards of a thousand Thug families were apprehended, and sent in to Jubbulpoor for trial; and as everything is on a great scale in India, it was no uncommon thing to see in a single morning fifteen, twenty, even twenty-five, of these wretches swinging upon the gallows. The consequence of this virtually humane severity was, that the whole race was seized with a panic; the gangs separated and fled; their individual members, of course, found their occupation gone; and in a space of time wonderfully short, a system that had been for hundreds of years rooted in habit and religion was broken up and destroyed.

But all the convicts could not be hanged, and many were found useful as approvers in obtaining the conviction of the rest, as they were captured from time to time. Of these there had collected at Jubbulpoor, in the year 1837, 450 men with their wives and families, who resided during the day in a walled village in the neighbourhood built on purpose for their reception, while at night the men were locked up in the jails of the town. Each family, according to size, received from four to eight shillings a-month for its support; but as the mouths increased in number, this grew more and

more inadequate, and the children were sent out by their parents to work, beg, pilfer, or forage for themselves in anyway they thought proper. Colonel Sleeman saw that this system could not go on. As the children grew up, their wants would be greater, and their will stronger, and the convict village would turn out to be a nursery of crime. Under these circumstances, he suggested to his able and energetic assistant, Lieutenant Brown, the necessity of their attempting to introduce habits of industry among the convicts and their families.

Lieutenant Brown set to work with his customary alacrity, and erected a few sheds near his own house, where he induced about two hundred of the approvers themselves to repair, for the purpose of working at some common manufacture. These men, however, had never in their lives tried their hands at anything but murder, and such work as they were now set to did not come kindly to them. Their reward was to be the profit on the articles manufactured; but the manufacture was so bad, and the profit, in consequence, so small, that the labourers became first discontented, then disgusted, and then enraged, at their having condescended to anything at once so mean and unprofitable as regular industry. One day, in order to make an end of the business, they set fire to the whole plant, and burned it to the ground. Here they had reckoned, however, without their host, Lieutenant Brown; for the circumstance only made him the more determined and peremptory. He turned out the whole village morning and evening for six hours, to make bricks sufficient for a shed eighty feet by forty; and having completed the building, he borrowed £50 from the government to roof it in. The lieutenant himself, however, had to attend to his magisterial and other duties from ten till five o'clock; and the native guards were useless in superintendence, as they stood in the most abject awe of their desperate prisoners, and allowed them to work or play just as they pleased. He applied, therefore, for an overseer, and obtained, in 1840, the services of a Mr Williams, a daring and indefatigable officer, who kept four hundred desperadoes at work from seven A.M. till five P.M., thrashing with his own hands the idle and refractory. Under this discipline, the convicts were able in two years to spin hemp, weave common carpeting, make coarse towels, door-mats, &c. all of which were sold at Jubbulpoor and the surrounding stations.

It was now considered advisable to make an attempt with the children; and the approvers were informed that all who chose might bring their sons to the factory, who would be taught a trade, and receive a monthly stipend. Not one appeared. It was the idea of the parents that the real object of the government was to make their children Christians; and although they, the prisoners, must work under compulsion, they were determined to place their offspring, who were free, under no such suspicious subjection. Mr Williams at length offered, as a premium to such parents as should comply, the privilege of sleeping in the village, instead of being locked up in the jail at night; and the consequence was, that twenty boys appeared at the factory the next morning, and one hundred more within a week. The latter, however, were rejected; for Mr Williams had become uneasy at the idea of leaving so many desperate men together in a village guarded by only four sentries. It was necessary to proceed by degrees, and let the *ci-devant* Thugs feel their way to the comparative freedom of the village.

The first twenty boys were taught the manufacture of Brussels carpeting by an expert weaver from Mirzapore, and in three months were able to go on without their master. Another score of boys were then admitted; and in six months there were in all fifty boys, under ten years of age, busily employed in carpet-weaving. But although such a luxury as Brussels carpets might employ fifty boys even in India, it could not afford occupation for hundreds; the overseer, therefore, constructed another shed similar to the one

built by Lieutenant Brown, and set more approvers and boys to the manufacture of cotton cloth. And cotton cloth they did manufacture to a considerable extent; but unluckily, when they came to sell it, they found the long cloths of another hemisphere offered in the bazaar at two shillings for six yards, while for the same money they could not afford more than seven of their own, as coarse as dowlas. This now, of course, remained unsaleable. 'Read this, men of Manchester!' says our correspondent. 'In the valley of the Ner-budda, where cotton is cheaper than in any part of India, and where labour is the cheapest in the world—being six shillings a month for weavers who will work with an Indian loom twelve hours a day—in that valley you can sell cheaper cloth than is produced at our very doors, although, to say nothing of the sea voyage of so many thousand miles, you have to bring your manufacture 800 miles inland, and pay duty on it four times after it has left Calcutta!'

What was to be done? The cloth must be used—the work must go on. It was suggested by the overseer to turn the stuff into tents; and although these had hitherto been supposed to require expert workmen, no one now saw a difficulty in teaching the Thugs anything. Expert workmen were brought from Futtyghur; and in twelve months, 100 people were employed in making tents, stamping the chintzes for lining, turning the poles, making carpets, ropes, and a score of other articles indispensable for a Bengal tent. From the year 1840 to 1847, this establishment has increased tenfold: it has now upwards of twenty large workshops, built in good style by the Thugs themselves; and among the hands are 150 boys, most of whom earn more than ordinary workmen in the town. The original 450 murderers by birth and profession who have thus been brought into habits of industry, are represented as exhibiting every appearance of contentment and comfort; their children are growing up respectable members of the new form of society of which they are a part; their wives keep their houses and village clean, and add to the family funds by spinning thread at their leisure hours, which is purchased at the factory. The wages paid to them average £80 a month; and the goods sold exceed £300 a month. In fine, the paltry outlay of the government has been already returned, and the establishment supports itself.

We have but one more trait to add to this cheering picture. The question is no longer how to induce the attendance of the children at the factory; but, on the contrary, the advantages derivable from *permission* to do so are so manifest, that the superintendent is able to make a condition with their parents. The condition is, that the children attend a school provided for them, and learn to read and write before being admitted to work! Notwithstanding all this growing prosperity, our readers will be surprised to hear that Mr Williams has as yet no assistant but a single native clerk to keep the accounts of the establishment. This would be incredible to those who are not aware of the wild extravagance of the Company in matters of show and bloodshed, and the miserable per centage on their princely revenue which they devote to the purposes of education and national progress. There are various persons in this country, however, who have an opportunity, as our correspondent suggests, of assisting the solitary overseer, and in a way perhaps conducive to the gratification of their own tastes. Models, for instance, of such simple machines as would assist him in his labours would be all-important to him: such as a brick-and-tile-making machine, a common windmill, or a warping-mill.

In the account already referred to of the Dundee School of Industry, we gave some details of the previous habits of the objects of the institution; but a picture of the same kind in the present case, besides being infinitely more painful, would have no compensating utility, referring, as it would do, to a state of society so widely different from our own. Still, with reference to the above history of their reform, we must say enough to dispossess

our readers of the idea, if any of them have formed it, that the Thugs were mere ignorant and brutal wretches, who murdered from an innate ferocity of character. On the contrary, their worst crimes were tinged with a sort of wild feeling of religion. In the establishment at Jubbulpore they are never unwilling to relate their adventures, asserting that they were themselves but blind instruments of a higher power, sent into the world for the purpose of punishing such objects of Divine wrath as were delivered into their hands. Our correspondent states that the approvers in question were supposed to have murdered, collectively, 25,000 persons by strangulation; but he must mean, we presume, that this was the number of the victims of the gangs to which these individuals belonged. The patience, perseverance, and ingenuity they are now exercising in the arts of civilised life, receive a remarkable illustration from the following anecdote related by Colonel Sleeman himself:—

'A stout Mogul officer, of noble bearing and singularly handsome countenance, on his way from the Punjab to Oude, crossed the Ganges at Gurmuktesur Ghat, near Meeruth, to pass through Moradabad and Bareilly. He was mounted on a fine Turkee horse, and attended by his khidmutgar (butler) and groom. Soon after crossing the river, he fell in with a small party of well-dressed and modest-looking men, going the same road. They accosted him in a respectful manner, and attempted to enter into conversation with him. He had heard of Thugs, and told them to be off. They smiled at his idle suspicions, and tried to remove them; but all in vain: the Mogul was determined: they saw his nostrils swelling with indignation, took their leave, and followed slowly. The next morning he overtook the same number of men, but of a different appearance, all Mussulmans. They accosted him in the same respectful manner; talked of the danger of the road, and the necessity of their keeping together, and taking advantage of the protection of any mounted gentleman that happened to be going the same way. The Mogul officer said not a word in reply, resolved to have no companions on the road. They persisted: his nostrils began again to swell, and putting his hand to his sword, he bade them all be off, or he would have their heads from their shoulders. He had a bow and quiver full of arrows over his shoulders, a brace of loaded pistols in his waist-belt, and a sword by his side, and was altogether a very formidable-looking cavalier. In the evening, another party, that lodged in the same suraa, became very intimate with the butler and groom. They were going the same road; and as the Mogul overtook them in the morning, they made their bows respectfully, and began to enter into conversation with their two friends the groom and the butler, who were coming up behind. The Mogul's nostrils began again to swell, and he bade the strangers be off. The groom and butler interceded; for their master was a grave, sedate man, and they wanted companions. All would not do; and the strangers fell in the rear. The next day, when they had got to the middle of an extensive and uninhabited plain, the Mogul in advance, and his two servants a few hundred yards behind, he came up to a party of six poor Mussulmans sitting weeping by the side of a dead companion. They were soldiers from Lahore, on their way to Lucknow, worn down by fatigue, in their anxiety to see their wives and children once more, after a long and painful service. Their companion, the hope and prop of his family, had sunk under the fatigue, and they had made a grave for him; but they were poor unlettered men, and unable to repeat the funeral service from the holy Koran: would his highness but perform this last office for them, he would no doubt find his reward in this world and the next. The Mogul dismounted; the body had been placed in its proper position, with its head towards Mecca. A carpet was spread; the Mogul took off his bow and quiver, then his pistols and sword, and placed them on the ground near the body; called for water, and washed his feet, hands, and face, that he

might not pronounce the holy words in an unclean state. He then knelt down, and began to repeat the funeral service in a clear, loud voice. Two of the poor soldiers knelt by him, one on each side, in silence. The other four went off a few paces, to beg that the butler and groom would not come so near as to interrupt the good Samaritan at his devotions. All being ready, one of the four, in a low under-tone, gave the *shirnee* (signal); the handkerchiefs were thrown over their necks, and in a few minutes all three—the Mogul and his servants—were dead, and lying in the grave in the usual manner—the head of one at the feet of the one below him. All the parties they had met on the road belonged to a gang of Jumaldehee Thugs, of the kingdom of Oude. In despair of being able to win the Mogul's confidence in the usual way, and determined to have the money and jewels which they knew he carried with him, they had adopted this plan of disarming him; dug the grave by the side of the road, in the open plain, and made a handsome young Mussulman of the party the dead soldier. The Mogul being a very stout man, died almost without a struggle, as is usually the case with such, and his two servants made no resistance.

In conclusion, we must permit ourselves to express the pleasure we feel in having had an opportunity of recording in these pages the names of the individuals who have been the proximate agents in bringing about so happy a moral revolution. We have strong hope that the good work will spread, and that the government of India will at length be awakened more fully to a sense of its duty, and even to a sense of the glory it may acquire—if glory be its object—by following up the bloodless triumphs of peace and humanity.

THE OLD MAID FROM PRINCIPLE.

'Let him deny himself.'

'COUSIN LUCY, when will you tell me why you are not married? You often promised to tell me when I was a little older. I am now nearly sixteen: is not that old enough?'

'Yes, love,' replied the mild-eyed Cousin Lucy; 'you are, I think, old enough, and thoughtful enough, to apply my tale to useful purpose; so I will defer it no longer. Let us go to my favourite seat under the fir-trees, and we can then watch the sun set, while you listen to the old maid's proxy story. Come, the shadows are stretching nearly across the lawn, and I have the history of a life to relate.'

The fir-trees crowned the brow of a gentle western declivity, along which ran the miniature moat and palisades which formed the boundary of the pleasant garden. The slope below was rich with waving corn, mellowing in the breath of a warm July. Farther still, the 'hedgerow elms' were here gathered into majestic groups, and there stretched away in long irregular lines, enclosing fields of every hue, presented by a rich country in high cultivation. There was the bright tender green where the young grass was springing up after the hay harvest, the dusky shade of the pastures, the yellow barley, the feathery oats, and the sombre bean-field, all studded here and there with patches of the brilliant scarlet poppy. Bounding the prospect on the right might be seen a portion of the park-like meadow belonging to the house, dotted with enormous oaks and beeches; while on the extreme left lay a wide extent of moorland, glowing with flowering gorse and heath flowers. The rich landscape swept away, diversified by an occasional village spire, a mass of darker wood, the picturesque gable of some old farmhouse, or the silvery windings of a small river, and was terminated by a chain of lofty hills, towards which the sun was just sinking in a blaze of golden and crimson light. The 'smell of dairy farms' mingled with the thousand luscious perfumes that hang about the air of a summer evening; and the ear was soothed by the cooing of the wood pigeons, the tinkling of sheep bells from the heath, the evening song of the blackbird, and the ceaseless murmur of a hidden brook.

A rustic bench of unbarked wood extended beneath the ancient fir, and on this Cousin Lucy and her youthful auditor sat for a while, watching in silence the sunset changes of the gorgeous landscape.

Now Cousin Lucy was by no means the venerable personage she seemed to think herself. She was not forty, and looked considerably younger; her complexion was pale and clear; her figure slight and graceful; and although the usual expression of her face, and her fine full eyes, was thoughtful almost to sadness, a sweet bright smile was ever ready to light them up as she witnessed the enjoyment of those around her.

'There is no romance in my narrative,' she began, after a pause, 'so you must not expect any stirring incidents, flitting ghosts, or mysterious warnings. I have had my trials, it is true; but I have the satisfaction of knowing that my life has been much more useful, and far happier, than it would have been had I not borne them with a patient spirit.'

'Well,' exclaimed Margaret, 'it is a comfort to know at the beginning that, whatever troubles and miseries you describe, it will all end happily at last.'

'Not according to the sense you generally give to those words, my wilding,' responded her cousin, caressing the young girl's redundant tresses; 'since that implies that the lovers are married, and live happily all the rest of their lives. My story, remember, is an answer to the question, Why am I an old maid?'

'Yet you seem happy?'

'Nay, I know not seems: I am happy: and there is no happiness equal to that which is inspired by the consciousness of having acted rightly. But your question reminds me that I must begin my story, or night will overtake us before it is ended. You must know that my mother died when I was quite an infant. She had had many children, but of the whole number, only the eldest and the youngest grew up to womanhood. Now pray observe how many circumstances, arising chiefly from ignorance, conspired to bring my poor mother to her grave at the age of twenty-seven. She was naturally delicate, and this delicacy was increased by a boarding-school education, where the confined polluted air, the want of exercise, the tight stiff stays, and the unceasing mental exertion, completed the destruction of the little vigour she once possessed. Nevertheless, like a forced flower, she flourished precociously for a time. At sixteen, she was a woman in appearance and manners; and she had only left school a few months, when she married a man as ignorant as herself of the grave error they were committing. Within a year, she gave birth to a daughter. Six years more passed away, each being marked by the birth of a child. I was the last, and, with the exception of my eldest sister, the only one who survived the age of eighteen. All the others sunk under some form of consumption, that fell disease to which my mother had a strong constitutional bias. Shortly after my birth, she, too, showed symptoms of this disorder, and in a few months she was laid beside her children.'

'Ah, then, I see why you would not marry: you feared that all your children might die of consumption?'

'Exactly. But I was not so fortunate as to learn my danger at your early years. In my young days, such subjects as physiology, or anything relating to it, were scouted, even by those who professed liberality, as quite unnecessary, if not improper, in female education. And so, for the want of the merest elementary knowledge of these important sciences, mothers, with the best intentions, bound up their daughters' figures in unyielding web and whalebone, compressed their lungs, distorted their spines, impeded the action of their hearts, shut them safely up from the free breath of nature, taught them assiduously every fashionable accomplishment and every artificial grace, but would have fainted at the vulgarity of a morning run over a breezy hill, had common sense ventured to propose such a remedy for the poor creatures' pallid cheeks and wasting forms. And as for reflecting on the effect this false system must

have on their children's children, that of course they never did. Women did not often reflect at that time, except upon the characters of their neighbours. It has often struck me as a singular anomaly, that we calculate the extent of land or the amount of money we shall bequeath to our offspring, but never bestow a thought on the health they will inherit from us!

'Well, ignorance of such matters was prevalent when my sister, then about eighteen, married a young man of good family, but no wiser than herself. My father rejoiced at the unexceptionable match, and pleased himself with flattering visions of her future welfare. In short, everything seemed to me to smile upon their union, until one evening I happened to overhear a conversation that made a strong impression upon me, though I did not understand it till some years after. Our medical friend, Dr Winter, who had been on the continent for several months, and had only heard of my sister's marriage on the day of his return, was chatting with Miss Rumball, the clergyman's sister, and another lady—the wedding of course being the staple of their discourse.

"It is a great pity," said the doctor with a deep sigh; "her mother died of consumption, and I understand that his family is not free from the same malady. They ought on no account to have married. The children will pay the penalty."

"But there may not be any, you know, doctor," interposed one of the ladies (*not* Miss Rumball, for she, I remember, kept her eyes fixed on the point of her toe, and looked excessively shocked); "there are many happy marriages without children."

'Miss Rumball here cast a horrified glance first at me and then at them. Mrs Bland stopped short; the doctor shrugged his shoulders, and walked away. I could not imagine why Miss Rumball had checked them, as if they were saying something which it was improper for me to hear; so I stood behind the window-curtain (not very creditable, you will say; and I hope you will not suspect I should do so now), that I might hear the remarks of the two ladies when the doctor was gone.

"Singular man!" said Mrs Bland, who was a warm-hearted, weak-headed matron; "now, for my part, I can see no possible objection to the match; there are youth, wealth, and beauty on both sides."

"Oh, I've no patience!" exclaimed Miss Rumball, indignantly whisking the crumbs off her black silk dress; "it is *dreadful*, it is *dis-gut-ing*, to hear human beings with immortal souls talked of in that way!—actually brought down to the level of the brutes that perish! Dr Winter ought to have been a horse-dealer, or something of that sort, and then he'd have been in his proper element. One would really think, to hear him talk, that there were different kinds of human beings, just as there are of cattle and such things."

"Why, I've heard him say," replied Mrs Bland, "that if we took half as much care to improve our own race as we do to improve our horses and sheep, the doctors would be obliged to turn farmers."

"Pray, my dear friend, don't repeat such things to me. The man is low."

"He is rather indelicate sometimes," said the other, urbanely siding with indignant virtue; "but then he's such a clever creature, one must make allowances for his odd little ways."

"Oh, clever! I've no patience!" exclaimed Miss Rumball.

'For many an hour afterwards did I puzzle my little brain to make out what they had been talking about; but, as I said before, the interpretation came at last. Six years passed away. My dear sister was blessed, as we thought it, with four sweet children—little fairies, like living lilies and roses; but her own health was delicate. But suddenly my whole attention was engrossed by a new object; and the consequences, a new and powerful feeling. This object was a cousin, a nephew of my mother. He was about twenty-two years of age, intellectual, accomplished—in short, a perfect gentleman.

He was the only survivor of a large family, and had lived from infancy with his widowed mother in the mildest regions of Italy. Important business at length compelled them to come to England, and it was then that Henry Goring paid his first visit to our quiet home.

'I sometimes smile, and sometimes weep, but oftener both together, when I think how very happy I was for two months after his arrival. Every object seemed to glow with radiant colours; the perfume of the commonest flowers became intoxicating; all the sounds and sights of nature spoke a new and delightful language. Music was—ah, I must not attempt to describe what music was! A strain that was familiar then, and is mixed up, as it were, with the dream-like recollections of that delightful time, will sometimes return, and wander through my brain for days and nights together, and then I sadly live over again my former happiness. But that is enough. One day you will know by experience how delightfully such moons as these roll by.

'As yet, no word had been said of our attachment. We had looked into each other's eyes, and read our souls there; and we might have gone on in the same way for two months more, had not Henry been summoned to London upon the business that had brought him from Italy. This drew matters to a crisis. It was just such a lovely evening as this when he first spoke to me of his attachment. It was agreed between us that he should speak to my father the next morning. He did so; and all seemed propitious to our wishes, for my father gave a cordial consent. Another day of bliss, almost too intense for endurance, and then came my first sorrow—the departure of my lover for one whole wearisome week. Well might Moore sing—

"There's nothing half so sweet in life as love's young dream!"

The first-love of a girl who knows that she loves worthily—the sacred halo which her pure thoughts cast around her ardent feelings—all make of that epoch in life a veritable foretaste of heaven.

'My approaching marriage soon became the talk of the little town. Everybody said what a good match it was. Miss Rumball was quite oracular on the subject; but Dr Winter called upon my father, with a book under his arm, and after being closeted with him for nearly two hours, went away, leaving the book behind him. I met him in the hall: he stopped, looked earnestly at me for a moment; then his eyes filled with tears, and he passed on without speaking. I felt as if under the influence of a coming nightmare. I could do nothing but wander about the house and gardens, visiting again and again the spots that were rendered sacred by some association with my beloved Henry; and cherishing but one definite idea throughout all the chaos of my feelings, and that was, a firm resolve that no power on earth should prevent my fulfilling the promise I had given him.

'My father remained in his study the whole day. The meals passed away without his appearing; and as I crept up stairs to bed, I saw, by a ray of light streaming through the keyhole, that he was still watching. The vague sense of approaching evil still hung over me; and as I laid my aching head upon my pillow, the words which I had heard Dr Winter utter respecting my sister's marriage rushed upon my memory, giving to this foreboding a shape of formless yet ghastly terrors. My dream of happiness was at an end!

'You may imagine I did not sleep much that night. In the morning, I hastened down, anxious to see my father. He was in the breakfast room, and a glance at his soiled dress and disordered hair showed that he had been up all night. I even thought I could detect the traces of tears on his pale and haggard cheeks. He looked at me as I entered, and then turned away with an expression of keen suffering on his face. In the midst of my agitation, that look made me think of Jephtha and his daughter. He was evidently striving to arrange his words and ideas to open some painful

subject, when it occurred to me that, by speaking first, on the clue of my suspicions, I might spare him the agony of plunging a dagger into his poor child's happy heart, and rudely destroying all her air-built castles.

'It is now twenty years since this happened; but I remember the whole scene as vividly as though it had taken place but yesterday. I hung upon my father's neck, and said in as firm a voice as I could command, "Father, I am prepared to bear anything you may have to tell me, even though it were that I must break my engagement with Henry Goring—provided," I added, "that I am convinced it is a duty."

"Thank God!" he exclaimed, clasping me to his heart; "and thank you too, my beloved child, for sparing me the trial I so much dreaded. I could not have hoped for this fortitude in one so young. My poor Lucy!" and as he said this he held back my face to look at me, "it is a severe trial for you, and one that ought not to have been imposed upon you; but how could I teach you that which I knew not myself? Read this book carefully. Had I been acquainted with it before I married, I should have avoided committing two grievous errors. Your noble conduct gives me the assurance that you will help me to prevent another. May God in heaven bless and reward you!" And so we parted at the untouched breakfast table.

'With a despairing calmness I shut myself up with that terrible volume, whose pages seemed to be inscribed with my death-warrant. For a while I felt prompted to blind myself to its warnings, and rush madly to the enjoyment of a brief summer-day of happiness. But calmer reason, and my father's solemn words, prevailed, and I sat down to its perusal. You shall read that book yourself one of these days: it is sufficient for me now to tell you that it explains the laws governing the transmission of qualities, mental and bodily, from parent to child; the immense amount of suffering and disease with which the world is filled in consequence of the frequent disregard of these laws; and how fearfully the sins of those who marry with a strong taint of hereditary disease are visited upon their children, even to the third and fourth generation. I now understood Miss Rumball's outcry against Dr Winter's indelicacy. She was a good sort of person, but too narrow-minded to perceive that prudery is in general far more indelicate than philosophy.

'Well, love, I must not now stand shivering on the brink of resolution, as I did when the light of that calmly-reasoned book was clearing away the mists which had made the valley of the shadow of death look like a paradise. As I read on, I saw clearly the position in which I was placed. The very affection, so ardent, so buoyant in its youthful energy, which I bore to my lover, was enlisted to oppose my marriage with him; for what true love would doom its object to the misery of seeing all his dearest ones sinking into an early tomb? Such at least was not my love; and seeing my path of duty thus strongly marked out before me, I resolved unflinchingly to follow it. But there was something more to be done. He, too, was deeply tainted with the same fell disease, and must therefore be convinced that marriage was forbidden to him. My own grief was nearly forgotten when I thought of this. Could I have borne the burden alone, it would have been comparatively light; but he must share it, and that indeed was bitter. To teach him to love me as a friend—to behold him happily married to some one who might marry—to train up his children, and rejoice over their health and beauty—this would have been to me a dear delight; but, alas! the ban was upon him likewise, and bound us both in the same dreary fate. All that was left me, as I now thought, was sternly to pluck out every hope of happiness from both our hearts, and make the best preparation for the early grave that yawned at our feet.

'I could fill a volume with the thoughts and emotions that passed through my mind during those few hours,

but such a recital would be useless. It is enough, that when the sharp conflict was over, and my resolution firmly bent to perform the hard task assigned to me, I felt a degree of tranquil composure that surprised myself, and which arose from a lofty faith that so great a sacrifice to truth and justice would not be made in vain.

'I went into my father's study, to concert with him the best means of breaking the subject to Henry. He was dreadfully agitated, but my calmness communicated itself to him; and when I saw that, it stimulated me to still greater efforts of self-control. He appeared astonished and delighted; and the fervent blessing he called down upon me, mingled with praises of what he called my heroic fortitude, reflected back upon me the consolation I had inspired. This was the first fruits of the faith that sustained me.

'It was agreed that I should not write to Henry immediately, but await the arrival of his next letter, which would give me time to deliberate. Sorrow seldom comes alone: while expecting this letter, we received a summons to my sister's bedside, as her illness had taken an alarming character. Her husband had carried her to Torquay soon after Henry's first arrival, and thither we followed them.

'A description of her illness would add nothing to the usefulness of my narrative, so I will not burden your young mind with it. She died a fortnight after our arrival. There is, however, one painful circumstance which I shall relate, because it bears directly on the principle I am endeavouring to enforce. This was my poor father's sorrow. He saw his daughter die, and that was grief enough; but it was trifling compared with the remorse that gnawed his soul at having first, by his imprudent marriage, inflicted upon her the enfeebled existence which could not stand the ordinary trials of a mother's life; and having then allowed her to commit the same error, by which her life was probably shortened, and her fatal malady transmitted to her four innocent children. It was no alleviation that he had acted in ignorance; he continually repeated that "he ought to have known it." The only drop of comfort in this bitter cup was derived from my patient submission to my own sorrow. To the hour of his death, he never knew what were my real sufferings; for I fortunately possess a good share of self-control, which enabled me to appear more calm than I felt. He did not see the paroxysms of agony which at times prostrated all my energy. They did not last long, however, and became daily of less frequent occurrence, for the resignation which I affected soon began to assume a real existence. I may praise myself at this distance of time, just as old ladies are permitted to boast of their youthful charms, because I have now nothing to do with disinterestedness, heroism, or anything, in fact, but taking care of my own little self, and doing such atoms of service to my fellow-creatures as chance may throw in my way. Then life appeared to me a blank—dull, hopeless, soulless. I was immolated on the altar of unrelenting justice, a sinless but unresisting victim; for the sentence was as distinct as it was righteous, and I could not wish to evade my doom. Gradually a serener mood came over me. First of all, my father required my every care: he would sit for hours plunged in melancholy reverie; and Dr Winter, a wise student of human nature, excited me to redoubled exertions, by awakening fears concerning his mental health—knowing that the surest means of drawing me from my own grief was to engross my attention with some external object. Under our united care, my father slowly regained his tranquillity; but he had sustained a shock from which he never wholly recovered.

'I had received one letter from Henry Goring, to which I had answered briefly, informing him of my sister's death. This sad event was also an excuse for leaving long unanswered that which he sent in reply, full of gentle and affectionate condolence, but not a word of our expected marriage. But the work was to

be done, and delay seemed but to magnify the evil. By Dr Winter's advice, I wrote at first vaguely, hinting that our marriage might be deferred longer than we had anticipated, but without assigning any reason. By return came his answer, assuring me that he would not press our union until my grief had quite subsided. I thought he had not taken the alarm as we intended he should do; but then followed these words in a postscript—"On reading your letter again, my mind misgives me. Surely there can be no other reason than your late bereavement for any delay of our marriage? For mercy's sake do not speak to me in riddles, but write immediately, and explain." I did write as he wished, entreating him to read the fatal book, and, divesting himself as much as possible of the trammels of passion, to submit implicitly to the dictates of right and justice.

"On the evening of the following day, as I sat by my father's sofa, watching the first sound sleep which he had enjoyed for many a weary day and night, the door opened hastily, and Henry entered. I suppressed with difficulty the scream that was bursting from my lips, and rising quietly, with a gesture of silence, I took his hand and led him into the garden.

"Have you read the book?" was my first question.

"I have," he replied.

"Then," said I, "you know what must be our resolution."

"Alas! I had judged too hastily. Either his feelings were stronger than mine, or he was less in the habit of controlling them. I was terrified at the storm my words aroused. The wildest expressions of love were mingled with anger, despair, bitter reproaches, jealousy, vengeance on those who had instigated me to such unnatural conduct: he was indeed shaken by a tornado of all violent emotions. He even declared, poor fellow, that changed affection was the real cause, and that the book and its arguments were only a subterfuge to get rid of him. Very, very dearly and truly did I love him, so you must not be surprised that, unaided and weak as I was, my resolution began to quail. Still I argued, I intreated, I wept; and he did the same, yielding at times to fearful paroxysms of passion. Dreading the effects of such powerful excitement upon his delicate lungs, I strove to calm him; and was about to give him a promise to reconsider my resolve, when his voice became suddenly husky and stifled, a deadly paleness displaced the brilliant flush upon his cheeks, he staggered, and fell upon a garden seat, near which we had been standing. Believing that he had fainted, I raised his head, when I felt my hand covered with the hot blood that was gushing from his mouth. He had broken a blood-vessel.

"I dared not scream, lest I should arouse my father, whose reason might be wholly unseated by the spectacle that poor Henry then presented. I dared not leave him while I ran to the house; but I supported him in my arms, and looked wildly round for help; and help was at hand. Dr Winter had caught a glimpse of Henry's face as he rushed through the town in a postchaise, and had followed immediately, to sustain me by his presence and advice, or to be at hand in case of such an accident as had actually happened. He quickly summoned the servants, who, under his direction, removed the poor invalid to the bed which he had occupied a few weeks before in apparent health.

"You may be sure that every imaginable care was lavished upon him that affection and skill could suggest; but I saw from the first that Dr Winter entertained little hope. The intelligence was broken with the utmost care to my father, whose greatest anxiety was on my account; but when he saw me no less tranquil than before (paler, my glass had told me, I could not be), he resigned himself patiently to this new affliction.

"It was now the commencement of autumn; during that season, and the following winter and spring, I was a constant attendant upon Henry Goring. His mother shared with me the duties of nursing him. At first, she

treated me with great coldness, I might almost say harshness, because she thought I had sacrificed her son's life and happiness to a fantastic and unnatural whim. But when Henry himself, calmed by suffering, at last recognised the rectitude of my conduct, her manner completely changed, and she became as kind as she had before been stern. At the beginning of the spring our patient seemed to rally; but Dr Winter warned me not to be deluded by appearances. Again he sunk; again his mother thought she read returning health in the bright hectic flush; and yet again was she compelled to own that her hopes had been illusory. Amid all these apparent variations, the insidious enemy silently continued its ravages, and ere the spring was quite gone, my poor Henry slept in his grave. He died; and (mark this, dear Margaret, for it has been my consolation during all the years that have since elapsed) his last words were a blessing on me for clinging to the right.

"I bore his loss with comparative patience, for sorrow had become my familiar companion; and thenceforth I devoted myself wholly to promoting my father's comfort. When he died, which was about six years ago, I became, at the invitation of your kind parents, a member of your family. And here I am still, you see; living very happily, and prepared, but not watching, for death; rendering what services I can to my fellow-creatures, and thereby securing constant pleasure to myself; fearless as to the future, careful of the present, and, above all—and oh, Margaret, think, think, think of this—free from remorse for the past! And now, do you at last understand," continued Cousin Lucy with a gentle smile gleaming through a tear that did not fall, "why I am an old maid?"

"I do, dear cousin; but may I ask you one or two questions? Will it be painful to you to say something more?"

"Certainly not. It must always be a sad, but can never be a painful subject. Ask as many questions as you like; my object would be ill attained if you did not perfectly understand all that I have said."

"I think I understand it all; but I wish to know if you did not feel as though you had been the cause of poor Mr Goring's accident? I think I should."

"In the first burst of grief I did; but I was soon convinced that I had done right, and that left no room for self-reproach."

"And yet you must have been very miserable when you reflected that you could never have a kind husband, or loving children to comfort you: you who are so fond of children too?"

"For that very reason, how much more miserable should I have been to see those children blighted in their youth; or, dying myself, to know that I left behind me unfortunate beings whom I had endowed with mortal disease! With what tranquillity could I meet death, knowing that my life had been injurious to the world—that I had spread contamination throughout unborn generations—that by my deliberate and premeditated guilt, incurred from intensely selfish motives, I had increased, to the utmost of my power, the mass of human misery? Is not my present lonely life preferable to this?"

"A thousand times!" exclaimed Margaret; "as your poor sister must have felt. What became of her children?"

"By very great care, they were reared to the age of man and womanhood; and then, one by one, they dropped off, and now all are dead."

"To what can you attribute your own exemption from this dreadful disease?"

"In the first place, to my having been brought up from my earliest infancy in a very healthful farmhouse; and secondly, to the incessant watch which I keep over my health, thanks to the judicious advice of Dr Winter. In short, to avoid being thrown a sickly burden upon my friends, my existence is one continued course of self-denial. Am I invited to a ball (and you know that I am

so sometimes, old maid though I be), I consider whether it would be wiser to go and enjoy myself very much, but at the risk of late hours, heated rooms, cold currents of air, the temptations of dancing, ices, and so on; or to stay quietly at home, read, work, or chat, content with my biscuit and glass of negus, and go to bed at ten as usual? In the same manner I reduce everything to this question—Which is the wiser? Not from any great love for life, but from a desire to preserve my independence as long as possible. It is, indeed, a duty incumbent on every member of society to preserve his health in the best possible state, for an unhealthy member is a burden instead of a support to the community. Think of this when a little spice of vanity prompts you to wear a pair of pretty thin shoes in dubious weather, instead of less slightly but more substantial old friends. "If I do catch cold," whispers vanity, "that will hurt nobody but myself." But vanity would mislead you, as she generally does those who listen to her; and pass over in silence the trouble which an illness would entail upon your family. You would be nursed and petted, while not one other person in the house would be exempt from care and anxiety on your account.

'Thank you, dear Lucy. I have often sinned in that respect quite thoughtlessly, but I will take care to do so no more.'

'If you act up to that resolution, Margaret, I shall see that my warning tale has not been given in vain. But come, the sun has just set, and I must not wait for the night dews; thereby, like too many teachers, spoiling a good precept with a bad example.'

THE ART-UNION JOURNAL.

Among the various periodicals which are now endeavouring to carry out objects of social improvement, we know of none likely to be more useful than the 'Art-Union Monthly Journal,'* a work devoted to the promotion of taste in the arts, and consequently to the refinement of the feelings. Too long has Great Britain hung back in morbid indifference to the *beautiful*, whether as directed to the eye or ear; and her suitable reward she has found in a people more sunk in sensual gratification than those of any other country in Europe. But all this, we are glad to think, is now in course of amendment. A taste for the elegant in art is no longer presumed to be incompatible with either religion or morals, but is known to be a powerful auxiliary to both: it is at least felt that a man is not the worse for surrounding himself with objects of refinement, instead of those that have no association with the higher sentiments.

While we are in a transition state from semi-barbarous to cultivated feelings, the 'Art-Union Journal' appropriately makes its appearance, and aspires to act as a monitor and guide. We do not presume to say that so noble an enterprise might not have been undertaken by persons more competent than Mr S. C. Hall; but we are certain that none could have entered on it with a more enthusiastic love of art, or a stronger desire to fulfil, in truth and honesty, the professed purposes of the work. Assisted by his gifted lady, who throws over the pages of the 'Art-Union' the charm of her agreeable fictions, Mr Hall has been fortunate in being the first to carry out to a successful issue a periodical production purely artistic in character; nor has this success been undeserved. We have before us a work literally overflowing with embellishment—engravings of some of the finest modern pictures, and highly-finished cuts in wood of things the most novel and tasteful in the useful arts; the whole designed to educate the eye, and lead to higher aspirations after physical and moral beauty. In the letterpress, a variety of observations occur calculated to rouse attention to subjects connected with art, and in particular to improve the forms of numerous articles of manufacture: to cabinetmakers, ornamental iron-

founders, glassmakers, potters, jewellers, &c. the 'Art-Union' will therefore prove a valuable counsellor and welcome visitor. Already we see evidences of the prodigious advance which has taken place in nearly all branches of art to which the ornamental can be applied; and we would only hint to young men, that they must now look to something more than mere imitation for a name, or even moderate success in their career.

In an article on the 'Prospects of British Art,' in the number for January, the following passages occur:—'In the whole history of the species, we doubt whether there has been anything comparable to the improvement of England within the last century—so many admirable inventions, so many applications of these inventions, such a progress of general cultivation, such an intellectual estimate of its individual advantages and of its moral power! We do not, however, say that this has not been accompanied with great evils. A large amount of capital has been employed, with increased ingenuity, to minister to the wants of increased refinement: this, which has ever a tendency to crowd men together in cities, has not hitherto had a beneficial effect. The arts have been separated from design; men have worked as machines; the pattern was imported and pirated by competition. The truth is, men have laboured without instruction, amid a caste without education. This is, happily, now undergoing a gradual change. Education, adopted upon a good system, will soon, we trust, induce habits of foresight and self-control, restrain the improvidence and profligacy of the idle hour of the artisan, raise him in his own respect, and make those arts which are mostly dependent upon intellectual and moral refinement the chief source of his pleasures.' As to the immediate prospects of art, 'Government has openly and liberally admitted its claim to public support. This concession is made, too, at a time when the education of the people is held binding as a public duty. Thus education and the arts will act and react, refine and elevate each other; it signifies but little how intellectual beauty is perceived (moral truth is only another form of this); once communicated, it must inspire aversion for everything vile and specious, which becomes thus a social guarantee, almost as effective as well-considered principles. As knowledge also enables us to see things in their causes and their consequences, so does genius, whether in literature or art, by operating upon these as a spiritual sense, enhance, vary, and gracefully combine them, until they become the silent monitors of the conscience and of the will. That, also, which genius discovers, is a possession for ever; for great truths, once admitted, remain the inheritance of generations. Thus permanency is added to principle. Of this, moreover, governments may be assured, that to develop, encourage, and employ the talent of a nation, is the best guarantee not only for public morals, but political good.'

Stepping down from this heroic altitude, our next extract will be from an article in the August number, on the adornment of houses with works of art. At present, there is much incongruity in domestic ornament, which the writer hopes to dispel. 'It is only natural to consider that, on entering a mansion, the first appearance should be one of simplicity, gradually leading the eye with increasing delight through the inferior apartments and staircases to the drawing-room, where the principal luxuries of art and ornamentation should be assembled.

'Thus a principle becomes established; and so it appears to be pretty generally carried out in our noblest abodes, unless interfered with by the architectural arrangements of the interior. It is upon such examples that it is safest to found some rules for our guidance in houses of lesser pretensions; and purely in the hope that the subject may engage the attention of others, who will communicate their views to the public, the few following remarks are thrown out for consideration.

'In the entrance-hall statues are appropriate, or busts upon consoles. If pictures are added, they ought to be

* London: Chapman and Hall. In monthly numbers, quarto.

adapted to the sizes of the spaces left unoccupied by doorways, and if inserted in the panelling, would form a continuation of architectural divisions; besides, they give an appearance of greater space than if hung in frames. In town-houses, allegorical or mythological figure-subjects are the most suitable. For country-houses, hunting pieces, fruit and game subjects, or whole-length portraits. Religious compositions are wholly out of place in entrance-halls.

'The dining-room, being dedicated to festivity, should have analogous subjects: bright landscapes, of good dimensions, are cheering. A superb example of this taste exists at Bowood, the seat of the Marquis of Lansdowne, where the panels are filled by large Italian landscapes, painted by C. Stanfield, R. A. The cheering, joyous effect of this decoration must be seen to be appreciated. There is another class of pictures which, with refined taste and love of literature, becomes appropriate—as the portraits of distinguished persons, either sovereigns, warriors, or men distinguished for acquirements which reflect honour on themselves or their country. To dine in the imposing presence of great "celebrities," is not without its influence on the grateful repast: it is adding the luxuries of mind to the lower gratifications of the table. The dining-parlour at Northwick Park, the seat of Lord Northwick, is an example that may be cited for the superb Vandykes by which it is decorated.

'Staircases are not generally suitable for pictures; but sculpture, bronzes, *bassi reliev*i, and vases, may ornament with propriety this common channel of communication. If pictures are there placed, they have the appearance of being discarded from the apartments, or thrust out of the way.

'The library, being occupied by books, offers little accommodation for the fine arts; but portraits of literary persons or divines appear suitable, and miniatures may be here disposed with advantage, as well as small and elaborate pictures or drawings of high quality.

'The next portion of an abode is that of the greatest consequence—being the drawing-room.

'It is generally considered that here profusion may be tolerated in articles which pass under the denomination of *vertu*. The elegances of rare porcelain, chasings, enamels, and objects adorned with gems, carvings in ivory, sculptures in alabaster, are all admissible according to the present received ideas. Pictures, too, so long rejected, are now considered as suitably placed in drawing-rooms. The subjects here appropriate are of two classes—either works of the highest character, or those of subjects only which are of elegant and chaste design. In the first class are, however, included the low *genre* subjects of the old Dutch school—the occupations of peasants, sometimes vulgar, or cattle pieces in farm-yards, and similar scenes—such as persons of refinement do not seek to witness as living realities. The wonderful talent with which the great masters invested these ordinary transcripts of common nature, makes them coveted as drawing-room distinctions. Of the other class, where this great attainment of skill has no existence, the admissible subjects for drawing-room decoration are the classic, the elegant, the poetic, the sylvan, and the pastoral. Fine prints, framed, may advantageously contribute to the cheerfulness of bedrooms and dressing-rooms.'

The writer recommends that the mechanism for hanging pictures should not be seen. This we would improve upon, by greatly altering the mode of picture-framing. A mass of gold frame is oppressive to the eye, and in bad taste. Pictures of a fine kind might advantageously be let into panels in the walls; but this infers structural alteration in the dwellings. We merely offer the suggestion for consideration.

In the number for May, we observe a smart article on the scenery of the stage. This is a good subject. The greater number of theatres in England do not trouble themselves very much about new scenery. In twenty different pieces may be seen the same everlasting

street, forest, castle, and interior. Occasionally, in the principal theatres, new scenes are painted, but are only sufficient to excite a desire for greater liberality in this department of art. Hear what is done in Italy and France. 'In Italy, the scenery of an opera or ballet is of equal importance to the composition. It is always new to the new pieces: if the opera or ballet fail, the scenery is totally obliterated. By these means a succession of original subjects analogous to the piece are constantly presented, and contribute to the general efficiency by boldness of design, and a close approach to the enchanting luxuries of the *beau ideal*. In execution, they differ materially from the careful finish of the Parisian stage, being as strongly imbued with poetic invention as their ancient school of painting, and executed with the same grandeur and massive idea. At the theatre of La Scala alone, upwards of one hundred and twenty new scenes are painted annually; and of such interest are these decorations in that classic land of art, that as regularly as a new operatic performance succeeds on the stage, so does a series of engravings appear contemporaneously with the publication of the music, delineating the scenery which has contributed to the triumph and embellishment of the musical composition. These prints, which are scarcely known in England, comprise designs of the highest magnificence, without the slightest violation of the grammar of practical art. Thus the twin sisters of music and painting are linked together, and the names of Perego, Sanquirico, and Tranquillo, who have carried the scenery of the lyric drama to the extreme limits of artistic quality, are as much honoured and caressed in their native climes as any of the illustrious composers of the chosen land of song.

'The scenery of the French stage is of a completely opposite character to that of Italy, being most elaborately worked and studied in the minutest details. Authentic authorities are investigated, to insure the truth of the most unimportant adjunct; and in completion, the scenes of the French stage are so many orthodox works, seldom soaring into the ideal, but forming perfect pictures of the subjects displayed. The visitors to the French metropolis will find plenty of artistic instruction in admiring the scenes painted by Ciceri, Cambon, and Zarra: those of the newly-erected Théâtre de Montpensier are by the latter. On the past incongruities and anachronisms of our own stage it were superfluous to dilate: the past may be forgotten, hoping the future is pregnant with better things for a higher object. That it is capable of becoming the facile medium of instruction to a race thirsting for knowledge, cannot be doubted, or of imparting sound information on the theories and capabilities of art; thus supplying the stepping-stone to a just, true, and wholesome understanding of its value.'

The 'Art-Union' is acknowledged to have done some good service by exposing on divers occasions the tricks of picture-dealers, who have lost all sense of decency in palming off, at high prices, trashy productions as the works of the great masters. We observe that the editor keeps up a shockingly uncomfortable series of exposures of these worthies, and that they no longer find it an easy matter to get up sales of their wares. Driven in a great measure from public auctions, and having even little chance with shop-windows, the picture-riggers, as they are called, have had the impudence to try to find purchasers in the trustees of the National Gallery. This comes out in a late report laid before parliament. 'There are many curious features in the report, not the least amusing of which will be found to be the vast number of pictures offered to the trustees for purchase by persons of no condition in life, but mere jobbers and brokers in the species of picture-ware we have so often denounced as vamped-up trash, for the unworthy purposes of deception. Mr Eastlake must have had a very sickening task to view and report on this mass of rubbish, and perhaps, but for his judgment and unflinching integrity, the fine works we already possess would have

been grossly contaminated by bad neighbours on the walls. We may congratulate ourselves on escaping from these numerous traps with only a mock "Holbein;" and although it is certainly not a "Holbein," it has many points to recommend it as a good work of the early period it represents: this has never yet been questioned; it is only the pecuniary value which has been impugned—600 guineas. We intend to give an analysis of some of the individuals who have been thus ardent in thrusting their pictures on the trustees; and some curious anecdotes of these "gems of art" will amuse the reader who is not behind the scene. We know of one picture offered by a man, a foreigner, which has since found its way to the stores of a pawnbroker for ten shillings; and another has, on the pressure of the disappointment, been offered for two sovereigns and an old coat.'

INTERMENTS IN LONDON.

From a statement made by Mr G. A. Walker, well known for his writings on intermural burials, we gather the following particulars:—"There are 182 parochial graveyards in London; of these only 48 were confined to the proper limit of 136 bodies to the acre; the rest exhibited various degrees of saturation, from 200 to 3000 bodies to the acre annually. In St Andrew's Undershaft, the average per acre was 1278; Portugal Street burying-ground, 1021; St Dunstan's, Fleet Street, 1182; St Dunstan's-in-the-East, 1210; St John's, Clerkenwell, 3073; St Mary-at-Hill, 1159; St Olave, Tooley Street, 1257; St Swithin's, Tooley Street, 1760. Turning from parish ground to disenting burial-places, the following were the results:—Wickliffe Chapel, Stepney, 1210; Enon Chapel, Woolwich, 1080; Parker, Dookhead, Woolwich, 1613; Moorfields, 1210; Cannon Street Road, 1109; and lastly, New Bunhillfields was distinguished by an average of 2323. It was humiliating to think that a parish ground—St John's, Clerkenwell—stood at the head of these unchristian nuisances, pestiferous in every respect, because, when a proportion of 3073 were annually interred on an acre of land, it followed that the bodies could only remain in the ground five months instead of ten years. Hence the stacking of coffins in deep pits, the brutal dismemberment of bodies, the consumption of coffin wood in many localities, the danger to mourners from attending such places; the insidious infection which, especially in the warm season, poisons the atmosphere, and by undermining health, or begetting disease, hurried thousands to an untimely end, again to become the subjects of fresh indignities, the centre of infection to survivors, and the distributors of pestilential emanations.' What admirable reasons for leaving the metropolis out of the late Health of Towns Bill!

HEALTHINESS OF CRICKET.

Within the last two years, it has been in the knowledge of the author that there are many clergymen in different parts of the kingdom who have been endeavouring to cultivate cricket in their respective localities, from a conviction, in common with himself, that a vast moral good is to be achieved by a general introduction of the game amongst all classes. It prevents any addiction to intoxication, because those who wish to excel, must, to a certain extent, if not entirely, eschew excess. Its characteristics, too, are the cultivation of a fine healthy and athletic exercise in the open air; a commingling, as he has often before stated, of all grades, the one with the other; combined also with the knowledge, that if a man desires to stand well either as an operator in the game or with his superiors, his habits must be regular and steady, and his conduct and demeanour respectful and proper. There is nothing so good as to let a man discover, by mixing with his betters in the common pastimes of his country, with those to whom he ought to look up, that course of conduct which it is best for him to pursue. The author has known many instances where the dissolute have, by being allowed to meet their pastor and the gentlemen of their neighbourhood at cricket, become excellent members of society. He has known those who, instead of attending to religious worship, have, on the contrary, spent most, if not the whole of a Sunday, in a public-house, turn from their ways, and become regular recipients of religious instruction by a constant occupation of a seat in their parish church.

He has known men whose dispositions have, from untoward circumstances, been of a wavering character, as between honesty and dishonesty, by being permitted to mingle with those above them in point of wealth and station, become fixed in the former. Surely, then, the clergyman who adopts such a course as shall lead to the accomplishment of these objects, does no more than perform one portion of the duty of his sacred calling? Teach a man, however uneducated, by association, example, and kindness, what is expected of him, and what his real duties are; let him mix with men of education on a proper footing—and the association in a national game like cricket is one of the first—and his natural perception will very quickly point out to him what those duties are.—*Denton's Cricketer's Companion.*

LABOUR.

BY CAROLINE F. ORNE.

Ho! ye who at the anvil toll,
And strike the sounding blow,
Where from the burning iron's breast
The sparks fly to and fro,
While answering to the hammer's ring,
And fire's intenser glow—
Oh! while ye feel 'tis hard to toll
And sweat the long day through,
Remember it is harder still
To have no work to do.

Ho! ye who till the stubborn soil,
Whose hard hands guide the plough,
Who bend beneath the summer sun,
With burning cheek and brow—
Ye deem the curse still clings to earth
From olden time till now—
But while ye feel 'tis hard to toll
And labour all day through,
Remember it is harder still
To have no work to do.

Ho! ye who plough the sea's blue field—
Who ride the restless wave,
Beneath whose gallant vessel's keel
There lies a yawning grave,
Around whose bark the wintry winds
Like fiends of fury rave—
Oh! while ye feel 'tis hard to toll
And labour long hours through,
Remember it is harder still
To have no work to do.

Ho! ye upon whose fevered cheeks
The hectic glow is bright,
Whose mental toil wears out the day
And half the weary night,
Who labour for the souls of men,
Champions of truth and right—
Although ye feel your toll is hard,
Even with this glorious view,
Remember it is harder still
To have no work to do.

Ho! all who labour—all who strive—
Ye wield a lofty power:
Do with your might, do with your strength,
Fill every golden hour!
The glorious privilege to do
Is man's most noble dower.
Oh! to your birthright and yourselves,
To your own souls be true!
A weary, wretched life is theirs
Who have no work to do.

A DESIRABLE NEIGHBOUR.

'Mother wants to know if you wont please to lend her a preserving kettle, 'cause as how she wants to preserve?' 'We would with pleasure, boy; but the truth is, the last time we loaned it to your mother, she preserved it so effectually, that we have never seen it since.' 'Well, you needn't be so sassy about your old kettle. Guess it was full of holes when we borrowed it; and mother wouldn't a troubled you again, only we see'd you bringing home a new one!'—*American paper.*

A HIGHLANDER OF THE LAST AGE.

BY THE AUTHOR OF 'MY FATHER THE LAIRD.'

In a small house near one of the numerous pretty villages scattered along the sea-shore on the coast of Devonshire, there had lived for many years back a retired general officer, of some note in his profession. He had served from very early youth almost by the side of our Great Captain—beginning his career in India, fighting through the battles of the Peninsula, and resting with the army of occupation before Cambrai. He had passed a lifetime in the field. He had gained laurels, medals, orders, a knighthood, and a pension—a moderate pension for several severe wounds—which addition to his half-pay enabled him to pass the decline of his bachelor days in the tranquillity which suited his disposition. Time glided quietly on with him towards the end he appeared neither to wish for nor to dread. He had a small society of brother officers within his reach, which he mixed with occasionally. He paid a yearly visit to London in the spring, enjoyed a few weeks of his club, showed himself at a levée, and returned to his country life all the cheerfuller for this short intercourse with the busy world. He had the look of a happy man, although his habits were solitary. He lived much alone, rode or walked alone, often spending hours on the sea-shore alone, pacing up and down some unfrequented stretch of sands in a sort of reverie, or standing quite erect to gaze upon the waves, with his hands, in one of which he held a stick, crossed behind him. His manner was invariably self-possessed, calm, and not ungraceful, though his speech betrayed at times the peculiarity of accent never thoroughly got rid of by the Celtic tongue, and which appeared always more remarkable as he became animated in conversation. He seemed to have no relations, and no friends but his military companions. He never alluded to any but his campaigning days; nor would a trace of his childhood's home have ever been recovered, had not a small bundle of letters, left, with other papers, to the discretion of his executors, been found after his death in a curious old wooden box, that had evidently seen much travel. His extreme reserve on the subject of his early life makes it probable that he had forgotten these notices of it, or had intended to destroy them; but as they contained nothing discreditable to the fame of any concerned in their production, the following memoir has been compiled from them, as an interesting reminiscence of a class of our countrymen now 'passed away.'

Lieutenant-general Sir Hector Macneil, we will call him, was the eldest of a fine family of children, born and bred on a small farm in the Highlands. His father, who had served with distinction in the German wars, though a Glasgow merchant's son, quitted the army, when only a lieutenant, to settle on a property he had

inherited, a wadset of a hundred acres, on the extensive estates of a noble chief whose distant relation he then married. On this humble portion of a barren soil he established himself while yet in the prime of life, content with the quiet happiness the cultivation of his land insured to him. His wife, in addition to her gentle blood, brought him a fair portion in a large green chest, which it took nearly half-a-dozen sturdy Highlanders to lift from the dray it had been carried on. She had herself helped to fill it; for having had this marriage for some years in contemplation, her wheel in the long winter evenings had not been idle; and the result of her labours, added to her mother's thrift, had provided her with a far from contemptible plenishing. She had passed the season of giddy youth, and both bride and bridegroom being of active habits, well acquainted with the business of a farm, as it was understood in their times, the lieutenant and his wife began the world together with very comfortable feelings, backed by the regular arrival of his half-pay. Their house was rather a good one for the age: it had an attic storey, which, though low in the roof, gave four decent bedrooms to people of such simple manners. They themselves occupied a room upon the ground-floor, to the right hand of the passage on entering the house. To the left was the kitchen, and behind, on either side the staircase, was the best parlour and the strangers' room. To judge of the attics from the appearance of the more carefully-furnished ground-floor, they must have been little incumbered with movables. The best bedroom contained only a four-post wagon-roofed bedstead, with red checked curtains, a home-made rug by its side, a deal table, a wash-hand stand, two mahogany chairs, the seats covered with horse hair, and a print of the Countess of Coventry, whom the lieutenant had somewhere seen in the course of his military experience, and been so struck with, as to possess himself of this portrait of the beauty of his day. The print had hung in his own room during his bachelor life, but his wife disapproved of its situation, and removed it to a 'higher sphere.' The best parlour had a carpet reaching to the front legs of the closely-set chairs, ranged round the walls, two of which had stepped out of the ranks to accommodate the best bedroom. A long mahogany table was placed under the window; a square mahogany table stood in the middle of the room; and there was a cupboard, with glass doors to the upper shelves of it, revealing how rich they were in glass and china. In their own room, as they principally lived there, there was a box bed, closed during the day. The few books they had were ranged upon a hanging shelf; two swords were crossed over the fireplace; the green chest stood against the wall; a small bureau near the window sufficed for the keeping of the goodman's accounts; while a great display of clews of yarn, fixed on nails

over the green chest, a small table with her knitting, and a little wheel in the corner, proved the industry of the goodwife. In this room was served the neat tea breakfast, of which they alone partook. Here was laid the slight supper, followed by the 'tumbler,' out of which the lieutenant spared his wife a wine glass, after all the house had gone to rest. Here the children read their 'chapter,' and received their lectures for misconduct; and here sometimes, when their mother's heart was soft, they were regaled with a treat beyond the common from the large closet adjoining the box bed.

The kitchen, where the family lived, where the meals were prepared and eaten, and where all the various works were done, had a door almost in every side of it—one opening into a large dairy, another into a sort of scullery or back kitchen, another into the yard. There was a wide hanging chimney, from within which depended a set of strong pot-hooks, and where a bright peat fire blazed the whole year round. The room contained a well-filled dresser, a meal girdel, a large and a small table, pots and pans, and tubs and cogs, a reel, a muckle wheel, several small wheels, a bread tray, a girdle, forms, creepies, a chair or two, and, fastened against the wall, numberless articles required in the family business, or the result of the family industry. The two servant-maids, and one old trustworthy man, had their assigned places in this general rendezvous; the other out-of-door servants lived with the ploughman in a divot hut near at hand, among the rest of the offices, which were set down here and there, as if by chance, without any regard to the economy of time or space, or any attention to the keeping of them in the background. Underneath his own window Mr Macneil had laid out a flower-plot, which he had pleasure in attending to himself. He had a good vegetable garden close by, through a corner of which ran a rapid burn, overhung by weeping birch. The ground being unequal, and a few rocky stones checking the stream just as it left the garden, he had managed to carry part of the water through a long spout projecting over the highest of these, and thus formed a natural douche bath, beneath which he every morning placed himself, to alleviate the pain of a rheumatic shoulder, the consequence of wet bivouacs. The little burn, wandering lazily on, as if wearied by this fretful interruption, expanded as it left the garden into a wide but shallow pool, beneath an alder tree; which change in its habits the goodwife had taken advantage of, there to erect the posts where swung her copper, gipsy fashion, for her washing. A row of beehives faced the south, at the upper end of the garden, the profits of which—not small, under such careful management—they let accumulate, to form the fund from whence their boys were to be outfitted. The situation of the house had been curiously chosen—so near a wild mountain river, as to be within reach of its sudden overflow, an accident that happened frequently, and gave an air of desolation to the few acres immediately around, as the stones, and sand, and other wrack brought down by the water lay scattered over the ground in unsightly profusion. But the little stream itself was picturesque in its windings, the high banks opposite were richly wooded, and the cultivated plain, which stretched far away behind the farm-steading, towards the distant amphitheatre of fantastically-shaped gray mountains, contrasted agreeably with the rougher foreground.

The habits of the family were simple even for the period. They rose early, laboured hard all day, and retired early to rest. All without was supposed to be under the direction of the Goodman, while the goodwife reigned supreme within, keeping every key, and not only directing all the various works, but assisting in their execution, and occasionally extending her watchful eye beyond her own particular limits, to where matters not especially under her control might not have gone on quite so prosperously without her. The children, of whom there were a round half-dozen, break-

fasted with the servants in the kitchen, though at a separate table; and often was the authoritative voice of Mrs Macneil heard of a morning, before she began the preparations for her own tea breakfast, calling out to her maid to 'put on the porridge for the pigs and the bairns.' At the noontide dinner she herself presided, as she always partook of the meal served at that time. In winter, it was almost invariably broth or kail, or beef brose the day after a bit of corned meat had been boiled, with potatoes. In summer, sowens, curds, mashed potatoes with milk, or oaten bread and cheese, were preferred to stronger food, particularly as the Goodman never came home at this hour. With a bannock in his pocket, he remained abroad till evening, when at the family supper time—a meal which was a sort of second or slighter edition of the dinner—the best the house afforded was prepared for him, and served to him in the family room. In his homespun, homeddyed suit of dingy blue, Mr Macneil braved all weathers. The small cocked bonnet feared no showers, the gray ribbed worsted stockings, of his wife's good knitting, rendered him indifferent to the wet his ill-dressed brogues hardly protected his feet from. In summer, he often wore the little kilt, with bright scarlet hose, bound below the knee by a smart fringed garter; the plaid was flung across his shoulders at all seasons, except when made quite a wrap of during the severity of the winter. He often put his hand to his own work, though his busy wife sometimes reproved him for the gentlemanly indolence of his management. She showed no lady-like feelings of this nature herself, being eternally employed in directing all around her. She had the children and the servants up betimes. She kept the servants as busy as herself, and the children all fully occupied till it was time to start them for the school.

On their return home, she still found plenty to set them about; and for her maids, in the intervals of their more active labours there were the wheels at hand, so that not an idle moment passed; and the work was never done, for every season had its appointed task. In the winter, the spinning and the knitting went briskly on; a certain quantity, about the utmost that active hands could do, being required by her from her maids and her daughters weekly. In the spring, the yarn was dyed: there were mixings, and boilings, and rinsings, and dryings, one effect of which was, to keep the Goodman long a-field superintending the ploughmen, for he seldom lingered much in the house during the progress of these chemical mysteries. Then came the blanket-washing, when such piles of comfort issued from beds and chests, as covered nearly a quarter of a mile of paling when they were hung out to dry. In summer, she had the yearly clearing of her napery—no small stock, for it was ever added to, and very carefully *hained*. The sheep-shearing, calf-rearing, butter and cheese-making, the bleaching of the linen webs returned from the weaver, kept the household busy till the harvest-time, after which the labours of the year began again. The goodwife set a bright example to her family; for she did not spare herself. She managed the dairy entirely, creaming the cogs, and making the butter, and breaking the curd for the cheese with her own hands. She also clear-starched her own high caps, ironed the shirts, and put the finishing strokes to almost all that every one else began. She moved slowly about the house in a linsey-woolsey gown of her own spinning, shot with two bright colours of her own dying; a shawl pinned over her handkerchief, a full white apron, and a large bunch of big bright keys fastened to her side. The close mutch over her braided hair in the mornings, was replaced towards noon by a high-crowned muslin cap covering a thicker, and between them she wore a gay ribbon bound about the head just above the lace-border. She was reckoned a good wife, and mother, and mistress, and to keep a full and hospitable house—the large closet in the useful room never being found empty. Cakes of oatmeal, scones of flour or barley-meal, good cheese, good butter, and some simple preserved fruits, were never wanting in it, with

bowls of rich cream from her full dairy, and bottles of various cordials—whisky plain, and whisky spiced, and whisky sweetened. Visitors on intimate terms were shown, without ceremony, by the mistress of this humble household into her ordinary living room, where the refreshments always offered were at hand. Those of higher degree passed on to the best parlour, there to wait for the bareheaded, barefooted maid in her blue flannel petticoat, and her white neatly-frilled bedgown, with her tray; for to meet without both eating and drinking, was unheard of in those days in the Highlands. And it was not a mere taste of cake and wine—a mere form of civility—it was good honest hunger well satisfied, the visitor having generally made a journey of some miles. It was a matter of duty with the host to partake of every article offered, even to the cordials, which had also to be tasted with every fresh arrival. Mrs Macneil carried her scrupulous adherence to these ceremonies of the olden time so far, that, in presenting powdered sugar and whisky, which was then much the fashion with the ladies, she invariably took the first spoonful out of the glass herself—a real relic of the barbarous ages, as the same spoon served all. Guests of their own degree often remained to a late dinner, when, if there were only gentlemen—which indeed mostly happened, as the Highland ladies seldom left their homes—the goodwife saw little more of them, her part being behind the scenes, to keep the punch-bowls going till long after they had better have been filled no more. It was rather a thickly-inhabited part of the country, full of half-pay officers and small lairds, and one or two retired merchants, at that time of day but little thought of, with one great house only, within a very large circuit of miles, the noble residence of the chief, to whom Mrs Macneil was distantly related.

Castle Fruch was a large building of gray stone, very irregularly constructed, surrounded by a perfect town of small houses and offices, placed on a wide moor, sheltered by a few very formal plantations, of what has been till lately called by the name of the Scotch fir; although its miserable appearance beside the natural forests of black pine, stretching in their grave beauty far up some of the more sheltered glens, might have shown to any observing eye how misnamed had been the interloper. A fine background of mountains relieved in some degree the uninteresting nature of the home scenery, and extensive shrubberies added a cheerful look to the immediate precincts of the castle. The laird of the clan Fruch passed the greater part of the year in this his bleak residence, keeping open house during the whole of the summer and autumn, and generally surrounding himself at all times with a constant variety of guests. He lived plainly in the hospitable manner befitting his station, his board being most plentifully provided, and the ever-changing company of all degrees being welcomed with unfailing cordiality. There was no attempt to encourage a select society. It was no mark of high caste to dine at the castle. Every one felt entitled to a place there, in a country where, however poor individual means might be, every man considered himself born a gentleman. The company consisted for the most part of the clan, all bearing the same surname with their chief, and repeating so constantly among them the one or two Christian names in favour with their race, that they could never have been distinguished but for the prevailing custom of conferring a sort of title on these far-spreading members of one family, each man being commonly known by the name of the place he lived at, whether it were his own, or merely a wadset, or even but his rented farm. And as in larger communities, so there was in this, degrees of rank perfectly recognised, although never offensively paraded. There were branches to the clan—cadets of the great house, gifted in far back times with such lands as they could keep or take, who had risen to independence, though they gloried in acknowledging the source from whence they had sprung. In their turn they had similarly provided for scions of their own stock, and thus in time the name

spread wide over the wild country they had settled in, descending even to those who laboured for their daily bread, though these, in general, had rather been adopted into the clan, when fleeing from justice or injustice in some other. All, however, felt themselves links of the one great chain which connected the least among them with their chief. When associating in his baronial hall, each fell into his own place easily, thus keeping up the manner of perfect equality, while, in reality, there was a wide difference between those whose station was below 'the salt' and the 'yellow drawing-room' section of the company, who entered the banqueting-room, and retired with Lady Margaret, the laird's high-bred lady, none of the miscellaneous remainder offering to attend upon her unless specially invited. Mr Macneil held a sort of middle rank amongst this assemblage. His commission, his manners, his wife's good birth, placed him above his wadset; but his known mercantile descent, and his very humble means, reduced him again in the scale of Highland society; so that he owed it to his sound common sense that he was a frequent invited guest at the castle.

As the lieutenant's sons grew up, they occasionally accompanied their father on these visits. They were ushered into what was to them the 'world,' with no further preparation than the donning of their Sunday suit; and they took their places in it with that simple composure born with the Highlanders. Their mother, indeed, had not omitted to inform them of their claim to a seat at their great relation's table; for she had her full share of pride, and she had given a due proportion to her sons of this failing of her age, instilling at the same time into their young minds firm moral feelings, worthy of the race from which she had descended. She was a woman of high principles, accurately discriminating between right and wrong, and never compromising the matter between them; yet, shrewd and active, she had always all her senses about her. After her household thrift, the one aim and end of her existence was the advancement in life of her children. She had hitherto well done her part as a good Highland wife and mother. She had gathered gear, kept all hands busy, advised her husband, nursed the babies, given habits of industry and obedience both to sons and daughters, with the best instruction within her reach. She had now to push her family on; and for this purpose, as regarded her sons, she looked to her chief for assistance, not as a favour, but as a right, for he well knew that they were his blood relations. It was the custom of the times for the great to keep their patronage, like their charity, at home among their own connexions and dependents, on whom, indeed, no act of kindness was spared when occasion offered for its being exercised. The laird, therefore, made little difficulty about obliging his cousin. Labour of any sort being utterly distasteful to the spirit of these children of the mountains, the army was then the refuge of all the unemployed—'to serve' being the sole ambition of the young Highlanders. And as commissions were easily obtained in that warlike period, when any man of influence asked for them, the lieutenant's eldest son had not long to wait before he saw himself gazetted. He passed the interim principally at the castle, Lady Margaret, out of regard to the parents, condescending to aid in fashioning the manners of the son. It was a happy novitiate for the future knight. With well-bred companions of his own age and sex, the days sped rapidly on in the pursuit of those active sports which still occupy the higher ranks during a Highland autumn, and were then almost the principal employment of all classes; while the fair daughters of the house, accomplished far beyond his simple ideas of female merit, gaily contributed to the cheerful passing of the evenings. Whether these influences altogether worked for good as to the young soldier's future happiness, however much they might elevate his feelings, is almost doubtful; for broken hints were scattered among the earlier letters, from which rather a melancholy romance of real life

could, with a little ingenuity, have been woven. But whatever may have been his youthful dream, his manhood was none the less vigorous for its indulgence. Bravely and honourably he won his way, well supporting, throughout his prosperous career, the character of a gentleman. With no education beyond the mere rudiments of such knowledge as he could acquire at the parish school, his manners formed only by the principles of rectitude, and the habits of application he had imbibed at home very slightly polished by a few months of intercourse with more refined society, Hector Macneil prepared to enter life without one feeling of timidity. Strong in the simple resolve to do his duty under every circumstance, he quitted his father's roof not without sorrow, but without fear. He had been brought up to expect this separation, to look forward to it as to a starting-point from whence his own independence was to spring, and good to result, through his means, to his family. Thus nerved by the hope of assisting those he loved, while reflecting credit on them by his own success, there was little room in his honest heart for the mere indulgence of the grief of leaving them. His courage drooped for one short moment only, when he bent before his mother for her blessing. Solemnly but calmly it was given, though the unusual paleness of her countenance betrayed something of what she felt on dismissing to the turmoil of the world her first-born. He left the north country with the chief. It was usual with the great men of those days to spend the winter frequently in the south with their families, and it was the custom for a considerable number of the clan always to attend their chief on this his progress. It was a very stately migration. There was a sort of body-guard of mounted gentlemen, with a crowd of humbler retainers on foot. The escort fell off as the great man travelled, till, towards the close of his journey, when he left the hills to enter upon the plains, only a few of his most intimate friends remained to take leave of him. At this point the lieutenant and his son parted. Calm, yet sorrowful, the old man retraced his steps to his humble mountain home. The young man moved on with equal steadiness to the fulfilment of his destiny. That they ever met again, is at the best uncertain; as among the papers alluded to there is no evidence of the fortunate soldier ever having revisited the Highlands.

NEW FACTS IN ASTRONOMY.

A WORK has just been published which reminds one of some of the achievements of the early ages of literature, when an enthusiastic and patient philosopher found a patron equally zealous, and devoted many years of his life to the accomplishment of a single object. We refer to Sir John Herschel's work*—the title of which is given below—and to the manner of its publication. To quote the author's words:—'To the munificent destination of his Grace the late Duke of Northumberland of a large sum in aid of its publication, it owes its appearance as a single and separate work, instead of a series of unconnected memoirs, scattered over the volumes of astronomical bodies.' Greatly to his honour, the present duke has completely carried out the intentions of his predecessor, who died before the volume was finished.

A simple enumeration of the contents of the book—a large quarto—will serve to convey some slight idea of its great scientific value. The observations comprise those of the southern nebulae, double stars of the southern hemisphere; astrometry, apparent magnitudes of stars; constitution of the galaxy in the southern hemisphere; Halley's comet, with remarks on its physical condition; satellites of Saturn; and lastly, obser-

vations of the solar spots. To all this labour, and to the bringing out of the work, a period of twelve years has been devoted. The results are described in language as philosophical as it is eloquent: many passages among the scientific details of the catalogues produce an impression on the reader equal to that caused by a sublime strain of poetry. We propose to lay before our readers such portions of the work as may appear most popularly interesting.

The late Sir William Herschel made, during his life, what he called 'sweeps of the heavens,' in which, as is well known, he discovered and investigated, amongst other celestial phenomena, those presented by nebulae. The results of these researches were published in the 'Transactions of the Royal Society,' but about the year 1825, Sir John Herschel proposed to re-examine the whole of his father's work, and spent eight years in the survey, which extended over 2306 nebulae and clusters of stars, 525 of which were described for the first time; and in addition, the places of 3000 or 4000 double stars determined. In this re-examination Sir J. Herschel made use of his father's twenty-feet reflector, over the manipulation of which, and the process of polishing the mirrors, he obtained a complete mastery. Afterwards, in obedience to an impulse arising out of the absorbing nature of the pursuit, he resolved on making a survey of the southern hemisphere, for the purpose of instituting comparisons with the northern. In pursuance of this object, as many readers are aware, he embarked with his apparatus for the Cape of Good Hope, where he arrived in January 1834. Having found a suitable residence, bearing the name of Feldhuyzen or Feldhausen, about six miles from Cape Town, in the direction of Wynberg, the instruments were fixed early in March, and ready 'to commence a regular course of sweeping.'

The hot season at the Cape—October to March—is said to afford many superb nights for observation, interrupted occasionally, however, by a wind called the 'black south-easter,' which attaches a black belt of clouds to the mountain, and stretches it over a large surface of the sky. At other times the air is so disturbed by the intense heat of the arid sandy plains, that distinct vision is impossible. 'Even in the hottest season, however, nights of admirable definition occur, especially looking southwards. But what is not a little remarkable, in the very hottest days, looking northwards over the burning tract intervening between Feldhausen and Table or Saldanha Bay, the most admirable and tranquil definition of the solar spots, and other phenomena of the sun's disk, is by no means unfrequent. In such cases, I presume the strongly-heated stratum of air incumbent on the surface of the soil, is swept off by the south-east wind blowing from False to Table Bay, before it ascends high enough to interfere with the visual ray.' 'It is, however,' we read, 'in the cooler months, from May to October inclusive, and more especially in June and July, that the finest opportunities occur for observation. The state of the air in these months, as regards definition, is habitually good, and imperfect vision is rather the exception than the rule. The best nights occur after the heavy rains which fall at this season have ceased for a day or two; and on these occasions the tranquillity of the images and sharpness of vision is such, that hardly any limit is set to magnifying power, but what the aberrations of the specula necessitate.'

A singular phenomenon was frequently observed, 'a nebulous haze,' which came on suddenly, and disappeared as rapidly; making the stars appear, while it lasted, as though surrounded by a 'nebulous photosphere of greater or less extent,' while to the naked eye the sky was perfectly clear. Similar phenomena occur in the atmosphere of England, but not with the frequency or suddenness of those at the Cape. The clouds, too, as seen from the southern extremity of Africa, are more opaque than in our latitudes: in England, astronomers not unfrequently observe the stars while veiled by a

* Results of Astronomical Observations made during the years 1834, 5, 6, 7, 8, at the Cape of Good Hope; being the Completion of a Telescopical Survey of the whole Surface of the Visible Heavens, commenced in 1825. By Sir J. F. W. Herschel, Bart. London: Smith and Elder. 1847.

thin stratum of cloud; but at the Cape, the clouds are too opaque for the rays of light to pass through them.

Of the star marked α , in the constellation Argus, and the great nebula surrounding it, we are informed that 'there is perhaps no other sidereal object which unites more points of interest than this. Its situation is very remarkable, being in the midst of one of those rich and brilliant masses—a succession of which, curiously contrasted with dark adjacent spaces (called by the old navigators "coal-sacks"), constitute the *milky way* in that portion of its course which lies between the Centaur and the main body of Argo.' The number of stars in this region is immense, as many as 250 being in the field of the telescope at one time. But the great point of interest is the star α , which, in Halley's Catalogue, 1677, is marked as of the fourth magnitude, and in later Catalogues as of the second magnitude. 'It was on the 16th December 1837,' writes Sir John Herschel, 'that resuming the photometrical comparisons, in which, according to regular practice, the brightest stars in sight, in whatever part of the heavens, were first noticed, and arranged on a list, my astonishment was excited by the appearance of a new candidate for distinction among the very brightest stars of the first magnitude, in a part of the heavens with which, being perfectly familiar, I was certain that no such brilliant object had before been seen. After a momentary hesitation, the natural consequence of a phenomenon so utterly unexpected, and referring to a map for its configurations with the other conspicuous stars in the neighbourhood, I became satisfied of its identity with my old acquaintance α Argus. Its light was, however, nearly tripled.' The star attained its maximum of brightness, when it was nearly equal to α of the Centaur, on the 2d January 1838, after which it faded into its former appearance. But since that period, it has again brightened so as 'to have surpassed Canopus, and even to have approached Sirius in lustre.' This was in 1843, and was noticed by observers in different parts of the world; and again, in 1845, the star passed through a similar state of fluctuating brilliance. As Sir John Herschel observes—'A strange field of speculation is opened by this phenomenon. The temporary stars heretofore recorded have all become totally extinct. Variable stars, so far as they have been carefully attended to, have exhibited periodical alternations, in some degree at least regular, of splendour and comparative obscurity. But here we have a star fitfully variable to an astonishing extent, and whose fluctuations are spread over centuries, apparently in no settled period, and with no regularity of progression. What origin can we ascribe to these sudden flashes and relapses? What conclusions are we to draw as to the comfort or habitability of a system depending for its supply of light and heat on so uncertain a source?'

Of the nebula in connection with Argus, we read that, 'It would manifestly be impossible, by verbal description, to give any just idea of the capricious forms and irregular gradations of light affected by the different branches and appendages of this nebula. Nor is it easy for language to convey a full impression of the beauty and sublimity of the spectacle it offers when viewed in a sweep, ushered in as it is by so glorious and innumerable a procession of stars, to which it forms a sort of climax, justifying expressions which, though I find them written in my journal in the excitement of the moment, would be thought extravagant if transferred to these pages. In fact, it is impossible for any one with the least spark of astronomical enthusiasm about him to pass soberly in review, with a powerful telescope, and in a fine night, that portion of the southern sky which is comprised between the sixth and thirteenth hours of right ascension, and from 146 to 149 degrees of north polar distance; such are the variety and interest of the objects he will encounter, and such the dazzling richness of the starry ground on which they are represented to his gaze.'

Instances of variability in some of the stars of the

Little Bear have been detected of late years, on which Sir John Herschel writes, in a profound and suggestive strain of reasoning—'Future observation will decide whether the change which is thus proved to have taken place be of periodical recurrence. . . . Ignorant as we are, however, both of the cause of solar and stellar light, and of the conditions which may influence its amount at different times, the law of regular periodicity is one which ought not to be too hastily generalised; and at all events, there is evidence enough of slow and gradual change of lustre in many stars, since the earlier ages of astronomy, to refute all *a priori* assumption as to the possible length of the cycle of variation of any particular star. The subject is one of the utmost physical interest. The grand phenomena of geology afford, as it appears to me, the highest presumptive evidence of changes in the general climate of our globe. I cannot otherwise understand alternations of heat and cold, so extensive, as at one epoch to have clothed high northern latitudes with a more than tropical luxuriance of vegetation; at another, to have buried vast tracts of middle Europe, now enjoying a genial climate, and smiling with fertility, under a glacier crust of enormous thickness. Such changes seem to point to some cause more powerful than the mere local distribution of land and water (according to Mr Lyell's views) can be well supposed to have been. In the slow secular variations of our supply of light and heat from the sun, which, in the immensity of time past, may have gone to any extent, and succeeded each other in any order, without violating the analogy of sidereal phenomena which we know to have taken place, we have a cause, not indeed established as a fact, but readily admissible as something beyond a bare possibility, fully adequate to the utmost requirements of geology. A change of half a magnitude in the lustre of the sun, regarded as a fixed star, spread over successive geological epochs—now progressive, now receding, now stationary, according to the evidence of warmer or colder general temperature which geological research has disclosed, or may hereafter reveal—is what no astronomer would now hesitate to admit as in itself a perfectly reasonable and not improbable supposition. Such a supposition has assuredly far less of extravagance about it than the idea that the sun, by its own proper motion, may, in indefinite ages past, have traversed regions so crowded with stars, as to affect the climate of our planet by the influence of their radiation. Nor can it be objected that the character of a *vera causa* is wanting in such a hypothesis. Of the exciting cause of the radiant emanations from the sun and stars, we know nothing. It may consist, for aught we can tell, in vast currents of electricity traversing space (according to cosmical laws), and which, meeting in the higher regions of their atmospheres with matter properly attenuated, and otherwise disposed to electric phosphorescence, may render such matter radiant, after the manner of our own aurora borealis, under the influence of terrestrial electric streams. Or it may result from actual combustion going on in the higher regions of their atmospheres, the elements of which, so united, may be in a constant course of separation and restoration to their active state of mutual combustibility, by vital processes of extreme activity going on at their habitable surfaces, analogous to that by which vegetation on our earth separates carbonic acid (a product of combustion) into its elements, and so restores their combustibility. With specific hypotheses as to the cause of solar and sidereal light and heat, we have, however, no concern. It suffices that they must have a cause, and that this cause, inscrutable as it may be, does in several cases, and therefore may, in one more, determine the production of phenomena of the kind in question.'

Turning to that portion of the volume in which the observations of the solar spots are contained, we read that, during a part of 1836-7, a more than usual accumulation and disturbance took place in the spots on the surface of the great luminary. One of the spots on

measurement, was found to occupy a space 'of nearly five square minutes. Now, a minute in linear dimension on the sun being 27,500 miles, and a square minute 756,000,000, we have here an area of 3,780,000,000 square miles included in one vast region of disturbance, and this requires to be increased for the effect of foreshortening. The black centre of the spot of May 25 would have allowed the globe of the earth to drop through it, leaving a thousand miles clear of contact on all sides of that tremendous gulf.' From January to March of 1837, numerous spots of most complex structure and character were formed in copious succession. During April and May the spots were fewer in number, and assumed generally a rounded appearance; in June and July they again increased; while we read that 'in August and October, so far as observed, the sun seemed to have passed into a quiescent state, the spots being few, small, and irregularly disposed.'

Sir John Herschel insists strongly upon a continuous and systematic observation of the solar spots, as the only means by which to explain the phenomena they present. 'We are naturally led to inquire for an efficient cause—for a *vis matris*—to give rise to such enormous dynamical phenomena, for such they undoubtedly are. The efficient cause of fluctuations in our atmosphere, in terrestrial meteorology, is apparent enough; namely, external agency—the heating power of the sun. Without this, all would be tranquil enough; but in the solar meteorology we have no such extraneous source of alternate elevations and depressions of temperature, altering the specific gravity, and disturbing the equilibrium, of its atmospheric strata. The cause of such movements as we observe, and upon so immense a scale, must therefore reside within the sun itself; and it is there we must seek it.' Sir John proceeds to show that the rotation of the sun upon its own axis may be the chief cause, by producing currents of air in opposite directions, similar to our trade-winds, and with a density at the equator different from that at the poles. 'The spots, in this view of the subject,' he then pursues, 'would come to be assimilated to those regions on the earth's surface in which, for the moment, hurricanes and tornadoes prevail. The upper strata being temporarily carried downwards, displacing, by its impetus, the two strata of luminous matter beneath (which may be conceived as forming a habitually tranquil limit between the opposite, upper, and under currents), the upper of course to a greater extent than the lower; and thus wholly or partially denuding the opaque surface of the sun below. Such processes cannot be unaccompanied with vorticoose motions, which, left to themselves, die away by degrees, and dissipate; with this peculiarity, that their lower portions come to rest more speedily than their upper, by reason of the greater resistance below, as well as the remoteness from the point of action, which lies in a higher region, so that their centre (as seen in our water-spouts, which are nothing but small tornadoes) appears to retreat upwards. Now, this agrees perfectly with what is observed during the obliteration of the solar spots, which appear as if filled in by the collapse of their sides, the penumbra closing in upon the spot, and disappearing after it. . . . The spots are black; the penumbra a nearly uniform half-shadow, with, however, here and there undefinable definite spaces of a second depth of shade. There is no gradual melting of the one shade into the other—spot into penumbra, penumbra into full light. The idea conveyed is more that of the successive withdrawal of veils, the partial removal of definite films, than the melting away of a mist, or the mutual dilution of gaseous media. Films of immiscible liquids having a certain cohesion, floating on a dark or transparent ocean, and liable to temporary removal by winds, would rather seem suggested by the general tenor of the appearances, though they are far from being wholly explicable by this conception, at least if any considerable degree of transparency be allowed to the luminous matter.'

The sagacity of these views is only equalled by the

earnest philosophical spirit in which they are written. Such works as that just passed in review become landmarks for science, by which present and future discoverers may direct their steps. We feel much pleasure in making it known to a large circle of readers, who otherwise would never hear of its publication.

THE KING AND THE CONSUL

It was the fortune of France, during the course of the eighteenth century, to be governed, at an interval of about ninety years, by two men who filled all Europe—shall we not rather say the world?—with their renown. One of these was Louis XIV., the descendant of a hundred kings, whose early promise of goodness was too quickly blighted by the baneful atmosphere of a brilliant and adulatory court; but who, amid his faults and errors, never ceased for a moment to be the courteous gentleman, as well as the despotic monarch. The other was Napoleon Bonaparte, who bore upon his brow the stamp of natural royalty, and who, by various qualities, won the hearts of his comrades in arms; but whose attempts at courtesy were as rare as they were unsuccessful. He found it easier to become an emperor than a gentleman; and this deficiency was felt by him more acutely than might have been expected from a man of his gigantic mind.

It was the singular fate of one woman, the Marquise de Créquy, to have been presented to both these great men, and to have been received by each of them with distinguished marks of attention. She has left behind her a brief sketch of these remarkable interviews, which we present to our readers, with the hope that it may prove interesting. Let us, however, say a few words first of the fair and distinguished writer.

Victoire de Froulay, Marquise de Créquy, was one of the most noble and witty, as well as one of the loveliest women of her day; and during the profligate reign of Louis XV., her life was so irreproachable, that the shaft of slander could find no arrow wherewith to wound her peace. At the age of ten or eleven, Victoire de Froulay accompanied her uncle, the Maréchal de Tessé, and her grandmother, the Marquise de Froulay, to St Cyr, where Mme de Maintenon was then staying; but we will give her own account of the visit.

'We stepped into the maréchal's carriage, and found ourselves on the road to St Cyr. At the end of a few minutes the equipage stops, and our laquais open the doors and let down the steps with precipitation. "It is the king," said my uncle, and we got out of the carriage leisurely; for the maréchal's people were too well trained not to have given ample notice of his majesty's approach. The king's carriage soon overtook us. It was drawn, as usual, by eight horses, and escorted by three *mousquetaires*, and as many light horse. There were two pages in front, and four behind, all of whom were clad in light-blue velvet, at that time the livery of France. Louis XIV. was alone in the carriage, and the moment he perceived us, the equipage and its escort stopped as by enchantment. His majesty let down the glass at our side, and saluted us with the most graceful courtesy. "That is the king, then," said I, with tears in my eyes—"the great king?" "You may add, the good, the unhappy king," replied the maréchal in a grave and melancholy tone.

'On arriving at St Cyr, we passed through a large apartment filled with the pages and attendants of his majesty, who was gone into the convent garden with the Bishop of Chartres and some other noblemen. Mme de Maintenon received us in a lofty chamber, wainscotted in oak, and singularly free from decorations of any kind. There were no paintings on the walls, neither was the floor of the apartment carpeted; but a small square of tapestry was placed before each of the chairs. Mme de Maintenon called me over to her, and fixing on me a look full of intelligence and sweetness, kissed me on the forehead. She then spoke to me of the high consideration in which she held my

family; and my grandmother rising soon afterwards to take leave of her, because the hour for the king's visit had arrived—"Stay, marquise, stay," said M^{me} de Maintenon in an earnest tone; and my grandmother readily yielded to her request.

"The monarch entered without any announcement, save that the folding-doors were all opened wide, and a gentleman-in-ordinary, who preceded his majesty by two or three minutes, approached M^{me} de Maintenon, making her a profound and silent obeisance, as is done to royal personages when their repast is ready. M^{me} de Maintenon advanced five or six steps to meet his majesty, who seemed to walk with difficulty, but nevertheless saluted her with the most graceful courtesy.

"Here is a young lady," she said, "whom I have taken the liberty to detain a while, that I might present her to the king. It is not needful that I should name her."

"I believe," replied the king, "that there is some sort of spiritual relationship* between this young lady and myself; but we are also relations after another fashion," added he, looking upon me as if he meant to congratulate me on the honour I enjoyed in being his cousin.

"I ask permission of the king that you may kiss his hand," said my grandmother with an air of solicitude, which had, however, no shade of obsequiousness about it.

"The king extended his hand with the palm downwards, as if he had presented it with the intention that I should kiss it; but a moment afterwards, he closed his hand quickly upon mine, which he deigned to press to his lips, and then he had the goodness—the exquisite politeness—or, if you will, the gallantry (for I know not how to designate his proceeding)—to place my hand gently by my side, and to detain it there long enough for me to understand that he did not choose me to offer him my intended homage."

The same mark of distinction which had been conferred upon M^{me} de Créquy by Louis XIV. as an act of gentle courtesy to a child, was rendered to her eighty-five years later by Napoleon Bonaparte, as a proof of respect and veneration. But before transcribing her account of this interview, we will relate her earliest impressions of Bonaparte, when she obtained a passing glimpse of him during his boyish days.

"It was the 31st December, in the year 1780. I had gone to pass a day at Elysée Marboeuf with my invalid friend, the Marquise de Marboeuf, and was sitting tête-à-tête with that dear woman, who was drinking apple-water incessantly, and talked of nothing but coughs and colds, tubercles and inflammations, until I was wearied to death with her conversation. The servant announced some lady, who was waiting in the antechamber, and had come to wish her a happy New-Year.

"May heaven bless her, and deliver me from her visit! Tell her that I have come out to Elysée on purpose to avoid company, because I do nothing but cough from morning to night. Why should she thus pursue me to Elysée? Have I never spoken to you of this M^{me} Bonne-ou Mal-à-parté?"

"Malàparté you call her? I rather think it is Bonaparté." And then M^{me} de Marboeuf began telling me how her husband had become acquainted with this family while he was governor of Corsica, and that he had procured for the husband a situation in the customs, as they were very poor, although persons of good family.

"Being thoroughly wearied of my friend's society, I proposed that M^{me} Bonaparte should be admitted; and accordingly there was ushered in a fine-looking woman, with a legion of ill-dressed children. Amid this covey of unfledged Corsicans, there was a little boy, whose red eyes betrayed some recent vexation, and who was making a strong effort to gulp down his tears. By way of being civil, I inquired, in a kind tone, what was the matter with her son. "*Mudama*," she replied, with a loud provincial voice, "*è ova piti monstro!*"—"he is a little monster!")

"M^{me} de Marboeuf looked quite distressed at the jargon of her visitor; but as it was rather amusing to me, I continued my inquiries until M^{me} Bonaparte related how she had taken her children to see the Bishop of Autun, and how this proud schoolboy had refused to kiss my lord bishop's hand, and how she had boxed his ears soundly as soon as they were outside the episcopal palace, by way of teaching him better manners for the future. "*Ma e ova testa de fer, madama!*"—"He has an iron head, madam!" Assuredly, I will not contradict the glorious mother of the citizen Bonaparte, now that the "*piti monstro*" is become the hero of St Roche and the Pont-tourmant."

About twenty years had elapsed since M^{me} de Créquy's first meeting with the Bonaparte family—years of multiplied trials to her, and of ardent activity to the 'iron-headed boy,' whose proud spirit a maternal hand had vainly endeavoured to repress. Early in the nineteenth century, she dictates to her faithful secretary, Dupont, as follows:—

"Bonaparte had returned from Egypt, and was dwelling in the palace of our kings. Talleyrand was using all his address to draw the nobility into communication with the republican government. Many of them had solicited an audience of the First Consul, in order to obtain a restitution of their sequestered forests. My cousin and heir, the Baron de Breteuil, was very desirous that I should write to Bonaparte, and with infinite repugnance I consented to do so. It is impossible either to conceive or to express the painful effort it cost me to take this step."

"Two days afterwards, Colonel (I forget his name), aid-de-camp to the First Consul, was announced; and I behold a tall fine young man, who, on entering my drawing-room, makes three profound bows, and tells me in a most respectful tone that the First Consul desires to see me, and requests my presence at the Tuileries on the ensuing day, at two in the afternoon. This summons perplexed me. I gave for answer that I was very aged and very feeble, but that, if possible, I would wait on the First Consul at the time appointed. Having applied to the Baron de Breteuil for his advice in this perplexing juncture, he counselled me by no means to neglect the invitation of the chief of the Republic, especially as he seemed willing to restore the confiscated forests. He added, that the Princesse de Gueménée had already presented herself to Bonaparte at his request, and that, after giving her a very polite reception, he had restored to her her forfeited lands. Let me confess that curiosity in some measure swayed my decision, and it was finally settled that I should wait on General Bonaparte.

"It was the 12th of November 1800, when I was carried in a sedan chair to the Tuileries. This poor castle seemed to me sadly dilapidated. The porters landed me at the entrance of the last saloon. (I must tell you that, for lack of dresses made according to the fashion of the day, I was habited in my usual costume; that is to say, in a petticoat and short pelisse of carnelite taffety, with a mantle and hood of the same material.) The "*Citoyenne Créquy*" was announced, and I found myself tête-à-tête with the conqueror of the Pyramids. He looked thoughtfully at me for a moment, and then addressing me in a kind manner, "I have wished to see you, M^{me} la Maréchale." But quickly assuming a more imperious tone, "I have desired to see you. Are you not a hundred years old?"

"Not quite, perhaps; but I am very near it."

* Extract of a note from M^{me} de Créquy, relative to the letter which she had consented to write to Bonaparte. "I will sign this letter, which I must not have the trouble to correct or to write. All the necessary formulas may be employed; but care must be taken not to use any expression which may convey the false idea of submission on my part; and I will not sign anything which can be at variance with sincerity or dignity of character. Therefore, let there be perfect politeness in the expressions, but no superfluous compliments. I ask for justice, not favour."

* Her grandmother was the goddaughter of Louis XIV.

"How old are you precisely?"

"I could scarcely forbear laughing at such an interrogation, made in so imperative a form. "Sir," replied I, smiling—in such guise, alas! as one can smile at my age; and perhaps my smile was not even perceptible to him—"I cannot tell you precisely my age. I was born in a castle of La Maine."

"Ah, yes," said he, interrupting me brusquely; "in your time the civil registers were either badly kept, or else altogether neglected." And then he resumed his interrogatories in a magisterial tone. "Where do you live?"

"In the Hôtel de Créquy."

"Ah diable! And in what quarter?"

"I could not understand this fancy to know where I resided; but am told that it is a sort of curiosity which he feels with regard to all those who approach him. It also perplexed me to know wherefore he addressed me as *Mme la Maréchale*; but on learning that he had bestowed equally inappropriate titles on other people, it occurs to me that he wishes perhaps to create an illusion to himself as to the date, origin, and nature of his consular authority. On learning that I resided in the Rue de Grenoble—

"Rue de Grenoble! There was a tumult in your quarter yesterday. Were you frightened? It was on account of the price of bread."

"The rioters were not numerous, and I did not trouble myself about the matter."

"There can be no disturbances under my government; no serious ones at least! There may be an uproar now and then; but France is not the less happy and contented. Don't let people deceive themselves; a little clamour is no proof of dissatisfaction among the people. Happiness does not go about and make a noise in the streets: a few restless spirits make a vast commotion. Is it not so?"

"Oh, assuredly; three women who set about screaming, make more noise than three thousand men who hold their peace."

"What you say, then, is very good; very good indeed, do you know?"

"And I answered him quite simply, as Colinette would have done at court, "You are very kind, sir!"

"The weather being dark and showery, with gusts of cold wind, "I am sorry to have made you come out to-day," said he, smiling; "the weather is arbitrary," laying an accent on the last word. "We see a relative of yours frequently."

"Who can that be?" I inquired with an air of surprise, and in as familiar a tone as that which he used. He replied it was *Mme de Mirande*. "I did not know we were relations! I am the Duchess of Miranda in Spain, and this perhaps has occasioned her mistake." But the First Consul looked so annoyed at the deception, that I was sorry to have said so much; for in truth I did not wish this Gasconne any harm.

"You have seen Louis XIV.?" continued he in an elevated tone; "have you also seen Peter the Great, *Mme la Maréchale*?"

"I have not had that honour, for I was in my province when"—

"I know that you were intimate with Cardinal de Fleury; is it true that he expected to obtain the imperial crown for Louis XV.? Had Louis any chance of being emperor?"

"It was believed, general, that his success was certain, but for the bad faith of Frederick, king of Prussia, whose treachery Fleury never forgave."

"Frederick was cleverer than Fleury, but not more astute: old Fleury was a cunning one. Have you suffered much from the Revolution?" he inquired dryly.

"Believing he would be glad to escape a long list of grievances, I mentioned my losses as briefly as possible; alluding especially to the forests of Versailles and St Pol, and the wood of Valenciennes. His answer was vague; for he evidently responded to his own thoughts rather than to my words. "Madame, the desire to do

good in a time of revolution is like writing upon the sand by the sea-shore; what is spared by the winds is effaced by the waves." After a moment's pause, he inquired, "Did you know Dubois and Cartouche?"

"Instead of answering a word, I looked at him with so severe an expression, that it surprised me now to think upon it. Most probably he became sensible of the impropriety of having summoned the Dowager Marquise de Créquy into his presence for the sake of asking news about Cartouche; and he smiled so naively, that I felt at once disarmed."

"Allow me, madame," said he, "to kiss your hand."

"I began to pull off my mitten as hastily as the occasion required. "Leave on your glove, my good mother," added he with an air of respectful solicitude; and then he pressed my poor decrepit centenary fingers firmly to his lips. He granted me the restitution of our forests with the best grace imaginable; and then spoke of the noble conduct of the Duke de Créquy Lesdiguières at Rome, adding, that France was wrong in allowing the destruction of this pyramid, which testified the reparation offered by Rome to her ambassador."

"Alas! what avails me this noble name of Créquy, which I shall be the last to bear; and which must very shortly be noted down for the last time in a dirty register, among the names of an undistinguished multitude!"

"I have remarked in the character and conduct of Bonaparte many things which are abhorrent to me, one thing that perplexes me, and one that I approve of. It is needless to enumerate the causes of my dislike; but the motive of my approbation consists in his unconquerable perseverance. He never retreats before any opposition; and in great affairs, as well as in little ones, he who is the most resolute will infallibly succeed. As for the matter which perplexes me, if Bonaparte be indeed desirous to reign over France, the enigma may be partly solved—Wherefore does he seek so earnestly to win over to his interest the high nobility of France, who never can be of any service to him? Heirs of their unworthy sires, most of our young nobility have been educated without piety, and too early plunged into the corrupting vortex of the world: an enervated and degenerate race, they are unfit to govern. Wherefore, among the nobles who have distinguished themselves during the Revolution by ability or self-devotion, has there not been found even one of our grand seigneurs? Wherefore have they made themselves remarkable only by their disloyalty or their want of intelligence?"

"I believe that the impiety and profligacy of the Regency, and of the closing years of Louis XV., have produced the dissolution of society in France; and that our country needed to be purified in a bath of her own blood. I believe that Bonaparte has been raised up to exterminate the assassins, and to dissipate revolutionary illusions. I think it very probable that his head may be turned by success; and perhaps this man of victory may so far forget the mission he has received, that his ambition may be severely chastised. Laurels are a perfect symbol; they yield shade, and nothing more."

THE MIDNIGHT JOURNEY.

BY LEITCH RITCHIE.

I HAVE lived a very wandering life. When quite a boy, I was taken from school to be consigned to the care of a near kinsman in the West Indies. In two years this gentleman died insolvent, and I tried successively several of the greater islands without finding a permanent place for my foot. I next found my way to the Spanish main, but in the company of loose and daring speculators, rather than in the regular mercantile employment for which I had been intended; and several years were passed in a course of adventure and vicissitude, many portions of which would seem too wildly improbable for romance. In the other division of the new world, I was carried by my wandering destiny along the whole of the Mexican range of coast, and passed nearly two years

in California. In the course of this time I visited several of the islands both in the North and South Pacific, and at a subsequent period hunted the sea otter, with a crew composed chiefly of Aleutian savages, in the ocean that separates Asiatic from American Russia.

All this had done nothing for me in the way of fortune. Indeed I cannot be said to have ever thought seriously of the future. Like the wild companions among whom my lot had been cast, I was satisfied with the bounties of the passing hour; spending gaily, whenever we had opportunity, the money earned at the constant risk of life and limb. But at length a circumstance occurred which made me think. When poring one day over an old newspaper in the cabin of an English ship, I observed with a surprise and incredulity—at first manifested by a fit of laughter—that the world had not altogether forgotten the poor, friendless, reckless adventurer of the Pacific. A series of unexpected deaths, as it appeared, had taken place; and the boy who had been shipped away at such early years from his home and country, in the hope of securing for him in the new world a provision, which in the old could only be the result, if it ever came at all, of the struggles of years, was now the heir of an independent property!

These particulars have nothing to do with an adventure (if it can be called an adventure) which I fell in with immediately on my return to England, and which I now sit down to sketch for the amusement of my new friends. But I give them in order to account for the wildness of certain hallucinations which beset me, and which would otherwise be considered merely an instance of bad taste, rather than traced to a habit of mind engendered by the extraordinary scenes that had formed my every-day life since the days of boyhood. Even the long homeward voyage had no effect in tranquillising my nerves; for it was a voyage of storm and other disaster, including hunger, and its frequent concomitant, mutiny. When at length the white cliffs of my country rose upon the horizon, steeped in the mellowed sunlight of these temperate latitudes, I felt an unaccustomed yearning after repose. My unquiet bosom grew calm; my wild eyes filled with tears; and I called upon the winds to swell our lagging canvas, that I might flee away and be at rest.

What a contrast was my life now about to present! What a novelty was even the physical aspect of the country about to disclose to my eyes! How should I fall in with the measured tread of that calm and orderly population of which I was to form a unit? How could I even walk steadily upon the level roads and smooth fields that awaited me? Presently, as these inquiries crowded into my mind, there mingled with my new-born longings after rest a kind of misgiving that I was not fitted for its enjoyment; and as the night began to close dark and heavy around while we were nearing the coast, I felt almost happy in the idea that another day was to dawn before I should enter upon my new course of tame, quiet, methodical, prosaic existence.

But this interval was not destined to occur. As lights rose here and there upon the dark mass before us, in clustering groups, long lines, or solitary stars, they rekindled my excitement. The voices of the land called me from a hundred points, and my heart answered to the hail. It seemed an *adventure* to plunge into that world of shadows, studded with so many gems that sparkled without illumining; and in the morning, it would be an amusement to observe into what common forms the phantasmagoria of my imagination had resolved. A conveyance, I was told by the revenue officers who boarded us, would set out in two or three hours from a neighbouring town, towards the distant part of the country which was my destination; and I suddenly determined to go on shore, and make as much progress on my journey as I could accomplish in the night.

On landing, I could form no distinct idea of the character of the country, for my vision was unable to penetrate more than a few yards around me. These few yards, however, were tame and civilised, just as I had

expected; and being informed at the Customs' station that I should find the road good and direct towards the next town, I at once shouldered my knapsack—for my worldly goods were then packed in small compass—and set out on the few miles' walk. The wind was against me, and felt keener and colder than I had known it under the tropics; and by and by it came on to rain, and the drops dashed in my face as if they would have cut the skin. Altogether, my walk was somewhat uncomfortable; and although it was impossible to wander from a narrow road that was bounded on both sides by a thick hedge, blinded as I was by the rain, and confused by the gust, I found the way a little longer than I expected.

I at length reached the town. The streets were already deserted; not a sound was heard but the wind moaning through them; and as I passed between rows of lamps, of what seemed to me an unearthly brilliance, I could have supposed that I had entered some dead city of enchantment. After wandering on for a considerable distance, I at length reached an open door of what proved to be a house of entertainment; and having signified to the people what I wanted, and whither I was going, and desired to be called in time for the conveyance, I sat down to a substantial and not unwelcome meal. This was indeed rest. I was alone in the room: the house, like the street, was profoundly silent; and as the servant-woman glided in and out to attend to my requirements, she seemed afraid to disturb by voice or footfall the repose of the scene. She at length left me, signifying that I should be called 'in time to start;' and while mechanically satisfying my appetite, I gave full reins to my excursive imagination.

It was still cold, although not late in the autumn; and in order to restore the circulation to my limbs, I drank a little spirits and water. This circumstance would not be worth mentioning; but my habits being strictly temperate, I am inclined to *hope* that I may thus in some measure account for a state of mind which I should be loath to describe as delirium. However this may be, I either fell asleep after supper, or into that trance-like reverie which can hardly be distinguished from a dream. I was still roaming by the cliffs of the Pacific, through the primeval forests of America, amid the breakers of Behring's Sea. I was still searching for gold (which had at one time been my occupation) among the mountains of the south-west, and listening to the wild legends of the place, as I paused at the opening of some tomb-like cavern, said by the natives to communicate, through the bowels of the earth, with lands beyond the ocean. But my reverie had not the effect of reality. I knew at the time that it was my imagination that thought, while my judgment watched its aimless gambols with a sense of languid amusement. Ever and anon, however, England mingled in my dream. From each loftier cliff, from the summit of each wilder wave, I saw spread out in the distant sea its green and level fields, bathed in the pale sunlight of the north, and slowly traversed with methodical steps by an industrious and orderly population.

I was at length suddenly awakened from my trance by the noise of heavy footsteps, clanging doors, and calling voices; but so imperfectly awakened, that I have only a confused recollection of having been told that it was time to set out on my journey, of being flooded along the street in a hurrying crowd, and of having paid, in the midst of a scene of tumult, some money, which I understood was to be the price of my transport. I may have been partly asleep, and partly under the influence of the unaccustomed glass of spirits and water; yet, after all, this confusion of mind is perhaps not very surprising in a stranger from the wilds of the Pacific set suddenly down in the heart of a distant country, and in the midst of an entirely new form of society. But mark the sequel.

I was hardly seated in the public vehicle, when it rolled off, leaving the tumult behind in an instant. A female, in the corner opposite to mine, was the only

other passenger; and by the light of a lamp which we passed now and then in the earlier part of the journey, I saw that she was young and fair, but pale, cold, mute, and passionless as a statue. Not a trace of excitement caught from the hurry and the crowd, or the romance of a midnight journey, was on that marble brow, or in those lovely but soulless eyes. They were fixed on mine, as her head leant back, with a look which confounded me by its utter want of human sympathy; and then, having wandered for an instant over my foreign garb, and my knapsack, which lay on the seat beside me, they withdrew so coldly and lifelessly, that when a hand was protruded from her cloak, to arrange with listless motions its folds about her neck, and exhibited not one trace of blood in its long, tapering fingers, that gleamed like snow in the darkness, I could have supposed her to be some preternatural being in whose custody I was travelling! There was no amusement without. We seemed to be journeying between two shadows, the denser being the earth, and the rarer the heavens; and again and again I turned to look at my companion. Sometimes, though rarely, I met the dead eyes as before; but at length they closed, and she was all statue.

The form of the denser shadow without now began to change, being half disclosed by a pale gleam from above, which seemed to indicate the quarter of the sky where the moon lay under her pall of clouds. The shadow grew loftier and more rugged, and then appeared to come out in cliffs and heights. These presently began to close in upon our path; and the sound of our rushing wheels, before partially lost in the surrounding atmosphere, was converted, by the interruption, into groans and screams. On flew the vehicle, shrieking as it flew, and answered by the thousand voices of the rocks, as they gathered closer and closer, till they seemed to totter over our heads. Nor was this idea so absurd as you may suppose; for as I thrust my head in alarm out of the window, there was a yawning gulf before us, into which we were obviously hurrying.

Was I still in the midst of my dream? Was this the Gold-seeker's cave, through which my 'extravagant and erring spirit' was to be transported beneath the foundations of the sea? I had hardly time to ask myself the question, ere the screams and groans of the vehicle, becoming more agonised every instant, were broken by an unearthly yell, which quivered in the ear for more than a minute, and then, with a rush and a roar, received with a sound of mingled laughter and sobbing, we plunged madly into the abyss.

Onward—onward—onward we flew, through as dark and wild a cavern as ever disclosed to modern men the extinct races of an earlier world. Sometimes a red and momentary gleam illumined, I knew not whence, our lonely path, and I saw the face of the living rock overhead jagged with stalactites, and its rugged sides dripping with water. On these occasions I turned a look of intense curiosity upon my companion. Sometimes her eyes were open, sometimes shut; but her manner remained as listless and impassive as ever. Sometimes her glance met mine, but it betrayed no trace of human emotion. She appeared to look on me as a portion of the material things before her, with which she claimed, and could feel, no sympathy. Sometimes her eye wandered to the window; but after a single glance, it returned as cold and unmoved as before. It was the same thing to her whether we were above or below the earth, whether we were flying upon the clouds or digging beneath the foundations of the sea; it made no change in her listless manner or reclining posture: she remained as cold, and pale, and mute, and passionless, and fair as ever.

How long this subterraneous course went on I cannot say. I lost account of time. We had set out from the mountains of Mexico, and for aught I knew, we were now beneath the Pacific, and destined to rise in the deserts of Australia. In fact, the old world and the

new were so strangely jumbled in my imagination, that I could not have determined, with any feeling of certainty, in which quarter of the globe our journey lay. All on a sudden, a wan, spectral light broke into the cave, and but for the wild absurdity of the supposition, I could have really supposed that I caught a glimpse of the moon emerging from her pall of clouds. This I *knew* to be impossible, although the other details of the scene were so terribly real, that I was sometimes fully persuaded I was awake! On, however, we rushed, in utter darkness as before, and for so long a time, that, worn out and stupefied by the over-excitement, it was with a feeling of little more than languid curiosity I saw—not by the approach of light, but rather by a steady change in the darkness—that we neared the end of our subterranean career, and were at length vomited forth into the upper world.

I beheld nothing distinctly for several minutes. My companion was asleep, or at least motionless; and, as if controlled by some strange fascination, I felt my own eyes growing heavy; when, all on a sudden, the moon burst forth, and lighted up a scene of such surpassing splendour, that I uttered an involuntary cry of admiration. We were in a deep glen, or rather gorge, the sides of which appeared to be formed of majestic cliffs of white marble, hung here and there with a drapery of woods. The summits were inconceivably various in their outlines: sometimes representing castles and towers; sometimes battlemented steeps; sometimes fringes of tall trees, that held up their finger-like branches between us and the moonlight. In the distance, the ravine, at a place where it sunk sheer down from the base of a lofty mountain, was spanned by an aerial bridge, that appeared to me like a path by which the sons of God might have descended to visit the daughters of men. My cry had aroused the female statue, and she even raised her head for an instant; but there was nothing unnatural to her in this spectral show, and in another moment she leant back in the carriage, although I could see her strange eyes gleaming upon me for some time through the gloom.

Onward we rushed through the gorge, now plunging into solemn woods, and now skimming along the extreme edge of steeps, from which I could see, through the tops of tangled trees, the gleam of a torrent far below. But presently, as we appeared to be issuing through the narrow portal of the ravine into a more open country, the moon was again hidden, and a thicker shadow than before descended upon our path. At this moment I received an impression which I shall long remember, for its remarkable consistency with the scene. My eyes were attracted to the opposite window of our headlong vehicle by a sudden and momentary gleam of red light, accompanied by a sound like the sweep of a tempest, and—smile if you will at the superstition!—I beheld a crowd of spectral faces glaring in upon us for an instant, and then vanishing in the night.

After our egress from the enchanted valley, we appeared to descend gradually, but without diminishing our speed. It was too dark for any distinct observation of the nature of the country; but the air felt thick, chill, and damp, and it was obvious that we were gaining an extremely low level, with perhaps a marshy soil. But at length the struggling moon was able to throw a wan light upon the scene, and I saw that we were either crossing the sea, or traversing a flooded district. Water was around us as far as the eye could reach, studded here and there with small islands, each bearing a hut, a rick of corn, or a few solitary trees, in the midst of which we continued our career without appearing to disturb the slumbrous wave by our rushing wheels. It seemed as if we skimmed along the surface of the liquid expanse without touching it. At this part of the journey, the marble fingers again stole out, to draw closer the drapery about the marble chin: my companion apparently felt the chillness of the air, but it gave her no farther trouble to find herself out of sight of the mainland.

Not the least extraordinary circumstance attending this extraordinary journey, was the rapidity of transition from one level and from one character of scenery to another, without our receiving any distinct impressions from the act of climbing or descending. It may be, however, that the monotony of the water-course lulled my over-excited senses into a temporary oblivion; but at anyrate, the next change I perceived was the moon completely free from the imprisoning clouds, and her faint beams struggling with the first rays of the dawn. We were now rushing through a wild and rugged country, evidently of considerable elevation, with here and there the adjuncts of wood and water giving variety and interest to the scene. Suddenly, however, as I leant out of the window to refresh my fevered brow with the morning air, I could perceive, by an appearance in the misty distance, that our journey was in all probability drawing to a close. A deep valley, if it would not rather prove to be a chasm in the mountains, extended at right angles with our course; and in order to pursue our career, it would now be necessary, instead of running, as we had hitherto done, pretty nearly as the crow flies, either to turn sharply away, or fling ourselves headlong over the steep.

It was with intense interest I watched the event; which became more and more puzzling, as I saw that there was no mass of houses giving indication of our having reached the goal. To turn away along the brink of the valley, would be contrary to the whole scheme of our journey; and as we approached nearer and nearer, it was obvious that to plunge into that gulf of tumbling shadows, on which the gray light of the dawn had as yet but little influence, was entirely out of the question. My agitation appeared to arouse in some measure even my strange companion; at least she leant languidly forward to give a single glance out of the window, and then returned to her marble repose.

How I wished that I could see more clearly!—but perhaps the wish was imprudent. Nearer and nearer we came to the edge of the chasm; deeper and more sudden appeared the precipice to fling itself into the misty gloom; swifter and wilder flew the wheels of the desperate vehicle: we are at hand; we are on the brink: my eyes closed—but not till I had seen that we were no longer on the firm earth. We had darted out into space, like an arrow from the bow. We had swerved neither to the right nor the left, neither upwards nor downwards. We had scorned the depths of the valley, just as we had laughed at the impediments of cliff and mountain; and now we appeared to be skimming through the air, with the same indomitable will, the same headlong impulse, with which we had thundered through the living rock!

The first edge of the sun arose as we flew, and the shadows of the valley disappeared. A beautiful and fertile plain stretched far beneath us both to right and left, diversified by woods and waters, farms and cottages, fields and gardens; and here and there we could see men and women, horses and oxen, coming forth to their daily employment. We were nothing to them. We did not belong to their world. A face may have been turned up for an instant, a finger extended; but the peasant returned the next moment to his cheerful toil, without a thought of whence we had come or whither we were going.

We had left this scene long behind before my bewildered senses revived; but at length I was aroused by the stopping of the vehicle, and I found myself suddenly in the midst of a crowd and bustle similar to that which I had witnessed at our departure. The mysterious female at once started into life. Her manner thawed; her complexion lost its marbly tint, and became human; and her beautiful face was lighted up with smiles.

'Give your ticket!' said she, teaching me by her example, as a functionary came to the door.

'What is this?' said I. 'Was it all real? Where have we been? How have we come?'

'I see,' replied she, smiling, 'you are a foreigner, and do not take well to the rail. It is very dull and stupid, I must needs confess, but I usually manage to sleep a little. However, I shall not find it quite so tame to-morrow when returning in daylight.'

'You return to-morrow?'

'Yes; I have only come down to dine to-day with some friends, who have made up a little party for a trip to America to see the Falls.'

'You do not go with them?'

'Alas, no! I am such a weak creature—so childishly nervous; and they say Niagara is so odd! In your country, too, I daresay there are wonderful sights, and strange adventures, and all sorts of things to keep one awake. Here we only spin cotton! Good-morning.' And with a kindly smile, and a graceful bend, the young lady tripped away, and was lost among the crowd.

Such was my first journey after my return to England; and it served to dissipate many delusions. I found every-day life a poem, a romance, compared with which the adventures of the Pacific are tame and commonplace. Even the cotton manufactories, so disdainfully referred to by my fellow-traveller, present scenes unparalleled for wonder and excitement, danger and hairbreadth 'scapes. But the magic with which my countrymen are surrounded is *their own*. A tunnel through a mountain, or a viaduct across a valley, is no marvel to them, because they know the amount and kind of labour which produced it, and the sum of money it cost. For my part, my impressions are as yet free from such associations, and I still walk about like a man in a dream. I went abroad in search of fortune, and found only danger and toil; I returned home for repose, and find nothing but headlong hurry and wild excitement. Science has changed the face of the world; and I am as a man called up by enchantment from the sleep of ages to find himself a stranger upon the earth.

MAN AND WIFE.

A TALE.

BY ANNA MARIA SARGANT.

'You wish to delay your decision until you have had an opportunity of further consulting your wife, I presume?' This observation was addressed by a house agent to a young tradesman with whom he had for some time past been in treaty respecting the lease of a shop.

'Consult my wife!' repeated Bradshaw in a tone indicative of surprise and indignation. 'No; I would never consult a woman upon a matter of business.'

'Oh, I beg your pardon,' hastily rejoined the wary house agent, secretly rejoicing at having at length discovered the weak side of the man he was dealing with; 'but I thought you might possibly like Mrs Bradshaw to see the house. I know the ladies like to have a voice in such matters.'

'I tell you I don't ask her advice in *any* matter,' the young man sharply retorted; 'and to prove to you, Mr Hutchinson, that I don't boast of an independence I do not really possess, I'll strike the bargain at once.'

The house agent had previously tried all the usual methods of drawing the business to a close. He had assured him that his rival draper, Mr Dawkins, had been after it, and that several other persons were eager to have it. These, however, had failed. Bradshaw still had scruples regarding the prudence of the affair; for the rent and taxes were exorbitant, and the terms of the lease far from favourable; but no sooner was it hinted that he was waiting for his wife's consent, than Hutchinson's end, as he had acutely perceived would be the case, was accomplished.

Now, it must not be inferred, from the above-related conversation, that Mr Peter Bradshaw was a domestic tyrant: he was willing to allow his wife all the home comforts his means would afford, and his manner towards her was not often unkind; but then she must never dare to express an opinion on any subject—the

preparation of the dishes for his table, or the dress of his children excepted. We sometimes hear mention made of individuals who have but two ideas, and this is surely a poor allowance. Unhappily, Mr Bradshaw had but one; and that one was—that it was beneath the dignity of a man to take the counsel of a woman. His notions of the mental superiority of 'the lords of the creation' were so towering, that he looked down upon his gentle spouse with feelings bordering on contempt, and consequently treated her as he would an upper servant, whose office it was to administer to his domestic comfort. He on his part thought he was discharging his sole duty by finding her the means to supply a liberal table and suitable apparel, and by treating her with negative kindness.

'Well, Martha, I've taken that shop in Market Street,' the husband exclaimed on returning home; and as he spoke, he threw himself at full length (which, to own the truth, did not far exceed five feet, notwithstanding his exalted idea of himself) upon the couch in his little back parlour.

'What shop, my dear?' Mrs Bradshaw asked in surprise.

'Why, the new shop opposite the market-place. Didn't I tell you I thought of taking it?'

'No, Peter; you once said that you had looked at it, and asked the rent, but it appeared much too high for our means.'

'I am going to try it at all events,' the husband rejoined a little tartly, for he was not pleased with her vague allusion to the imprudence of which his conscience accused him of having been guilty. 'There is nothing to be done now-a-days without a great show; and I think I have stayed in this dull street long enough.'

'This shop has afforded us a comfortable maintenance for seven years, my dear,' the wife quietly observed.

'The change will be for your benefit, Martha,' Mr Bradshaw interposed; 'you will have the use of three or four additional rooms, and large ones, instead of these little pigeon-holes, so I don't see that you will have any reason to complain.'

'I am not complaining, Peter,' she returned; 'I am only fearful that you will find it difficult to meet the expenses from your profits; besides which, we must, you know, have this house on our hands three years longer.'

'I shall easily find a tenant,' he carelessly replied; adding, 'and I have taken the other for twenty-one years.'

'Twenty-one years!' exclaimed the wife in astonishment and alarm; but seeing that the gathering storm was about to break, she dared not add more.

When some persons have done that which their consciences decide to be wrong, they not unfrequently have recourse to a fit of passion, as the only means of silencing the remonstrances of those who have most cause to complain; and to this refuge Mr Bradshaw fled, knowing that he had no arguments to trust to. His wife being too gentle to resist, and too wise for strife, suffered it to have its vent without a word of retort. Thus it shortly subsided into a calm.

Another month found the family settled in their new abode; and the usual methods of advertising informed 'Mr Bradshaw's friends and the public that he had removed from No. 7 Church Street, to 50 Market Street, where he hoped, by offering the best articles at a very moderate price, to merit their continued patronage and support;' but notwithstanding this announcement, the expected influx of customers did not follow, at least in proportion to the additional expenditure of the shop-keeper, and his spirits consequently fell.

'Martha, my dear,' he one day said, addressing his wife a few weeks subsequent to the period at which the change took place, 'I am convinced that my want of success here is wholly owing to the small capital I have, so I have been thinking of taking a partner into my concern.'

'You must be cautious whom you trust, my dear Peter,' Mrs Bradshaw quietly remarked.

'Oh, I have taken care to be on the right side,' her husband answered. 'I have made a bargain which cannot be otherwise than for my benefit.'

'Then you have already settled the affair!' cried the wife in surprise. 'I thought you implied that you had it only in contemplation. Pray who may it be that you have made this arrangement with?'

'With the son of my father's old friend, Smithson. The old man is anxious to associate his son with some steady man of business, and is willing to put a thousand pounds into the concern, which will be an excellent thing to stock my new shop, and will enable me to extend my connection.'

'A thousand pounds will, I think, be a poor recompense for having a young man of George Smithson's habits as a partner in your business,' Mrs Bradshaw observed. 'It is not often that I interfere in such matters,' she pursued; 'but if you take my advice, Peter, you will have nothing to do with him.'

'And why not, pray?' her husband sharply asked. 'I have known the father these twenty years, and his character has always stood high for integrity.'

'That may be; but it does not follow that the son will not bring you into trouble. You know he has caused his father a great deal of unhappiness by his imprudence and extravagance; and it appears to me to be like rushing into ruin with your eyes open to have any connection with him.'

'You are too severe upon the young man, Martha,' Mr Bradshaw interposed, with an inflection of voice which indicated that his judgment was more than half convinced by her argument. 'He has been a little extravagant in his youth; but now he has sowed his wild oats, his father hopes he will settle down into more steady habits.'

'It is quite natural that the father should hope so; but not that you, my dear Peter, should depend on such slender foundations in a matter which may be so very serious. My own observation,' she added, 'has led me to remark that a disobedient, extravagant youth, seldom makes a steady, persevering man.'

'Oh, you always look on the dark side of the picture, Martha; you are always prognosticating evil. For my part, I like to hope the best.' This speech was accompanied with one or two of those nervous movements which often attend unsound arguments; but Mrs Bradshaw, who was really much concerned at the new step of imprudence her husband was about to take, thought it right to be more than usually tenacious in maintaining her ground. All, however, was vain. 'Fahaw—stuff!' muttered Mr Bradshaw. It was all he could say, for he had not even a lame leg to stand upon.

Mr Peter Bradshaw's once small and comparatively unpretending concern now assumed the more substantial appellation of a *firm*, though it had really less ground for so doing; and fresh placards and advertisements announced 'that Messrs Bradshaw and Smithson would now be able to offer the public goods of superior quality at a before unheard-of price.' But neither the plate-glass, the puffing, nor the partner, had the desired effect of enticing fresh people to inspect the wares; and many of those who had been regular customers at the late shop in Church Street discontinued dealing, thinking that, in order to make so much show, the articles must really be inferior. To add to Mr Bradshaw's distress, the house he had before occupied did not let, nor did it seem likely to do so till the lease had expired, owing to its being in want of a thorough repair.

Just at this period the attention of the family was called to an affair of a different nature. Mr Bradshaw's eldest brother had died some years previously, and made him his executor, and also the guardian of his only daughter. The interest of the money was to be appropriated to the young lady's board and education till she became of age, when it was to be at her own

disposal. Miss Caroline Bradshaw had been brought up at a boarding-school in the suburbs of London, and remained there after her education was deemed *finished*, till within a few months of the expiration of her minority, at which time it was proposed by her uncle that she should take up her residence in his house. As his fair ward had, in addition to a pretty face, the attraction of fifteen hundred pounds, Mr Bradshaw had, during those few months, several overtures for her hand; but, to the dismay of the rival candidates, it was at length discovered that Mr George Smithson, who was amongst the number, was the favoured individual. This circumstance caused Mrs Bradshaw considerable uneasiness. Unhappily for her own prospects, she had no reason to alter the opinion she had formed concerning the young man. She foresaw that poverty and misery must be the termination of the career he was pursuing, and she trembled lest her niece should be involved in the ruin he was bringing upon himself, and she feared on them also. She made several appeals to her husband, begging him, as he valued the happiness of his brother's child, to warn her of the precipice on which she stood; but he was deaf to her pleadings. 'Caroline is old enough to choose a husband for herself, and I shan't interfere in the matter,' he on one occasion angrily returned. 'I would not certainly have any hand in making up the match, because people might say that I wanted to keep her money in my own hands for the use of the firm; but she shall certainly do as she pleases.' The wife had next recourse to arguments with the young lady herself; but Miss Caroline thought her own judgment superior in such matters to that of her good aunt. Mrs Bradshaw then tried to delay a union which she could not prevent. She represented to her husband that if he withheld his consent for twelve months, he would by that time see how the young man conducted himself in the connection he had already formed with the family, and thus have a better opportunity of judging whether there was any prospect of happiness for his niece. Poor Mr Bradshaw's prejudices concerning the superior judgment of his own sex came again into full play. He was angry at what he termed his wife's pertinacity in groundless apprehensions, and persisted in saying he should let the young people follow their own course. The result was, that Miss Caroline Bradshaw became Mrs Smithson on the very day that she attained her majority.

The young couple had arranged, though without the consent, or even the knowledge, of Mr Bradshaw, to invest the greater part of the bride's fortune in establishing a business in London. The fact was, that Smithson was not at all pleased with the subordinate position he held in the firm. He wanted to have the entire management; and, above all, that the money should pass through his hands, which Mr Bradshaw had hitherto wisely prevented. A proposal to spend the honeymoon in town did not awaken surprise or suspicion; but this was the preparatory step for the plan being put into execution.

Three weeks after his niece's marriage, Mr Bradshaw received a letter from his young partner, stating that he had just had the offer of a dashing shop in Regent Street on very advantageous terms; that they wished, therefore, to take up their residence in London, instead of returning to B—; and that, in the event of Mr Bradshaw approving of the arrangement, he and his beloved Caroline were quite willing that the profits of the concern should be equally shared with their dear uncle. All he desired was, he said, to have the superintendence of the London business left wholly to himself. Mrs Bradshaw, with her customary penetration, perceived that this was likely to involve them in still greater trouble. She foresaw that it would enable Smithson to make what use he pleased of his partner's name; and now that he was removed from under their eye, it was likely that he would become more improvident and reckless than ever. She again ventured to expostulate with her husband, representing

how much better it would be to dissolve the firm at once, and thus save himself from absolute ruin. Had this advice come from any other quarter, it is probable that Mr Bradshaw would have seen and acknowledged its wisdom. Indeed, as it was, he had his misgivings; but the fact of its being urged by his wife, was a sufficient reason why he should pursue a contrary course. The result was, that at the expiration of a few months, the names of Bradshaw and Smithson appeared in the Gazette amongst the list of bankrupts; and a very inconsiderable dividend had they to offer, for Smithson had given bills upon the credit of the firm to a large amount, having in the meantime launched out into expenses which a capital of five thousand, instead of fifteen hundred pounds, would scarcely justify. Nor was this all. He had, during his residence in London, formed connections with several dissolute young men, who, being, like himself, in want of sufficient means to gratify their extravagant desires, occasionally had recourse to fraudulent acts in order to supply those means. This was discovered just at the time his commercial affairs were finally settled; and the consequence was, that he was obliged to fly the country, leaving his unhappy wife in a most destitute and hopeless condition.

Poor Mr Bradshaw was in a state bordering on insanity. His naturally weak mind sunk under an accumulated load of sufferings, which, in spite of his inordinate self-esteem, he could not but feel had been brought on by his own want of prudent forethought. He was really distressed beyond measure at the contemplation of the misery in which it had involved his gentle wife and innocent children; his niece's distress, too, and consequent illness, gave additional poignancy to the stroke. He could not but feel that he had not fulfilled the part of a father or guardian towards her; and that her premature death, or the horrors of her future life, would be alike owing to this fact. Mrs Bradshaw was the only person capable of action, and she in this emergency displayed an energy of character which was little expected, but which could alone be of any avail in saving her family from a total wreck. Her kind and judicious treatment of the unhappy young wife restored her, in a short space of time, to some measure of health; and her prudent counsel then induced her to make an effort for self-support, by means of the education which she had received. The task of soothing the irritated feelings, and calming the perturbed spirit of her husband, was less easy; yet this she in time had the happiness of accomplishing. She did not, it must be told, do it by vaunting her superior judgment and forethought, and taxing him with being the cause of all the evils which had befallen them. She did not even vaguely allude to his folly, or to her having foretold the event. She merely endeavoured to show him that, however unprosperous his circumstances might be, her affection was unchanged, and her desire to share his fortunes unabated. She bore his petulance with calmness, and his only half-subdued pride with patience, trying to soften the rigour of their present situation, and selecting opportunities for offering wholesome advice, and forming judicious plans for the future. Though weak-minded and imprudent in the extreme, Bradshaw was not an unprincipled man. Notwithstanding the late unhappy affair, his character for integrity was not impeached. Mrs Bradshaw, therefore, advised that they should return to their late residence in Church Street, which was still untenanted, and recommence business on a small scale, trusting to the generosity of their former customers for a renewal of their favours. She went on to say that she would cheerfully confine the household expenditure within the limits of their profits, whatever they might be; and not only so, but proposed, if possible, laying aside some portion of those profits for the purpose of paying at least a part of the debts they had themselves incurred. Bradshaw listened, for the first time in his life, with something like complacency to this prudent counsel. He was too well satisfied with

the plan to raise even an objection; and though his pride would not allow him to acknowledge it, he was really much pleased with the part she had taken in the whole matter. Mrs Bradshaw, too unostentatious to feel any desire for commendation, was satisfied with accomplishing what she felt to be right, though she would certainly have been pleased with an expression of approbation, and she immediately set about the necessary preparations for removal.

B— had, for nearly a century, been one of those quiet country towns in which the only variations known are the deaths of the elder members of the families, and the younger ones springing up into their places—the changes of the seasons, and the alternations of day and night. The inhabitants had gone on for so many years in the same routine of events, that they looked upon anything which prognosticated advancement as an absolute evil. This state of things, however, had its day, and also its termination; for a railway was just at this period brought so near to the place, that it was deemed requisite to have a station there; and such a circumstance of course turned the heads of half the inhabitants, by exciting a desire for speculation. As in all other revolutions, the results were various: to some it wrought evil, to others good. In this instance, however, the preponderance was of the latter; and amongst those individuals who benefited was Mr Peter Bradshaw. His small unpretending shop by degrees assumed a more substantial and stylish appearance; and three years subsequently to the period when we commenced our narrative, at which time his lease had expired, he was able to renew it on highly advantageous terms. The fact was whispered, and not without some ground, though he would not own its truth, that he on this occasion consulted his wife regarding the length of time it would be most prudent to extend it.

Mr Bradshaw was one evening strolling, business hours being over, in the precincts of the railway station, amusing himself by watching the passengers alight—some looking anxiously after their luggage, some greeted by beloved and familiar faces, others seemingly lonely, and with little of worldly wealth to look after—when a smart rap on the shoulder, and a hearty ‘How do you do, my old friend?’ from a voice the tones of which were not unknown to him, aroused him from his contemplations, and he the next moment recognised the features of an old schoolmate. ‘Bradshaw, my dear fellow!’ exclaimed the traveller, now bending to seize him by the hand, and shaking it with earnestness; ‘I’m glad to see you—glad to see you; on my word, this is an unexpected pleasure.’

‘It is so on my part as well as on yours, my good friend,’ our hero returned, surveying with a pleased expression the almost gigantic form of his quondam play-fellow.

‘I lost sight of you when I settled in London,’ the traveller resumed; ‘but I’ve often thought of you. We used to be cronies at school, you know.’

‘Yes,’ Bradshaw rejoined, with a very undignified ‘he—he—he!’ ‘You used to fight my battles, correct all my exercises, and work my sums, for I never had much taste for such things.’

‘No, nor ability neither,’ thought his auditor; but he loved his little protégé, from the very fact of his having always looked up to him as a protector and friend, and was really pleased with having met him again.

‘Come home and take supper with me, and I’ll introduce you to my good lady,’ Bradshaw continued. ‘I’ve been an unlucky wight, but I’m getting on pretty comfortably now. How has the world treated you?’

‘Oh, I’ve managed at least to avoid failure; but I’ll accept of your kind invitation when I’ve secured a bed at the inn, and then we’ll make mutual revelations.’

‘Make our house your home for the night,’ exclaimed the draper: ‘we can find you a bed; and I see,’ glancing at the carpet-bag his friend held in his hand—‘I see you have your luggage with you. Let us go home at once.’

‘But are you sure that my stay will not be deemed an intrusion by Mrs Bradshaw?’ the traveller hesitatingly interposed; adding, ‘It is not, I know, always agreeable to ladies to perform the rites of hospitality for a stranger, without any previous intimation of the visit.’

‘Mrs Bradshaw never thinks of opposing anything I do or say,’ the little man pompously returned.

‘Indeed!’

‘I wouldn’t allow it; and, to do her justice,’ he pursued, ‘she never showed any inclination to dispute my authority. All the complaint I can make of her is, that she is a little too forward with her advice sometimes. But that has nothing to do with the present matter; she’ll make you welcome, I promise you. I never yet knew her look black upon a guest, let me invite him when I would.’

‘You seem, my good friend, to have been lucky in your choice of a wife at all events,’ the traveller observed; ‘and your description of your home is so inviting, that I cannot resist the very strong inclination I have to avail myself of your kind offer.’

‘That’s just what I wanted you to do. I’m not a man for unmeaning compliments,’ cried Bradshaw; and as he spoke, he with some difficulty linked his arm within that of his companion, and bustled towards his dwelling. ‘Are you married, Rawlins?’ he abruptly asked after a brief pause.

‘Oh yes, I’ve been married these seven years.’

‘Then I shrewdly guess that you have been foolish enough to let your wife get the upper hand: is it so?’

‘You’re quite mistaken there, my friend. My idea of happiness in married life is for man and wife to go hand in hand, and to have no upper hand in the matter.’

‘Oh—oh! that is your opinion, is it? Well, I can’t say it is mine. I could never live with a woman who did not allow me to be master.’

‘Nor I, my friend; but then I would, at the same time, allow her to be mistress.’

‘Then you are under female rule, after all, Rawlins?’

‘Not a bit of it; but I am under female influence.’

The friends had by this time reached the door of the house; and the cheerful smile which sat upon Mrs Bradshaw’s countenance, when told by her husband that he had brought home a guest for the night, and the alacrity with which she set about the necessary preparations for his accommodation, clearly indicated that the draper’s statements were perfectly correct. The absence of the lady gave the gentlemen an excellent opportunity for unrestrained confidence. Rawlins would not have hesitated to tell his tale if Mrs Bradshaw had been present, but poor Mr Bradshaw never could allude to the circumstances of his late failure in the hearing of his wife. The shrewd reader may possibly give a broad guess for what reason, but it was unacknowledged even to himself. Rawlins, at the request of his host, related his story first; but as it was void of interest, excepting to those who had a personal regard for him, we will not tire the reader with the recital.

‘My narrative is, you see, very barren of incident,’ he observed as he concluded. ‘I have had no hair-breadth escapes; no sudden reverses; no accounts of being dragged to a prison either for my own or any one else’s debts; and now, shall I tell you what has been the key to my prosperity?’

‘Why, you’ve been a fortunate fellow, that’s all; you always were so; you never got into the scrapes that I did when you were a boy.’

‘Fortune has had nothing to do with it, my friend,’ Rawlins exclaimed. ‘The secret of my success is this—I made choice of a good partner; and—’

‘Ah, you were lucky there at all events,’ Bradshaw interposed. ‘My partner has been my ruin.’

Rawlins looked up in astonishment. ‘What! that quiet, gentle-looking woman?’ he remarked. ‘Why, I thought—’

‘She! No, I don’t mean her: I mean the partner I took into my concern.’

Rawlins laughed heartily at his own blunder. 'I beg Mrs Bradshaw's pardon a thousand times,' he said; 'but, my good fellow, I was alluding to my wife when I spoke of my partner. I have had no other partner—I have needed none.'

'I took a young man into my business because he brought a thousand pounds, but he turned out a sad rogue.'

'Ah, I had no such inducement,' Rawlins interposed. 'I selected a partner with good sense and good principles; that was of far more value than a thousand pounds; and the secret of my success, my friend, is my having made use of those qualifications, and placed unbounded confidence in her.'

The little draper looked somewhat disconcerted, and glanced quickly round, to observe if Mrs Bradshaw were within hearing.

'Pshaw!' he pettishly exclaimed; 'you've been a fortunate fellow, that's the upshot of the matter.'

'I tell you once more, my good friend, that fortune had nothing to do with it; but we went get into a dispute. Let me hear your story; I fancy it has more interest than mine.'

Bradshaw was not sorry to change the subject; and putting on a very dolorous aspect, he commenced his woful tale. Happy would he have been had Rawlins allowed him to proceed without interruption; but, as the poor little draper thought, some evil genius possessed him, and induced him to make occasional queries, which were by no means pleasant to answer. These were—'But what did your wife say to this?' 'What did Mrs Bradshaw advise?' 'Surely Mrs Bradshaw was more quicksighted?' 'Women are good advisers in such cases,' &c. The poor man got more nervous than ever when obliged to confess that Mrs Bradshaw had opposed his taking the new shop and the long lease; that she did object to young Smithson as a partner; and that she had done her utmost to prevent his niece's marriage; but he made an attempt to get out of the rallery which, though not very quicksighted himself, he could not but foresee would follow, by lamenting that he had been born under such an unlucky planet.

'The planets have had no more to do with your disasters than I have, my worthy friend,' Rawlins interrupted him by exclaiming; 'but I'll give you a piece of information for which, if you make good use of it, you'll thank me if, at the end of another ten years, we should meet again.'

'Oh, I hope we shall meet long before that!' cried Bradshaw.

'I hope we shall; but be that as it may, you will thank me for the information whenever you see me.'

'Pray, what may it be?'

'I am afraid you will not make use of it without a little reluctance,' Rawlins resumed; 'but I'm confident that the result will fully recompense you for the effort it may cost you. It is this, my friend:—All your misfortunes have arisen from your having pursued a course diametrically opposed to that which I have taken; that is, from your having scorned the counsel of your wife.' Poor Bradshaw at that moment wished his old schoolmate anywhere but where he was; still he made no remark.

'Now, I tell you what it is, my good fellow,' Rawlins proceeded, 'we lords of the creation are apt to plume ourselves on a superiority we do not possess. We give the ladies credit for affection, gentleness, kindness, and all that sort of thing, but we fancy that all the intelligence, good sense, and sagacity are thrown into our scale—that is, our pates. I had an early opportunity of observing this. My father and a twin brother were partners in business, and occupied adjoining houses. They married, and commenced the world together, and they were as alike in character as in age. They were upright, well-meaning men, and were, in consequence, much esteemed; but they both held the lordly views of which I spoke. My father, happily for his family, made a wise choice in his partner for life; but there his wisdom

ended: he scorned to make use of her good sense and judgment, supposing, like you, that women ought not to be consulted in any matters beyond the household economy. My uncle was less happy in his selection. He married a giddy, thoughtless woman. Still, had he treated her with confidence, and showed her that he considered she had an equal interest with himself in his commercial success, he might possibly have corrected her thoughtlessness; but as this was not the case, she was always carrying on some petty deception, which wholly destroyed their original peace. I learned a valuable lesson, however, from their experience. Thinks I to myself, when I marry, I'll have a wife I can trust, and then I will trust her. She shall see that I expect her to take an interest in my well-being in everything. She shall be my confidant in every affair relating to my interest or my feelings; and she shall have no temptation to deceive me, because she shall not have any cause to complain that I am ungenerous. Well, I put these resolves into practice, and it has fully answered my expectations. Depend upon it, my friend,' he concluded, perceiving his companion was lost in a fit of musing—'depend upon it, there is no happiness in the marriage state without mutual confidence. The more a woman is trusted, the more she will feel that the interests of her husband are her own; and I believe that extravagant, mismanaging wives, are more frequently made so by the want of this confidence than by any other circumstance.'

The entrance of Mrs Bradshaw, followed by a little handmaid with a well-cooked savoury supper, put a stop to the conversation, also to poor Bradshaw's reverie; and in performing the rites of hospitality to his friend, he forgot, or at least pardoned, his telling him a truth which no one had ever had the moral courage to tell him before.

It was nearly three years ere the two friends again met, and then it was by the same fireside, though the room they occupied contained many useful and ornamental articles which it had not done at the former meeting. Mrs Bradshaw being present the greater part of the evening, Rawlins could not allude to the subject of their last conversation; but he thought, from the fact of her being present, that there was some improvement in the quarter where he most desired it. At length he found an opportunity of whispering a word in Bradshaw's ear; but as it was a whisper, and only heard by the person to whom it was spoken, we cannot be expected to make the reader acquainted with it. The answer of the little draper will, however, possibly elucidate the mystery. It was this: 'I've not forgotten it, my good fellow; I've not forgotten your prophecy, and I can't help fulfilling it. Thank ye—thank ye!'

GENUINE CONVERSATION OF A CURIOUS MAN.

A GENTLEMAN remarkable for his curiosity, retired in his latter days to a rural villa near one of the principal rivers in Scotland, where time used to hang rather heavily on his hands. Nevertheless, his curiosity was active, and he was wont to go forth every day to the roads, and to a ferry station in his neighbourhood, where he would assail travellers of all kinds, in order to make them give an account of themselves. He would make even beggars stand and deliver—their histories; after which they were usually surprised when he gave them only a civil good-morning. A lady who lived near his house was one morning walking in her garden, when she became an involuntary listener to the following conversation, in which she was herself referred to; the interlocutors being the curious man and a peasant whom she had despatched on a small piece of business:—

'Well, honest man, what's this you've got in your cart?'

'Some draff.'

'Draff! What are you going to do with draff?'

'It's for Miss ———.'

'Miss ———! What is she going to do with draff?'

'It's to feed her cow, I reckon.'

'And where have ye gotten't?'

'At the New Town.'

'At the New Town! Wha did ye get it frae?'
 'Frae Lord Belhaven.'
 'Lord Belhaven!! (*Great surprise.*) How do ye come to get draff frae Lord Belhaven?'
 'It's frae his distillery.'
 'Oh, ay, the distillery. Ye've got it frae Lord Belhaven's distillery. But ye wadna get it for naething?'
 'Na.'
 'And what did ye pay for't then?'
 'Two shillings the sack.'
 'And ye'll ha'e to get something to yoursel'?'
 'I'll get a shilling, I reckon.'
 'Ay, a shilling to yoursel'. But there would be a toll?'
 'Yes, sixpence.'
 'Ay, sixpence for a toll. Two shillings a sack for the draff is four shillings; a shilling to yoursel' makes five; and sixpence for the toll makes five-and-sixpence. Five-and-sixpence in all. My friend, I begin to understand you now. You've got two sacks of draff frae Lord Belhaven's distillery at the New Town for Miss ——'s cow, at two shillings the sack, with a shilling for yoursel', and sixpence for a toll, being five-and-sixpence in all. Good-morning t'ye. Jenny [addressing his wife, who always walked behind], come away home to breakfast.'

SACREDNESS OF THE QUESTION OF SANITARY LAWS.

The aristocracy only visit the cities in the season, and spend the rest of the year in the purest of atmospheres and the healthiest of mansions. Even when 'up,' they have a city within a city—spacious houses, wide streets, remote from manufacturing nuisances. Merchants, and the higher class of tradesmen, have the country or suburban villas, and, whatever the air they breathe in the day, spend the evenings, nights, and mornings far away from smoke and smell. All who can afford it, have their annual excursion 'to lay in' a stock of health and spirit for the year. It is not so with the vast majority. They have no such chances for health and existence. From hour to hour, day to day, and year to year, they must go on respiring in the same tainted atmosphere in which the majority came into the world. As we pass through the streets, and hasten, with mixed terror and disgust, first through one ill savour and then through another, by filthy corner, open grating, dark alley, or noisome workshop, we should remember that these airs of hell, the merest waft of which is enough to turn our stomachs, are the fixed conditions under which many thousands live and die. It is for them, not for us, not for the fortunate and free, that sanitary laws are needed. *Their case imparts necessity and sacredness to the question.*—*Times.*

ANTS IN SOUTH AMERICA.

But there is one variety of ant which must be excluded from all commendation. There is a small species, called *Saüba*, and they are a terrible annoyance to the proprietors of rosinhas, inasmuch as they strip the fruit-trees of their leaves. An army of these will march to the tree, part ascending, and the others remaining below. Those above commence their devastation, clipping off the leaves by large pieces; and those below shoulder them as they fall, and march away to their rendezvous. It is surprising what a load one of these little things will carry, as disproportionate to its size as if a man should stalk off beneath an oak. Before morning, not a leaf is left upon the tree, and the unfortunate proprietor has the consolation of knowing that, unless he can discover the retreat of the *saübas*, and unhole them, one by one every tree upon his premises will be stripped.—*Edwards's Voyage up the Amazon.*

THE LAW'S DELAY.

In the one case, there is a straight road of a mile long, and without a turnpike in it: in the other case, you may go to, or at least towards, the same place by a road of a hundred miles in length—full, accordingly, of turnings and windings—full, moreover, of quicksands and pitfalls, and equally full of turnpikes. In conducting the traveller, nothing obliges the conductors to avoid the straight road, and drag him along the crooked one: nor would they ever have given themselves any such trouble, had it not been for the turnpikes, the tolls of which are so regularly settled, and the tills in such good keeping!—learned feet, could they be prevailed on, are no less capable of treading the short road than unlearned ones.—*Benthamiana.*

THE KILT, THE CLAYMORE, AND THE COTTON UMBRELLA!

TUNE—'Cam' ye by Athole?'

CAM' ye by Badenoch, lad wi' the paletôt?
 Saw ye the Highlanders, loyal, good fellows?
 Wrapped in their dripping plaids, wiping their rusting blades,
 'Waiting their Queen under cotton umbrellas!

Badenoch, Badenoch, who isn't proud of thee?
 Were not thy sons ever loyal, brave fellows?
 Who wouldn't rush to thee, ay, stand a crush for thee?
 Though it should pelt, ye have store of umbrellas!

Macpherson of Cluny, and Tulloch, I feel for them;
 They've drawn out their men like Castilian guerillas;
 To welcome their Prince and Queen, such a sight ne'er was seen—
 Highlanders ranked under cotton umbrellas!

Highlanders, Highlanders, well have ye fought of yore,
 Led by the sound of your bagpipers' bellows!
 Now for your tartans green, and ye a proper screen,
 Under your chiefs—and your cotton umbrellas!

But ye had example set, under the heavy wet;
 Didn't the Queen, as the newspapers tell us,
 Ay, and the Prince and train, land in the pouring rain,
 Under the shelter of 'goodly umbrellas?'

Wet Caledonia! who wouldn't drown for thee?
 Are not your sons loyal, brave-hearted fellows?
 Keeping their powder dry, while with a smothered cry,
 Comes a damp welcome from under umbrellas!

—September 1847.

. 'Her Majesty,' says the correspondent of the *Morning Chronicle*, 'landed under cover of a goodly umbrella, carried by her own royal hands. The judicial authorities of the county of Inverness—Mr Tytler, the sheriff, and Mr A. Fraser, one of his substitutes—were in due attendance; and there was a tolerable turn-out of the men of Lochaber, with plaids, kilts, claymores, and cotton umbrellas, who waved glittering blades and dripping gingham, and shouted Gaelic salutations to the "wife of the king"—for such, I understand, is the literal signification of *Ehes Righ*—the Erse words meaning Queen.'

DOGMATISM.

Maintain a constant watch at all times against a dogmatic spirit: fix not your assent to any proposition in a firm and unalterable manner till you have some firm and unalterable ground for it, and till you have arrived at some clear and sure evidence—till you have turned the proposition on all sides, and searched the matter through and through, so that you cannot be mistaken. And even where you think you have full grounds for assurance, be not too early nor too frequent in expressing this assurance in too peremptory and positive a manner, remembering that human nature is always liable to mistake in this corrupt and feeble state.—*Watts.*

WASTE OF LABOUR.

There are in some of the villages of the wolds of Lincolnshire, farm labourers who regularly walk 1252 miles, in going and returning from their work, year after year; and several have done so for eight or nine successive years, thus travelling nearly the distance of half round the world in that time, besides performing their regular work. One man can be pointed out who has walked this distance for fourteen years; and others in the same place whose yearly journeys to and from work amount to 1666 miles; and all this because of the law of settlement preventing them from living near their work!—*Newspaper paragraph.* [An argument for erecting cottages for labourers near the scene of their labours.]

UNWISE CHOICE.

A very fool is he that chooses for beauty principally; his eyes are witty, but his soul is sensual; it is an ill band of affection to tie two hearts together by a little thread of red and white.—*Jeremy Taylor.*

PRICE 1½d.

THE LITTLE DANCING-MASTER.

POLYDORE JASMIN was, as he said himself, 'a professor of the Terpsichorean art;' in plainer terms, a dancing-master. Being a short-legged, dumpy little man, nature did not seem to have intended him for any extraordinary feats of agility; but an irresistible vocation had enabled him to overcome every physical obstacle. As he was a married man, and the father of seven children, he remained poor, in spite of the almost supernatural industry with which he applied himself to his art both day and night. Instead of owning a handsome and fashionably-situated *salon de danse*, he was allowed to waste his talents in a damp cellar-like room, looking on the yard of a dingy house in the Rue St Denis, where he daily revealed the mysteries of the light muse to the smart shopmen and pretty *grisettes* of the neighbourhood.

Still, Monsieur Jasmin was a contented, and even a happy man: the lightness and buoyancy of his profession seemed to have passed into his heart. His manners, however, were very grave and dignified; and when he danced, he became so solemn, that his pupils, like the courtiers of the *Grand Monarque* on a similar occasion, remained struck with awe at the imposing sight. To say the truth, M. Jasmin had a respect for dancing; he looked upon it as a very grave affair, and could not bear to hear it lightly spoken of, or turned into ridicule. If anything could tend to increase M. Jasmin's natural equanimity of temper, it must have been the high opinion he entertained of his art, his own person, and his family. Madame Polydore Jasmin, according to him, possessed the gift of eternal youth; at least he solemnly averred—and he believed it—that she had not altered in the least since the day of their first meeting, when her coal-black eyes, rosy cheeks, and pleasant smile first won his tender heart. Others averred that cares and anxiety had rendered the poor woman pale and thin, and that she was only the shadow of her former self; but of this he saw and knew nothing, and his love for his wife remained unabated. She was a good, simple-hearted woman, well deserving of affection, and entirely devoted to her family: her love and veneration for her husband were unbounded: she entertained, moreover, the deepest respect for dancing, and looked upon M. Jasmin as the high priest of that mysterious art. The children of this worthy couple were like their parents—contented, good-humoured, and simple-hearted: their education was very carefully attended to; for there had not been danced a *pas* in France since the days of Louis XIV. with which they were not thoroughly acquainted.

Amongst the few acquaintances of M. and Madame Jasmin, who were rather shy and reserved, was one of their neighbours, M. Bourreux, a disagreeable, satirical old man, who had no children, was thought to be in

easy circumstances, continually talked about making his will, and seemed privileged to say whatever he pleased, without giving offence, to any of the families which he daily visited—teasing the children, annoying the parents, and turning the household arrangements into ridicule, during the whole time of his stay. On a fine summer evening this amiable individual condescended to pay M. Jasmin a visit. To the dancing-master's surprise, he was unusually gracious. The high polish of Madame Jasmin's bees'-waxed floors seemed to transport him with admiration: by an adroit transition he contrived to connect the subject with M. Jasmin's proficiency in his art; and he was so eloquent on both topics, that the heart of the dancing-master's wife swelled with pride, whilst equally gratifying feelings agitated her husband. In his sudden fit of amiability, M. Bourreux even attempted to pat the heads of the children, and say a few kind words, but they all drew away with instinctive mistrust. When his stay had been somewhat prolonged, M. Bourreux rose to depart; but, as though suddenly recollecting himself, he turned towards his host, and with a bland smile observed, 'My dear Monsieur Jasmin, allow me to congratulate you before I go; I am indeed delighted.'

M. Jasmin opened his eyes very wide, and seemed bewildered; his wife looked at him as though for an explanation. M. Bourreux continued: 'It is perhaps indiscreet in me to mention this so early; but I really could not command my feelings.'

The dancing-master and his wife exchanged glances: 'What could this mean?'

'What!' exclaimed the visitor; 'can you be unacquainted with an event concerning you so nearly? Nay, then, let me have the pleasure'—And without finishing the sentence, he drew a newspaper from his pocket, and handed it with a smile to M. Jasmin. The dancing-master mechanically glanced over the paragraph pointed out by M. Bourreux; but scarcely had he read a few lines, when he became very pale, and sank down on a seat.

'What is the matter, Polydore?' cried the alarmed Madame Jasmin.

'Tis only the effect of joy,' coolly remarked M. Bourreux; 'he will soon come round.'

But instead of coming round, M. Jasmin betrayed increasing emotion; his little gray eyes twinkled with tears; and mournfully shaking his head, he exclaimed in a broken tone, 'Poor fellow! I taught him how to dance: is it now come to this?' and with another shake of the head, expressive of the deepest melancholy, he allowed the paper to fall to the ground. Madame Jasmin hastily picked it up, looked over the paragraph which had so affected her husband, and fairly burst into tears, whilst M. Bourreux eyed them both with undisguised contempt. Not to keep the reader in suspense,

we will state that the paper so officiously produced by M. Bourreux announced the death of Jacques Jasmin, merchant of New Orleans, where he had died of the yellow fever, on the eve of returning to his native country with a large fortune. As the deceased was a cousin of M. Jasmin, of whom he had not heard for several years, the golden consequences of this event chiefly struck M. Bourreux, who, when he saw the paltry light in which his friends beheld it, began to look upon them as more shallow and foolish beings than he had till then thought them to be. M. and Madame Jasmin were in the meanwhile relieving their grief by enumerating, as is usual in such cases, the manifold virtues of the deceased.

'So good-tempered!' exclaimed madame.

'So willing to learn too!' observed her husband.

'The newspaper says he died immensely rich,' urged M. Bourreux.

'He deserved it,' warmly cried M. Jasmin. 'Poor lad! when he went away, ten years back, to seek his fortune, "Trust me, Cousin Jasmin," says he, "I shall make my way; and honestly too," he added proudly; for he was proud, poor Jaques was.'

'Ay, and don't you recollect how, when you slipped the piece of gold into his little trunk, he pressed your hand, and could not speak?' observed Madame Jasmin, wiping her eyes.

'I declare,' replied her husband with surprise, 'I had forgotten all about that. Well, he was welcome to it; but it was a loan, not a gift; and indeed, if ever his children come to France, I shall remind them, in a polite manner of course, of the debt.'

'Your cousin was never married, and has left no children,' sharply said M. Bourreux.

'Well, I might have known that,' replied M. Jasmin; 'for when he was going away, "Cousin," says he, "I shall never marry but a pretty lively Frenchwoman like Madame Jasmin." Here the dancing-master tenderly glanced towards his wife, who positively blushed.'

'Well, but do you also know,' impatiently exclaimed M. Bourreux, 'that your cousin has left no will?'

'What about it?' calmly asked M. Jasmin.

'What about it!' almost indignantly echoed his neighbour; 'why, if he died childless, and without making a will, does it not follow that his large fortune—two millions of francs, the newspapers say—must be divided amongst his relations?'

M. Jasmin opened and rolled his eyes in a manner which showed that the thought now occurred to him for the first time. For a while he seemed lost in thought, then incredulously exclaimed it could not be; a sentiment in which his wife fully concurred. On hearing this, M. Bourreux became indignant, then satirical, and at last, by a natural transition, quite sentimental. He begged of his dear friends to believe him—what interest had he in deceiving them? The dancing-master and his wife at length allowed themselves to be convinced; and after giving a few more tears to the memory of Jaques, they agreed that the intelligence must be true. M. Bourreux having thus accomplished his errand, departed, leaving them to their own reflections. These were dismal enough; and what with their grief for the death of Jacques Jasmin, and their joy of becoming at once so rich, the worthy couple spent, upon the whole, a rather miserable evening.

By the next morning they were more composed, and had settled how to act. The whole family immediately went into mourning; for what less could be done to honour the memory of a man who left them a fortune?

Besides this, M. Jasmin had to write to his Norman cousin, M. Legros, who was the only other heir of the deceased. The next, and still more important step, was to remove from their present 'low neighbourhood to a more convenient residence.' So at least said Madame Jasmin, who had a secret taste for grandeur. A fashionable apartment in the *Chaussée d'Antin* was accordingly found. It was horribly dear; and though nominally consisting of four rooms, might be said to be all *salon*, every other convenience being sacrificed to that one room. The kitchen was a square hole, where daylight had never penetrated; the dining-room could hold only about four full-grown persons at a time; and although the *salon* or drawing-room was handsome and well-proportioned, it unfortunately happened that the only spot in which the sofa could possibly be put, was precisely against the only door that led into the bedroom. This door, which would otherwise have spoiled the symmetry of the room, was supposed to be there incognito, and was papered over like the rest of the walls, in order to keep up the delusion; but as the bedroom, like the kitchen, had no window, the architect had humanely caused a few panes of glass to be inserted into the highest portion of the door already mentioned; so that, with a little complaisance on the part of visitors, they might be supposed to be out of view altogether.

After a long consultation, M. and Madame Jasmin agreed that the sofa must be put against the door, and that, as the glass panes fortunately opened and shut like a real window, the aperture should serve to introduce them into their sleeping apartment. It is true it was somewhat narrow; but, as M. Jasmin wisely observed, 'you had only to step up on the sofa, pass your head through the opening, and you were sure to come down, most probably on the bed, and without being more than slightly grazed at the utmost.' Notwithstanding these advantages, the dancing-master and his wife soon grew dissatisfied with their apartment, which, they began to think, was not at all suited to them. Madame Jasmin's mind and cookery were perfectly bewildered by the dark and narrow kitchen; the unhappy children were cooped up night and day in the dining-room, lest they should soil the elegant paper of the *salon*; and it was found that, upon the whole, the manner of going in and out of the bedroom was anything but convenient, especially when it had to be repeated about a dozen times a-day. 'We shall get accustomed to it in time,' was M. Jasmin's comforting reflection. In the meanwhile, he discovered, to his great chagrin, that his pupils of the Rue St Denis refused to walk so far in order to take their lessons, and deserted him altogether; another source of mortification was to perceive that the fortune which he had expected would come to him of its own accord, delayed making its appearance; and the worst of it was, he could learn nothing more about it than what he had seen in the newspaper paragraph communicated to him by M. Bourreux.

The family had not been more than three days in their new apartment when they were surprised one morning by the sudden arrival of the country cousin, his wife, and his two sons. When the first greetings were over, M. Legros, who was short and stout, and a very abrupt, business-like little man, informed his cousin that, having learned living in a hotel was horribly dear in Paris, he had determined to give him a proof of his friendship by lodging and boarding with him during the whole time of his stay. He partly apologised for bringing his two boys; 'But the poor fellows,' he said, 'were so very anxious to come, that he really could not leave them behind.' Words could not describe the consternation which seized M. and Madame Jasmin on hearing this. The dancing-master made a feeble attempt to remonstrate, by urging want of room, and so forth; but M. Legros checked him in the very beginning, by vowing to hear no apologies, and that it would all do excellently well. He and Ma-

dame Legros could sleep in the *salon*, or in the dining-room, and the two boys would do admirably in the kitchen; in short, a few mattresses, feather-beds, sheets, blankets, and coverlets, were all they required. Without giving his unfortunate relative time to recover from this stunning blow, M. Legros continued—'We shall lead, I foresee, a very pleasant life. Madame Jasmin, I have no doubt, is an excellent cook; the boys and your children will be sure to agree together; and you, my wife, and I, shall go out sight-seeing; for you must know, cousin, this is our first visit to the capital. But first of all, what news on the business that brings us here?'

'Why, none as yet,' answered M. Jasmin.

'None!' echoed M. Legros with an anxious frown, and as though he strongly suspected his cousin of having fraudulently abstracted the two millions for his own benefit. 'Well, do you know,' he continued with a look meant to be particularly cutting in case M. Jasmin was guilty—'do you know I think this very strange?'

'To say the truth, so do I,' ingenuously replied the dancing-master.

M. Legros coughed doubtfully, and in a manner to show that, for the present, he would not decide on so grave an affair; but that he would, nevertheless, keep his eye on M. Jasmin.

We will not attempt to describe the sufferings M. Jasmin and his family had to endure during the first week of the stay of their relatives. Matters went on, however, as M. Legros had predicted. The unfortunate Madame Jasmin cooked from morning till night; the children agreed or quarrelled as their fancy led them; and whichever they did, always made such a fearful noise, that the lodger who resided underneath offered M. Jasmin a certain sum on condition of his removing instantly, which, from a sense of dignity, he refused to do. But the worst of it was, that the luckless dancing-master was compelled to show his cousins about not only over all Paris, but also over every portion of the surrounding country that had ever possessed the least celebrity. M. and Madame Legros were determined to make the best of their stay. As though to increase M. Jasmin's deep mortification, no tidings whatever could be had of Jacques Jasmin's fortune, a circumstance which caused M. Legros to hint, in a dark manner, that he strongly suspected the newspaper paragraph of being entirely groundless, and that he was not even far from considering his cousin as accessory to the fabrication, which had been the means of involving him in travelling expenses—and all in order to gratify M. Jasmin's selfish wish of enjoying the company of himself and his amiable family! M. Jasmin protested such an idea had never even entered his mind; but this of course only increased M. Legros's suspicions. 'But look ye, sir,' he added in a threatening tone, 'it would be better for you never to have made a dupe of me, sir; for I protest I shall leave neither this city nor this house, sir, until I have ascertained the truth of the whole affair.'

This was an awful threat, and M. Jasmin felt it in all its force. Legros was one of those suspicious men who are always imagining that all sorts of conspiracies are going on to cheat them, and who are resolved never to believe anything which is opposed to their own preconceived notions. His wrong-headedness on the present occasion was very perplexing, but what could the simple-minded Jasmin do? It was altogether against his nature to be rude.

During the whole of this time, M. Bourreux visited the family, and on learning that nothing was to be heard either of Jacques Jasmin or of his two millions, he appeared disappointed; but he soon grew accustomed to the circumstance, which even seemed to afford him peculiar pleasure, as was evident by the chuckle of satisfaction with which he alluded to it. One morning, when the whole family were at breakfast in the drawing-room—the only room which could contain them—M. Bourreux made his appearance at an earlier hour, and with a

more agreeable and pleasant look than usual. On being asked to partake of the morning meal, he readily consented; and whilst Madame Jasmin was pouring him out a cup of coffee, cheerfully hummed a merry tune. M. Legros opened the conversation by asking if there were any news.

'Why, yes, there are,' answered M. Bourreux with great liveliness; 'and very good news too. What do you think now of your cousin Jaques not being dead?'

'Not dead!' echoed M. Legros, laying down his cup in indignant astonishment; 'not dead!'

'Yes; excellent, is it not?' chuckled M. Bourreux, rubbing his hands. 'But perhaps you don't believe it? Read this, my dear sir—read this!' and with the utmost complaisance he handed a newspaper to M. Legros. The paragraph to which he drew his attention merely stated that it was with the greatest pleasure the editor announced to the public that the merchant of New Orleans whose demise had been so deeply lamented a few weeks ago was still in the enjoyment of excellent health, the report having originated entirely through a mistake. As M. Legros read this aloud, M. Jasmin had his full benefit of the intelligence. It would be difficult to state exactly what the dancing-master's feelings were: he was rather disappointed at the loss of a fortune; but he was still better pleased to think that Jacques Jasmin was alive, observing aloud, in the simplicity and openness of his heart, that it was a great comfort.

'And do you call this a comfort, sir?' cried M. Legros in a rage. 'Do you know, sir,' he continued, scowling upon him fearfully, 'that these words would lead me to suspect that you have agents in New Orleans by whose means you contrived to spread this report? But no!' he exclaimed, checking himself, 'I will not believe it; nor will I believe that Jacques Jasmin is alive: it is a moral impossibility; and as there is no name mentioned in this statement, I am authorised to believe either that it is utterly false—a scandalous fabrication—or that it does not in any manner relate to my deceased cousin.'

'But supposing it is true?' observed M. Bourreux.

'I will suppose no such thing!' exclaimed the irascible M. Legros.

'Well, but it may be true,' persisted the other; 'and I ask how you would behave in case your cousin Jaques were to come home unexpectedly?'

'Sir,' gravely replied M. Legros, 'I should consider myself a deeply-injured man, and require a compensation; but admitting that my deceased cousin could come home, which I consider impossible, I should think myself justified in not recognising him, as I have a very faint recollection of his person.'

'Ah, but I remember him quite well,' here interposed M. Jasmin with a knowing look.

'I would not recognise him on your authority,' hastily exclaimed his cousin; 'indeed I should consider the whole affair so extremely suspicious, that I would turn my pretended cousin out of doors directly.'

'A very prudent course indeed!' observed M. Bourreux with a sneer. 'But,' continued he, changing the conversation, 'I have more news; and an excellent joke they will make too,' he shrewdly added. 'You must know, neighbour,' addressing M. Jasmin, 'that your old lodgings are let—you would never guess to whom? Well, not to keep you in suspense—to a dancing-master, who has now all your scholars: so you see you are fairly in for it;' and M. Bourreux chuckled very merrily at the idea.

This was pouring oil on M. Legros's wounded spirit: he laughed very long and very loud; so did his wife and his two boys. Madame Jasmin made a faint attempt to smile; her husband, seeing that his friends enjoyed the joke so much, thought it must be a capital one, though he could not exactly see where the point of it lay: he therefore laughed as much as he could; but his eyes glistened, and his lips quivered, as he thought

of his seven children, and wondered what he should do.

'Well,' said M. Bourreux, who had finished his breakfast by this time, 'now that I have made you so merry and comfortable, I think I shall go.' And away he went with a very satisfied air.

Still, it must be confessed that no particular signs of mirth or comfort were shown by the individuals whom he left behind him. Madame Jasmin had gone into the kitchen to cry; Madame Legros seemed to think that she had been mortally offended by her cousins, for she scarcely deigned to look upon them; her husband, who believed more in the truth of the newspaper paragraph than he chose to confess, was exceedingly snarlish and ill-tempered; M. Jasmin was overwhelmed by the news of the rival dancing-master: a reputation of twenty years' standing had been overthrown in a moment. After an hour's deep meditation, M. Legros rose, and stating that he was going out, asked his wife to accompany him; in a few minutes they walked out, without requesting, as usual, their cousin to come with them. M. Jasmin was not sorry for this; for, to say the truth, he wanted to speak to his wife. When they were alone, the children being all stowed away in the dining-room, he began pouring his sorrows into her faithful bosom, accusing himself of folly, and lamenting his imprudence. Madame Jasmin consoled him as well as she could: 'he had done everything for the best, and everything might yet turn out well.' M. Jasmin was easily comforted; he tried to persuade himself matters were not desperate, and that the best thing he could do would be to see about it directly. What 'seeing about it' meant, neither he nor his wife exactly knew; but it must have been something pleasant, for it caused them to brighten up immediately. In order to effect this, it was necessary to dress and go out: the first of these operations was not half over when a ring came at the bell. Madame Jasmin ascertained, by peeping through the key-hole, that it was a stranger. The worthy couple were in a terrible dilemma: M. Jasmin could not take refuge in the dining-room, for the children were there; neither could he enter the kitchen, lest the grease off some of the plates and saucepans should contaminate his new suit of clothes; it was impossible for him to remain in the *salon*, for there was no other place in which to receive the stranger: in short, M. Jasmin saw that his toilette must be finished in the bedroom. There was no time to lose; so, hastily catching up his clothes, he jumped up on the sofa, darted through the window, and alighted safely on the bed. Scarcely was this delicate operation concluded, when the stranger was ushered in by his wife.

'Is Monsieur Jasmin at home?' he inquired.

'Yes, sir,' she somewhat hesitatingly replied.

'Could I speak with him?'

'Oh, certainly, in a few minutes,' answered Madame Jasmin, wondering how ever her husband was to get out.

'He is a dancing-master, I believe?' continued the stranger; and on being answered in the affirmative, 'Is he usually moderate in his terms?'

Madame Jasmin was going to answer 'Exceedingly so,' but her husband, who had been extremely fidgety and nervous since the beginning of the interview, now thought it proper to interfere. Standing on the bed, he therefore thrust his head through the window, and coughed gently. The stranger immediately gave a start, and looked up. 'Good-morning, sir,' affably said M. Jasmin; 'I believe you want to speak to me?'

'You are Monsieur Jasmin, then?' observed the stranger with the greatest gravity.

M. Jasmin bowed.

'And I believe you are a dancing-master?'

'I have that honour,' replied M. Jasmin; 'but if we are to speak on professional matters, will you allow me?'—And by an appropriate gesture he indicated his wish to come out.

'Oh, by all means!' cried the stranger.

Out accordingly, in more senses than one, the danc-

ing-master did come, performing the awkward feat with truly professional grace and agility; and as he was now quite dressed, looking very dignified indeed.

The stranger did not even smile; and when M. Jasmin had taken a seat, resumed the conversation as though nothing had occurred. After several inquiries, he suddenly asked, 'Did you not formerly reside in the Rue St Denis?' When M. Jasmin had answered in the affirmative, the stranger dryly observed he thought it was a great pity he had ever left that neighbourhood. This mysterious speech led the dancing-master to conclude that his visitor resided in that quarter himself; and as, from the nature of his questions, he looked upon him in the light of a future pupil, he began to feel nervously alive to the danger of losing him beforehand.

'Ah! sir,' said he, sadly shaking his head, 'it was indeed a melancholy event that brought me here.' And as though he had known him for years, he began relating to his visitor how he had learned the death of Jacques Jasmin, and had been induced to remove to his present lodgings. 'Poor fellow,' he added with glistening eyes, 'I taught him how to dance!—poor Jacques! But there is yet hope,' said he, checking himself; 'yes, sir, there is yet hope: Cousin Legros says he could not recognise him, but I am sure I should. I have him even now in my mind's eye—a tall, good-looking young man; taller and younger than you, sir, a good bit, with darker hair too, and more colour. Oh, I should know him instantly!'

'Well,' said the stranger rather ironically, 'if your cousin is alive, what becomes of your fortune?'

'Sir, I will not think of that,' manfully replied M. Jasmin; 'it is his, not mine. I confess that I shall feel sorry to have ever heard of his death, as this has been the cause of a few disagreeable circumstances; but I shall feel still more pleased, sir, to hear that he is alive. But really there is quite enough of this. I believe you wished to speak to me on professional matters: my terms are very moderate,' he added with an insinuating smile.

The stranger looked embarrassed. 'Why, to say the truth'—he began, and then paused hesitatingly.

As M. Jasmin was wondering what this could mean, the drawing-room door opened, and M. Legros majestically stalked in. Without regarding the presence of the stranger, who, on seeing him, discreetly retired to the other end of the room, he indignantly exclaimed, 'Well, sir, I am satisfied now; I know everything. Yes, sir,' he fiercely continued, 'I have been making inquiries, and have actually learned that Jacques Jasmin, or rather an impostor, taking the name of my deceased and respected relative, has been seen this very morning in the Rue St Denis inquiring after you!'

'Thank God for it!' fervently exclaimed the dancing-master. 'He is then alive and well, and Monsieur Bourreux was right.'

'Sir,' said his cousin, with a glance of withering contempt, 'you are mad, wretchedly insane; if I had my will, you should be sent to Charenton [the Parisian Bedlam]. If you were not so blind and deluded, I could prove to you, as clearly as two and two make four, that Monsieur Bourreux's intelligence was a vile calumny on the character of our late cousin, inasmuch as it accused him of the grossest inconsistency—namely, of being dead at one time, and actually alive again in less than two weeks afterwards! Where is the newspaper?'

Whilst the eye of M. Legros was wandering about the room in search of the paper, it chanced to alight on the stranger, who was looking at him very fixedly. On meeting his glance, M. Legros started back, and even turned pale; but rapidly recovering his presence of mind, he folded his arms upon his breast, and in a tone and attitude of defiance, exclaimed, 'Well, sir, what about it? I suppose you are going to say you are Jacques Jasmin, and that I recognise you! You are mistaken, sir; I shall do no such thing: the fact is, I do not recognise you!'

'Jaques!' cried M. Jasmin, sinking down on a chair in the height of his astonishment.

'Oh!' ironically observed M. Legros; 'I suppose, sir, you recognise him: very good, sir. I have a witness, mind you, who has heard you say you would; so that it is evidently quite premeditated!'

'Jaques! Jaques! can it indeed be you?' exclaimed the dancing-master, without heeding M. Legros.

Jaques Jasmin—for the strange visitor was no other—merely smiled in reply, and warmly shook his relative by the hand. M. Polydore Jasmin, with all his simple-heartedness, was somewhat of a formalist; and though his eyes were filled with tears as he gazed on the altered and sunburnt features of his long-lost cousin, he gravely folded him in his arms, and kissed him on each cheek, according to the old French fashion, which, though wearing away, is still in use among the middle and lower classes, and all the partisans of the old school.

'Very well, gentlemen, very well,' indignantly exclaimed M. Legros, as he witnessed these friendly proceedings with very ferocious feelings—'very well, you might have waited to kiss each other until I was gone! I shall soon rid you of my presence; but before I go, you shall hear some of my mind. You, sir'—to Jaques—'I look upon as a swindler, seeking to involve your unhappy relatives in expenses; and you, sir'—to M. Jasmin—'are a mean hypocrite. I have the honour to bid you both good-morning: my innocent family shall no longer undergo the contamination of this roof.' With this M. Legros walked out of the room in a very stately manner. When he stood on the threshold of the apartment, however, he turned back to inflict a last blow. 'My dear fellow,' said he, smilingly addressing the dancing-master, 'I must give you a friendly piece of advice before I go: learn to dance, my dear sir—learn to dance!'

M. Jasmin had heard himself called a mean hypocrite; and being naturally good-tempered, and inclined to make allowances for the blighted hopes of a disappointed heir, he had borne this unjust treatment with the greatest equanimity. But there are limits to endurance; and when M. Legros ventured on making the audacious remark above recorded, M. Jasmin started to his feet in a fit of ungovernable fury, and seized on the object nearest to him, with the firm intention of throwing it at M. Legros's head. Although this object happened to be a large arm-chair, he lifted it up with the greatest ease, and would actually have accomplished his design, but for the interference of Jaques Jasmin, and the precipitate retreat of M. Legros, who rushed down the stairs in a state of great terror, calling out murder all the way, and followed by his screaming wife and children. As soon as M. Jasmin's momentary anger had subsided, he felt very much ashamed at having so committed himself. He would even have run after M. Legros, to apologise for his inhospitable hastiness of temper, but the terrified gentleman was already out of sight. This made M. Jasmin very uncomfortable. The only reflection that alleviated his distress was, that what he had done was merely in defence of his art, and so far excusable. By repeating this a number of times, he confirmed himself in the belief that personal feelings had in no manner influenced his conduct, and that his art alone had been insulted—an impression which Jaques Jasmin carefully refrained from removing. When the dancing-master's mind had recovered its usual equanimity, he hastened to introduce his cousin to his wife, who had rushed in from her post behind the door (where she had been listening till then) on hearing the altercation between M. Legros and her husband. Though not quite so astonished as M. Jasmin had expected her to be, she was nevertheless very hysterical, and might even have fainted away, if the continued whining which proceeded from the dining-room had not recalled her to the necessity of giving the children a good scolding. Jaques Jasmin having, however, interceded for them, they were forgiven, and at

his request allowed to enter the drawing-room immediately.

We will not dwell upon the manner in which the day—which, notwithstanding the many disappointments it brought with it, was truly one of happiness—was spent by the family of M. Jasmin, nor on the long account which Jaques had to give of himself. His history was simple enough, and will be easily detailed in a few words. The first of the newspaper paragraphs, which had caused such a series of mistakes, turned out to be false in every respect. Jaques did not possess two millions of francs; he had not much more than one: worse still, he was married—to a Frenchwoman, however—and was the father of several children, so that all chance of inheriting his fortune was at an end; yet, strange to say, M. Polydore Jasmin seemed quite happy on hearing this, and actually rubbed his hands with glee. But the most singular portion of Jaques Jasmin's history was, that the piece of gold which he had received from his cousin at the epoch of their parting had partly been, he said, the means of making his fortune. This struck M. Jasmin as one of the most extraordinary circumstances he had ever heard, and made so deep an impression on his imagination, that for a long time afterwards he mentioned it to every one he knew as a great natural curiosity; for, he observed, there must have been some virtue in the gold: it could not have happened otherwise; so at least says Madame Jasmin.

As it had never occurred to the simple-minded dancing-master that he had anything to expect from his rich relative, he felt somewhat surprised when, on the second day which followed his first visit, Jaques Jasmin hinted that, as he had been the involuntary means of causing him to remove from his old quarters to a neighbourhood wholly unsuited to his circumstances, he felt it his duty to provide him with new lodgings. M. Jasmin would not at first hear of this; but he at length consented, and in a few days was comfortably settled with his family in a large and airy apartment in a part of the town equally removed from the commercial Rue St Denis and the fashionable Chaussée d'Antin. Here the dancing-master rapidly found scholars; but as they did not pay him very highly, he might still have repented leaving the Rue St Denis, if it had not occurred to Madame Jaques Jasmin, who turned out to be a very pretty and amiable woman, that, as her family was rapidly increasing, it would be a prudent and economical plan to settle a certain annual sum on their cousin, on condition of his engaging to teach his art to their children, with all the new *pas* that might come out. Her husband, who is partly suspected of having suggested it, immediately submitted this plan to his relative, who, after mature deliberation (for although he said nothing about it, the clause of the new *pas* was to him a great objection), adhered to it, and faithfully performed his part of the agreement, always being in mortal fear lest some new *pas* should come out without his knowledge, and render him guilty of what in his eyes would have been direct perjury.

It was shortly after these events that M. Jasmin wrote a long letter to M. Legros, in which, after tendering the most satisfactory apologies, he gave him a detailed account of Jaques Jasmin's marriage, his family, and what he had done for him personally. M. Legros, instead of being pacified, considered the dancing-master's epistle as a direct insult on his feelings. The only answer he condescended to return to it was, that he left Polydore and Jaques Jasmin to the workings of their own consciences; but that, for his part, he could never forgive them. Strange to say, M. Bourreux was glad to hear of M. Jasmin's good fortune: he might have been still better pleased, perhaps, had matters turned out otherwise; but he was pleased. As it has been discovered, in the Rue St Denis, that his only fortune consists in an annuity which must die with him, and that, consequently, he has no property to bequeath,

his importance is very much diminished; but it is pleasant to reflect that his temper is greatly improved.

The Jasmin family are happy and comfortable. M. Jasmin has been somewhat troubled by the Polka mania, but he is reconciled to it now. He thinks his wife prettier than ever, and idolises his children. Upon the whole, he may be described as that human curiosity—a happy and contented individual. He has entirely forgotten that he once thought himself rich, though it is said he still remembers the miseries he had to endure in his fashionable apartment.

TUITION OF IDIOTS.

At the conclusion of our last article on the tuition of idiots, we dwelt briefly on the methods of exciting the senses of taste and touch. We now proceed to consider the means to be adopted with a view of acting on the organ of vision. In devising expedients for this purpose, as also in every other proceeding respecting the object in hand, the condition of the young subject must be carefully regarded, and the appliances made to bear on the individual in greater or less intensity, according to the peculiarity of the case. In most idiots a vacant wandering gaze is observable; the first aim of the tutor should therefore be directed so as to fix the eye of the pupil on some object. This may, in general, be accomplished by holding up a small substance in the axis of vision, and causing it to follow the varying motions of the eyeballs. As soon as the regard is attracted to whatever is thus presented, and the eye is noticed to dwell upon the object, it should be kept stationary until the attention is fixed upon it; and then being slowly moved backwards and forwards, so as to draw the eye in a corresponding direction, a regular and voluntary action of the muscles of the eyeball becomes excited. In most instances this preliminary exercise will be followed by the desired result; but should a more powerful stimulus be found necessary, it may be advisable to employ a luminous body. If this prove insufficient, the room ought to be darkened, and a beam of light permitted to enter through a small circular aperture in the shutter. To this point the face of the pupil should then be directed for a longer or shorter time; and when the object of fixing the attention by means of this strong impression is obtained, the exercises on the organ of sight, already described, may be adopted at a subsequent period.

As soon as the efforts to fix the regard prove successful, attempts may be made to impart an idea of colour. To accomplish this, pieces of wood, of the same form and size, painted with the three primitive colours, red, blue, and yellow, as well as white and black, should be provided. These should be successively and slowly exhibited. In due time duplicates of each colour ought to be placed on the table; and the tutor, selecting a particular piece from the one set, intimates that the pupil should take a corresponding one from the other set which are placed before him. Whenever an indication of appreciation of colour is manifested by readiness in matching the portion presented by the tutor, it will be advisable to pronounce the name of each, so as to affect both the eye and the ear with a distinct impression in relation to the quality of the object held up for observation.

In like manner, some impression as to the different forms of objects may be engendered by placing on the table pieces of wood having distinct and marked shapes—such as square, circular, triangular, &c. The exercises with these may be pursued in a way precisely similar to that adopted to impart ideas of colour—namely, by first showing each separately, then by placing the whole before the pupil, and drawing from a duplicate set a particular piece to be matched, and at the same time pronouncing its form.

When conducting this exercise, it is advisable to bring the sense of touch, as well as that of sight, into play. The hand should be caused to pass over the surface of each figure, so as to distinguish the different

sensations produced by objects differently shaped. At a more advanced period, it may serve a good purpose to bring each sense into operation independent of the other, with a view of quickening them in a still higher degree. To accomplish this, a bandage should be lightly passed over the eyes, and then each figure should be placed in the hands, in order that the sense of touch may be exercised to discover the form of the object without the aid of sight; and so, in a similar manner, the eye may be encouraged to discriminate without the assistance of the hands.

The continued action of the senses of sight and touch may, after the lapse of a short interval, be made serviceable to communicate the separate ideas of size and number. This can be accomplished by pursuing the principle adopted to impart notions of colour.

To give instruction as to size of objects, procure several duplicate pieces of wood, some in the form of squares, others oblong, and another set in long pieces. Each set being successively placed before the pupil, his attention is to be directed to them; and if he has already conceived the idea of shape from the previous exercise, he will become conscious that the objects before him have the same figure, but are different in another particular—namely, size. Whenever this conception is formed, the duplicate set may be produced, and the exercise pursued in the manner already described when speaking on the method of communicating ideas of colour, using the words *large* or *small* as the corresponding fragments are presented. In conducting this, as well as every other exercise, care must be taken that no objects except those in use are exposed to view, otherwise the attention will become distracted, and the ideas confused. It is equally important to avoid wearying or irritating the pupil by continuing any effort too long, or by an unnecessary repetition of performances in which he is tolerably perfect. A judicious variety of action, passing from the simple to the more advanced, by bringing into play the several functions of the mind, prevents irksomeness, and promotes improvement in a material degree.

Notions of number will be generated if twenty or thirty circular pieces of white card are exposed to view in two different quantities, distinguishing each by the words *larger* and *smaller*. As soon as this conception is created, equal numbers should be presented, using at the time the word *same* or *like*. Subsequently, a single portion should be held up, and indicated by pronouncing the figure *one*, then *two*, and so on. Whenever ideas of quantity and number are thus formed, attempts should be made to impress the mind with the corresponding symbol. To effect this, a black board should be provided, having white spots painted upon it of the same size as the pieces of card, and with the figure corresponding to the number placed at the extremity of each line, thus—

10
200
3000

A single line should be exposed separately, so as to show only one figure and the corresponding circles at the same time.

To those pupils who have the capacity, and with whom it is desirable to pursue instruction further respecting the power of numbers, the task will be much facilitated, and the object better attained, by employing the separate portions of card in preference to the arbitrary symbols. The design of tuition should be carefully kept in view—namely, that of quickening the faculties, and creating clear conceptions, so as to turn them to good account. We should therefore be especially guarded against the temptation of stepping beyond the bounds of utility: we should ever keep in mind what ought, rather than what can, be accomplished.

It is pleasing to discover, amidst much that is unattractive in these imperfect creatures, some peculiarities

which are singularly interesting. Among these may be noticed the remarkable susceptibility of the majority of idiots to musical sounds. Nearly all are acutely sensible of this influence, though they may be unable to utter a note or intelligible sound; and many, ignorant and incapable in other respects, manifest a remarkable power of imitating with the voice any simple air which has been carefully and repeatedly executed for their benefit. This sensibility of the organ of hearing becomes important as a means of producing impressions and awakening emotions. By a judicious education of the ear, the tutor acquires both a capability of communicating pleasing sensations, and also an increased power of enforcing obedience by a careful and marked intonation of his own voice, when imparting the various necessary directions to his pupils. Although in general naturally acute, yet this sense should receive a like systematic culture with the others. In addition to the regular gradations of the gamut, impressions should be made by striking various sonorous bodies together, and by uttering the different vocal expressions indicative of the emotions of the mind. It may be here remarked that there appears to be a greater susceptibility to lively and well-marked instrumental music than to that produced by the voice.

In following out the foregoing directions respecting the cultivation of the senses, great discretion will be absolutely necessary on the part of the tutor in adjusting the exercises to each particular case, as well as to the relative imperfections of the different organs observable in the same individual. Careful observation, combined with a fair amount of tact, will, however, lead to an adaptation of suitable means to each pupil. It may here be remarked that too rigid an observance of the above directions should not be enforced. Considerable latitude should be taken by the tutor, lest, by following too rigidly the somewhat artificial, though scientific and progressive order of cultivating the senses, a degree of irksomeness might in some instances be produced. To prevent this, frequent opportunities should be made available of directing the notice of the pupil to all ordinary objects which come within the range of his observation. He should be made as familiar with their names and uses as his imperfect capacity will allow. He should be taught to handle various articles, to attend to personal cleanliness, to dress and undress, as well as to take his food, without assistance. To accomplish all these objects, the force of example must be brought into operation, and much reliance must also be placed on the ingenuity, judgment, patience, and perseverance of the instructor.

In pursuing a systematic course of training, it will be found that the imitative tendency is strongly implanted in the objects before us. This is a fortunate circumstance, as, by a judicious use of that well-known influence which the stronger has over the weaker mind, a valuable means of leading forward, regulating, and rendering useful the rudest and most inert materials is placed in our hands. Of all the various elementary principles brought into operation in the tuition of idiots, this is the most powerful and important. It fortunately happens that so useful an agent is applicable in all cases, and may be made to bear with due efficacy upon each, taking, as the faculties become developed, a higher range of action. It may be divided into three kinds or stages: first, the simple motions of the limbs; next, the handling of objects; and lastly, the moral influence of example in all that relates to conduct and duty. The manner of causing the pupil to conceive and follow the various positions of the tutor having been already described when speaking on the regulation of muscular action, we proceed to the consideration of the more advanced stage—namely, the method to be employed with a view of leading, by means of the imitative tendency, to the use of various implements.

The first step in this important procedure may be accomplished by placing on the table two pieces of wood, about the size and shape of ordinary building

bricks. One of them being handed to the youth, the instructor takes the other, and placing it in a certain position, requires that the remaining piece shall be moved by the pupil so as to correspond with it in situation. At first, little or no idea of the intention is formed, and some assistance becomes necessary. In a short time, however, an appreciation of the object sought is engendered, and the pupil will readily cause his portion to assume the various positions of the opposite one. When this is accomplished, an increased number should be employed, and the faculty of imitation cultivated, by arranging one set in a certain order, to be followed by the pupil with the other set. Succeding to this exercise, domestic implements may be introduced, and their uses taught through the power of imitation. Thus, by gradual and progressive steps, instruction in various easy occupations may ultimately be inculcated, and the apparently hopeless object rendered useful and happy by means at once simple and applicable.

From what has been already advanced, the reader will perceive that the impressions received by a sound infant mind intuitively, require to be communicated by artificial means to the idiot. In pursuing those higher branches of instruction which prepare him to enter on active and useful avocations, the same principle must be carefully kept in view. Before the attempt is made to instruct the pupil in any handicraft employment, his ideas of form, and his capability of describing various figures in chalk, must be fully cultivated. This is an exercise which usually excites an agreeable impression among the pupils, and is accordingly entered on with readiness and pleasure. A black board being provided, the tutor draws upon it, by means of a rule and chalk, a single line; then requires that a similar one shall be imitated by each pupil in succession. The first lesson is devoted to a perpendicular line, the next to a horizontal, and the following one to an oblique.

As soon as the pupil has made each respective line, he should be required to utter the word, *up, flat, slant*, according as the line is perpendicular, horizontal, or oblique. After this combined exercise of both hands has been duly practised, he should be taught to draw a straight line without the aid of a rule. Then the three lines he has been taught being connected at each extremity, a triangle becomes represented on the board. To familiarise him, or rather to impress him, with a just conception of the nature of this picture, place in his hand the triangular piece of wood formerly employed to impart ideas of form, and encourage him to compare it with the figure on the board. By so doing, he becomes aware that the lines he has made constitute a representation of the substance he holds in his hand. A little reflection will convince us that the various steps embraced in this simple lesson are of great value in creating steadiness and capability of directing the hand, in perfecting the conception of form, and in generating a power to draw a representation of a simple object.

Whenever some proficiency is attained in drawing straight lines, the pupil should be taught to describe a curve; first by the aid of the rule, one extremity of which being fixed by the thumb, forms an axis, and becomes the centre of the circle. Subsequently, the hands should be exercised in forming curves without the aid of any instrument. After some practice of the eye and hand, in proportion to the capacity of the pupil, these preliminary exercises in the art of drawing should be followed up by efforts to impart the power of representing simple objects. This will be effected with the greatest ease by presenting the mathematical figures shaped in wood for imitation, beginning with the triangle, and passing to the square, circle, oblong, oval, &c. In due time, simple implements, with which the youth has become familiar, should be held up, that he may attempt a rude picture of them.

Several advantages ensue from this course of tuition. The object sought is not to make a painter, but to

expand and cultivate the mind, to open out stores of improvement and enjoyment by this simplest of languages—the hieroglyphical. It also serves a most useful purpose in perfecting ideas of shape, and a power of imitation which can ultimately be turned to good account in manual operations requiring a capacity to cut and work out rude materials into useful articles.

The first instruction in letters is founded on the preliminary exercise respecting a straight line and curve, the various combinations of which form the complete alphabet. This important branch of instruction is greatly facilitated, and precise ideas respecting the symbols of language are created, by first making known those letters which consist of simple lines, next the circle, and lastly those consisting of a straight line and portion of the circle. We may here remark, though not forming a part of this portion of instruction, that when a consonant is represented, the simple sound should be associated with it, not that compound with a vowel which is usually employed in ordinary schools. This both aids utterance, and prevents confused notions.

Most idiots are mute; that is to say, they do not utter any intelligible sounds, owing to causes analogous to those which impede control over muscular action in other parts of the body. The means of cultivating the organ of speech consist in producing successive motions of the jaw, lips, and tongue. When the faculty of imitation is developed, and the pupil is able to control the muscles of those parts, the object may be easily attained if the tutor exhibit the necessary movements. But in some cases, both the tendency to follow the actions of others, and the power over the vocal apparatus, are so imperfect, that it becomes necessary to aid the muscles. The jaw should be opened and closed, the lips brought into various positions by the use of the fingers, and the tongue moved by means of a paper knife.

When, however, imitation and power of motion are more perfect, the mechanical assistance is unnecessary. Such exercises as whistling, sucking a ferule, holding a small body between the lips, protruding the tongue, and moving it in every direction, should be practised. After these muscular actions have been many times exercised, a simple sound should be uttered by the tutor, and repeated till the pupil does the same. When he becomes perfect in uttering simple labials and linguals, he should be practised in uttering consecutive syllables.

The power of arrangement may be taught by placing several square and oblong pieces of wood so as to form a certain figure, to be imitated by the pupil. As soon as some knowledge of letters is communicated, he should be taught the sound of two letters combined, and then of those which form a word. The instruction in this department is greatly facilitated by having the letters on separate portions of card, so that they can be selected and brought together. The first words formed should be substantives of one syllable only, as hat, cap, &c. The object should also be presented at the time, so as to impress the mind with the power of the letters employed in forming the word. No words should be used of which the meaning has not been communicated.

From substantives proceed to adjectives: show that a hat may be white or black; then to verbs: form the sentence 'move the hat,' and when moving it, point to the verb. So with prepositions, place an object in, on, under the hat, &c. repeating the respective preposition, and showing the word whenever the object is placed in these different situations.

We now approach a most important department of tuition; namely, that of moral guidance. Owing to the inherent deficiencies already described, the several actions of idiots, constituting conduct, belong in a great measure to that class termed evil. To check this unfortunate tendency, and to cultivate the moral sense, so as to engender ideas of duty and improved conduct, form the highest office of the tutor. Although certain influences about to be described may be said strictly to belong to the class of moral agents, yet it is to be observed

that every step already taken bears on the same end in a most material degree. The faculties have been cultivated, knowledge imparted, and an affectionate regard for, and obedient reliance on, the tutor is felt. During the whole progress of intellectual training, it is vitally important that the moral sense be regarded, and that means should be taken to regulate and cultivate it. The first object to be accomplished is to prevent the pupil from committing any evil act; the next, to direct him to a more improved conduct by constant supervision; and lastly, to promote a desire and will to continue such conduct when no control is exercised over him. It will be perceived that, in training the moral sense, a course very similar to that adopted in the regulation of muscular action is recommended to be pursued; namely, first the prevention of vicious tendencies and habits; next, a judicious regulation under control; and lastly, a free and unrestrained power, stimulated by due excitants.

In accomplishing this latter and very exalted duty, the pupil should be taught to notice, compare, and judge—in fact, to reason, and then to will. He should be made to feel his wants both in food and clothing, and to supply them by fetching the necessary articles from a distant part of the establishment. When conducting this moral tuition, the first dawning of a better disposition should be carefully looked for, and made available when discovered. It is probable that, after the perverse propensities have been conquered, and the pupil has submitted to direction in a better course, some manifestation of a new desire or will may become apparent. This, if correct, should be actively encouraged, and other aids sought for to cultivate and gratify pure tastes and feelings. By these means he will, in course of time, be made sensible of many rational enjoyments, the gratification of which can be turned to good account as rewards for improved conduct.

Our remarks on the tuition specially adapted to the idiotic having already occupied so much space, we are unable to dwell at any length on the means applicable to those children in whom the development of the mental faculties has been retarded, owing to the occurrence of certain actions of the brain which have supervened after birth. The gymnastic exercises calculated to invigorate the bodily functions may be safely encouraged, but it will be advisable to adopt precautions respecting those agents destined to stimulate the brain in a direct manner, lest, by an injudicious excitement of a disordered organ, additional disturbance arise which it may be difficult to allay. The advice of a medical man should be sought, who, taking into account the cause which has operated in preventing the expansion of the mind, will be able to suggest what exercises are likely to prove advantageous, and what prejudicial.

Something remains to be said respecting the properties of the individual required to execute this nice and delicate work of tuition. He who is employed in the task should possess many amiable qualities. A mild, gentle, persuasive, serene, and charitable nature should be sought for, but at the same time a weak and yielding disposition is to be avoided. With much calm self-possession should be united an equal share of firmness, consistency, and perseverance. Those endowments of temper, address, forbearance, superior judgment, and strong determination, constituting a power to command, are especially needed; as well as that ready and decisive appliance of just means to every emergency, usually denominated tact. Considerable play and power of voice, gesture, and look, are necessary to fix attention, communicate an impression, and enforce obedience. A capability to enter with spirit on various games and pastimes, and a facility of expressing emotion, as well as a taste for music, are all desirable qualities.

The power of observation should be studiously applied, the peculiarities of each pupil carefully marked, and met with that discretion which can alone lead to success.

We have now traced some of the essential influences

destined to elevate the most inert and degraded creature, by the education of the whole being, to the likeness of man. The means are as simple and applicable as they are sound and philosophical, and it is only necessary to use them with energy and discretion, to secure happy results.

TRUMAN HENRY SAFFORD.

THIS is the name of a boy now ten years of age, who, if he lives, and continues to enjoy mental and corporeal health, will in all probability be one of the most remarkable men America has ever produced. He is not one of those 'prodigies' in whom a single faculty is developed to a preternatural extent; for his general talent is nearly as conspicuous as his aptitude for mathematics. He has both the will and the power to *learn* in a very extraordinary degree, and his success cannot by any means be ascribed, as in other cases, to the collective energies of his mind being turned into a single channel.

He was born at Royalton, Windsor County, Vermont, on the 6th of January 1836. His father is a farmer, and a person of considerable intelligence; and both his parents, during the earlier portion of their lives, were instructors of youth. From his father he appears to have inherited his passion for mathematical studies, and from his mother a nervous temperament, so exquisite,

'That one might almost say his body thought.'

In his first year he was so delicate, so fragile, that perhaps no other mother could have reared him; but from the wan unearthly lips of the infant there came questions that made the listeners start and thrill by their preternatural intelligence. It seemed as if he had come into the world with a craving for knowledge, which he waited only for the gift of speech to 'wreak upon expression.' But it was not till his third year that the grand bias of his mind was suspected; nor did this fully develop itself till three years after. His parents had already amused themselves with his power of calculating numbers; but one day now, as we are told, he 'remarked to his mother, that if he knew how many rods it was round his father's large meadow, he could tell the measure in barleycorns. When his father came in, she mentioned it to him; and he, knowing the dimensions of the field, made a calculation, and told the boy it was 1040 rods; the lad, after a few minutes, gave 617,760, as the distance in barleycorns, "in his head," as the phrase is.'

This was sufficiently remarkable in a child of six years of age; but before his eighth year, he had gone to the extent of the famous Zerah Colburn's powers, and had answered, in fifteen minutes, all the questions which more recently made the reputation of a negro boy, detecting three mistakes either of the press or the boy. But these feats were not achieved—and this is the most promising fact in his history—by the kind of intuition usually observable in such cases, but by means of study; and it was observed that he improved rapidly by practice, and lost proportionately when he neglected the cultivation of his powers. At this time he acquired from books some knowledge of algebra and geometry, and appeared to possess, 'in addition to the power of performing lengthy calculations in his head, the higher power of comprehending and solving abstruse and difficult questions in the various branches of mathematics.'

He was now attacked by typhus fever; and an incident of his illness is related which exhibits at once his passion for such studies and the extreme delicacy of his nervous temperament. 'When the alarming crisis of his disease had passed, and he was slowly recovering, he pled most affectingly with his mother for Day's Algebra and his slate. His mother, aware of his extreme nervousness and irritability at the time, thought it would be better to gratify than to refuse him, and gave him the Algebra and slate. He immediately commenced making a long statement, which extended nearly

across the slate; but before he could finish it, his little hand failed, his pencil dropped, and giving up in despair, he burst into tears, and wept long and bitterly.' After his recovery, Hutton's Mathematics and the Cambridge Mathematics were added to his few books, and in the winter of 1844-5 he studied hard. In the following spring, Dr Chester Dewry, a mathematician well known throughout the United States, writes of him thus:—'He is not one of the calculators by instinct, if I may use the language, but a real regular reasoner, on correct and established principles, taking the easiest and most direct course. As he had Hutton's Mathematics, and wanted some logarithms, his father told me he computed the logarithms from 1 to 60 by the formula given by Hutton, which were afterwards found to be the same in a table of logarithms for the same number of decimals. He is a wonderful boy. His mind seems bent on the study of mathematics, and he takes his books about with him, that he may study some every day. He was also much interested in three lectures on chemistry that he attended. He seems very able to make a practical application of his knowledge. His mind is too active; and when roused in the night, or made wakeful by his nervous temperament, it is often difficult to arrest the current of his thoughts on some interesting calculation. The study of mathematical relations seems to be amusement to him.'

He was now taken to Hanover, where he saw for the first time an extensive collection of books and mathematical instruments. The sight made the poor nervous student wild with excitement; and when taken away, he was drowned in tears. On returning home from a little tour, in the course of which he had been introduced to various scientific men, and had his library enriched by several useful acquisitions, he set about constructing an almanac, which was actually put to press in the autumn of 1845, having been cast when its author was just nine years and a half old. In the following year he calculated four different almanac calendars—one for Cincinnati, which was published with a portrait; one for Philadelphia; one for Boston; and one for his native Vermont. 'While getting up the Cincinnati one, he became much abstracted in his manner, wandered about with his head down, talking to himself, &c. as is his manner while originating new rules. His father approached him, and inquired what he was doing, and found that he had originated a new rule for getting moon risings and settings, accompanied with a table which saves full one-fourth of the work in casting moon risings. This rule, with a number of others for calculating eclipses, is preserved with his manuscript almanacs in the library of Harvard University.' This almanac was placed upon a par by scientific men with the works of mathematicians of mature years; and the wonderful boy, who saw two editions of his book sold almost immediately—one of 7000, and one of 17,000 copies—became at once a public character.

'Not satisfied,' says the Rev. H. W. Adams of him at this time, 'with the old, circuitous processes of demonstration, and impatient of delay, young Safford is constantly evolving new rules for abridging his work. He has found a new rule by which to calculate eclipses, hitherto unknown, so far as I know, to any mathematician. He told me it would shorten the work nearly one-third. When finding this rule, for two or three days he seemed to be in a sort of trance. One morning very early he came rushing down stairs, not stopping to dress himself, poured on to his slate a stream of figures, and soon cried out, in the wildness of his joy, "Oh, father, I have got it—I have got it! It comes—it comes!"'

We now proceed to give the results of a regular examination of the boy, in which the questions were prepared beforehand by a skilful mathematician, with the view of testing his powers to the uttermost.

'I went, firmly expecting to be able to confound him, as I had previously prepared myself with various problems for his solution. I did not suppose it possible for

a boy of ten years only to be able to play, as with a top, with all the higher branches of mathematics. But in this I was disappointed. Here follow some of the questions I put to him, and his answers. I said, "Can you tell me how many seconds old I was last March, the 12th day, when I was twenty-seven years old?" He replied instantly, "85,255,200." Then said I, "The hour and minute hands of a clock are exactly together at 12 o'clock: when are they next together?" Said he, as quick as thought, "1 h. 5 5-11 m." And here I will remark, that I had only to read the sum to him once. He did not care to see it, but only to hear it announced once, no matter how long. Let this fact be remembered in connection with some of the long and blind sums I shall hereafter name, and see if it does not show his amazing power of conception and comprehension. Also, he would perform the sums mentally, and also on a slate, working by the briefest and strictest rules, and hurrying on to the answer with a rapidity outstripping all capacity to keep up with him. The next sum I gave him was this: "A man and his wife usually drank out a cask of beer in twelve days; but when the man was from home, it lasted the woman thirty days. How many days would the man alone be drinking it?" He whirled about, rolled up his eyes, and replied at once, "20 days." Then said I, "What number is that which, being divided by the product of its digits, the quotient is three; and if 18 be added, the digits will be inverted?" He flew out of his chair, whirled round, rolled up his wild flashing eyes, and said in about a minute, "24." Then said I, "Two persons, A and B, departed from different places at the same time, and travelled towards each other. On meeting, it appeared that A had travelled 18 miles more than B, and that A could have gone B's journey in 15½ days, but B would have been 28 days in performing A's journey. How far did each travel?" He flew round the room, round the chairs, writhing his little body as if in agony, and in about a minute sprung up to me, and said, "A travelled 72 miles, and B 54 miles—didn't they? Yes." Then said I, "What two numbers are those whose sum, multiplied by the greater, is equal to 77, and whose difference, multiplied by the less, is equal to 12?" He again shot out of his chair like an arrow, flew about the room, his eyes wildly rolling in their sockets, and in about a minute said, "4 and 7." "Well," said I, "the sum of two numbers is 8, and the sum of their cubes 152. What are the numbers?" Said he instantly, "3 and 5." Now, in regard to these sums, they are the hardest in Davies's Algebra.

"I took him into the mensuration of solids. Said I, "What is the entire surface of a regular pyramid, whose slant height is 17 feet, and the base a pentagon, of which each side is 33.5 feet?" In about two minutes, after amplifying round the room, as his custom is, he replied, "3354.5558." "How did you do it?" said I. He answered, "Multiply 33.5 by 5, and that product by 8.5, and add this product to the product obtained by squaring 33.5, and multiplying the square by the tabular area taken from the table corresponding to a pentagon." On looking at this process, it is strictly scientific. Add to this the fact, that I was examining him on different branches of mathematics requiring the application of different rules, and that he went from one sum to another with rapidity, performing the work in his mind when asked, and the wonder is still greater. Then I desired him to find the surface of a sphere. "Hence," said I, "required the area of the surface of the earth, its diameter being 7921 miles?" He replied as quick as thought, "197,111,024 square miles." To do it, he had to square 7921, and multiply the product by 3.1416. Then I wished him to give me the solidity of a sphere; therefore, said I, "What is the solidity of the earth, the mean diameter being 7918.7 miles?" He writhed about, flew rapidly about the room, flashed his eyes, and in about a minute said, "259,992,792,083." To do this, he multiplied the cube of 7918.7 by 5236. I believe he used a few figures in doing this sum, but it was unneces-

sary, as he performed a much larger one in his mind, as I shall soon show. I then asked him to give me the cube root of 3,723,875. He replied quicker than I could write it, and that mentally, "155—is it not? Yes." Then said I, "What is the cube root of 5,177,717?" Said he, "173." "Of 7,880,599?" He instantly said, "199." These roots he gave, calculated wholly in his mind, as quick as you could count one. I then asked his parents if I might give him a hard sum to perform *mentally*. They said they did not wish to tax his mind too much, nor often to its full capacity, but were quite willing to let me try him once. Then said I, "Multiply, in your head, 365,365,365,365,365 by 865,365,365,365,365!" He flew round the room like a top, pulled his pantaloons over the top of his boots, bit his hand, rolled his eyes in their sockets, sometimes smiling and talking, and then seeming to be in agony, until, in not more than one minute, said he, "133,491,850,208,566,925,016,658,999,941,583,225!" The boy's father, Rev. C. N. Smith, and myself, had each a pencil and slate to take down the answer, and he gave it to us in periods of three figures each, as fast as it was possible for us to write them. And what was still more wonderful, he began to multiply at the left hand, and to bring out the answer from left to right, giving first "133,491," &c. Here, confounded above measure, I gave up the examination. The boy looked pale, and said he was tired. He said it was the largest sum he had ever done!

Well, indeed, may the poor child have looked pale, after a three hours' examination like this! Such experiments resemble certain animal murders, in which the victim is tortured to death for the gratification of scientific curiosity. It is no wonder that young Safford has been pronounced to be 'fore-doomed.' But more merciful inquirers have given a very different account of the relative working of his mind and body. They deny any distortion of features, any clouding of the brow, any diminution of the cheerful brightness of his boyish eye. They tell us that he walks with a free step round the room, threading his way behind chairs, gliding into corners, and looking up at the questioner as he passes with a smile, apparently no more fatigued than a boy with his usual play. It would seem clear from this that if he is fore-doomed, it is not by nature, but by man. But the frail constitution, the delicate health, the small limbs, the brilliant eyes, the pallid countenance, are not necessarily indications of early death; and there are circumstances in the case before us which give every hope that, if the boy only receives fair-play, he may live long enough to obtain a permanent place in the constellation of science, instead of passing away, as some anticipate, like the meteor of a moment. One of these circumstances is what appears to us to be the curious and interesting fact, that in him the intellectual does not require to draw upon the physical man for aid in extraordinary emergencies. In ordinary cases, when the feats, as in the present, are not performed by intuition, but are the result of previous study, the calculator or reasoner suspends, so far as he can, the exercise of those faculties that are applied to the uses of the body: he abstracts his senses from external objects, and appears either to exact from them some mysterious aid within, or at least to require a strict neutrality. With the Vermont boy, on the contrary, the external perceptions seem to quicken in the mental excitement. The exercise of his body goes on at the same moment with the exercise of his mind; and if he is engaged in any ordinary employment at the time, instead of suspending it, he redoubles his energy. This affords a hope that in his case the mind may not be worked in any fatal disproportion.

The value of that mind may be collected from the following statements by Mr Adams, the gentleman who tested its powers so rigorously.

'But young Safford's strength does not lie wholly in the mathematics. He has a sort of mental absorption. His infant mind drinks in knowledge as the sponge does water. Chemistry, botany, philosophy, geography,

and history, are his sport. It does not make much difference what question you ask him, he answers very readily. I spoke to him of some of the recent discoveries in chemistry. He understood them. I spoke to him of the solidification of carbonic acid gas, by Professor Johnston of the Wesleyan University. He said he understood it. Here his eyes flashed fire, and he began to explain the process.

His memory, too, is very retentive. He has pored over Gregory's Dictionary of the Arts and Sciences so much, that I seriously doubt whether there can be a question asked him, drawn from either of those immense volumes, that he will not answer instantly. I saw the volumes, and also noticed he had left his marks on almost every page. I asked to see his mathematical works. He sprang into his study and produced me Greenleaf's Arithmetic, Perkins's Algebra, Playfair's Euclid, Pike's Arithmetic, Davies's Algebra, Hutton's Mathematics, Flint's Surveying, the Cambridge Mathematics, Gummere's Astronomy, and several nautical almanacs. I asked him if he had mastered them all. He replied that he had. And an examination of him, for the space of three hours, convinced me that he had; and not only so, but that he had far outstripped them. His knowledge is not intuitive. He is a pure and profound reasoner.

What to do with this remarkable boy was the question. A neighbouring bank offered him a thousand dollars a year to enact the part of a machine for calculating interest. Another admirer of genius, equally disposed to turn the penny by it, advised his father to carry him about the country as a show; in the hope, no doubt, that his intellectual greatness might stand as well in the market as the physical littleness of General Tom Thumb. If this plan had been carried into effect, we should have had him in England no doubt; when, of course, her Majesty and her principal nobility would have treated him with at least the distinction they lavished, so honourably to themselves and to the character of the British court, upon the dwarf! Some thought that he should be lavishly supplied with books, and his genius left undisturbed to itself; while others contended that he ought to have the benefit of a public education, superintended by men eminent for their acquirements. This last opinion, we are happy to say, was adopted by his father; who, on the invitation of the Harvard University, removed to Cambridge with his family, where about this time last year Truman Henry Safford was placed under the charge of Principal Everett and Professor Pierce.

The above is compiled, so far as the facts are concerned, from a long article in a Boston (American) paper, called the 'Christian Alliance and Family Visitor.'

THE PRIVATEERS.

IN order to recollect the last shots fired in the European battle-field of this country, a man must now be well up in middle age. The young know nothing of arms but from history; and they can hardly persuade themselves that the most pacific old man in England, is the same Iron Duke who commanded at Waterloo before they came into the world. The trade of soldiering has no longer any necessary connection with fighting. Its duties are merely the drill and parade, and the wearing of gay clothes. And although the officers, in their different grades, are hardly so well paid as merchants' clerks, still there is always a sufficient number found for so easy and amiable a service. It is true they have a chance of being drafted, at some time or other, to the farther East, several thousand miles away; but they know very well that in India they will meet with no such equal enemies as were formerly grappled with in Europe, while in China, it is a mere amusement to bring down the baldheaded Celestials—in fact, a human *battue*.

Under such circumstances, we look back upon war as one of the interesting or terrible things of the past;

and although somewhat sick of the details of its bloody struggles, from their having been so frequently obtruded upon our notice, we regard the composition of its materials and character as legitimate objects of literary curiosity. One of the strangest departments of such a subject is the Privateering system; and we now proceed to offer some illustrations of a class of belligerents who have not as yet received due attention either from history or romance. This we shall do by means of a couple of individual portraits—one French, and one English—which may be taken as exhibiting, though of course in higher relief than usual, the general features of the tribe.

As for the system itself, it is a relic of the barbarism of the middle ages, organised and legalised by the folly or depravity of modern governments. It is the piracy of the northern barbarians and eastern infidels sanctioned by letters of marque—a document which affects to give the right of reprisal, but, in reality, invests the desperadoes of the country with the privilege to rob and murder. This sort of commission did not come generally into fashion till the end of the sixteenth century; but once fairly afloat, the privateers continued to maintain their flag in time of war, in spite of the bursts of indignation which their excesses called forth from the neutral nations. Various attempts were made to bring them under legal restraint; but to impose any control but that of force upon ruffians called into action by such sordid motives was impossible. Sometimes the Channel between France and England was swept so clean by the sea guerillas of the two nations, that the poor privateers must have starved if they had not turned their arms against neutrals. In 1758, a ship belonging to Holland (with which country we were then at peace), having on board the Spanish ambassador on his way to Denmark, was boarded by three different squadrons of privateers, and plundered even of his excellency's baggage. A little hanging was had recourse to on this occasion; and in the following year, the nuisance still continuing unabated, great numbers of the privateers, as they were taken and brought into the English ports from time to time, were consigned to the gallows. The neglect of our internal police added to the disorders of the period; and the result, as we are informed by historians, was, that an ingredient of savage ferocity mingled in the national character.

Forty years later—in the first year or two of the present century—when the war raged bitterly between France and England, the career of two adventurers commenced, one on either side of the Channel, who were destined to exercise some influence on the fortunes of each other.

Jérôme Harbours resided in a little sea-port on the coast of Brittany—that is, when he was on shore; for although now only twenty-four years of age, he had been fourteen years a sailor, man and boy. He was little, fat, fair, with short arms and round shoulders. His face was the reverse of long; but his small nose, small mouth, and small blue eyes, were lost in its width. He was, in fact, anything but the pirate of poetry or romance in form; and in other respects he had nothing to distinguish him from the commonest of common sailors, except his genius for sea robbery. When in his twenty-fourth year, his uncle, a weaver at Vannes, left him 20,000 francs—a large fortune either in Normandy or Brittany; and after twelve months' cogitations, assisted by as much brandy as would have gone well-nigh to float a letter of marque, he determined to invest his money in the purchase of a vessel, and go a privateering.

To present little surface; to take hold of the water by length rather than breadth; to keep the sea in any weather; and to be able to run close in-shore at almost any depth—these were Jérôme's requirements in a ship. And all these and more he found in a long, low, narrow schooner, which, notwithstanding, he cut down still farther; shaving her off almost to the water's edge, so that she ran constantly between two seas—one below her keel, and the other above her always wet deck.

This vessel he rigged with a single sail of enormous proportions, with the weight of which the long, low, narrow craft rocked like a cradle, even in the harbour. The astounded spectators called her *La Grenouille*, as signifying that she would soon seek her proper place at the bottom. 'Be it so,' said her owner; and presently the figure-head of a frog, splendidly painted in green and gold, appeared at the bow. Jérôme himself was from that day called Captain Grenouille, and in the course of a few years was known on the shores of the Channel by no other name.

His commission, in the meantime, had arrived; and all being ready, he filled his tarry hat with six-franc pieces, and stirring them up as he walked with his tarry hand, so as to make them discourse most eloquent music, he went from tavern to tavern to find a crew. The guests crowded round him at the enticing sound.

'Who is for the Grenouille?' said he; 'she sails this afternoon.'

'I—I—I!' cried they with one voice.

'Avast, brothers! Who are you with the game leg?'

'I have only a little coolness with the government just now.'

'You are a deserter?'

'Yes, Captain Grenouille.'

'Nothing more?'

'Nothing more at present.'

'There are forty francs; ship yourself at once. And you with the plaster on your eye?'

'The police are such ugly fellows, I hate to look at them.'

'You are an escaped prisoner?'

'Yes, captain.'

'You belong to the Grenouille. And you with the down-look?'

'I was in the purser's department of a government ship, and the rascals accused me!—'

'We shall hear the story again. You are now in the purser's department of the Grenouille; but mind this, brother, that the first cipher you turn into a nine by putting a tail to it, I shall take off your head from your shoulders, and so make a cipher of you!'

This arithmetical sally was received with a roar of laughter which made the glasses jingle; and, in fine, by the time Captain Grenouille had made the tour of the taverns, a crew was collected which comprised the choicest ruffianism of the place.

That afternoon the whole population ran along the rocks to see the Grenouille leave the harbour. The sight was worth the trouble; for as she got out into rough water, she appeared to pass between two seas, like a weaver's shuttle between the threads. Nothing was visible but the mighty sail flinging its gigantic shadow upon the water, and the legs of the crew, who were squatted listlessly at the port-holes, leaning their chins on the breeches of the guns, and smoking with imperturbable gravity. The next afternoon the Grenouille returned into the harbour, towing after her an English brig loaded with sugar and tobacco.

But we have no intention to record the battles, victories, repulses, flights, and escapes of the Grenouille. Such narratives have now become nauseous, from the frequency of their appearance, and the change that has taken place in the taste of the public. Suffice it to say, that the vessel became the terror of the Channel; and her captain, notwithstanding his awkward build and low-breeding, the very Roland of privateers. It may be matter of surprise that a little fat man, with a bullet-head and a great stomach, should have acquired and retained so perfect a command as was necessary for the success of the letter of marque over the most desperate crew that ever floated on blue water; but Captain Grenouille had such ways of persuasion as no human being could withstand. When he ordered, implicit and instantaneous obedience was necessary: but not because he spoke louder than usual, or had recourse to such ungentlemanly enticements as knocking recusants down with a handspike: far from it. If a voice or a hand was

raised beyond the desirable pitch, he invited the indocret individual to his cabin, and pouring out for him a glass of rum from his oldest bottle, addressed him in some such terms as these:—'Now do, brother, I beg of you, treat me with a little more kindness. I am as true a comrade as ever a fellow had, and even now, so far from being angry, you see I am as mild as a lamb. But my dear friend, don't do so again; for it would compel me—you know it would, old chap—it would reduce me to the really unpleasant necessity of blowing out your brains with this pistol. There, it is all amicably understood between us; and now, take another glass of rum—it is real good stuff—and jump up to your work again like a rigger!' This remonstrance never failed of its effect; and for the simple reason, that every man on board knew that Captain Grenouille would do what he said—'seeing as how' he had already done it more than once.

Captain Grenouille was widely different from his crew, and from most other seamen, in one remarkable particular. He was no niggard of his money, and yet no spendthrift. He was devoutly attached to the sea, but at the same time had a passionate desire to be a landed proprietor. He was, in short, a Norman as well as a rover; and he garnered up from time to time the produce of his lawful piracy in fields, and barns, and cows, and cider-mills. An economist privateer must needs be a terrible phenomenon, and Captain Grenouille was this phenomenon.

But Captain Grenouille was not alone in his glory. He had a rival from the other side of the Channel who was as distinguished a scoundrel as himself. The real name of this worthy, we regret to say, is not on record; but his soubriquet was Beggar—Captain Beggar—and the vessel he commanded was a schooner called the *Hunger*. Among his crew were some regularly-bred seamen; but the greater number were smugglers, thieves, ruined gamblers, and bankrupts—the miscellaneous vagabonds, in short, who, in this amphibious country, take to the water by instinct when the land becomes too hot to hold them. Captain Beggar himself had been bred to the law, and is even said to have practised as a barrister; and his early studies were of great benefit to him in sundry predicaments arising in his new profession. He was a little young man, like the French privateer; but, unlike him, was thin and pale. In action he sustained himself with gin, as Napoleon did with snuff; but as the liquid fire burned in his entrails, it served only to sharpen his intellect, while externally it gave him a phantom-like appearance that terrified his very crew. When all was over, his excitement suddenly evaporated; and the poor little wretch dropped upon the deck, a mere lifeless rag soaked in spirits, and was carried off to his hammock.

These two great rivals met for the first time off Cape la Hogue, and in circumstances of some interest. The English privateer was in chase of a French brig loaded to the gunwale, and stretching in desperation under a cloud of canvas for Cherbourg. But the efforts of the latter were vain; for it was *Hunger* that was after her, and the importunate Beggar would not be denied. She was just about to surrender as the guns of her pursuer thundered quicker and quicker over the abyss, when suddenly the desert circle of water, which was their field of strife, opened at another point of the horizon, about three leagues distant, and there entered upon the arena two other vessels. One of these fled, and the other pursued, and the sound of their distant cannonade came sullen and subdued over the deep. They were of course French and English; and Captain Beggar had here an opportunity of saving a countryman and destroying an enemy. But the privateers, even in the construction of the law, were afloat on their own account; they were under no legal constraint to interfere;* and even after the strangers proved to be an

* This is proved by the division of spoil; which, in the case of a government prize, was shared in by any government ships that

English argosy in the very clutches of the Grenouille, Captain Beggar looked with his hungry eyes at the heavy French brig, teeming with spoil, and stood irresolute.

Desiring to learn the enemy's intention, he at length put his ship about, and made a sweep round, as if with the view of examining the new-comers from a different quarter. This manoeuvre was exactly imitated by Captain Grenouille; and by and by the two privateers were in a line in which, if far enough produced, they must have met. As they came nearer and nearer, they both cleared for action; but even when greatly within cannon range, not a gun spoke their counsel. When at length they might have fought with pistols, a small boat was seen putting off from the Grenouille; and Captain Beggar, leaping instantly into his yawl, went out to meet her, as in politeness bound, half way. The two captains saluted each other as their boats came alongside.

'What are we to be about?' said Captain Grenouille.

'Don't know,' replied Captain Beggar.

'If I take you, what shall I do with your rascally crew, that are not worth a five-franc piece?'

'And if I take you, what shall I make of yours, for the whole boiling of whom I would not give a herring?'

'Then I should lose yonder three-masted prize.'

'And I yonder brig, with a cargo that seems bursting out of her hatches for very richness.'

'Suppose we each go about our own business?'

'Done.'

'Done.'

'Shall we do a little more, Captain Frog?'

'Say away, Captain Beggar.'

'Well, there are ten ships of ours which will pay me a thousand pounds a piece, if I bring them safely through the Channel. Will you let them alone? One good turn, you know'—

'Of course. Here is a list I happen to have in my pocket of ten customers of the same sort. Give me yours. Is it agreed?'

'Agreed;' and the two captains, first shaking hands, and then pulling off hats, returned to their own ships, and bore away for opposite points of the horizon.

The paction was honourably kept. Gold became a drug among the privateers, who could hardly contrive to spend it fast enough to prevent its accumulation; and Captain Grenouille, who still held to his crotchet of investment, was at length so great a landed proprietor, that he had serious thoughts of giving up the sea, except a cruise against the English now and then for amusement.

One day, when this idea was passing through his mind, and with the greater force, that he had been scouring the Channel for a week without falling in with anything worth his attention, a promising object was seen on the verge of the leeward horizon. It proved to be a large, dusky, awkward ship, which lay upon the water like an island; and the heart of Captain Grenouille was glad within him, as he noted her unwieldy bulk, her peaceful build, and fat bloated appearance. A thousand jibes passed from mouth to mouth on the privateer's deck, as they set their vessel, with her gigantic sail, large before the wind, and trundled down upon the stranger, rolling from side to side, now over, and now under the waves, like a porpoise gambolling after a shoal of herrings. They likened the huge merchantman to a sleeping whale, whose blubber they would have under hatches in no time; and then they described her as an overgrown turtle, which they would cut up and devour for dinner. The object of their curiosity, in the meantime, as if confiding in her vastness, took no notice of their approach; and Captain Grenouille, as he neared her, threw his ship up in the

wind, that he might not damage his green and gold frog against the senseless sides of the leviathan.

'I see nothing on deck,' said Captain Grenouille, when they were within a stone's-cast, 'but a dog, and a man in a cotton nightcap. Ahoy!' bellowed he through his speaking-trumpet, 'which of you two is the captain?'

'Tis I,' replied the man in the cotton nightcap—'I—Captain Beggar!'—and at the word, a discharge of musketry swept the decks of the French privateer as with a besom. Captain Grenouille, like most of his comrades, was laid prostrate; and when he next opened his eyes, he found himself in the prison of Plymouth.

He was one of the ten Frenchmen who effected an escape famous in the annals of ingenuity and daring. Without the assistance of a single instrument of any kind, wood or iron, they excavated a tunnel from their dungeon, eighty feet long, and four feet wide, carrying away the rubbish in their pockets, and spreading it over the surface of a court where they were permitted to walk twice a day. The task, however, was not a brief one; and when Captain Grenouille at length revisited his Norman farms, the harvest had been gathered three times during his absence.

He was wealthy; his estate was flourishing; and his friends urged him to marry, and subside quietly into a great proprietor. But Captain Grenouille had an account to settle, which was his thought by day and his dream by night. Captain Beggar must be paid to the last farthing!—he must be rewarded with interest upon interest: this was the only condition upon which he could rest. After a glance over his farms, and a second at the lady recommended for promotion as Madame Grenouille, he set himself to look out for a vessel which should rival his lost beauty. All was ready towards the end of January 1814; and for no other reason than that all *was* ready, he set sail in quest of his enemy, in the midst of what was little less than a gale of wind.

By and by it was quite a gale of wind; and at the tail of the storm there descended so thick a fog upon the Channel, that Captain Grenouille, by this time dismasted and water-logged, found himself driving about, the sport of the winds and waves, without the possibility of ascertaining his bearings, or even knowing whether they were close to the land, or had a dozen miles of sea-room. It was intensely cold, and the air was so thick, that they seemed to breathe sponge. All day they could only just recognise one another's faces; but as the night fell down in darkness and horror, even this last comfort was withdrawn. The strain of the ship's timbers was so great, that there was the strongest possibility of her going to pieces; without the agency of anything harder than water; but at two hours after midnight a sudden shock was felt, and after some wild convulsions, the groaning vessel seemed to be settling down in deep water.

'Out with the long-boat!' roared Captain Grenouille through his trumpet, and the order was not given a moment too soon; for the ship, after a furious plunge, went down like a stone, very nearly sucking boat and men with her into the abyss. The proximate cause of the catastrophe had become obvious as the long-boat was leaving her side; for in addition to their own crew, numbering nine men, eleven strangers tumbled in in the dark. It was a case of collision. Both vessels, being near their last hour at anyrate, perished in the shock; and both crews saved themselves in the same boat.

Captain Grenouille, who had been the last man to quit his ship, threw himself down sulky and silent in the bottom of the boat; leaving the task of baling to the rest, who had some difficulty in keeping her afloat. Not a word was exchanged among that sullen crew till the gray light of the dawn broke upon the sea, showing that the fog had cleared. Captain Grenouille, who had sank into a doze, opened his eyes, then shut them again; then rubbed them very hard, opened them once more, and stared right forward. But he had not rubbed out the phantom which haunted him, and which he at

chanced to be within sight, it being supposed that it was their intention, as it was their business, to lend a hand. The privateers, on the contrary, whose business was their own interest, received prize-money only when they had been actually engaged in the *mélée*.

first supposed to be the fragment of a dream; and when he recognised Captain Beggar in lith and limb sitting quietly on a beam before him, he sprang up with a shout, and catching an axe from one of his men, rushed upon his enemy.

But the ten English sailors were up as promptly in defence of their captain; every right hand on board was in the air; and every bunch of fingers grasped a cutlass. The two leaders, however, accustomed to think in the midst of peril, soon came to their bearings.

'Good morning, Captain Grenouille,' said he of the departed Hunger. Captain Grenouille growled.

'Have you any biscuit?' persisted the English privateer.

'We have nothing,' replied Captain Grenouille.

'We could offer you as much ourselves,' said Captain Beggar; 'but since we cannot eat, let us go to council. We are now between Guernsey and Cherbourg—that is, between England and France; but nearer the former. It is clear to me, therefore, that we must steer for Guernsey.'

'It is clear to you that I must still be a prisoner in England! To the east, say I—for France!'

'Where I shall be your prisoner. Is it not so?'

'Exactly.'

'But I have two men more than you, and that turns the scale.'

'We shall see,' and the Frenchmen ranged themselves in the bows, while the English, under their captain, kept the stern. Appearances threatened a bloody struggle; but at that moment a large ship was seen emerging from the haze, and presently the report of a heavy gun boomed along the water.

'She is French!' cried Grenouille; 'you will dance, captain!'

'She is English,' replied Beggar; 'you will return to Plymouth, captain!' But she was neither one nor other, for the next moment the Dutch flag rolled out upon the breeze.

'Are we your prisoners, or you ours?' shouted the two privateers to the Dutchman with their customary audacity.

'Neither,' replied he: 'Napoleon has ceased to reign, and all the world is at peace.'

'Give us your hand!' said Captain Beggar.

'There it is,' replied Captain Grenouille. 'I wish that Dutchman had not been in such a confounded hurry with his news, that I might have taught you to dance, brother: but since we are at peace, why, we are—there is no help for it!'

Who would promote a state of things which could resuscitate the Grenouille and Beggar school of miscreants?

THE RUNAWAY SLAVE.

[We copy the following simple sketch, on an exciting subject, from a very small work—'Sparks from the Anvil,' by Elihu Burritt.]

To one born and bred in New England, the sentiment must be inevitable, that it is a 'free country.' The language of every-day life teems with that capital idea. It is the first idea that infancy is taught, and the last one forgotten by old age. Freedom, Liberty, Free Institutions, Free Soil, &c. are terms of costly water in the jewellery of our patriotism.

How pleasant it is to think—be it true or false—that cold, hard-soiled, pure-skyed New England is indeed a free land! that in her long struggle for freedom, she expunged from her soil every crimson spot, every lineament of human slavery, and severed every ligament that connected her with that inhuman institution! And so we thought. We got out of our cradle with that idea. It was in our heart when we looked up at the blue sky, and listened to the little merry birds that were swimming in its bosom. It was in our heart like thoughts of music, when the spring winds came, and spring voices twittered in the tree tops; when the swallow, and the lark, and all

the summer birds sang for joy, and the meadow stream chimed in its silvery treble, deftly singing to the daisies. When everything was alive with the rapture of freedom, we thought, among other bright and boyish vagaries, that this land was free—free as the air; otherwise we would never have slid down-hill on it, or rolled up a snow fort, or have done anything of the kind by way of sport. And we were told that it was free. Old men who wore queues, and hobbled about on crutches, came and sat by our father's fireside, and showed great scars on their flesh, and told how much it had cost to make the land free. And on a hot summer day of every year, the people stuck up a long pole in the middle of the village green; and they tied to the top a large piece of striped cloth; and they rung the bell in the steeple; and they shot off a hollow log of cast-iron; and the hills and woods trembled at the noise, and father said, and everybody said, it was because this land was free. It was our boyhood's thought, and of all our young fancies, we loved it best; for there was an element of religion in it. We have clung fondly to the patriotic illusion, and should have hugged it to our bosom through life, but for an incident that suddenly broke up the dream.

While meditating one Sabbath evening, a few weeks ago, upon the blessings of this free, gospel land, and on the liberty wherewith God here sets his children free, a neighbour opened the door, and whispered cautiously in our ear that a young sable fugitive from slavery had knocked at his door, and he had given him a place by his fire. 'A slave in New England!' exclaimed we, as we took down our hat; 'is it possible that slaves can breathe here, and not be free!'

There were many of us that gathered around that young man, and few of us all had ever seen a slave. There were mothers in the group that had sons of the same age as that of the boy, and tears came into their eyes when he spoke of his widowed slave mother; and there were young sisters, with Sunday school-books in their hands, that surrounded him, and looked in his face with strange and tearful earnestness, as he spoke of the sister he had left in bondage. He had been 'hunted like a partridge upon the mountains,' and his voice trembled as he spoke. His pursuers had tracked him from one place to another—they were even now hard at his heels; his feet were bruised and swollen from the chase; he was faint and weary, and he looked around upon us imploringly for protection. Starting at every sound from without, he told, with a tremulous voice, the story of his captivity and recapture; for thrice had he fled from slavery, and twice had he been delivered up to his pursuers. He was chequered over with the marks of the scourge; for his master had prescribed a hundred lashes to cure him of his passion for freedom. A worse fate awaited him if he failed in his third attempt to be free; and he walked to the window, and softly asked the nearest way to Canada. 'Canada and Heaven,' he said, 'were the only two places that the slave sighed for,' and he tied up his clouted shoes to go. He laid his hand on the latch, and his eyes asked if he might go. We knew what was in his heart, and he what was in our own, when the children came near and asked their parents why the negro boy might not live in Massachusetts, and why he should go so far to find a home. And we looked in each other's faces, and said not a word, for our hearts were troubled at their questions.

Some one asked for 'the bond,' and it was read; and there, among great swelling words about liberty, we found it written that there was not an acre nor an inch of ground within the limits of the great American republic which was not *mortgaged to slavery*. And when the reader came to that passage in the bond, his voice fell, lest the children should hear it, and ask more questions. He passed the instrument around, and we saw it written—'too fairly writ'—that there was not a foot of soil in New England—not a spot consecrated to learning, liberty, or religion—not a square inch on Bunker Hill, or any other hill, nor cleft, or crag, or cavern in her mountain sides, nor nook in her dells, or lair in her forests, nor a hearth, nor a cabin door, which did not bear the bloody endorsement in favour of slavery. 'It was in the bond'—the bond of our Union, 'ordained to establish justice, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity'—it was in that anomalous instrument, that the slave-hunter and his hounds might seize upon his trembling victim on the holiest spot of this land of the free.

It was a bright night. The heavens were full of eyes

looking down upon the earth; and we wished that they were closed for an hour; that the clouds would come over the moon; for the man-hunters had come. They had tracked the young fugitive, and were lying in wait to seize him even on the hearth of a freeman. We never shall forget that hour. We had attired the young slave in a female garb, and put his hand within the arm of one of our number. A passing cloud obscured the moon, and the two issued into the street. Softly and silently we followed them at a distance, and our hearts were heavy within us that Massachusetts had no law that could extend protection to that young human being, or permit him to be protected without law. It was a strange feeling to walk the streets of Worcester as if treading on enemies' ground; to avoid the houses and faces of our neighbours and friends, as if they were all slaveholders, and in pursuit of the fugitive; as if here, in the heart of the Old Bay State, there was something felonious in that deed of mercy that would obliterate the track of the innocent image of God flying for life and liberty before his relentless pursuer. We passed close by the old burial-ground, where slumbered many a hero of '76. There, within a stone's throw, was the grave of Captain Peter Slater, one of the 'Indians' who threw the taxed tea into Boston harbour. It was a moment of humiliation and indignant grief, when, passing by his monument, we compared the taxes on tea and sugar of his day with that despotic land-tax, that slave-breeding incumbrance, that Shylock mortgage, which the founders of our constitution imposed upon every square inch of New England, in the terms of 'the bond.'

We have now neither time nor space to tell the story of that young fugitive. We wish he might tell it himself upon every hearthstone in New England. We wish no human heart a needless unpleasant emotion; but we would that every child in this 'land of the free' might see a slave—a being that owns a God, yet owned, and bound, and beat, and sold by man. We would have the rising generation well instructed in the terms of 'the bond,' and a few personal illustrations of the condition which it 'secures' might be of service in defining their path of duty. They will soon enter upon this goodly heritage; and shall we give it over into their hands incumbered with this iniquitous entailment in favour of slavery? No! If there be wealth enough in all New England's jewels—in the cabinet of her great deeds of virtue and patriotism—let us lift this bloody mortgage from one square acre of her soil, whereon the hunted slave may say, 'I thank my God that I too am at last a man!' When, trembling and panting, he struck his foot on that consecrated spot, then the chase should cease, though his master and his dogs were at his heels. That English acre in New England should be another Canada for the fugitive bondman. He should carry a handful of its soil in his bosom as a certificate, honoured throughout the world, that he was free!

WARRINGTON INDUSTRIAL SCHOOLS FOR YOUNG WOMEN.

[The following communication, from a gentleman residing in Warrington, seems to us so interesting in itself, and so suggestive of good doings elsewhere, that we gladly give it insertion.]

LAST Whitsuntide, when the stoppage of the factories became general, some ladies who had carried on a free night school through the winter, and were practically acquainted with the wants of the young women, determined on adopting some plan to keep them from the terrible evils of idleness, and at the same time increase their future powers of usefulness. The result was the establishment of an Industrial School, in which the pupils should be taught to sew, and should be enabled to earn something towards their maintenance. Subscriptions were received to the amount of £120; a large flustian cutting-room, unoccupied through the slackness of trade, was engaged, and forms borrowed from various Sunday schools. One tradesman lent a clock, another a chest of drawers; and in this way the fittings were completed at a trifling expense. Scampatresses, themselves out of employment, were engaged as teachers, the ladies attending constantly as visitors. The school has now been open for sixteen weeks, during which two hundred and sixty-nine scholars have been admitted. About half of this number only attended two days a-week, as they belonged to a factory which was in partial operation. Strange as it may appear, a large proportion of these were quite unable to sew; and only ten had

ever made a shirt previously to entering the school. They have, however, made such improvement in this short space of time, that now about one half can fix their work and sew well; and of the rest, a large proportion can sew neatly. They are instructed in cutting out the clothing, and many can make their own dresses. Rewards have been distributed weekly, according to the industry, improvement, and good behaviour of the pupils. The highest amount has been 1s. 6d., the lowest 6d., to each. One half has been given in money when desired; the other in clothing made in the school. Small as these rewards appear, they have been to a large number (independently of the aids afforded by private benevolence) the only means of support. During a few weeks, when bread was at the highest, and potatoes were not ripe, a lady furnished dinners of stewed barley to the most destitute. Instances were frequently discovered of girls having spent the whole day without food. The state of poverty to which the mass of the factory operatives was reduced, was strikingly shown by the following fact:—A visitor offered each of the scholars permission to purchase a dozen pounds of the best flour at twopenny per dozen below the usual price. The offer was received with universal joy, and the following Monday was appointed for distributing tickets. However, only fourteen dozen were applied for. Several large families could afford to purchase only three pounds. In about seventy cases out of a hundred and twenty in the school at the time, not a single member of the family was working; and of the remainder, the earnings of an apprentice lad of fourteen or sixteen were often the sole support of large families. The gratitude of the parents for the pains taken with their daughters has been very encouraging. One woman said, 'This is the grandest thing that was ever invented. I was quite stagnated when Ellen brought me home ninenepe and a pinafore.' Another remarked that she had never before been able to get her daughter to mend her clothes.

The order, regularity, and cleanliness of the scholars has been very satisfactory. Not a single instance has occurred of a scholar being dismissed for ill behaviour. On several occasions, the pupils have cheerfully contributed time, and even money, to assist those who were more than ordinarily suffering, and to purchase Bibles as presents for their teachers. The monotony of the sewing has been relieved by the practice of music, as well as by reading aloud interesting and instructive books. During the late severe fever epidemic, much sickness has been prevented by attention to first symptoms, and strict enforcement of cleanliness. It is believed that the life of one scholar was saved by the devoted attention of a young woman (also a scholar), who nursed her friend night and day during the whole progress of malignant fever. This nurse was in the lowest class; could not read at all, nor sew, previously to entering the school. A visitor lent her a small sum of money to get some clothes out of pawn. She made no stipulation as to the time when it should be returned. But no sooner did the young woman obtain a little work, than the first money she earned was brought to the lady to repay the debt.

The school has been visited by many of the principal inhabitants of the town, as well as strangers from a distance; and all have expressed themselves as much gratified with the working of the institution. The Rev. W. Wight, B. A., who had been lecturing in the town on the 'model parish,' addressed them the next evening on the subject of total abstinence, on which occasion about sixty of them took the pledge.

What has been done shows the power of strong determination in overcoming difficulties, and of kindly interest in gaining the affections, and thus influencing for good one of the most neglected classes of our social community. We regret to say that the school is now suspended for want of funds; and this, too, at a time when the few mills which are now working have announced their intention of stopping. If any of your readers feel disposed to assist in the effort which is being made for the continuing of the school through the winter, their donations will be thankfully received by Mrs B. Pierpoint, treasurer, Friar's Green, Warrington.

HOPE OF A FUTURE.

I find in life that suffering succeeds to suffering, and disappointment to disappointment, as wave to wave. To endure, is the only philosophy—to believe that we shall live again in a brighter planet, is the only hope that our reason should accept from our desires.—*Baker.*

A CHILD'S QUESTION.

The discussion of the Oregon question had assumed its most serious aspect, when a British ship, the 'Earl of Eglington,' was driven ashore on the island of Nantucket, and six of her crew perished in the waves, in presence of hundreds of the islanders, notwithstanding the most desperate exertions to save them. Some of the leading merchants of the town were foremost in the efforts to rescue the drowning men from the terrible surge. They vied with the hardy whalers in venturing into the surf, each with a rope fastened round his body, by which he was to be drawn ashore the moment he had got hold of one of the shipwrecked mariners. Several of the English sailors were thus drawn almost senseless upon the beach, where they were caught up in the arms of strong men, and conveyed into the town. Every door was opened, and every fireside ready for their reception; and warm clothes, and warm sympathies, and every comfort that kindness could dictate, were in profuse requisition to make them at home. The details of the disaster were rehearsed, and all the hair-breadth escapes of those on ship and shore. An eminent merchant, who had perilled his life in the surf in plucking from its fierce eddy a struggling sailor, was relating his adventure at his fireside, with his little daughter on his knee, when the little thing, looking into the father's face, with its earnest eyes full of tears, asked, in all the simplicity of a child's heart, 'Why did the people work so hard to save the British sailors, if they want to go to war and kill them?' It was a word fitly spoken; and it passed around from house to house, and from heart to heart, and many were made thoughtful by the child's question.—*Eliza Burritt.*

ENGLISH AND AMERICAN SHIPS.

The following appears in a late number of the New York Journal of Commerce:—"It is a strange fact, that while we have many English ships in port, American vessels obtain 6d. and 9d. per barrel-bulk more freight than they do. An English merchant offered the other day, on 'Change, 3s. 6d. per barrel-bulk to an American owner, who could not take the flour; and an English captain standing by offered to take it at 3s., and then at 2s. 9d.; but the merchant would not accept his offer. There was no particular objection to this English captain or his vessel, but the general unpopularity of them all. The English people at home ought to know how it is that Americans are getting such great advantages over them, that they may remedy the evil if they please. The complaints we hear made first are against their ships, and second against the captains and crews. The ships, it is said, are not so well put together, nor of so good timber. But the chief difficulty is the bad repute which, either truly or falsely, has fallen upon the captains and crews during the two or three months in which so many English ships have been here. The report is spread that English captains and their crews are intemperate; for this reason there is no certainty that a ship will go to sea after she is loaded, or that the captain, mates, or crew can be found in a condition to do business. It is said that, after the news of O'Connell's death, a good many British captains were drunk for two or three days, by way of a wake for O'Connell. These are the stories, and the English ships will do little here until the matter is cleared up. The American captains and mates are now universally sober business men. They are now to be relied upon, and so much superior to the reputation which the English have acquired, that merchants and underwriters make a difference which must drive the English from the ocean, unless they get a better character. We hope they will do so. There will be business enough to occupy all the ships which can be found at leisure. We should be glad to convince all the nations, that unless they join the temperance cause, they cannot maintain themselves in the world with the cold-water men. A man who is liable to be unmanned, to make himself a fool, is not fit to be trusted; and he will not be, if temperate men can be procured at any price. A large proportion of the American merchant vessels are now under the control of "total abstinence." If there be any such English ships, it would give me much pleasure to publish their names, and so get them better freights." Can all this be true?

INGRATITUDE.

An ungrateful man is detested by all; every one feels hurt by his conduct, because it operates to throw a damp upon generosity, and he is regarded as the common injurer of all those who stand in need of assistance.—*Cicero.*

TO THE SUN.

[A translation in prose of a poem by Silvio Pellico, composed in the dungeons of Spielberg, and which has appeared in an edition of his work published at Leipzig.]

Who will give back the love of song to the prisoner? Thou alone, oh, Sun, divine treasury of light!

Oh how dost thou, beyond the darkness of this my tomb, intercate with thine enchanting ravishment all nature with thy love!

If from these floods, the torrents of genial light in which thee dost bathe the worlds, and which by thee do vivify the worlds—

If from these, but one little drop cheer my prison, that also wake up into life, and is no longer a tomb!

But, alas! why dost thou so rarely pour forth of thy gifts upon these fatal shores?

Why comest thou not more often in thy brightness to the gloomy dungeons where groan Italian hearts?

Less accustomed to the glory of thy radiance, the Sons of the North love thee not so ardently, so deeply!

But we, nursed from the cradle in the love of thee, we must seek thee, see thee, or die!

Oh never may so dense a gloom veil thee in the far distant skies of my own sweet country!

Beam forth to the eyes of the poor captive's father, beam forth to the eyes of his mother, and let thy cheering ray charm away their grief!

Yet what matters it in what dark vault I be left to cast off this wretched mortal coil, since God has given me a soul that might here below can fetter!

TEA AND COFFEE.

There are probably few things for which we ought, as regards the means of health, to be more grateful to Providence than for the introduction of tea and coffee. As civilisation advances, the man of wealth and rank uses personal exercise less, whether in walking or on horseback, and prefers the luxurious carriage as a means of transporting himself from place to place: keeping pace with the progress of civilisation, is the number of the thinking and the studious increased, a class of men which is proverbially, and with few exceptions, sedentary: tantamount to the increased number and importance of our commercial relations, is a larger number of men drawn from the fields, and the health-fraught toils of agriculture, into the pent-up and close atmosphere of a town, and have their time occupied in sedentary, or almost sedentary, employment; and in these ways there has arisen a daily increasing number, of all classes, who, taking less exercise, could bear less food, could assimilate, consistently with health, a less amount of nutriment; who could not eat with impunity the meat and beer breakfasts, the heavy and substantial food, to which their fathers had been accustomed; and, as if to meet this, tea and coffee have been introduced, and supply the desideratum: a diet which is palatable, only moderately nutritious, and, if not abused, quite harmless. It has been the fashion of late years for the professors of certain new guises, in which quackery has presented itself—arrayed in one case in the assumed garb of facts and experience; in the other, in that of mystical and fanciful reasonings—to contend against the harmlessness of these great beverages of daily use; and to advise their discontinuance, unless in occasional, and probably infinitesimal doses, and for directly medicinal purposes. The experience, the comfort, the temperance, and the well-being of civilised man, are all happily adverse to such a view as this; and, like most of the other errors of these quacks and visionaries, it hardly influences the many, and cannot long continue to influence even the few.—*Robertson on Diet and Regimen.*

MEANS OF PREVENTING ACIDITY IN BREAD.

Bread made in warm weather is frequently sour, and is thus not only disagreeable, but unwholesome. We are assured by a correspondent that a little carbonate of magnesia, in the proportion of three grains to a pound of flour, entirely obviates the risk of this accident.

AN ANCIENT CITY—ITS IMPROVEMENTS AND IMPROVER.

'Another Day at St Andrews, papa; and this time, take us with you, for we long to see what that singular man Major Playfair has been doing since you visited the town three years ago.* So spoke a young voice representing more persons than one; and being in a mild mood at the moment, I was foolish enough to give an assenting answer. Once in for a promised treat to these youngsters, I always find it the best policy to come to performance as quickly as possible, there being no such thing as rest to be expected in the interval; so the second evening thereafter saw us on our way through Fife by a coach which might be regarded as in interesting and almost affecting circumstances, seeing that on Saturday night it was to be numbered among the things of the past, the railway being announced to open at the beginning of the ensuing week. We felt the tedium of the conveyance, and yet could not, without a sigh, think of even the *last* of a stage-coach. It was evening when we drove into the broad venerable streets of the ancient city. We therefore had no expectation of seeing any of the characteristic features of the place till the dawning of another day. We had, however, scarcely settled ourselves at a late tea, when one of the young people peeping through the window-blind of our parlour, announced the rise of a full-moon of portentous magnitude, and it instantly occurred to us that, the night air being cool and pleasant, we might have a walk before retiring.

Threading some narrow streets and lanes, we soon reached the fine terrace called the Scores, lying between the town and the sea, which here dashes at the bottom of a sandstone cliff of nearly sixty feet in height. I had formerly enjoyed this promenade by daylight, charmed with the view which it afforded of a vast sweep of the scenery of Perth and Forfarshires—for which it seemed only inferior to the Calton Hill of Edinburgh; but I was not prepared for the fine effect of the moonlight in such a situation. While the effulgent luminary rode unbridled through the cloudless vault, the town lay in huge dark masses to the south, tipped only with the aerial silver. In full light, and therefore in strong contrast, rose on the other hand the ruins of the ancient castle, casting a giant shadow backward across the glittering sea. This passed, we speedily came to the ruins of the cathedral and ancient Culdee church, an assemblage of objects at all times fine, but now a perfect romance of beauty. Taking our station on a hillock overhanging the sea, we could see the large churchyard and its monuments fully below our feet, the light being sufficient to enable us to parti-

cularise every stone; while from the midst of them all sprang up the isolated gable of the cathedral and St Regulus' square tower, like irregular twin columns, the moon shining through between them. A side wall of the cathedral, with a row of entire Gothic windows, through which the moonshine poured, had also a fine effect. Glancing from this to the sea, which laboured not more than fifty horizontal feet from the base of the ruins, one could not but attest that a poetry had mingled with the piety of the ancient religious men who chose this situation for a temple. Worthy was it to be the last adopted resting-place of the bones of one who had followed the Nazarene—for in this moonlight the legend of St Andrew was not to be disbelieved, and it seemed nothing improbable that the whole of the European nations had taken their form and boundaries long after this dark-gray tower was reared! The story, after all, has some plausibility even in a sober daylight consideration, for it is now discovered that the very peculiar architecture of the old church and its tower is *Byzantine*, and a Scottish antiquary lately visiting Patras, whence it is said came the colony of monks who founded it (bringing with them the relics of St Andrew), found still rife there the very names of the men enumerated in the ancient legend. Henceforth let us not disbelieve a thing merely because it has been related by the indwellers of a monastery.

We prolonged our ramble to the little rough antique harbour, and along under the grand old wall built by Prior Hepburn to enclose the concerns of this princely religious establishment. Every step of our progress brought out into the moonlight some bit of hoary masonry, rough perhaps with sculpture, or honey-combed by the sea-breezes. Much was coarse, but we felt that nothing was commonplace, scarcely even the matters of present domestic existence which would everywhere intrude. We returned to our inn with a strong sense of the peculiar character of the place, and of the charm which it possesses for impressionable minds.

With the next day awoke an interest in those modern improvements for which the town is now almost as much celebrated as it formerly was for its relics of antiquity. I was eager to renew my acquaintance with that extraordinary Major Playfair who, at the close of 1843, had introduced me to the many remarkable operations which he was then carrying on for the *decoration* of his native city. He was fortunately at home, and with his characteristic promptitude, entered my parlour almost as soon as the waiter who had carried my message. The same hardy strong-set figure, vigorous florid face, and firm hearty voice and blunt manner as before—the same resolute grasp of the hand—the same readiness to do the honours of his domain. 'And so, major, you are still provost, notwithstanding all the

* See No. 3, new series.

good you have done. One would have expected to find your fellow-townsmen tired before this time of hearing your praises.' 'Why, as to that, many of them are heartily sick of my services, and anxious for my promotion. Meanwhile, here am I, still "my lord," and at your service.' 'Well, I wish to see your works now they are comparatively complete: can you be my conductor?' 'With all my heart—come along.' In two minutes we were in the street.

The South Street of St Andrews was formerly a handsome and even imposing one, broad, composed of tall and goodly houses, and slightly bending, like the High Street of Oxford, so as to insure a constant change of scenery as one moved along. It was now, however, very much improved from its former self; for, while all those good features remained, a rough causeway, filling it from side to side, had been replaced by an arrangement in which a central line was laid down after the rule of Mr Macadam, with margins of causeway, while near the houses ran lines of flagstones, forming a double promenade of the most elegant description. This pavement is the major's great work. It was a thing long wanted for the comfort of the inhabitants; but unless a new pavement for St Andrews could have been formed, like that of a certain inferior region of good intentions, there was no chance of its being executed under any former management, seeing that the corporation had no funds to bestow in such a manner. Provost Playfair commenced a subscription amongst the inhabitants, made application to natives and well-wishers of the ancient city, however distant; and by the vigour of his procedure, soon raised the necessary funds. It was no small task; but no one will at all comprehend the case unless he acquires the idea that the major is a man of genius, of great insight into human character, of wonderful command of argument, and untiring perseverance in working out his ends. He wiled, screwed, pinched, *curried* the money out of men. Very few possessing any means at all could wholly resist him. When enabled to commence operations, he was sleeplessly diligent in engineering and superintending, and thus caused every penny of the money to do the utmost possible work. The lines of foot pavement could not be placed close to the houses, as these were not all in a straight line; it was necessary to lay them at a little distance, and certain irregular gaps were therefore left to be filled with causewaying as of old. This created an unexpected demurrage; but the eloquence of the major overcame all difficulties, and in the long-run, most of the proprietors of houses filled these spaces with additional pavement at their own expense. The consequence is, that in some places the entire pavement is of princely width; and while individual hardships are forgotten, the community is universally pleased. The indefatigable provost at the same time performed some wonderful exploits, in whisking away certain unseemly projections upon the line of way, using, I believe, all kinds of means for the purpose, even to the expenditure of not a little of his own money. In some instances he had these operations effected at an early hour in the morning, so that men wakened, like Aladdin's father-in-law, to see buildings wanting which existed when they went to sleep. A feeling of insecurity took possession of some persons who knew that they stood in the way; and it is told that, in one house which had an elbow pushed into a lane too narrow otherwise, the family kept watch and ward for a night or two while matters were at their highest crisis, lest this modern magician should have all smack smooth before morning. Many, however, caught a happy contagion from his spirit, and commenced volunteer reforms on their property, to the no small help of the general effect.

As we rambled into other streets, I found that similar changes had taken place in nearly every quarter, so that walking in them, from being a penance, had become a pleasure. The means had been procured in various ways—by subscription, by sales of ladies' work, by an

exhibition of pictures collected from the salons of the neighbouring gentry, everything, I believe, short of downright larceny. At the same time, a thousand small matters of convenience had been attended to, and a system of careful and thorough cleaning rigidly enforced. Amongst the greatest of the doings of the major, was the perforation of a dense mass of town with a neat street, serving as a needful communication between one district and another, and which the inhabitants insist upon calling Playfair Terrace. Had not the worthy provost bought up the property for this purpose at his own hazard, it certainly could not have been effected. Neatness and propriety were everywhere predominant, excepting only in the fishermen's quarter, and even there, some changes for the better were apparent. The major, however, had not confined his exertions to his own department. Prompted by his spirit, a well-known millionaire had projected a wholly new *quarter* of the city, to accommodate the many persons in easy circumstances who now flock to St Andrews, for the sake of its numberless pleasant qualities and circumstances. At the instigation of the major, the Commissioners of Woods and Forests had laid out the sepulchral precincts of the ruined cathedral in such a manner as to render them an agreeable—at least a solemnly agreeable—promenade, and they were now much resorted to accordingly. He had also taken up the long-neglected case of the college of St Salvator, and succeeded in urging the government to complete its renovation. This work was now advancing. The rude old hall, which had long been unfit for use, was pulled down, as were several clumps of equally dismal masonry, reared in ages when taste was not, and even comfort hardly had a recognised place in men's affections. In their stead there had been reared a beautiful structure, in the form of a half quadrangle, including not only good classrooms for the professors, but a large hall of meeting, a private business-room, and a spacious apartment to serve as a museum. An arcade, serving to complete the external decorations of the beautiful old chapel, and a terraced garden, were also in progress. The ancient mother of the Scotch universities must soon, therefore, assume a form worthy of her—a union of ancient and modern edifices truly elegant and graceful. All this is mainly the result of the major's diligence and force of character, for it does not appear that any other influence connected with the university could have induced the government to grant the means. The money has been most economically as well as judiciously expended; and the expenditure seems fully justified by the prospects of the institution, which, from various causes, are decidedly brightening.

In the course of our ramble, the young people had seen the chief curiosities usually shown to strangers in St Andrews. I therefore felt myself at liberty to conclude with a visit to the major's own residence, which I had heard was amongst the things not the least worthy of attention in the ancient city. I must take some pains to describe it, for it conveys, in my opinion, a most agreeable idea of the domestic establishment of a man living in independent circumstances, and mingling the enjoyments proper to the evening of a well-spent life with the volunteer labours of a public-spirited citizen. Imagine, in a situation retired from the principal street, a long irregular building, partly old, and partly new, having a tall antique structure placed at the opposite side of a courtyard, the whole being the relics of a suppressed college (St Leonards), but altered to suit the requirements of a private family. Behind the house, towards the south, is a large productive garden, lying beautifully to the sun, and surrounded by ancient turreted walls. Here the patriotic major and his amiable lady spend their cheerful and hospitable life, surrounded by a blooming troop of children of nearly all ages. The owner's character is everywhere to be traced. In the courtyard, a servant was taking the portrait of a visitor by the kalotype process, of which Major Playfair was an early and successful cultivator. In the lobby, we

found some optical instruments, which are occasionally called into use in amusing company. The parlour we found half hung round with kalotype portraits, a perfect gallery of the family's circle of acquaintance, many of whom now live at the distance of half the globe. Amongst these sun-pictures are many presenting groups of ladies, gentlemen, and children, seated in arbours, or under garden trees, or in parlours. These are generally combinations of some portion of the family, with their relations and friends, taken at times when the latter were living at St Leonards, or had casually called. The pictures, therefore, serve as memorials of those meetings and associations which often survive so long in memory's waste, but which could by no other available means be recalled in their actual features. Ages hence, if preserved so long, these little frames will depict domestic groups of our era, 'in bodily habit as they lived,' not a peculiarity of costume wanting or changed. In the same apartment is a series of Indian landscapes, done by various officers in the major's regiment in Bengal, and presented to him in gratitude for the care he had taken of them, and the instructions he had given to them, when they were young in the service. In his own room, the active character of the man is strongly traced in the numberless philosophical instruments, maps, plans, books, bundles of papers, knick-nackeries of all kinds, which are seen around. One can see it is the retreat of a man who is never one moment idle. It is also visibly the temple of the *practical*, even while something of whim and drollery mingles with most things the major has to do with.

A door from the dining-room admitted us directly into the garden, which all of us declared with one voice to be the *bonne bouche*, for nowhere else are the characteristics last hinted at more strongly displayed. Having been formed at a time when the family were young, it was fitted up, as I may say, with an especial regard to their amusement, at the same time that instruction was not overlooked. At the head of the principal alley, a figure of the sun is placed: along the alley, perched on sticks, are figures of the various planets and their satellites, in such sizes, and at such intervals, as to express their relations to the sun and to each other, while the chief elements of each are stated on a tablet below. In the same line are inserted small tablets, expressing, by the distance from the head of the walk to the several points indicated, the length of the principal large vessels of modern times—the Britannia royal ship of 130 guns, the Great Western and Great Britain steamers. Here, however, the most remarkable thing is a light paling which extends along one side of the walk, bearing a continuous slip of wood, on which is painted the chronology of the world in the ratio of an inch to every year. It is wholly the work of the major's own hands, and cost him four months to execute. As you pass along, you first catch a few sparse notices, as, 'At this time men began to call on the name of the Lord'—'Methuselah born'—'Adam dies'; and so forth. Half way down the walk, you find King David reigning, and the Greeks sacking Troy. Then come the glories of Rome—the darkness of the middle ages—the Crusades; and the rise of the modern nations. At the close, under 1830 and 1831, we have, 'Reform Bill introduced'—'Riots and disorder very general'—and finally, in a somewhat larger size of lettering, a sentence which no doubt sounded at the time like a knell—'Britain having attained a position of power, glory, and respectability never enjoyed by any other nation, it required a mighty effort to subvert her stability. This was effected on 7th June 1832, from which we may observe the decline of the British empire!' I trust that the ingenious chronologist will by and by add a postscript detailing the dismal events which have occurred during the ensuing period of national decay and degradation. Turning to another part of the garden, we find the ancient mill-course of the priory passing through it—a provocation to device and contrivance which such a man as Major Playfair could not have resisted. Accord-

ingly, as the water rushes along, it is made to perform a great number of ingenious feats for the amusement of the family and the public. First, however, you see a Chinese bridge across it, with a number of tiny animals and human beings thronging over in different directions. Then come water-works, including jets, straight and spiral, dancing balls, a Barker's mill, the hydraulic ram, Archimedes' screw, wind-gauge, rain-gauge, &c. &c.—these being connected with a tall pagoda-like structure, in which a Chinese emperor swings about in obedience to every passing breeze, and a revolving wheel, fitted up with obliquely-arranged mirrors, casts reflections on every surrounding object. Then there are rockeries in all forms and dressings. Finally comes a pavilion, containing a little puppet theatre and an organ, all of which may be put in motion by a water-wheel, which can be sunk into the mill-course, while, to appearance, the mechanism is driven by a man toiling at a windlass. The grotesque waltzing party here presented elicited shouts from my young people, and sent us all away in the highest good-humour. Altogether, the mixture of cleverness, humour, and rationality which we had seen at St Leonards, made a strong impression on me, and I could not help applauding a life in which the gifts of fortune and the high privilege of leisure are to all appearance so felicitously used.

I returned from St Andrews more than ever convinced of the immense power for good which exists in every individual of mankind. Here is one not inconsiderable bit of our common country—a town of above five thousand inhabitants—which has been in five years, as it were, transmuted into something better, through the almost sole efforts of one private citizen. May not similar phenomena be effected elsewhere? When I ask the question, I feel how unjust it is to such doings as those of Major Playfair to regard them in their material aspect, or to designate them as local. Physical in the first place, they are in the long-run moral, in as far as elegance and cleanliness are refining and ennobling influences. Through the principle of example, they are operations not merely upon one little spot of ground, but which may be expected to exercise an influence on surrounding districts, so as finally to affect the whole country. But if they did nothing else than show what one man may do by a well-directed mind for the benefit of his fellow-creatures, they would fulfil a high object, and be entitled to the public gratitude.

FACTS RESPECTING THE SLAVE-TRADE.

A SHORT time ago we presented, from a London newspaper, an abstract of a late report to parliament on the present position of the slave-trade, which it was shown was apparently as far from extinction as ever. A communication still more lately made by a committee of the British and Foreign Anti-Slavery Society to the First Lord of the Treasury, offers such remarkable and instructive evidence on the insufficiency of all past efforts to put down the trade in negro slaves, that we take the liberty of returning to the subject, with a view to popular information. The communication in question, as we perceive from the 'Daily News,' opens with an announcement of the conviction, 'that so long as slavery exists, there is no reasonable prospect of the annihilation of the slave-trade, or of extinguishing the sale and barter of human beings'; further, that the employment of armed force must ever prove inadequate, and that 'the extinction of slavery and the slave-trade will be attained most effectually by employing means of a moral, religious, and pacific character.' The communication proceeds to notice the extent of the slave-trade, and the melancholy results of all past efforts at its suppression, concluding with the expression of an opinion which it is impossible any longer to resist.

'With respect to the extent of the slave-trade, it appears that from the year 1816 to 1843, both inclusive, the number of African negroes landed for the purposes of slavery on

the islands and on the continent of America, so far as the same could be made up from the official reports, was 657,187; of these 18,042 were captured, and brought to or driven on shore on the islands or coasts of America, and there liberated. But it is clear, from the documents on which this statement is founded, that a much larger number of slaves was landed than is here given. The number of vessels reported to have landed their slaves during the period stated was 2313, of which the number of slaves on board 545 could not be ascertained. These slaves probably carried about 208,000 slaves, which, added to 657,000, will give a total of 865,000 victims for the twenty-seven years. Yet this estimate, fearful as it is in the aggregate, does not approach the actual number of wretched Africans who were torn from their homes, and securely landed in the transatlantic slave-markets. It is highly probable that treble the number would scarcely approach the truth. At the present time, it is believed, on good authority, that the number of Africans annually imported into the Spanish colonies and Brazil amounts to from 80,000 to 100,000.

'The great secrecy with which the slave-trade is now carried on, and the facilities which the extensive coasts of Cuba and Brazil offer for the landing of slaves, together with the connivance and venality of the authorities, render it impossible to obtain a correct estimate of the negroes imported, or the places at which they are landed. This is admitted by her majesty's consular agents and commissioners residing in those countries. But all agree that the number is immense.

'The latest official reports indicate an increased activity in the slave-trade. The commissioners at Sierra Leone, in their report for 1844, say that, notwithstanding the augmentation of the cruisers, the addition of steam-vessels, and the increased vigilance of the squadron, "We believe that the slave-trade is increasing, and that it is conducted perhaps more systematically than it ever has been hitherto;" and they add, "Nearly all the former noted slave-haunts appear to be still frequented, and in spite of the stringent measures adopted by the British commodore with the powerful force under his command, there can be no question but that there has been a very large number of slaves transported both to Cuba and Brazil." Her majesty's commissary judge at the Havana, in his report for the same year, gives it as his opinion that 10,000 Africans had been brought into slavery during that period, and adds, "that the fears expressed in the report of the 1st of January 1844, respecting an active continuance of the trade, have been confirmed." This gentleman further states, that if the average of the importations of slaves does not equal at the present time the number annually introduced previously to the administration of General Valdez, "the cause must be ascribed to the smaller demand for slaves, rather than to the diminished activity of the dealers, or prohibitory measures of the government;" and he gives it as his opinion, that "if it suited their interests to send vessels," whether from Havana or other parts of Cuba, he "doubts whether they would be deterred by the fear of the blockading squadron." Her majesty's commissioners at Rio de Janeiro, in their report, remark that "the importation of African slaves during the year 1844 has not diminished;" that the slave-dealers have "managed to obtain the cover of different flags, under which they place in Africa, without risk, the indispensable means of pursuing their nefarious trade;" that enjoying "the certain protection of their own government on the shores and in the territorial waters of the empire, they cannot but augment their infamous transactions, stimulated by the profits they leave, and regardless of the horrors they occasion." These profits must be immense; for we are told, on the same authority, "that the capture of four vessels would not subject them to loss, provided the fifth was successful in landing the slaves in Brazil." Among the instances given of the successful prosecution of this detestable traffic, is that of Manoel Pinto da Fonseca, who, the commissioners state, "has publicly declared that his profits in the African trade alone, during the year 1844, were 1,300,000,000 reas, or about L.150,000!"

'With respect to the incompetency of an armed force to suppress the slave-trade, the foregoing facts might be deemed sufficient; but the papers laid before parliament still further demonstrate this point. It appears from official returns, that from the year 1829 to 1844, both inclusive, the number of slaves captured and adjudicated in the Mixed Commission Courts at Sierra Leone, the Havana, Rio de Janeiro, and other places, was 407, and the number

of slaves liberated, 57,639. About 150 of the slaves were captured under the equipment article. In two cases the prosecution was abandoned by the captors, and in twenty cases no adjudication took place; so that the actual number of slaves condemned amounted to 385. But these captures were but few compared to the great number of cases which escaped the vigilance and activity of the British cruisers. The fact is, the skilful arrangements, the daring energy, and the personal impunity enjoyed by all parties engaged in the slave-trade, are found to be more than a match for the present, or indeed for any squadron of cruisers that can be employed on the coast of Africa in that service.

'It is evident to the committee, that whilst vessels of all descriptions and sizes are employed in the slave-trade, few comparatively of the larger size are captured; and from facts which an analysis of the returns has brought to light, it would appear that many of the slaves taken are used as decoys; and that the principal business of the British cruisers now is to recapture old slaves. This fact is strikingly exhibited in the return made by Commodore Jones, of the slave-vessels detained by the squadron under his command from April 1, 1844, to August 26, 1845. The captures were seventy-one. Of these, only twenty were detained for the first time; the others had passed the courts frequently—namely, fourteen had been condemned twice; twelve thrice; nine four times; five five times; four six times; three seven times; one eight times; one nine times; one ten times; and one eleven times. Of these seventy-one slaves, fifteen only were captured with slaves on board; the rest were detained under the equipment article. These facts prove two things: first, that the losses of the slave traffickers are not very heavy, especially as through their agents at Sierra Leone and elsewhere they have the power of repurchasing the detained vessels and their stores at extremely low rates, and of sending them forth again and again on their detestable voyages; and secondly, that this country is put to heavy charges, in the shape of prize-money, on vessels which are frequently captured under circumstances which scarcely admit of a doubt of their having been used as decoys.

'It is impossible, perhaps, to give an exact estimate of the sums of money which have been expended by this country in the attempt to suppress the slave-trade. It is highly probable, however, that L.20,000,000 sterling have been devoted, first and last, to this branch of the public service. There is not only the direct expense incurred by the cruisers which have been employed on the coasts of Africa, the West Indies, and Brazil, but that which has been paid to foreign powers to secure their co-operation, the expenditure in and for Sierra Leone, the Gold Coast, and Fernando Po, bounties paid to captors of slaves, salaries to the mixed commissions, pensions, &c. &c. &c. According to the latest estimate, the charge for the suppression of the slave-trade is stated as follows:—Vessels employed in the west coast of Africa, L.291,501; and for vessels not exclusively employed on that coast, L.414,953; total, L.706,454, exclusive of the sums paid to captors, mixed commissioned courts, &c. Probably, the amount actually expended is more than L.1,000,000 sterling per annum. So vast an expenditure on ineffective efforts to suppress this hateful traffic, clearly shows the impolicy of the measures hitherto adopted to secure that end.

'But to this expenditure must be added the loss of life sustained by the cruisers on the pestilential shores of Africa, from which the dangerous and the destructive character of the service to British officers and seamen becomes apparent. By returns made in 1841, it appears that, during the preceding eleven years, the number of deaths on the West African station amounted to 840, of whom eighteen were killed in action with slaves. The number wounded is not given, nor the amount of invalids sent home during the period, but they must have been considerable. The number of cruisers employed varied from year to year from seven to nineteen, and the complement of men from 710 to 1536. The deaths, &c. which took place on board of vessels employed in the same service in the West Indies, Brazil, &c. are not given. A more perfect return for 1845 has, however, been laid before parliament, from which it appears that the number of ships of war of all classes employed for the suppression of the slave-trade was fifty-six, mounting 886 guns, and manned by 9283 men. The mortality and casualties are stated as follow:—Number of deaths of officers and men in vessels employed

on the west coast of Africa, 166; and in those not exclusively employed on that coast, 93—total, 259; officers and men invalided, 271; making a grand total of 530. Such a waste of life and health in a service which, it must be allowed, has failed in its object, is greatly to be deplored. But when it is found associated with other evils of a more aggravated character—that, in point of fact, it increases rather than diminishes the horrors of the traffic—it may be hoped that the government will pause before it sanctions the continuance of the system, or recommends further grants of the public money for its support.

The frightful misery and death to which the armed suppression of the slave-trade gives rise on board the slavers, is most afflicting. Since the traffic has been declared contraband, it is an undoubted fact that the vessels employed in the transport of slaves from Africa to Cuba and Brazil, have been constructed rather for swift sailing than for stowage, and yet that on board of them incredible numbers of slaves are usually packed. The history of human suffering and crime presents no picture so truly heartrending and revolting as that which is frequently witnessed on board the slavers. In the list of captures furnished by Commodore Jones for 1844-5, we find a felucca of ten tons loaded with 40 slaves, another of eighty-one tons with 312 slaves, a schooner of ninety-four tons with 444 slaves, a brigantine of sixty-seven tons with 435 slaves, and another of one hundred and thirty tons with 685 slaves, besides their crews and stores! Of course the most frightful misery, disease, and death result from this overcrowding; and the wretched victims who survive the perils of their voyage, are usually in so diseased and emaciated a state, as might justly fill with indignation and sorrow the hearts of all not hardened by participation in this atrocious trade. Even in those cases in which the cruisers have been successful for a time in driving the slavers from particular parts of the coast, the slaves accumulated in the barracoons for shipment have suffered "much disease and mortality from the crowded state of those places, and a scarcity of food," as may be seen from the last official report of the commissioners at Sierra Leone. The committee would add, that there are good grounds for believing that, in some of these cases, the slaves are deliberately butchered to avoid the cost of their maintenance, and the trouble of securing them.

It is, then, incontrovertible that the coercive principle, as applied to the suppression of the slave-trade, has failed; that it costs this country an immense amount of treasure; that it wastes the health and lives of British seamen; that it aggravates the horrors, without sensibly mitigating the extent, of the traffic; and that some other means must be found, if ever this scourge of the human race be removed.

BENITO, THE HORSE-TAMER.

THE traveller in Mexico, while threading his way through the dense forests of the country, or crossing its scorching deserts and vast savannahs, not unfrequently meets with a party of *vaqueros*—those indomitable horsemen—riding fearlessly along, their lassos coiled on their saddles, conducting a train of furious-looking horses to market, or preparing for a chase among the numerous herds of wild cattle which roam in thousands over the broad grassy plains. In one of my journeys across the sandy regions in the northern part of the country, I arrived, after encountering fearful privations, at the establishment of Don Ramon, to which I had some weeks before been invited.

The farm, if such it can be called, which was devoted principally to the rearing of horses, was situated in the centre of a small district, whose fertility, in striking contrast to the surrounding waste of sand, was maintained by the presence of an abundant and inexhaustible spring, which gushed from the soil at the foot of a group of stately ash-trees. The surface of the smooth green turf was dotted here and there with clusters of sumachs and gum-trees, while immense troops of cattle, horses, and sheep were galloping or moving slowly across the enclosure, to drink at one of the little water-courses which were led in all directions over the surface of the ground. At a short distance beyond stood the

house, serving at once as fortress, church, and dwelling, in the form of a huge parallelogram, flanked by long rows of stables and low buildings, in which the numerous domestics were lodged.

Fastening my horse to a post in the courtyard, which I was surprised to find deserted, I crossed to an open door, whence a voice issued in monotonous tones. It was the chaplain reciting prayers; and being Saturday evening, the whole household were present, in accordance with the old Spanish custom. Among them were two females, whom, as well as could be ascertained through their *rebozos*, or veils, I took to be Don Ramon's wife and daughter. The latter absorbed the whole attention of a young man, who entered soon afterwards and knelt on the floor among the others. A tedious interval followed, when at length the last response was chanted, and the whole assembly rose to their feet and dispersed.

We had scarcely exchanged greetings when supper was announced. The head of the long narrow table was occupied by Don Ramon, the chaplain, and myself; the remaining space was filled by a crowd of servants of both sexes, who, with patriarchal simplicity, ate at the same table with their masters. I was astonished and disgusted at the profusion of dishes: excepting a fine piece of venison, the others consisted of fowls dressed in an ocean of pimento sauce, or buried under a mountain of rice, from which exhaled an insufferable odour of saffron. Besides these, there were enormous masses of half-cold beef, surrounded by rancid olives, dried raisins, and indescribable vegetables: all rapidly disappeared, however, before the appetites of the hungry household. The absence of liquid was remarkable; but in Mexico no one drinks during dinner.

The capacious flagons were brought in, and each person drank in turn, when Don Ramon informed me that I had arrived at a fortunate juncture, for that the next day would be the *herradero*, or annual counting and marking of the horses and cattle. The supper was eaten to celebrate the occasion: the meal generally consists of a cup of chocolate only; and to this cause was owing the absence of the ladies from the table.

It was scarcely daylight the next morning when I rose, and made my way to the apartment in which prayers had been chanted the previous evening. Don Ramon, his daughter Maria-Antonia, and the chaplain, were already assembled; the horses were waiting saddled at the door, and we immediately mounted. We rode to the edge of the wood, and waited the arrival of the herd which the *vaqueros* were driving in. A confused noise was heard; the ground trembled; and suddenly, from every avenue of the wood rushed a serried column of cattle and horses, bellowing, neighing, and throwing their heels into the air, as the daring *vaqueros* hurled their lassos from the rear. Our horses began to chafe, excited by the tumult; all at once the chaplain, letting his hood fall on his shoulders, galloped off at full speed after the torrent. His example was instantly followed by Maria-Antonia, who, with streaming hair as her horse flew over the ground, resembled a beautiful Amazon rushing to the charge. Don Ramon in turn spurred his horse to the rush, and whether or no, I was forced to join the tumultuous cavalcade. In a few minutes we reached the *torils*, or enclosures, into which the animals were driven; at first, all was an indescribable confusion of kicking, leaping, roaring, and neighing. By and by, however, the impotent struggles ceased, and the *herradero* commenced. Large fires of wood had been kindled on iron tripods placed at the entrance of the *toril*: the irons placed in the glowing coals had become red-hot; and the *vaqueros*, after a few minutes of repose, proceeded to their rude and dangerous task.

Looking over the throng with an experienced eye, no sooner did they see a horse, bull, or heifer without their master's mark on the skin, than with a cast of the lasso they invariably secured the beast they wanted, amidst the confused multitude of horns and heads, which opened as the animal was drawn out of the en-

closure. A second vaquero then approached, and throwing his noose carelessly on the ground, made his horse leap, and in an instant the lassoed animal was stretched on the earth. Before he had time to recover from his surprise, the red-hot iron was hissing upon his flank, from which arose a little cloud of smoke; the thongs were then loosened, and the trembling beast galloped off to the woods. Very soon the dust and vapour arising from the *mélee* formed so thick a cloud, that we could scarcely distinguish what was going on within; sometimes a colt, mounted for the first time, leaped madly from the throng, with a vaquero on his back, striving in vain to escape from his rider and the pain of his wound.

The breaking in of a horse is the most dangerous part of the vaquero's business. Their manner of proceeding is, after the animal has been branded, to let it rise to its feet, if not too restive, when a leathern band is placed before its eyes; and, deprived of light, it generally stands quiet while the heavy saddle is strapped on. A horse-hair rope (*bozal*) is then passed over the nostrils, performing the double office of snaffle-bit and bridle. The vaquero, having assured himself of the security of the saddle, buckles on his enormous spurs, leaps on the creature's back, and removes the band from before its eyes. For an instant, the horse hesitates, but soon the sight of the plains, in which he has been accustomed to roam at liberty, makes him burst into a furious neigh, and try every means to shake off his burden. The saddle is too tightly strapped to give way; he then tries to bite the rider's legs; but a pull at the bozal, which presses over his nostrils, makes him desist. He then describes immense curves, throwing out prodigious kicks, and standing almost upright on his hind-legs, endeavours to dislodge the horseman by a sudden spring forwards. The rider, however, remains immovable in his seat, and in turn becomes the assailant. Two strokes of the spurs produce a cry of surprise and pain, followed by a succession of prodigious bounds; but the rider still maintains his position. The spurs are now worked without a pause; the terrified animal, as a last resource, tries to dash himself with his tormentor headlong against a tree; and failing this, finds it impossible to disobey the rider's will: in a word, he is broken—tamed. The vaquero takes breath, lights a cigar, and straps his still humid saddle on the back of another horse, and is ready to go through a similar trial.

We were seated on a temporary stage, erected under the shade of a group of sumachs; Don Ramon asked me if we had such horsemen in Europe. Instead of replying, I inquired whether accidents did not sometimes happen in these equestrian struggles.

'Now and then,' he answered. 'Two of my fellows were lately killed by the *Endemoniado*, and they have taken care not to bring him to the herradero.'

'And who is this *Endemoniado*?' I asked.

'A horse which has been mounted only twice: the first rider was trampled to pieces; the skull of the other was split against the branchless tree that you see yonder. These, however, are family affairs; the vaqueros and horses are both mine, and both have a perfect right to kill themselves if they please.'

The vaqueros began to utter excuses, when a man arrived unexpectedly, dragging an unwilling horse: it was the *Endemoniado*. The pain caused by a hair rope, which the new-comer had succeeded in passing round his upper lip, extorted a sullen obedience. The appearance of the animal justified its name—*Demoniac*, or *Possessed*; its colour was dark sorrel, with white legs, signs of a vicious temper. Its ears were pointed forwards, its long mane hung down in disorder, and every time it stamped, the hoof rung with a metallic sound against the pebbles. A look of alarm went through the attendants as Don Ramon asked, 'Now, my braves, which of you is going to mount the *Endemoniado* for the honour of the establishment? It will not do to let a horse boast of having frightened us all.'

Not a voice was raised in reply: presently some one called out the name of Benito Goya.

The individual signalled, whom I recognised as the young man who had fixed his regards so attentively on Don Ramon's daughter during the devotions of the previous evening, stepped before his chief, and replied—'If you think, señor, that I ought to get myself killed for the honour of the place, I am quite ready to do whatever you may order.'

A supplicating look from his daughter made Don Ramon hesitate; at last he rejoined, 'I have no right to order you to kill yourself; but if you will risk the adventure, I give you full and entire liberty.'

'It is well,' answered Benito, and turned away to make preparations for saddling the *Endemoniado*—no easy task; for, as if anticipating the intentions of the vaqueros, the horse began to kick furiously. A lasso was passed round the pastern of the left hind-leg, and passed tightly round the animal's breast, by which means the leg was drawn up close to the belly. The right fore-leg was bent upon itself by a similar process; and in this state of equilibrium the horse remained motionless. Benito threw the heavy saddle on the animal's back, drew the girth tight, and then sat down upon the sand to fix on his spurs. I looked at Maria-Antonia: she sat motionless, but her large dark eyes, widely opened, glittered strangely in her pallid features, and her laboured breathing betrayed her emotion. Don Ramon himself seemed frightened, and for a moment I hoped he would withdraw the permission which exposed an intrepid young man to almost certain death; but he said nothing. When Benito had fastened his spurs, the horse's legs were released, and the band of leather placed before his eyes. Yet although held by the rope which wrung his lip, the tremendous plunging of the *Endemoniado* prevented all attempts to mount. He was made to kneel down; and two vaqueros, biting each one an ear of the animal, held him for a moment in this position. Benito leaped on his back, and in a firm voice desired the others to 'let go.'

The attendants rushed out of the way to the rear, while the *Endemoniado* leaped upwards, as though lifted by the release of a hidden spring. Thanks to the leathern band which blinded him, he stood at first trembling upon his legs, with distended nostrils and quivering body. Benito profited by this brief respite to secure himself in the saddle; then leaning forwards, he removed the covering from before the animal's eyes. A contest truly wonderful then commenced between the man and the horse. Startled by the sudden light dazzling his bloodshot eyes, his tangled mane bristling with rage, the impetuous beast uttered a terrible neigh, and, recoiling upon himself, bounded towards every quarter of the compass. Benito, without appearing disturbed by these efforts, held himself upon the defensive, defeating the horse's attempts to bite by severe kicks upon the mouth. Disappointed in his object, the *Endemoniado* went suddenly down upon his haunches. The spurs were now plied; but instead of rising to his feet, the horse fell violently over upon his back. A cry of alarm broke from the spectators; it was, however, only the pommel of the saddle that struck the ground: Benito, foreseeing the shock, had leaped rapidly off. An instant afterwards, enveloped in a cloud of dust, the daring horse-tamer was seen to remount on the contrary side to that fixed by the laws of equitation, at the same moment that the bewildered animal rose again to his feet with renewed neighings. The vaquero, in turn, appeared beside himself with rage. For the first time in his life he had been thrown off. Burning to wipe off the disgrace, he ploughed the creature's flanks incessantly with his formidable spurs, while, with a tight hand upon the hair snaffle, he rained a shower of blows upon the bruised hide of the *Endemoniado*. Neither side as yet could be said to have the advantage; and after a few minutes more of this desperate struggle, the two antagonists remained for an instant motionless. A burst of applause rang from every quarter; and whether

the vaquero was flattered by the movement, or wished to excite still further admiration, he profited by the brief interval to draw a long narrow knife from its place in the lacing of his boot.

'Holla!' exclaimed Don Ramon, whose feelings were excited when the life of a horse appeared to be at stake; 'is the fellow going to murder the Endemoniado?'

A flash of indignation glowed in the dark eyes of Maria-Antonia at the supposition that the man whom she had distinguished with her favour should prove a coward, followed by a proud smile at the sight of Benito, who, with reckless temerity, leant forward and cut the bozal in two, leaving himself thus, without any check or hold, at the mercy of an untameable beast. Finding his nostrils relieved from the pressure of the snaffle, the Endemoniado gave a loud snort, shook his long mane, and rushed madly towards the branchless tree before spoken of. Such was the impetuosity of his start, that no one doubted of his destruction against the obstacle standing in his way; nor did there appear any chance of the rider avoiding the same fate. Another stride, and the contest would be terminated; when, just as the Endemoniado was about to make the final spring, Benito, taking off his broad-brimmed hat, stretched out his arm and covered the animal's eyes. The horse recoiled in alarm; and we had then the extraordinary spectacle of a horseman guiding an unbroken steed without a bridle: the latter started in terror from side to side, according as the hat covered one eye or the other. In this way the animal passed before our seat, and a look from the maiden repaid the vaquero for his successful hardihood; his handsome features, animated by the consciousness of triumph, justified the maiden's choice. The Endemoniado was breathless and disconcerted at the unexpected resistance offered to him; but, roused anew by Benito, scampered off in the direction of the forest. We followed him with our eyes for some minutes as he awayed about like a reed under the prodigious strides of the animal, which seemed to devour the distance, and soon lost sight of him. A few cavaliers started after him; but such was his speed, that they soon gave up the useless pursuit.

It is unnecessary to repeat all the commentaries that attended the vaquero's disappearance. By some he was regarded as lost, notwithstanding his first triumph; for one of the Endemoniado's former victims had also escaped the fatal tree, and was afterwards found, far from the farm, trampled to death: others, however, were inclined to augur more favourably of the horse-tamer's skill. But after some time spent in idle speculation as to the fate of their comrade, they began in turn to display their powers and agility by a thousand feats of horsemanship: the thought of the absent vaquero, however, prevented my feeling interested in the exercises. An expression of the deepest anguish was imprinted on the beautiful features of Don Ramon's daughter. In vain her father besought her to retire: her looks remained fixed upon the place where Benito had disappeared, while her hands crushed convulsively the sumach flowers that hung around. More than an hour passed in this way; the sun rose higher and higher, and the landscape began to droop under the scorching heat. At length a long-drawn sigh escaped from the young girl's lips, which again resumed their rosy tint; an inexpressible joy beamed from her face, for a light cloud of dust seemed to be approaching far in the distance, and her heart told her who it was yet hidden behind the cloud. Benito, in fact, was coming, swift as the wind; the vaqueros suspended their exercises, and had scarcely time to form a double line to receive their victorious comrade. One glance was sufficient to show that the Endemoniado was at last broken; with panting sides, dimmed eyes, his hind quarters stained with a coating of dusty sweat, it was easy to see that the redoubtable animal was now obedient to the vivid terror inspired by his rider. The latter, with a countenance inflamed, and furrowed here and there by long scratches, his hair in disorder, his

clothes in tatters, showed all the signs of a dearly-bought victory. At the moment that the Endemoniado arrived opposite to our stage, Benito leaned suddenly backwards, uttered a cry, and the horse stopped short; his conqueror's voice now sufficed for his guidance. A general hurra then arose from all the vaqueros; while Benito, with the grace of a finished courtier, bent respectfully from his saddle, as though to lay the homage of his victory at Maria-Antonia's feet. New acclamations followed; and while a mixture of embarrassment, pride, and joy tinged the maiden's beautiful features, a bunch of sumach flowers fell into the vaquero's hands. The young man could scarcely contain his emotion; he turned pale, stammered, and, as if powerless against a flower thrown by the hand of a woman, the resolute cavalier trembled in his saddle.

Some hours afterwards, when the work of the herradero was completed, I was returning alone to the house, where I met one of the vaqueros. 'Agree, Senor Cavalier,' he said, addressing me, 'that Benito Goya is a happy mortal, for, unless I deceive myself, we shall have him for a new master before long.'

'It appears to me,' I replied, 'that he will only receive his deserts.'

MUSIC FOR ALL.

It has been justly said that music had no mortal artist for its inventor; it was implanted in man's nature, as a pure and heavenly gift, by the great Creator himself. Of all the fine arts, it alone comes home to every heart. The uncultivated rustic, who would feel less pleasure in contemplating the Apollo of Belvidera, than in gazing at one of the coarse-painted plaster-of-Paris figures hawked through the streets, and would turn from one of the finest of Titian's paintings to admire some flaring sign over a country inn, is alive to the tones of music, and can feel all his sympathies awakened by a tender or a lively air. Music is so much a part of our nature, surrounds us so completely in this vocal world of ours, that its influence begins at the cradle, and only ends at the grave; it has even been conceived to make part of the enjoyment in a happier state of existence. There is a sweet harmony even in inanimate nature—the measured flow of the waters, the regular rushing of the tide, the wintry gust sighing through the woods, or the summer breeze rustling the leaves, and the sweet echoes returned from rock to glen, or breathing in melting cadence along the waters—which gives the listener a feeling as if he were admitted to a communion with the unseen world.

When we consider the music of the animated world, the singing of birds, the hum of insects, the lowing of cattle, it seems reasonable to ask whether this melody is meant for the delight of man alone? Though his organs may be more delicately adapted for musical sounds, and his feelings more exquisitely alive to them, yet we may still believe that the lower creatures participate in some degree in the enjoyment—a belief that may be the more readily granted, from the innumerable instances on record of the pleasure which musical has appeared to give them. We are told that musical sounds have wonderful power over the stag, exciting complacency, if not rapture; and that his enemies frequently employ the shepherd's pipe to lure him to destruction. Mr Playford mentions that he met a herd of stags, consisting of about twenty, on the road following a bagpipe and a violin. So long as the instruments were played, the stags went forward; when the music ceased, they stopped. In this way they travelled from Yorkshire to Hampton Court. The excitement of horses and of hounds, when they hear the hunter's horn, is well known. Stephanus states that he saw a lion leave its prey to listen to music. There is a remarkable instance of the delight which a flock of sheep and some goats took in listening to the flute, mentioned in the life of Haydn. A party of young people were enjoying themselves one summer's day on the side of a mountain

near Lake Maggiore. One of the party took out his flute and began to play. The sheep and goats, which were following each other towards the mountain, with their heads bent downwards, raised them at the first sound of the flute, and all advanced in haste to the spot from which the music proceeded. By degrees, they flocked round the musician, and listened in motionless delight. He ceased playing, but the sheep did not stir. The shepherd with his staff obliged those that were nearest to him to go on; but when the flute-player began to perform again, the flock returned to him. The shepherd became impatient, and began to pelt them with clods, to force them to move, but not one of them would stir. The shepherd, enraged with them, whistled, scolded, and finally pelted them with stones. Such as were struck passed on, but those who were not refused to stir. The shepherd had at length to intreat the musician to cease before he could get his flock to move; but whenever he resumed the instrument, they would stop at a distance to listen.

It is said by Goldsmith and others that the elephant appears delighted with music, and very readily learns to beat time, to move in measure, and even to join his voice to the sound of the drum and trumpet. Not long since, an officer mentioned that, at Gibraltar, the monkeys used to come forward to listen to the military bands, and during the time of their performance, would seat themselves on a wall to listen, retiring as soon as the music was over. It is well known that there have been dogs which evinced the greatest pleasure when they have heard music. The story of the dog at Rome, which went by the name of the Opera Dog, from his regular attendance at the opera, is well authenticated; many witnessed his raptures, and have seen him, when he could not gain admittance to the theatre, stand, with his ear close to the wall, to catch the sounds. Some have evidently distinguished airs, testifying more delight at some than others. My father had a cat, unlike many of her kind—which seem heedless of all music but their own purring—for she evinced the most extraordinary feeling whenever she heard the song of 'Mary's Dream.' It was frequently and most sweetly sung by a gentleman, who was sometimes a guest in the house. Poor puss would listen with wrapt attention till she heard 'Sweet Mary, weep no more for me!' when she became excited to an extraordinary degree, mewing most piteously. Had we believed in the transmigration of souls, we should most assuredly have thought that 'sweet Mary' was again an inhabitant of this world, in the shape of a sleek tabby cat. It has been said that even the wild antelope has been known to come out of the woods to listen to music. I have met with an account of the surprise which a party of choristers experienced one evening, when they were enjoying themselves on the banks of the Mersey. As they sat upon the grass, they joined in an anthem; and after a while, as they sang, they perceived a hare come from an adjoining wood, and stop within about twenty yards of them, turning her head with evident pleasure to catch the sound of the music. When the singing ceased, the hare went back towards the wood. When she had nearly reached it, the singing was resumed. She stopped, turned round, and hurried back to the spot where she had before remained to listen: here she stayed, in evident delight, as long as the music continued. When it was over, she walked slowly across the field, and disappeared in the wood. In Mexico, it is absolutely required that the swineherd should have a musical voice, that he may sing when the pigs quarrel, which has the effect of soothing them, and lulling them to sleep at the proper time, which greatly promotes their fattening. The gushing of the wind, and all sounds, it is well known, have a great effect upon these creatures. Snakes can be tamed by music: it is said that even when irritated by pain or hunger, they can be soothed by a plaintive air. Sir William Jones heard from a person on whose veracity he could rely, that he had often seen the most venomous and malignant snakes leave their holes upon

hearing tunes upon the flute. It is thus the Indians free the houses which are infested by snakes; the sound of the flute entices them out from the hiding-places where they lurk. It is said that when the negroes search for lizards, which they make use of for food, they attract them by whistling an air. We may almost credit the powers of the lyre of Orpheus, when we read of a gentleman confined in the Bastille, 'who begged the governor to permit him the use of his lute, to soften, by the harmonies of his instrument, the rigours of his prison. At the end of a few days, he was greatly astonished, while playing on his lute, to see peeping out of their holes great numbers of mice; and descending from their woven habitations crowds of spiders, which formed a circle about him while he continued breathing his soul-subduing instrument. When he ceased to play, the assembly, who did not come to see his person, but to hear his instrument, immediately broke up. As he had a great dislike to spiders, it was two days before he ventured to touch his instrument again. At length having, for the novelty of his company, overcome his dislike of them, he recommenced his concert, when the assembly was by far more numerous than at first. Thus is this anecdote given in 'The Curiosities of Literature,' and has often been reprinted. It may fairly be credited, when we recollect that bees, when flying away, will lag behind if they hear any tingling sound, and their flight, when about to swarm, can be effectually arrested by the sound of a bell, near which they will settle themselves. Bullfinches can be taught to warble an air with the most astonishing precision. Sir William Jones states, on good authority, that when a celebrated lutanist was playing to a large company in a grove near Shiraz, the nightingales were distinctly seen trying to vie with the musician: sometimes warbling on the trees, sometimes fluttering from branch to branch, as if they wished to approach the instrument; and at length dropping on the ground in a kind of ecstasy, from which they were soon raised by a change in the measure. If music has such charms for the lower creatures, well may its influence be great over the human race, whose sensibilities, fond associations, and tender recollections can be awakened by its witching spell? It indeed mingles itself with all our pursuits; it quiets the child in its cradle, as the nurse sings her soothing lullaby; it rouses the patriot's zeal; it stirs up the spirit to revelry, or raises it to devotion; it exhilarates intercourse, and lightens labour; sweet is the milkmaid's song as she plies her task; its cadence falls alike soothingly upon her own ear, and upon that of the cow who supplies her pail. There is in the chorus of the 'yo-ho' of the sailor, as he labours in his vocation, that which makes it lighter.

The very itinerant venders of goods have set their proffered sale to regular notes, so that the different articles which they carry are known long before the words which accompany the cadence are heard. I was much amused lately, when reading 'Letters from a Gentleman in the North of Scotland to his Friend in London,' written before the year 1730, with an account of the manner in which music accelerated the harvest work. He says, 'When there are any number of women employed, they all keep time together, by several tones of the voice, and stoop and rise together, as regularly as a rank of soldiers when they ground their arms. Sometimes they are incited to their work by the sound of a bagpipe; and by either of these things proceed with great alacrity, it being disgraceful for any one to be out of time with the sickle.' They use the same means when thickening the new-woven plaiding, which is done by six or eight women, sitting upon the ground near some river or rivulet, in two opposite ranks, with the wet cloth between them: 'their petticoats are tucked up, and with their naked feet they strike one against another's, keeping exact time, as above-mentioned; and among numbers of men employed in any work that requires strength and joint labour, as the launching of a boat or the like, they must have the

piper to regulate their time.' To keep time seems a natural propensity: why it should be so, may yet be determined by philosophers. It would indeed be far beyond our limits to point out one instance in a hundred that we could enumerate; but in everything we hear (though it may pass without our observing it), there is a kind of measure, and this often suggests subjects to musical composers. A favourite air imitated the yelping of dogs so exactly, that it could not be heard without the resemblance being perceived. One of the most delightful compositions was suggested by the regular strokes of the blacksmith's hammer against the anvil. Sir Charles Bell, in his admirable treatise on the hand, observes—'The divisions of the time in music in some degree depend on the muscular sense.* A man will put down his staff in regulated time; and in his common walk, the sound of his steps will fall into measure. A boy striking the railing in mere wantonness, will do it with a regular succession of blows. This disposition in the muscular frame to put itself into motion with an accordance to time, is the source of much that is pleasing in music, and assists the effect of melody. The closest connection is thus established between the employments of the sense of hearing and the exercise of the muscular sense; the effect of disorders of the nervous system is sometimes to show how natural certain combinations of actions are in the exercise of the muscular frame.' Sir Charles illustrates this observation by a curious case of a young woman who had never been able to learn a common country dance, yet, when under the influence of a morbid mental excitement, in association with the organs of voluntary motion, began to exercise involuntary movements not unbecoming an operadancer. 'At one time she would pace slowly round the room, as in a minuet, with a measured step, the arms carried with elegance; at another time she would stand on the toes of one foot, and beat time with the other; on some occasions she would strike the table, or whatever she could reach, with her hand many times, softly, and then with force. At length it was found that she did everything in rhythms. A friend thought that in her regular beating he could recognise a tune, and he began singing it. The moment this struck her ears, she turned suddenly to the man, danced directly up to him, and continued to dance until she was quite out of breath. The cure of this young woman was of a very unusual kind. A drum and fife were procured, and when a tune corresponding to the rhythms of her movements was played, in whatever part of the room she was, she would dance close up to the drum, and continue dancing until she missed the step, when these involuntary motions instantly ceased, and the paroxysm ended. The physician, profiting by this, and observing a motion in her lips, put his ear close to her mouth. He thought he could hear her sing, and questioning her, she said there was always a tune dwelling upon her mind, which at times had an irresistible influence upon her, and impelled her to begin her involuntary motions. In the end, she was cured by altering the time in the beating of the drum; for whenever she missed the time, the motions stopped.'

The nicety of perception for fine sounds in some minds is as remarkable as the extreme enjoyment they derive from them. A musical friend of ours lately mentioned in our company, that amidst all the noise of a large party, he could distinguish the faintest tinkle on a wine glass, because it was a musical sound. Some years ago, an eminent violinist arrived in Edinburgh, and took up his lodgings in a street where all the houses were externally alike. Returning home late one evening, and having forgot the number of the house, he was at a loss to find his home, till a musical expedient occurred to him. Conceiving that he should be able to distinguish the street-door bell of his landlady's house,

he deliberately went along a small portion of the street, ringing each bell, till he arrived at one of a peculiar tone, which he at once recognised as the right one, and on hearing which, he waited till he was admitted. I do not know if the hero of the subsequent anecdote was in any degree gifted as a musician; but his perception of nicety in tone seems to have been as great as that of Signor E—. It was in April 1836 that Lieutenant Laver, on leave of absence from his regiment, spent a night in the Bush Inn in Manchester. In the morning, as he was sitting at breakfast, a band of street musicians came past, and in one of the instruments (the serpent) he thought he recognised the peculiar style of playing of a man who had once performed on that instrument in the band of his regiment, but who had deserted. The lieutenant immediately ran down stairs, found his surmise correct, and had the man apprehended. To those entirely ungifted with music, such delicacies in this particular intellectual sense seem miraculous.

Mr Burette, and other physicians, have believed that music affected the whole nervous system, so as not only to give temporary relief in some diseases, but to achieve radical cures in many cases. He thought that music could palliate the pains of the sciatica. He conceived that certain vibrations of the nerves, along with other effects produced, to be the cause of this; and that its power of fixing attention, and withdrawing the mind from the feelings which occupied it to different channels of thought and sensibility, awakening dormant sensations, might produce a powerful effect, that might operate on the entire frame, causing changes almost miraculous. Theophrastus asserted that diseases have either been cured by music or mitigated. We find this illustrated in Mrs Grant's 'Letters from the Mountains,' when she mentions the effect which the singing of his attendants had on her little boy, in soothing his last sufferings; but, like everything she wrote, it is so interestingly given in her own words, that it is best to transcribe the passage. 'I, for my part, though a stranger to the art of music, am well acquainted with its power, and subject to its influence in its rudest forms, particularly when it breathes the spirit of that sentiment which for the time predominates in my mind, or wakes some tender remembrance with which accident has connected it. When my dearest little boy was in the last stage of that illness which proved fatal to him, we had three maids who had all good voices. One was afraid to sit up alone to attend my calls, on which the nursemaid agreed to sit with her, and lull the infant beside her. The solitary maid was then afraid to stay alone in her attic abode. The result was, that the three syrens sung in concert a great part of the night, which seemed to soothe the dear sufferer so much, that when they ceased, he often desired that they would begin again. He listened to it three hours before he expired. I never hear the most imperfect note of *Cro Challa* since without feeling my heart-strings accord with it.'

Sir Henry Hallford, in his essays and orations, mentions the case of a gentleman who became insane on the loss of his property, and for months was in such a state of stupefaction, that he remained perfectly motionless, not moving unless when pushed; nor would he speak to or notice any person. Music in the street at length produced its effect. He was observed to listen, and to be still more awakened to its power the second time he heard it. The person under whose care he was, availed himself of this happy omen, and offered him a violin. He seized it eagerly, and constantly amused himself with it. The result was most fortunate: in two months he was dismissed cured. Sir Henry alludes distantly, but affectingly, to the case of George III., who had been his patient, and bears testimony to the power which music had over his mind, mitigating the sadness of seclusion. I have elsewhere met, though I cannot exactly recollect where—it may have been in some of the journals of the day—a most touching account of the venerable king: sightless and secluded,

* Sir Charles was not without prejudices, and the exact thing on which time in music depends may well be considered as still in doubt.—Ed.

a prey to visionary delusions, yet finding a sweet solace for his troubled mind in 'the touches of sweet harmony.' There, at his instrument, he might often be seen, wrapt in thought, as the strings responded to his touch in the sacred strains of Handel.

One of the most remarkable instances of the efficacy of music occurred during the celebrated Farinelli's visit to Spain. The queen determined to try the effect of his astonishing powers on the king, who had had a passion for music. He was then labouring under such a dejection of spirits, as baffled all medical treatment, and disappointed every effort made to divert his thoughts. Neither pleasure nor business could rouse him from the hopeless melancholy under which he laboured. Utterly incapable of managing public affairs, or of enjoying domestic intercourse, he remained in a state of the most deplorable sadness and apathy. Farinelli was placed in a room adjoining that where the king sat; he sang some of his pathetic songs with all the captivating expression for which he was so remarkable. The queen anxiously watched the effect; nor was she disappointed. The king seemed surprised; and as he listened, he became affected, and tears forced their way, and the pent-up feelings gushed forth once more. Another song, and he ordered the attendance of the singer. Farinelli appeared; the king gave utterance to his delight and admiration, and desired him to say how he should reward him for the gratification which his wonderful talents had given. Farinelli, who had been directed how to act, only intreated that his majesty would permit his attendants to dress him, and that he would appear in council as usual. The king complied; his spirits returned; and thus Farinelli effected a cure in some moments which the ablest medical men in Spain, all the devoted courtiers, and the anxious family, had in vain endeavoured to bring about. This affecting anecdote naturally reminds us of the playing of David before Saul, when the evil spirit departed from the king, and he was well. To this very remarkable case the beautiful lines of Cumberland, now almost forgotten, but worthy of being remembered, are appropriate. The last stanza runs thus:—

'The turbid passions shall retire
Before the minstrel's art,
And the same hand that sweeps the lyre
Shall heal the stricken heart.'

As to Farinelli, he rose to the highest favour at court; and, to his great credit, instead of being elated by an elevation so exciting to one of humble birth, he preserved a humility and simplicity which endeared him to the Spanish nobility, and won from them their esteem and confidence. The various anecdotes recounted of this gifted man, reflect as much honour on his disposition and character as they do on the genius that so eminently distinguished him. There was such enchantment in his singing, that it completely overcame Senesino, who was himself one of the finest singers. He and Farinelli had long wished to hear each other sing; the opportunity was at length afforded, and they were engaged to perform at the same theatre. Senesino played the part of an inexorable tyrant, and Farinelli of his unhappy captive. When he appeared in chains, he sang with such exquisite pathos, that Senesino forgot the cruel part he had to sustain; he forgot everything; and, throwing himself into Farinelli's arms, he burst into tears. But this need not surprise us, when we recollect that two hired assassins, who, it may be presumed, were not possessed of very tender feelings, when they waited to fulfil their engagement to murder Stradella, near the door of a church in Rome, where he was taking part in an oratorio, were so completely overcome by his pathetic music, that they not only abandoned their purpose, but confessed it to him, and warned him of his danger. The complete mastery which music often exerts over the mind may be considered its greatest triumph. I need only allude to the *Ranz des Vaches* of the Swiss, and the *Lochaber* no more of the Scotch regiments. Its influence over

the affections may be illustrated by an anecdote connected with a custom which is observed among the Greeks. The young Greek often leaves his home for a foreign land, but never without grief. Fondly attached to the place of his birth, and to his domestic ties, he feels himself an exile wherever he goes, and endures the greatest anxiety on account of those near and dear to him that he has left, and is often haunted with a sad foreboding that he is to meet them no more. When he is about to take his leave, there is a farewell repast, to which the relations and the friends are invited; when it is over, all the guests accompany the traveller some miles on his journey. During this, and at the repast, it is the custom to sing farewell songs; many of these have been long in use, but some are composed specially for the occasion; and it not unfrequently happens that they are composed extempore by some one dearest to him, or by himself. There was such a meeting held one day near Pindus, on the occasion of the youngest of three sons of respectable parents devoting himself to voluntary exile. The deepest regret which he felt in leaving the home of his childhood, was the consciousness that he carried with him no share of the affections of a mother on whom he doted. She, unlike the generality of Greek mothers, had never marked him as an object of her love, but had treated him with a coldness painfully contrasted with her conduct towards her other children; this he had borne without a murmur, but now that he was about to leave her, perhaps for ever, his heart was breaking. The spot chosen for the parting was a wild and desolate scene, among high and rugged rocks. Several of the mournful songs had already been sung, when the young traveller, separating from his company, ascended a rock which overhung the path; here he sang his last and farewell in tones that sank into every heart, and drew tears from every eye. He expressed, with the deepest pathos, the passionate grief which he felt in quitting his home and those he loved; but his greatest anguish was in thinking he was going without his mother's affection. The heart of the mother was touched; her emotion increased with every word and every note of the pathetic air to which he sang; the warm current of affection gushed from its hidden springs; she clasped him in her arms, and weeping and kissing him over and over again, she intreated forgiveness, and promised to love and cherish him as long as she lived. The promise was inviolably and tenderly kept.

The most simple music, or that which is hardly music at all, often finds its way to the very heart. It is said that Curran attributed his first impressions of eloquence and poetry to the wild chant of the Irish cry, or funeral dirge. The memory of some of those strains, which have been often described as something unearthly, and resembling the melody of an Æolian harp, no doubt flitted across his mind, as he has sat preparing himself for the defence of some client's life, as was his wont, with his violin in his hand, from which ever and anon he drew forth wild and plaintive sounds. It is customary with the improvisatori to sweep the chords of an instrument as they compose their verses, to aid their conceptions. Even the music of bells produces a powerful effect. Who does not feel his spirit lighten as he hears the merry chime of festive bells? Who does not feel a touch of awe as the death-bell tolls? The inhabitants of Limerick are proud of their cathedral bells; and well they may, for they are passing sweet. They boast that they were brought from Italy, and tell of their having occupied the skill of a clever young artist for some years. By the time he had manufactured them, their chime had taken such possession of his heart, that he resolved never to leave them; so that when he sold them to the prior of a convent, he removed to their neighbourhood, that he might still hear their music: he hoped that they would toll his requiem. Troubles came—he lost his property—the convent was laid waste—the bells were taken away—and this grieved the artist more than any of his losses; he wandered over many of

the countries of Europe, hoping to reach the spot where his bells might be. Years after they had been manufactured, it happened that, towards the close of spring, on a lovely evening, a vessel had anchored at some distance from Limerick, and a boat was seen to glide from its side along the Shannon. It had been hired by one of the passengers—the Italian artist—now grown old and gray. He was impatient to reach the city, to which he had traced his much-loved bells. As they rowed along the smooth waters, the steeple of the cathedral appeared in the distance above the surrounding buildings; the boatmen pointed it out to the stranger, as he sat in the stern; he fixed his eyes earnestly and fondly upon it. The boat glided on; but all at once, through the stillness of the hour, the peal from the sweet cathedral bells burst upon the air; the stranger crossed his arms upon his breast and leant back. The shore was reached; the face of the Italian was still turned towards the cathedral, but the spirit had fled, and the bells had tolled his requiem!

MEASURING AN ARC.

THE accurate measurement of a portion of the earth's surface involves so many points of high scientific and commercial interest, that the labours undertaken to effect the object may be regarded as among the greatest triumphs of philosophy. Such measurements were made at an early period by the Greeks, and have been repeated subsequently, as the necessity for greater accuracy became apparent. An almost incredible amount of labour and difficulty has been encountered in performing the operations, arising from various causes. From the confines of the polar circle to the equator, nearly every nation has contributed its share to this important work, of which the ordnance survey now carried on in England may be looked upon as a necessary consequence; there are few governments which have not had a desire to know the precise position and configuration of the country over which they ruled.

It will be seen that the ignorance and jealousies of mankind often cause as much annoyance to peaceful philosophers as to real enemies. On the cessation of hostilities between France and England, in 1783, a proposition was made, through the French ambassador, to the government of the latter country, for a joint survey to determine the exact distance between the observatories of Greenwich and Paris; the proposition was favourably received, and the measurement of the portion of the line between Greenwich and Dover intrusted to General Roy, who had already been employed in similar labours. In a survey of this nature, the distance is measured by a continuous series of triangles, commencing from one base line, which must be determined with the greatest possible precision. General Roy's base line, more than 27,000 feet in length, was measured on Hounslow Heath, near London; its correctness was insured by the employment of three several kinds of measures—a steel chain, and wooden and glass rods, all constructed by the celebrated Ramsden: this preliminary operation occupied from April to August of the year 1784; and from the line thus laid down, the measurement was carried on to Dover, when three members of the French Academy were sent over to confer with the English *savants*, and to decide on the points of land on which the signal-lights should be fixed, by which the measurement was continued across the Channel. The large folio in which all these proceedings are detailed, attests the diligence and zeal with which they were conducted.

In 1790, the French Academy, in consequence of a request from the National Assembly, appointed a commission to report on a new standard of weights and measures. On referring to the standards already in existence, they were found to be so imperfect, that it was recommended to measure anew an arc of the meridian, as the only means of obtaining a true standard. The extreme points chosen on this occasion were Dun-

kirk and Barcelona, both on the sea level; the necessary operations were commenced in 1792, but with great impediments in the turbulence of the Revolution. Mechain, to whom the southern end of the line had been assigned, was arrested while making his observations at the base of the Pyrenees, as a traitor conveying signals to the enemy; and was afterwards imprisoned for nearly a year in Spain, as it was feared that the local knowledge he had obtained might be employed in favour of the French arms. Delambert, his coadjutor, who surveyed in the interior of France, was exposed to still greater risks; he was beset by mobs, his observatories and signal-posts were thrown down and destroyed, and, together with his assistants, he was frequently imprisoned. On one occasion, at St Denis, they were only saved from the popular fury by the presence of mind of the mayor. Sometimes passports were refused them, and at others they were compelled to leave their observations, and give an account of themselves at one of the numerous clubs which then existed in every part of France. The depreciation in value of the assignats with which they had been supplied to pay for what they wanted, was also a cause of great inconvenience. Besides these, there were natural obstacles to be encountered and overcome: in placing the signals, it was often necessary to climb to the top of precipitous and almost inaccessible heights, and to sleep there without any protection from the weather. Such, however, is the energy inspired by a genuine love of science, that the work was at last successfully completed by the eminent individuals engaged.

Some time afterwards, on extending this line from Spain to the Balearic Islands, the persons employed underwent severer privations. Biot and a brother philosopher were shut up for two or three months in a temporary cabin on the top of a rock in the little island of Formentera, while waiting for an opportunity to observe the signals on the heights of Ivica. Arago, who watched during a similar period from a dreary spot called the desert of Las Palmas, was afterwards taken for a spy at Majorca, and on attempting to escape disguised as a peasant, was captured, and imprisoned several months in the citadel. On regaining his liberty, the ship in which he embarked was wrecked on the coast of Africa; he then sailed for Marseilles in an Algerine vessel, which was made prize of by a Spanish corsair at the entrance of the port. The Algerine was, however, reclaimed; and sailing a second time for France, narrowly escaped destruction on the shores of Sardinia, and was ultimately driven back, with several feet of water in her hold, to Algiers. In this city M. Arago lived for six months, in the garb of a Mussulman, until an opportunity offered of sailing once more for France. The convoy was met and captured by an English squadron; but in this instance fortune favoured the astronomer; the vessel in which he had embarked was the only one that escaped and arrived safely at Marseilles. When to this account we add the labours of the Swedish philosophers while measuring an arc in the dreary and frozen regions of the north, we have striking examples of what may be accomplished by perseverance; to this apparently humble virtue the greatest philosopher, as well as the humblest artisan, is indebted for success.

The history of one of the most recent surveys has just been published by the direction of the East India Company,* over whose territories arcs have been measured extending from Cape Comorin to the Himalah Mountains. The directors have had in view the publication of an atlas of that important country; and to insure correctness, by actual observation, the labours recorded in the volume now under notice, extending over a period of fifteen years, were undertaken. On measuring a base line near Calcutta, so many obstructions to the view were opposed by trees, that two towers, each

* An Account of the Measurement of Two Sections of the Meridional Arc of India. By Lieutenant-Colonel Everest. London: Allen and Co. 1847.

seventy-five feet high, were built at the extremities. From this the line was extended northwards to the district known as the Doab, where the impediments to observation seem to have been increased. 'The inhabitants,' according to Lieutenant-Colonel Everest, 'in common with those of other parts of India, are congregated in villages and towns which vary in extent and character according to the wealth and traffic of the owners, from the veriest hovel composed of straw, to the costly four-storeyed edifice of masonry; but instances of isolated dwellings are rare, and hardly ever met with, except in the case of indigo planters, or now and then a temple or mosque, the bare walls of which offer no temptation to the plunderer. The villages, however, lie so thickly scattered over the surface, that it is difficult to trace a line in any direction so as to pass free of all habitations, and quite impossible to calculate on seeing between the breaks which occasionally appear in the dense belt of foliage; for, in the very few instances where such do exist, they stand altogether at random. In fact, generally speaking, the trees form to all appearance a continuous dense belt of foliage, at the distance of four or five miles from the eye of the observer; and if an interstitial space is anywhere found, it as often as not leads to low marshy or other land totally ineligible as a principal station.

'The smoke from the daily and nightly fires which, particularly in the cold season, envelopes the villages, and clings to the groves surrounding them; that arising from brick and lime-kilns, and conflagration of weeds; the clouds of dust raised by herdsmen and their cattle in going out to graze in the morning, and returning in the evening; by travellers and processions of men, carriages, and cattle, proceeding along the diverse roads for business or pleasure; and by the force of the wind, the slightest action of which suffices in this arid, parched-up soil to obscure the view—form an assemblage of obstacles which it is only possible in very favourable contingencies to surmount.'

Northwards from the Doab lie the Sewalik Hills, and the beautiful valley of the Dehra Dun; in the hilly country higher observing stations became necessary, and as these were to be permanent structures of solid masonry, the determination of the best locality for them was of much importance. This was accomplished by means of tall bamboo masts, sufficiently strong to bear a scaffolding, with a tent, signal-lights, and observers; at the top of this a smaller bamboo was attached, which afforded the means of exhibiting a blue light at a height of ninety feet above the surface of the ground. Thirteen such stations were required; and as large bamboos are not to be found in Upper India, orders were sent to all the commissariat officers in the neighbourhood to procure supplies from the country boats on the rivers, and forward them to Agra as a temporary dépôt; at the same time the other materials required were accumulated. The blue lights were burned at intervals of ten minutes; and as they were seldom visible to the naked eye, an observer was constantly on the watch with the telescope to mark the first moment of ignition—a work of no small labour, when it is considered that from each station six others were observed. The towers which replaced the temporary erections are massive structures of solid masonry, fifty feet high, with a railed platform at the top, from which observations are taken.

Of Batal, a civil and military station in the Mahadeo mountain range, we read that, in 1824, it was 'so notoriously unhealthy, as to have appropriated to itself *par excellence* the appalling title of the Valley of Death. That valley has since become highly cultivated and flourishing, and is considered one of the healthiest places in the tropical parts of India. This is not, however, the case with the mountain range in general, which continues to be about as deadly a tract in 1840 as it was in 1824. It is a long and weary journey through this unhealthy range; the inhabitants are scanty, the water and provisions are scarce, and it is only at certain sea-

sons of the year that travelling through them can be attempted with any reasonable prospect of impunity.' Notwithstanding all precautions, the party suffered severely from sickness while traversing the region of the Mahadeo mountains.

Recent improvements have tended greatly to diminish the chances of sickness in out-of-door operations in tropical countries. The atmosphere being best for the perception of distant objects when it is charged with humidity, there was a standing order for the surveying party to wait till the first heavy fall of rain, and then take the field. 'It is easy to conceive,' writes Colonel Everest, 'what a reckless waste of life and health was caused by this exposure to the pitiless pelting of the tropical rains, in forest tracts teeming with miasma: no constitution, European or Asiatic, could bear up for any length of time against such a complication of hardships as thence arose—eternal watchings by day, to the prevention of all regular exercise; tents decomposing into their original elements; servants, cattle, baggage, clothes, bedding, *la cuisine*, all daily dripping with rain; every comfort which the indwellers of cities and leaders of regular lives deem essential to happiness, and even to existence, remorselessly sacrificed; and yet, strange to say, except when under the actual influence of a jungle fever, which sometimes swept like a destroying angel over us, and prostrated the whole camp in one night, we hardly ever knew what it was to have a sorry hour. Surely the great trigonometrical survey of India in those days was the proper school to teach men how to laugh at the calamities and nothingness of life. The introduction of lamps and heliotropes has totally changed the face of things; and by rendering the rainy season the least fitting period for observing luminous objects, especially those dependent on cloudless skies, has afforded an opportunity, of which I eagerly availed myself, to spare the health of my valuable subordinates, by ordering them to desist from field operations at the very period which, in the early part of my career, and my four years' heavy apprenticeship, used to be chosen *par excellence* for their commencement.'

Lieutenant-Colonel Everest looks forward to the period when the meridian arc, commencing at Cape Comorin, will be extended northwards to the extremity of the Russian dominions, near Nova Zembla. 'The trace contemplated,' he observes, 'would extend our geographical knowledge over a part of the globe highly interesting and but little known; and though, in truth, there is a belt to be passed through of several hundred miles in extent, over which the Chinese government have a control nominal or real, yet as that belt is bounded by the territory of Russia on the north, and the British possessions on the south, the jealousy to be apprehended from that source would no doubt be mainly counteracted by the influence of two such potent neighbours, could they be persuaded to act combinedly.'

THE LATE PROPRIETOR OF THE 'TIMES.'

A REMARKABLY interesting memoir of Mr Walter appeared in the 'Times' of September 16th, from which it appears that he was the son of a bookseller and publisher of London, was taught printing as a trade in early life, afterwards spent some time in study at Oxford—being then designed for the church—but ultimately devoted himself, in the year 1803, to the management of the 'Times,' then a languishing paper in the hands of his father. His career during the forty-four subsequent years appears to have been a remarkable example of unobtrusive diligence and skill directed to a specific end. It also forms a valuable illustration of the rise and progress of the newspaper power in England—to which no man contributed more than he.

On obtaining the sole charge and property of the 'Times,' he instantly remodelled its establishment, and worked the scanty supplies of capital at his command with what

other nations call the felicitous temerity of English enterprise. His genius was essentially creative; and while his extraordinary foresight enabled him to anticipate the demands of the public, his untiring energy pointed out to him the way to execute them. Like some great military commanders, Mr Walter seems to have been gifted with an intuitive perception of character, and he soon organised a corps of agents whose zeal and intelligence were almost equal to his own. The difficulties which he encountered at the very outset of his career, would have daunted any ordinary mind; to say nothing of the opposition he met with out of doors, the paternal auspices were anything but encouraging. His persevering, and, for a long time, fruitless efforts to introduce greater expedition in printing, were treated as a piece of juvenile folly and extravagance, and excited his father's serious displeasure. Indeed it is not a little remarkable that the two earliest acts of Mr Walter's life which bespoke the enterprise and high-mindedness of his character—namely, his efforts just referred to, and his abolition of the system of theatrical puffs, which, up to his time, were a source of considerable revenue to the daily press—became the subjects of painful comment in his father's will.

The attributes of a newspaper forty years ago bore that general resemblance to those of the present day that the child does to the man. There were leading articles, criticisms, foreign intelligence, reporting, and miscellaneous news. The first difficulties of reporting had been surmounted; its second epoch had not yet arrived. When Mr Walter entered the world of journalism, he found a very small but well-organised corps of reporters connected with each of the morning papers; in that department, therefore, he had too much prudence to attempt originality of design, but he wisely aimed at its extension and practical improvement. In criticism he pursued a course somewhat similar, but differing in this respect—that he sought to elevate its moral character, and to render it dignified by insisting that it should be impartial. His honourable labours for the purification of diurnal criticism were commenced early, and continued late. With unceasing vigilance he endeavoured to protect the drama, the fine arts, and the literature of the age from the evil influence of venal panegyric on the one hand, or unscrupulous malignity on the other. Few amongst the labours of his long life have been crowned with more real and less apparent success; for not many undertakings are more difficult than any attempt to disabuse the public mind of a persuasion that a friendly or a hostile bias must necessarily govern the tone of every critical lucubration; but as Mr Walter despised temporary advantages, and considered not the probable condition of affairs to-morrow or next day, but how they would work in "the long-run," so he relied upon ultimately securing the grand desideratum of impartial and independent criticism, by following out in that department pretty nearly the same rules that he applied to all other concerns. He began by setting an example of independence in the more important affair of the political department of his journal. He was too proud for a partisan, and the force of sympathy attracted to his side men of his own stamp in moral feeling, though with mental accomplishments of a character wholly dissimilar. From amongst these his profound knowledge of human nature enabled him to select a succession of writers as incapable of yielding to personal pique or private favour as any class of men that have ever yet contributed to a public journal; but in this important branch of journalism the reputation of Mr Walter was of slow growth, and some twelve or fifteen years elapsed before the world fully acknowledged his inaccessible independence.

The progress that he made in the department of foreign intelligence was, however, more rapid. Forty years ago, all Europe was one vast theatre of war; and it was no light achievement for the voice of the press to make itself heard amidst the roar of Napoleon's artillery. But in mercantile affairs apparent difficulties become instruments of victory when courage and conduct happen to be united with wisdom and capital. All Mr Walter's rivals supported or opposed the ministers of that day. In supporting a vigorous prosecution of the war, without supporting either the party of the minister or that of the opposition, he lost the political assistance of the one, and the foreign information of the other; but he won the hearts of the people of England. The monied and the commercial class supplied the sinews of war. Early intelligence has long been the vital principle of British commerce. Mr Walter's mind became fired

with the noble ambition of being its first and greatest purveyor. Those very difficulties which inferior spirits viewed with dismay, protected him from rivalry, and so became ancillary to conquest. Wherever important events were in progress—no matter on what part of the continent—some emissary of his was in the midst; not perhaps such a complete and varied agency as is now established, but one sufficient for the exigency; and before the close of the war, Mr Walter's broad-sheet had become to the British merchant a necessity of his existence. Under various disguises, and by means of sundry pretexts, his *employés* on the continent ascertained facts, and conveyed them to London—often at imminent risk, always at prodigious expense. But he was amply rewarded; for he outstripped the government couriers, and half the trade of London proceeded on the faith of the intelligence that he published.

Allusion is next made to the intensely *English* character of Mr Walter, and his remarkable Napoleonic power of surrounding himself with energetic coadjutors. His great discrimination and munificence collected around him the ablest writers of the age, and that formed the second source of early success. A third was that extreme self-reliance which unfitted him for party purposes, and protected him from the necessity of labouring for party interests. A fourth was his extraordinary boldness and resolution. That spirit, though it often brought him into difficulties, operated most favourably in its ultimate results. Of this truth a striking exemplification occurred in 1810. Towards the latter end of May in that year, the pressmen—not those who arrange the types, but those who impress their forms on the paper—insisted upon increased wages. The men then employed in working the *day* newspaper came to the "Times" office in Printing-House Square, and called upon their brethren to join them in a combination which was illegal under the circumstances, and must at any time have been regarded as unjustifiable. They insisted upon uniform rates of wages throughout all the printing-offices, overlooking the fact, that the men of the "Times" enjoyed indulgences, as well as opportunities of extra labour and reward, which in other quarters were denied. At first Mr Walter was disposed to make concessions; but a boy employed at the "Times" office informed him that a conspiracy had been organised not only amongst the pressmen, but amongst the compositors also, to abandon his employment under circumstances that would stop the publication of the paper, and therefore destroy the most valuable property that he then possessed. The complaints of the compositors not only had reference to wages, but to a particular description of type then getting into use—the effect of which type, it was alleged, would materially diminish the remuneration for piece-work. These unfortunate men bound themselves by a solemn oath, that unless the proprietors of the "Times" acceded to the previously unheard-of terms which the general body of the London compositors and pressmen then thought proper to dictate, the combination into which they had entered should be carried out into its fullest effect.

The "strike" took place on a Saturday morning. Mr Walter had only a few hours' notice of this formidable design, and, beset as he was, most men would have submitted to any conditions; but as he despised mediocrity, so he hated compromise. Having collected a few apprentices from half-a-dozen different quarters, and a few inferior workmen anxious to obtain employment on any terms, he determined to set a memorable example of what one man's energy can accomplish. For six-and-thirty hours he himself worked incessantly at case and at press; and on Monday morning, the conspirators, who had assembled to triumph over his defeat, saw, to their inexpressible astonishment and dismay, the "Times" issue from the hands of the publisher with the same regularity as ever. A few months passed on, and Mr Walter brought out his journal every day without the aid of his *quondam* workmen; but the printers whom he did employ lived in a state of the utmost peril. Two of them were accused by the conspirators of being deserters from the royal navy, and this charge was supported by the testimony of perjured witnesses, but eventually fell to the ground. Those, however, who thus conspired against his men, were not permitted to go unscathed. He had been for some time cautiously but unceasingly engaged in the discovery of evidence sufficient in a court of law to bring home the charge not only of illegal combination, but of the still higher offence that had been

committed—the crime of conspiracy. His legal advisers at length informed him that he might prefer a bill of indictment against twenty-one of the men who attacked workmen whom he had recently employed. On the 8th of November 1810, the persons thus accused were placed at the bar of the Old Bailey. The trial lasted eight hours. Mr Walter, with several other witnesses, underwent long examinations, and the offence charged in the indictment was brought home to nineteen of the prisoners. The chiefs of the conspiracy, two in number, were sentenced to two years' imprisonment; three others to imprisonment for eighteen months; three for twelve months; and eleven for nine months. Thenceforward everything like combination ceased in Printing-House Square. It is believed that by that operation Mr Walter never expected to effect any diminution of wages; on the contrary, the incomes of the men were gradually improved; they were relieved from the expenses of combination societies, and the intemperance which their meetings—always held in public-houses—frequently occasioned; a fund was created to provide for sickness as well as old age; and from the year 1810 to the present hour, the "Times" office has been by far the most advantageous place in which a competent printer can obtain employment. It is a fact worthy of being recorded, that a very considerable number of the younger compositors of the "Times" are men whose fathers have been in Mr Walter's employment. Although the conviction of the conspirators had led to no direct pecuniary saving, nor had ever been intended to produce that effect, yet Mr Walter had secured future protection for his men, protection for his property, peace in his office, and the full command of his establishment; he could now do as he pleased with his own, and an admirable use he made in after-years of the resources which his perseverance, talent, and courage had enabled him to command.

'We cannot quit this part of our history without recording another highly characteristic anecdote which a friend and eye-witness has kindly communicated to us. We give it in the words of our informant:—

"In the spring of the year 1833, an express arrived from Paris, bringing the speech of the king of the French on opening the French chambers. The express reached the 'Times' office at ten A. M. There was no editor on the spot—no printers; but Mr Walter was in Printing-House Square. He sent for ****, ****, ****, ****. Not one of them was to be found. I, too, was sent for, but was out. It was a 'Mail' day. I came to the office about twelve o'clock, and found Mr Walter, then M. P. for Berks, working in his shirt sleeves at ease. He had himself translated the principal parts of the speech, and was setting up his own translation with his own hand, assisted, I think, by one compositor. He gave me a proof of what he had set up, and desired me to read over the speech, and see whether he had omitted anything material. I found only two very short sentences of any importance omitted. I translated them, and Mr Walter set them up. The second edition, with the speech, was in the city by one o'clock.

"Had not Mr Walter turned to in the way he did, the whole expense of the express must have been lost; for I am sure that there was not one man in the whole establishment who could have performed the double part which he executed that day with his own hands."

It is not surprising of one so self-devoted as Mr Walter, to learn that he took little ease, and scarcely ever entered society. One of his greatest feats was his introduction of steam printing—for he it practically was who gave the world this invention. The first printing machine employed in England was erected in his office in 1814. It was an invention absolutely essential to a large newspaper circulation, seeing that, by common presses, only a comparatively small number of copies can be thrown off within that space of time which makes all news lose its savour. By and by the circulation of his journal became so extensive, 'that even at the rate of 1100 per hour, it took six or seven hours each day, with the machinery and the steam-engine at full speed, to satisfy the public demand. Once more he exercised his own ingenuity, while summoning to its aid the ablest men of the period, and by means of further improvements, increased speed was attained; but the additional supply seemed to inflame instead of satiating the public appetite, and 5000 copies per hour do not now suffice to meet the still growing and apparently indefinite demand. From Mr Walter's mind the improvement of printing machinery seemed scarcely ever to have been absent; and in the latest year of his invaluable life, his atten-

tion was given to a new engine of power tenfold greater than that which Koenig originally suggested. To describe the machinery now in work at Printing-House Square would require a goodly volume, and no small amount of complex diagrams and elaborate drawings; but the material fact in Mr Walter's biography is this, that whereas before his time 5000 copies of important intelligence could be circulated in the course of a day, ten times that number can now be issued without any duplicate composition of the types. As many as 54,000 copies of one number of the "Times" have been worked off by the present machinery fully in time for the despatch of the mails.'

Some personal traits of the 'potentate of Printing-House Square,' as he has often been called, are curious. It is asserted that he combined, what are so rarely seen together, 'the wisdom and circumspection which accompanies age, with the strong passions, vivacity, and cheerfulness of early youth. No one moved about more than he did, but he was not impelled to the indulgence of locomotive habits by any childish impatience of restraint. His intense activity did not result from any series of temporary impulses, but from a sense of duty which his position and his previous life had imposed. Within certain limitations, it might be said that he preferred an interview to a letter. In his intercourse with total, or even comparative strangers, he—being a cautious man of the world—liked to communicate through third parties—through the agency of the half-dozen professional gentlemen who were respectively at the heads of the several departments which he himself governed in chief. But with those whom he admitted to his acquaintance, he generally conversed rather than corresponded; he therefore largely patronised every mode of conveyance that served to bring him into contact with those whom he desired to see, or to escape from the bores who desired to see him. Men incapable of understanding his character would exclaim, "Strange man that he is! no sooner settled steadily at his business in the City, than he is off to the West End, no one knows about what; then back in the middle of the night for an hour or two, and the next morning at sunrise away to Bearwood!" At one moment tempted from home by the stirring calls of business, the next invited to return by the recollection of past happiness, and the hope of future enjoyment. An almost consuming zeal for the improvement of the "Times" newspaper alternated with his passion for planting and pruning, creating artificial lakes and undulating lawns. At night, seated in the editorial chair, directing the pens that made the popular voice of England heard in every court of the continent, spending his strength in the foul atmosphere of the City, and the exhausting labours of a newspaper office; in a few hours afterwards, however, the carol of the lark and "incense-breathing morn" restored his jaded faculties, and the same hand now wielded a woodman's axe which, a short time previously, had been guiding the greatest political engine in Europe.'

The memoir makes strong claims for Mr Walter, on the score of his political sagacity and liberality, and for the vast power which he exercised in public affairs. We dispute not the power, but we fear that the whole political life will not bear strict scrutiny with advantage. The changes of tone and sentiment in the 'Times' throughout the last fourteen years alone have been so marked, as to impress indelibly on the general mind its want of any fixed principle. This cannot be altogether a popular delusion. We were once much struck by hearing a remark on that journal from one of the most philosophical writers of our age—one unconnected with journals—"So great and powerful, without a high and unimpeachable morality, what would this paper be if it were otherwise!" We are reluctant, however, to do more than indicate the one subtraction which most persons will make when they read the history of this extraordinary, and in many respects admirable man. Let the unequivocal good that was in him have the last word. 'It was,' says the memoir, 'by a rare combination of qualities that Mr Walter was enabled to achieve the great work which has immortalised his name. From the first dawn of life, he had set his mind on purifying and strengthening public opinion, by the creation of an organ which, as a necessary means to its end, should beat in perfect unison with the heart of his country. No one can suppose for a moment that this was an easy task, yet none but Mr Walter's most intimate friends can have any conception of the difficulties and trials he encountered in the progress of his work. The mere physical labour which it imposed upon him required a constitution of uncommon

vigour and buoyancy. For many years, he never enjoyed a single unbroken night's rest, while his days were consumed with restless anxiety, either in counteracting the increasing attempts that were made to thwart his undertaking, or in devising new means to promote it. The success that crowned his exertions brought perils in its turn of a still more subtle and deadly character. The opposition of enemies might be overcome by energy and perseverance: the treacherous favours of the great might insinuate themselves when open hostility had failed. Against both, however, Mr Walter was proof. No dangers or difficulties could daunt him; no proffered advantages conciliate him. So careful was he to avoid even the very appearance of evil, where his honour and independence were concerned, that he shrank from accepting the slightest compliment that could be construed by the bitterest enemy into an attempt to bias his judgment or flatter his self-esteem. Bearing always in mind the saying of the wise man, that "a gift perverteth the understanding of the wise," he steadily refused even those apparently harmless acknowledgments which undoubtedly sprang from the purest gratitude, and which were offered to him in common with some of the most illustrious men of his day. Among other instances, it may not be generally known that at the close of the war he received through the Spanish ambassador a splendid tea-service of gold plate, as a memorial of the vigour and constancy with which he had kept up the spirit of this country during the manifold vicissitudes of the Peninsular war. Mr Walter instinctively shrank from a supposed interchange of personal favours with a Ferdinand, or any set of advisers who might happen to be ascendant in Spain. No sooner had the glittering bauble tantalised the eyes of the feminine spectators, than it was returned to its case, and sent back as it came. This noble self-denial—a proof of watchful integrity—alone covers the name of Mr Walter with undying honours.

THE COUNT DE DIJON.

OF this eccentric but benevolent French nobleman the following anecdote is related:—

One morning during the last winter, being at his country residence, he recollected that the lease of an inn called the Red Cross, about three leagues distant, had expired. The landlord was soliciting a renewal; but wishing to judge of the state of the premises, he set out on foot, although the weather was intensely cold, and the snow falling.

At some distance from his château he overtook a wagoner walking along by the side of his cart. Between pedestrians acquaintance is soon made; and it was not long before the count discovered that the man's name was Penot, his wife's name Marianne; that he had five children, and as many horses; and that all he had to depend on for the support of his family and cattle was his errand-cart.

But all at once, while they were walking on in earnest conversation, the leading horse made a false step, fell down, and broke his leg. At this sight the wagoner cried out in despair, and began to use epithets which are not to be found in any vocabulary of polite conversation.

'You do wrong to utter such language, my friend,' said his companion; 'your conduct in this small misfortune is really sinful. How can you tell what may be the intentions of Providence towards you?'

'Will you hold your peace?' replied the wagoner. 'I wish you were in my place, and that you were losing that fine horse instead of me. Do you know that he cost me twenty-five louis? Do you know how much twenty-five louis are? I am afraid not. What will my poor Marianne say? No, if God were just, He would never have permitted the horse of a poor man like me, with a large family, to have broken his leg.'

'And I tell you again, my friend, that it is wrong to doubt the goodness of God, and for twenty-five miserable louis.'

'You talk very much at your ease about twenty-five louis, as if you knew anything at all about them. Did such a sum ever find its way into your pocket, I wonder? Oh my poor horse! Twenty-five louis are not to be found upon the highways.'

'Well, I will give you the twenty-five louis; so compose yourself,' said the count.

'Oh, you are making game of me into the bargain!'

exclaimed the wagoner, throwing a contemptuous look at the well-worn brown surcoat of his companion. 'You will give them to me—you will steal them then, I suppose? Come, say no more about it, but lend a hand at unharnessing the poor beast. Marianne, poor Marianne! what will she say!'

The count readily did as he was desired, and gave all the assistance in his power; but this accident having caused considerable delay, they did not arrive until late at the Red Cross Inn.

'Can you give me a room and a bed?' said the count to the landlord.

The latter seeing a foot traveller, covered with snow, and without either a cloak or an umbrella, haughtily replied, 'There is no room for you here; you must go elsewhere.'

'But I should have to go a league further, which would not be very pleasant in frost and snow: let me have any place; I am not particular.'

'I should think not, indeed,' replied the hostess; 'but our inn is not for every one that comes the way. I admit none but respectable people—all wagoners; I will admit your companion, but not you.'

'Allow me at least, madame, to share the supper and room of my companion.'

'As to that, it is no concern of mine; you must settle it with him.'

The count then turning to the wagoner, repeated his request.

'Well, be it so. Come then, good woman, supper for two, and a comfortable room.'

When supper was over, they paid their reckoning, and retired to their apartment; the count then made some inquiries respecting the people of the house.

'I know,' replied Penot, 'that they have well feathered their nest; this is the only inn in the district, and during the nine years they have kept it, they must have laid by a pretty good sum. Oh if my poor Marianne and I had such an inn, I should not grieve so much for the loss of my horse!'

'Well, if this house suits you, you shall have it.'

'Why, how bravely you talk! First you say you will give me twenty-five louis, and then you say you will give me an inn. I cannot help laughing at the idea. However, take care; I tell you I won't be played upon.'

'No play in the case. I tell you that if you like this house, I will give it to you,' replied his companion.

'And I tell you again, that if you say another word, I will turn you out of the room,' said the wagoner.

He seemed a likely person to do so, therefore the count said no more.

The next morning the count rose early, and repaired to his solicitor in the next town. After some conversation between him and the solicitor, the latter set off for the Red Cross.

On reaching the inn, he told the landlord that the count had arrived.

'Mercy on us!' exclaimed the landlady, 'where is he? Why would he not honour us by putting up here?'

'He came here, but you refused to admit him,' replied the attorney.

'That is not true; he never came here.'

'Yes,' said the attorney, 'he came here last night in company with a wagoner. Where is this wagoner?'

'There he is,' replied the landlady, pointing to a stout-looking man, who was eating his breakfast near the fire.

'My friend,' said the attorney, addressing himself to the wagoner, 'the person with whom you shared your room last night is the Count de Dijon. In the first place, here are the twenty-five louis he promised to give you for the loss of your horse that broke his leg; and in the next, here is a lease, which puts you in possession of this inn for nine years, on the same terms as your predecessor: but in order to repay you for your hospitality last night to a poor pedestrian, the count gives it to you rent free for the first three years. Will that suit you?'

'Oh my poor Marianne—my five children! Oh my good sir!' exclaimed the wagoner, letting the knife drop from his hands; 'and I who said such rude things to that kind gentleman! Where is he, that I may go and throw myself at his feet?'

'He has returned to his château,' replied the attorney.

THE JEWS AT ROME.

THE Jews first settled in Rome at a period not now to be exactly determined, and under the emperors inhabited the region of Trastevere, where they had a synagogue; they continued in the same location under the popes, though at liberty to reside in other parts till the time of Paul IV., who, by a bull issued in 1555, obliged them to settle on this side the Tiber, within a given circuit, thus originating the enclosure called the Ghetto. Their numbers were allowed to increase under Leo XII., and their quarter was enlarged.

The question of the era of their first establishment in Rome has been discussed at a reunion of the Roman Academy of Archaeology.

The professor of Hebrew in the Roman university opposed, on that occasion, the opinion that the Jews had been first located in Trastevere by Augustus, or that Pompey had conducted them in slavery to Rome after his capture of Jerusalem. He maintained the probability that at least a portion of the colony in Rome had been conducted hither from Asia Minor in the time of the republic; finding support for this opinion from the use of the Greek language in some ancient sepulchral inscriptions belonging to this nation in Rome. He observed that the number settled here at the time of Caligula amounted to about 25,000. So numerous were they at the time of Augustus, that, according to Josephus, 8000 residents accompanied the ambassadors arrived from Jerusalem to the imperial palace. Their burial-place was discovered by Bosio, outside the Porta Aortese, in 1602, with several tombs, on one of which was the seven-branching candlestick, on another the Greek inscription, ΣΥΝΑΓΩΓΗ, proving that their synagogue had existed in that quarter.

The present population of the Ghetto was computed at 3800 five years ago, the number of families 800; but the contemporary press now raises the number of inhabitants to 5000. Amongst these, 2000 are paupers; 1000 support themselves by various trades, chiefly that in articles of dress; and the rest, in easy circumstances, have made their fortunes by merchandise. It is much to their honour that the poor, to whom the rich are so disproportionate in number, are entirely supported by the aims of their co-religionists; and the sick, though admission is open to them alike with Christians into any hospital of Rome, are provided with every attainable comfort, medicine, and advice, from Jewish doctors, without leaving the Ghetto. The chief practitioner of the medical profession (which they are only allowed to exercise among themselves, nor can it consequently be any road to distinction or affluence) is the high priest, who every morning goes his rounds to the houses of the sick, after attending the daily devotions in the synagogue. We have met this functionary, attended by a servant in a Turkish dress, and received with marks of profound reverence as he passes on his medical progress; his imposing and majestic appearance, with a turban, a flowing beard, and long vestment, added much to the Oriental character the scene already possessed, from the *al fresco* habits of living, and peculiar physiognomies of the inhabitants. The high priest (or more properly *capo-rab-bino*) has lately arrived here to fill the place of his deceased predecessor from Jerusalem, where, we have been informed, seven dignitaries of this rank preside over a college supported by the subsidies of the Hebrew communities scattered over the world for the education of rabbis; and with this central synod, the community of Rome is in regular correspondence. Subordinate to him are six or seven rabbis, to perform the usual service in the synagogue, here called the *scuola*.

It is another circumstance much to the honour of the Roman Israelites, that their children of both sexes are almost all educated at the expense of the community; the wealthier parents contribute to the support of the teachers, but the children of others are received at the schools without any exaction of payment, and thus all among the inhabitants receive the same degree of instruction. There are five spacious class-rooms, in a rambling and outwardly dismal-looking mansion; the expenses, over and above what the slight assistance received from the wealthier covers, are defrayed by a contribution made on the simple method of carrying a money-box every day through the streets. At about five years of age, the children begin their studies with the Hebrew language, which precedes the Italian, and they are to a degree masters of this before

even learning the letters of the latter. The religious studies, taken entirely from the Old Testament, occupy the early part of the day; then follow the profane, consisting of writing, accounts, ancient history (Greek and Roman), the Italian language, and, for the higher classes, a course of logic, the author used for which is *Soave*, a writer once in more general repute than at present.

We regret that there is still so much in the condition of this people at Rome imperatively calling for amelioration, before it can be said that they have been dealt with in the spirit of Christian justice. The confinement within a given space (directly tending to confirm national failings, to keep alive whatever prejudices, whatever narrowness of ideas may possibly exist, and to widen the alienation from those whose intercourse might be of healthful consequence) has hitherto prevented them from leaving their quarters after sunset, when the gates are shut, or from settling in any part of the city, however unexceptionable be their character or station—leaving only the privilege of depositing wares for merchandise in buildings without the enclosure. This evil has been, in its principle at least, abolished by the beneficent sovereign; but others, which a deputation of Israelites has submitted to his clemency and judgment—such as the prohibition against the exercise of liberal professions, of all occupations coming within the category of *arts*, thus confining industrial energies to a narrow, un-intellectual, and profitless circle—these are grievances which, we trust, cannot long continue to be felt by any of whatever persuasion among the subjects of Pius IX.—*Roman Advertiser*, as quoted in the *Voice of Jacob*.

MEMORY.

I AM an old man—very old;
My hair is thin and gray;
My hand shakes like an autumn leaf,
That wild winds toss all day.
Beneath the pent-house of my brows,
My dim and watery eyes
Gleam like faint lights within a pile,
Which half in ruin lies.

All the dull years of middle age
Have faded from my thought;
While the long-vanished days of youth
Seem ever nearer brought.
Thus, often at the sunset time
The vales in shadow rest,
While evermore a purple glow
Glids the far mountain's crest.

O'er happy childhood's sports and plays,
Youth's friendships, and youth's love,
I ofttime brood in memory,
As o'er its nest the dove.
In fancy through the fields I stray,
And by the river wide;
And see a once beloved face
Still smiling at my side.

I sit in the old parlour nook,
And she sits near me there;
We read from the same book—my cheek
Touching her chestnut hair.
I have grown old—oh, very old!
But she is ever young,
As when through moonlit alleys green
We walked, and talked, and sung.

She is unchanged—I see her now
As in that last, last view,
When by the garden gate we took
A smiling short adieu.
Oh Death, thou hast a charmed touch,
Though cruel 'tis and cold;
Enbalm'd by thee in memory,
Love never can grow old.

MADAME LOUISE.

BY MRS CROWE.

LOUIS XV. of France had, by his marriage with Maria Leczinska, daughter of Stanislaus, king of Poland, two sons and several daughters. These ladies were the aunts of Louis XVI., of whom we frequently find mention made in the history of that unfortunate monarch.

Madame Louise, the heroine of our story, was one of the youngest, and was also the one that took most after her mother in character. Maria Leczinska was a pious, amiable, tender-hearted woman, and Louise resembled her in these characteristics; whilst the sort of education she received, being brought up in the Abbey of Fontrevaux, tended very much to increase the seriousness of her natural disposition; so that, after she lost her mother, though she continued to reside with her father at Versailles, or Paris, or wherever he might be, and so lived in the court, she was not of it, nor ever imbibed a taste for its splendours or amusements, and still less for its dissipations and vices. Notwithstanding all her virtue and piety, however, Louise was a woman still, and a woman with a tender, loving heart; and in a court where there were so many gay and accomplished cavaliers, it must have been next to impossible for that loving heart to remain untouched. But poor Louise had one safeguard against love, which, pure and pious as she was, she would willingly have dispensed with—she was deformed. With a lovely and bewitching face, and eyes of inconceivable beauty, her figure was quite distorted, from the consequences of an unfortunate fall in her infancy. Without meaning to derogate from her merit, it is extremely possible that this misfortune may have considerably influenced her character, and led her to seek in Heaven those consolations of the heart that she despaired of enjoying on earth.

Of course each of the princesses had a regular suite of servants, and of ladies and gentlemen in waiting; and amongst these, each had also an écuyer and a lady of honour, who were in immediate and constant attendance on their persons. The office of the écuyer was one which placed him in a peculiar situation as regarded his mistress: he placed her chair, opened the door for her, handed her up and down stairs, and accompanied her in her drives and walks, and, in short, wherever she went; so that, were it not for the respect due to royalty, it must have been difficult for a susceptible young man, or a susceptible man of any age, to be in this hourly attendance on a charming princess and retain his heart entire. The deformity of poor Madame Louise, as well as her piety, however, were perhaps thought sufficient defences against any dangers of this description, as regarded either party; for without some such confidence, it would seem a great oversight on the part of the king to have placed in this necessarily intimate relation with

her one of the most fascinating men about the court; for such, by universal admission, was the young Vicomte Anatole de Saint-Phale, who was appointed écuyer to the princess upon the marriage, and consequent resignation, of the Baron de Brignolles.

At the time of his appointment, Saint-Phale was not much more than twenty years of age, the son of a duke, handsome, accomplished, eminently agreeable, and with a name already distinguished in arms. He had himself solicited the appointment, and it had been granted to his own wishes, and the influence of his father, without demur; Madame Louise, when the thing was mentioned to her, making no objection. Indeed she had none. The vicomte was but little known to her; for, avoiding the court festivities as much as her father would permit, and when she did attend them, appearing there rather as a spectator than a partaker—beyond the general characters and the personal appearance of the gay cavaliers of the court, she knew nothing of them. She had always heard Saint-Phale's name coupled with the most flattering epithets; she had also heard that he was brave, generous, honourable, and extravagantly beloved by his father and mother; and her own eyes had informed her that he was extremely handsome. To the latter quality she was indifferent; and the others well fitting him for his office about her person, she signed his appointment without hesitation, little dreaming at the moment that she was also signing the fiat of her own destiny. In due time the Baron de Brignolles took his leave, and the vicomte entered on his duties; and it soon appeared evident to everybody that he had not sued for the situation without a motive. The princess's lady of honour was the Comtesse de Châteaugrand, Anatole's cousin; and with her he was, to all appearance, desperately smitten. He wore her colours, as was the fashion of the gallant world at that period, paid her the most public attentions, and seemed determined not only to be violently in love, but that all the world should know it.

There was, however, nothing very surprising in this. The Comtesse de Châteaugrand was a widow with a considerable fortune, and though nearly ten years older than Anatole, she was still extremely handsome; added to which, she was very amiable, much esteemed by her mistress, and she and the young vicomte had always been on the most friendly terms. His passion, therefore, as we have said, excited no surprise in anybody; but whether the lady returned it, was altogether another affair, and was indeed a question that created considerable discussion amongst the curious in these matters.

'But she looks so happy—so calm!' said the young Duchesse de Lange.

'And why not, when she has every reason to be so?' answered the Comtesse de Guiche. 'Are not his attentions unremitting? What can she desire more?'

'Ah, true,' replied the other; 'happy if you will, but calm!'

'Well, and why not calm?' repeated Madame de Guiche.

'Ah, one is never calm when one loves!' returned the duchesse, with a little air of affectation.

'That is so like you!' returned the comtesse laughing. 'You are so sentimental, my dear—a real heroine of romance. I maintain that Madame de Châteaugrand is perfectly content, and that she intends in due time to reward his devotion with her hand. I am sure he deserves it. Except waiting on the princess, he never does anything in the world but attend to her caprices; and I do believe she often affects to be whimsical, for the sake of giving him occupation.'

'He certainly does not seem to recollect that there is another woman in the world besides the princess and his cousin,' said the duchesse with some little spite.

Many a conversation of this nature was held almost within hearing of one of the parties concerned—namely, the vicomte—and many a jest, besides, amongst his own companions, rendered it quite impossible that he should be ignorant of the observations made upon him and Madame de Châteaugrand; but he never showed himself disposed to resent this sort of interference, nor did it cause him to make the slightest attempt at concealing his attachment; whilst the comtesse herself, though she could not be more ignorant than he of the court gossip, appeared equally indifferent to it. The consequence was, as is usual in similar cases, that the gossip nobody seemed to care for, and which annoyed nobody, became less interesting; and gradually the *grande passion* of the Vicomte Anatole for his cousin being admitted as an established fact, whilst it was concluded, from the calmness of the lady's demeanour, that she had accepted his proposals, and that they were to be married some day, people began to think little about them; and except a hint now and then, that in all probability the true interpretation of the mystery was, that they were privately married already, very little was said.

But now there arose another bit of court gossip. 'Observe, my dear,' said the Duchesse de Lange to her friend the comtesse, 'how fast Madame de Châteaugrand is declining in the princess's favour!'

'I am perfectly confounded at it,' returned Madame de Guiche; 'for certainly her attachment to Madame Louise is very great; in short, it is devotion; and the princess herself has always, till lately, appeared to set the greatest value on it. How is it that she, who never in her life showed the slightest tendency to caprice, should begin with such an injustice towards her most faithful friend?'

'It is inconceivable!' replied the duchesse. 'But what do you think the Duc d'Artois says about it?'

'Oh, the wicked man!' returned the Comtesse de Guiche laughing; 'but what does he say?'

'He says it is the attachment between her and Saint-Phale that offends the princess: that she is so rigid, that she can neither be in love herself, nor allow anybody else to be so; and that he has seen her turn quite pale with horror at the sight of the vicomte's attentions.'

'Be in love herself—certainly not,' said Madame de Guiche; 'besides, to what purpose, poor thing, with her unfortunate figure? But I think she is much too kind-hearted to endeavour to cross the loves of other people. However, certain it is, that she is not so fond of Madame de Châteaugrand as she was.'

And so, to her great grief, thought Madame de Châteaugrand herself. Louise, the gentle, the kind, the considerate, was now often peevish, impatient, and irritable; and what rendered the change infinitely more afflicting to the comtesse was, that all these ill-humours seemed to be reserved solely for her—to every one else the princess was as gentle and forbearing as before. So she was even to her at times still; for there were moments when she appeared to be seized with remorse for her injustice, and on these occasions she would do everything in her power to make amends

for it; but as these intervals did not prevent an immediate recurrence of the evil, poor Madame de Châteaugrand began to think very seriously of resigning her situation, and so she told the vicomte.

'If you do, my dear Hortense,' answered he, turning as pale as if she had pronounced his sentence of death—'if you do, I am undone!'

'Why?' said the comtesse. 'You need not resign because I do.'

'I should not dare to remain,' answered he. 'Besides, it would be impossible—I know it would! I have always told you so. But for you I never could have undertaken the situation, as you well know: I should have been discovered.'

'But my dear Anatole, you can hardly expect me to remain here to be miserable; and I really am so,' returned Madame de Châteaugrand. 'It is not that I would not bear with her humours and caprices; I love her well enough to bear with a great deal more; but to lose her friendship, her affection, her confidence, breaks my heart.'

'She must be ill,' said the vicomte. 'Some secret malady is preying on her, I am certain. Do you observe how her cheek flushes at times, and how her hand trembles? To-day, when I handed her a glass of water, I thought she would have let it fall.'

'It may be so,' returned Madame de Châteaugrand. 'Certain it is, that she does not sleep as she used to do—in short, I believe she is often up half the night walking about her room.'

'I think his majesty should be informed of it,' said the vicomte, 'that he might send her his physician.'

'I think so too,' answered the lady; 'but when I named it to her the other day, she was very angry, and forbade me to make any remarks on her; and, above all, enjoined me not to trouble her father with such nonsense.'

'I am afraid her religious austerities injure her health,' said Anatole.

'Apropos,' returned the comtesse; 'she desired me to tell you that she goes to St Denis to-morrow immediately after breakfast, and that no one is to accompany her but you and me.'

St Denis, as is well known, is the burying-place of the royal family of France, and there, consequently, reposed the remains of Maria Leczinaska, the princess's mother; and it was to her tomb that Madame Louise first proceeded alone, whilst her two attendants remained without. A long hour they waited for her; and Saint-Phale was beginning to get so alarmed at her absence, that he was just about to violate her commands by opening the gate of the sanctuary, when she came out pale and exhausted, and with evident traces of tears on her cheeks. She then entered the precincts of the convent, requesting to be conducted to the parlour. Even in a convent of holy nuns, who have abjured the world and its temptations, the *prestige* of royalty is not without its effect; and on this occasion the prioress came forth to meet the princess, whilst the sisters rushed to the corridors to get a peep at her, with as mundane a curiosity as the mob runs after a royal carriage in the streets of Paris or London. Louise looked at them benevolently; and with tears in her eyes, and a sad smile, told them how much happier they were than those who lived amongst the intrigues and turmoils of a court. 'Ah, my sisters,' she said, 'how happy you should be! What repose of spirit you may attain to in this holy asylum!'

Alas! could she have looked into some of those hearts, what a different tale they would have told her! But when we are very miserable ourselves, that situation which presents the greatest contrast to our own is apt to appear the one most desirable.

'There is amongst you, my sisters—that is, if she be still alive—a princess, at whose profession I was present when a child, with my mother,' said Madame Louise. 'Is the friend of Maria Leczinaska here?'

'I am here,' answered a sweet low voice.

'Clotilde de Mortemart?' said the princess inquiring, looking in the direction of the voice.

'Formerly,' answered the nun; 'now *Sœur Marie du Sacré Cœur*.'

'I would speak with you,' said Madame Louise, taking her by the hand; 'lead me to your cell.'

Accordingly, whilst all the others retired, Sister Marie conducted her royal visitor to her little apartment.

'That stool is too inconvenient for your highness,' said she, as the princess seated herself. 'I will ask the prioress for a chair.'

'By no means; it is what I wish,' said Madame Louise. 'Sit down opposite me—I want to talk to you. Nay, nay, sit!' she added, observing the hesitation of the nun. 'Sit, in the name of Heaven! What am I, that you should stand before me? Would to God I was as you are!'

'How, madame!' said the sister, looking surprised. 'Are you not happy?'

'Friend of my mother, pity me!' exclaimed the princess, as she threw herself into the nun's arms with a burst of passionate tears—for they were the first open demonstration of a long-suppressed grief. 'Tell me,' she continued after an interval as she raised her tearful face—'tell me, are you really happy?'

'Yes,' replied Sister Marie, 'very happy now.'

'Would you go back again to the world; would you change, if you could?'

'No, never!' answered the nun.

'I remember your taking the veil,' said Madame Louise, after an interval of silence; 'and you will remember me, probably, as a child at that time?'

'Oh yes; well, quite well, I remember you,' replied the nun. 'Who could forget you that had once seen you?'

'I was pretty, I believe, as a child,' said Louise.

'Beautiful! angelic! as you are now my princess!' exclaimed Sister Marie, surprised for a moment, by her enthusiasm and admiration, out of her nunlike demeanour.

'As I am now?' said Louise, fixing her eyes on the other's face.

'Pardon me!' said the nun, falling at her feet, fearing that the familiarity had offended; 'it was my heart that spoke!'

'Rise, my sister,' said Louise; 'I am not offended; rise, and look at me!' and she threw aside the cloak which, with its ample hood, had concealed her deformity.

'Jesu Maria!' exclaimed the sister, clasping her hands.

'You are a woman—you were once young yourself, and, as I have heard, beautiful also. Judge, now, if I am happy!'

'But, my princess,' answered the nun, 'why not? Is there no happiness on earth, nay, even in a court, but with beauty? Besides, are you not beautiful? Ay, and a thousand times more so than hundreds that are not!'

'Deformed,' rejoined Louise: 'do not fear to utter the word; I repeat it to myself a hundred times a-day.'

'This amazes me,' said Sister Marie, after a pause, whilst her countenance expressed her surprise as eloquently as words could have done. 'Madame Louise, the fame of whose devotions and self-imposed austerities has reached even our secluded ears, are they but the refuge of a mortified!'

'Vanity,' added the princess, as respect again caused the nun to hesitate. 'Not exactly: I cannot do myself the injustice to admit that altogether, for I was pious before I knew I was deformed. It was my natural disposition to be so; and my mother, foreseeing how much I should need the consolations of religion, cultivated the feeling as long as she lived; and when I was old enough to be aware of my misfortune, I felt what a blessing it was that I had not placed my happiness in what seemed to make the happiness of the women

that surrounded me. But it was not to speak of myself that I came here,' continued Madame Louise, 'but to ask a favour of you. Young as I was when you took the veil, the scene made a great impression upon me; and I well remember my mother's tears as we drove back to Paris after she had bade you farewell. I remember also, when I was older, hearing a motive alleged for your resolution to retire from the world, which, if it would not give you too much pain, I should be glad to learn from your own lips.'

The pale cheek of the nun flushed with a faint red, as she said, 'What would my princess wish to hear?'

'Is it true,' said Madame Louise, 'that it was an unrequited love that brought you to this place?'

'It was,' answered the sister, placing her hand before her eyes.

'Excuse me,' said Madame Louise; 'you will think me cruel to awaken these recollections; but it must have been a bitter sorrow that could have induced you, so young, so beautiful, so highly-born, to forsake the world and become a Carmelite?'

'It was,' returned the nun, 'so bitter, that I felt it was turning my blood to gall; and it was not so much to flee from the misery I suffered, as from the corruption of my mind and character, that I fled from the sight of that which I could not see without evil thoughts.'

'Ah, there it is! I understand that too well!' said the princess; 'you were jealous!'

'I was,' answered the nun; 'and what made it so bitter was, that the person of whom I was jealous was the woman I loved best in the world.'

'You loved Henri de Beaulieu, and he loved your cousin?' said Madame Louise. The nun covered her face with her hands and was silent. 'How cruel you must think me, to rend your heart by recalling these recollections!' continued the princess.

'It is so long since I heard that name,' said Marie, 'I did not think I was still so weak.'

'But tell me,' said Louise, seizing her hand, 'did your anguish endure long after you had entered these gates? Did repose come quickly?'

'Slowly, slowly, but surely,' returned the nun with a sigh. 'Till I had taken the irrevocable vow, I had a severe struggle; but I never wavered in the conviction that I had done wisely; for it was only by this living death I could have ever conquered myself. Dreadful temptations had sometimes assailed me whilst I saw them together. Here I saw nothing—heard nothing; and my better nature revived and conquered at last.'

'I see,' said the princess, rising: 'I comprehend it all!' and then embracing her, she added, 'Pardon me the pain I have given you: it has not been without a motive. We shall meet again ere long.'

On the following day, Madame Louise requested a private interview with the king, for the purpose of obtaining his permission to join the Carmelites of St Denis. Louis was at first extremely unwilling to hear of the proposal. Louise was his favourite daughter; and he not only did not like to part with her, but he feared that her delicate health would soon sink under the austerities of so rigid an order. But her determination was taken; and at length, by her perseverance, and the repeated assurance that she was not, nor ever could be, happy in the world, she extracted his unwilling consent. She even avowed to him that, besides her own private griefs, the being obliged to witness his irregularities afflicted her severely; and as she believed that to immure herself in a convent, where she could devote her life to prayer, was a sacrifice pleasing to the Almighty, she hoped by these means to expiate her father's errors, as well as attain peace for herself. Fearing the opposition she might meet with from the rest of her family, however, she intreated the king's silence, whilst she herself communicated her resolution to nobody except the Archbishop of Paris; and he having obtained his majesty's consent in form, Madame Louise at length, on the 11th of April 1770, at eight o'clock in the morning, bade adieu to Versailles for ever.

Accompanied by the vicomte and Madame de Châteaugrand, to whom, since her former visit to the convent, she had been all kindness, she stepped into her carriage, and drove to St Denis. As by taking the veil she renounced all earthly distinctions, and amongst the rest that of being buried with the royal family of France, she now visited those vaults for the last time; and having knelt for some minutes at the tomb of her mother, she repaired to the convent, leaving her two attendants in the carriage. The abbot, who, having been apprised by the archbishop, was in waiting to conduct her to the parlour, now addressed several questions to her with respect to her vocation, representing to her the extreme austerity of the order, which was indeed a sort of female La Trappe. She answered him with unshaken firmness; and then, without once looking behind her, she passed into the cloister, where the prioress and the sisterhood were informed of the honour that awaited them. She next proceeded to the chapel, where a mass was performed; and having thus, as it were, sealed her determination, she requested that her two attendants might be conducted to the parlour, whilst she, through the grate which now separated her from the world, told them that they were to return to Paris without her.

The effect of this unexpected intelligence on Madame de Châteaugrand was no more than the princess had anticipated. She wept, intreated, and expostulated; but the Vicomte de Saint-Phale, after standing for a moment as if transfixed, fell flat upon his face to the ground. Amazed and agitated at so unexpected a result, the princess was only restrained by the grating which separated them from flying to his assistance; but before she could sufficiently recollect herself to resolve what to do, the prioress, fearing the effect of so distressing a scene at such a moment, came and led her away to her own apartments.

It would be difficult to describe the state of the princess's mind at that moment. The anguish expressed by Saint-Phale's countenance could not be mistaken. He that she had supposed would be utterly indifferent to her loss! Why should it affect him thus, when he had still with him his love, the chosen of his heart—Hortense de Châteaugrand? She did not know what to think; but certain it is, that the resolution which had been so unflinching an hour before, might perhaps, but for *pride*, have been now broken. With a bewildered mind and a heavy heart she retired to her cell, and there kneeling, she prayed to God to help her through this last struggle.

From that time nothing more was known with respect to Madame Louise till six months afterwards, when, her novitiate being completed, she made her profession. On that morning the humble cell inhabited by the princess exhibited a very unusual appearance: robes of gold and silver brocade, pearls and diamonds, and a splendid lace veil, were spread upon the narrow couch. In this magnificent attire she was for the last time to appear before the world, and for the last time her own women were in attendance to superintend her toilet. When she was dressed, everybody was struck with her beauty; and as she wore a superb cloak, the only defect of her person was concealed.

Of course the profession of a 'daughter of France' was an event to create a great sensation. All Paris turned out to see the show, and the road from thence to St Denis was one unbroken line of carriages. Mounted officers were to be seen in all directions, the Royal Guard surrounded the abbey, and the pope's nuncio came from Rome to perform the ceremony.

On this solemn occasion, of course the attendance of the princess's écuyer and lady of honour was considered indispensable, and Louise had prepared herself to see them both; but instead of Saint-Phale, to her surprise she beheld advancing to offer his arm her former attendant, the Baron de Brignolles. A pang of disappointment shot through her heart: he had not cared, then, to see her for this last time, and she should behold him no more! She felt that she turned pale and trembled, and

she could not trust her voice to inquire the cause of his absence; but De Brignolles took an opportunity of saying, that hearing the vicomte was too ill to attend, he had requested permission to resume his service for this occasion. Louise bowed her head in silence—she durst not speak.

At that solemn ceremony were present Louis XVI. then dauphin of France; Marie-Antoinette, the queen of beauty, and the idol of the French nation; the Comte de Provence, afterwards Louis XVIII.; and the Comte d'Artois, who subsequently, as Charles X., likewise lost the throne.

After an eloquent discourse by the Bishop of Troyes, which drew tears from every eye, the princess retired for a few moments, and presently reappeared strip of her splendour, shorn of her beautiful hair, and clothed in the habit of the order. She was then stretched on the earth, covered with a pall, and the prayers for the dead pronounced over her. When she arose, the curtain which closed the entrance to the interior of the convent was lifted, and every eye was fixed on it as she passed through the opening, to return to the world no more. As that curtain fell behind her, a fearful cry echoed through the vaulted roof of the abbey, and a gentleman was observed to be carried out of the church by several persons who immediately surrounded him. Every one, however, was too much occupied with his own feelings at the moment to inquire who it was. On the ear of the new-made nun alone the voice struck familiarly; or perhaps it was not her ear, but her heart that told her it was the voice of Saint-Phale.

Louise was a Carmelite; the profligacies of the king and the court proceeded as before; Madame de Châteaugrand, instead of marrying her cousin Saint-Phale, married M. de Rivremont, to whom it appeared she had been long engaged; and Saint-Phale himself, after a long and severe illness, which endangered his life, quitted France for Italy, whither he was sent for the sake of the climate. At length, in 1777, when Lafayette astonished the world by his expedition to America, the vicomte astonished his friends no less by returning suddenly from the south, in order to join it; and in spite of the intreaties of his relations, he executed his design, and there he fell at the battle of Monmouth, in the year 1778.

He did not, however, die in the field, but lingered some days before he expired; during which interval he wrote farewell letters to his father and mother; and one also, which he intreated the latter to deliver according to its address, which was to 'The Sister Thérèse de Saint Augustin, formerly Madame Louise de France.'

As soon as the poor bereaved mother had sufficiently recovered the shock of this sad news, she hastened to St Denis to fulfil her son's injunction; and the Sister Thérèse, having obtained permission of the superior, received and opened the letter. The first words were an intreaty that she would listen to the prayer of a dying man, who could never offend her again, and read the lines that followed. He then went on to say that from his earliest youth he had loved her; and that it was to be near her, without exciting observation, that he had solicited the situation of écuyer; but knowing that, from the inequality of their conditions, his love must be for ever hopeless, he had studiously concealed it from its object. No one had ever penetrated his secret but Madame de Châteaugrand. He concluded by saying, that when that curtain hid her from his view on the day of her profession, he had felt the world contained nothing more for him, and that he had ever since earnestly desired that death which he had at length found on the field of battle, and which he had gone to America on purpose to seek; and asking her blessing and her prayers, he bade her farewell for ever.

Poor Louise! poor Thérèse! poor nun! poor Carmelite! For a moment she forgot that she was the three last, to remember only that she had been the first; and falling on her knees, and clasping those thin

transparent hands, wasted by wo and vigils, she exclaimed with a piercing cry, 'Then he loved me after all!'

Rigid as were the poor nun's notions of the duty of self-abnegation, such a feeling as this was one to be expiated by confession and penance; but as nuns are still women, it was not in the nature of things that she should not be the happier for the conviction that her love had been returned—nay, more than returned, for Saint-Phale had loved her first; and if she had forsaken the world for his sake, he had requited the sacrifice by dying for her. It was a balin even to that pious spirit to know that she, the deformed, the *bossue*, as she called herself, who had thought it impossible she could inspire affection, had been the chosen object of this devoted passion.

Madame Louise survived her lover nine years; and they were much calmer and happier years than those that preceded his death. She could now direct her thoughts wholly to the skies, for there she hoped and believed he was: and since human nature, as we have hinted before, will be human nature within the walls of a convent as well as outside of them, she had infinitely more comfort and consolation in praying for the repose of his soul in heaven, than she could have had in praying for his happiness on earth—provided he had sought that happiness in the arms of Madame de Châteaugrand, or any other fair lady.

LIEBIG'S RESEARCHES ON FOOD.

Nothing but accurate scientific investigation can ever teach the proper treatment of the human system either in health or in disease. No length of experience of vague sensations, following up the taking of certain kinds of food, exercise, or drugs, is enough to determine the precise virtues of these appliances. There is only one sure way of finding out the exact uses and functions of what we eat, or what acts on our bodies; and that is, to determine precisely on the one hand the substances used by nature in the vital processes, and on the other, the composition of the materials that we supply to the system. If we determine first the wants of the body, and next the resources of the world, and select the latter exactly to meet the former, we will learn on truly rational grounds the way of keeping up the vigour of our physical framework.

Baron Liebig is at present conducting a series of researches on the nutrition of animals, on exactly the same principle that he and others have proceeded with respect to the nourishment of plants.* A plant is analysed, and found to contain certain constant elements; some of these derived from air and water, others of an earthy kind derived from the solid soil. The requirements of the plant being thus laid open, it can be seen by a similar investigation if a soil contains in proper form these precise elements. If it contain some of them, and not others, then what is wanting is communicated, and no more. This is true insight and rational practice. All other schemes, founded on what is called 'farming experience,' can be at best mere probabilities.

The present work of Liebig is a contribution to the accurate knowledge of the action of food on the system. It is wholly devoted to the constitution of the flesh or muscles of the body, which form one of the largest and most important constituents of the system. The fleshy masses, which make the soft parts between the skin and the deep-lying bones of the skeleton, are the prime forces of the moving organs—the source of strength, energy, and every form of bodily activity. The first consequence of derangement in the constitution of the flesh is a loss of working vigour; and this is apt to

be followed up with disorders in the other parts of the system—the stomach, lungs, brain, &c. It is of prime importance, therefore, that we should know in a rigorous scientific way (which means in the *one perfect way*) what is necessary for preserving or restoring the elements which enter into healthy flesh.

Liebig, accordingly, has set to work, by chemical analysis, to find what are the substances that are combined together in animal muscle; and in the present work he has described them, so far as his examination has gone. Some of the substances that he has found are entirely new; and he confesses that there yet remain one or two constituents which he has not sufficiently investigated, so as to be able to say what they are.

Flesh is made up of solid fibres, cells, membranes—all of an organised structure—with fat; it also contains a very large quantity of liquid matter, called the juice of the flesh. This juice is a solution of a great many elements or substances in water; the weight of the water itself being many times that of all the dissolved substances put together. Liebig's investigations have been directed to the analysis of these substances. He takes a mass of ten pounds of newly-killed flesh, reduces it to a fine mince, mixes it with water, and squeezes the whole mass through a linen bag, until he has extracted as much of the liquid contents as possible, and left only the solid portions behind. When the fluid thus obtained is heated up to a certain temperature, the *albumen*, which is one constituent, coagulates, and can be separated. At a still higher temperature, the *colouring matter*, which makes the redness of raw flesh, also coagulates, and is removed. The separation of these simplifies the compound. The remaining fluid is always of an acid character, showing that it contains, with its other ingredients, one or more acid substances, in a free or unneutralised state. A part of the inquiry is to find what these acids are: accordingly, an alkali (*baryta*) is poured in to combine with and precipitate them. The precipitate is withdrawn and examined, and found to consist of *phosphates*, which phosphates have the double base of baryta and magnesia, which last, therefore, must have been present in the juice. It is thus shown that *phosphoric acid* is an essential constituent of the juice of muscle.

The liquid that is freed by filtration from these precipitated phosphates is slowly evaporated, until at last crystals, in the form of colourless needles, appear at the bottom. These crystals, when examined by chemical tests, are found to be an entirely new substance, with distinct and specific properties, which Liebig has fully investigated; and it has received the name of *kreatine*, from the Greek word for flesh. This kreatine, therefore, is an invariable constituent of the muscular fluid. Its amount in any animal is greatest when there is least fat; as fat accumulates, it diminishes.

The physical properties of a substance are its specific gravity, texture, colour, and appearance. The chemical properties are its composition, or the proportions of its elementary constituents, and its chemical action upon other bodies, such as acids, alkalies, and tests of all sorts. These properties Liebig has detailed in reference to the new substance, and by them a key will be found to its uses in the living body.

The action of a strong acid on kreatine creates a second substance hitherto unknown to chemists, which is alkaline in its nature, called by Liebig *kreatinine*. This substance, however, may not only be produced from kreatine, but it is found in the system as another permanent constituent, and as such its properties deserve and have received a distinct investigation.

The original kreatine, resolved by an acid into kreatinine, is next resolved by baryta into two other elements, one of them *urea*, already well known; but the other is a completely new substance of the alkaline character, named *sarcosine*, and apparently worthy of being studied. Here, therefore, from one crystalline deposit there arises three *organic compounds*, that have all something to do with human vitality.

* *Researches on the Chemistry of Food*, by Justus Liebig, M.D., Professor of Chemistry in the University of Giessen. Edited from the Manuscript of the Author, by William Gregory, M.D., Professor of Chemistry in the University of Edinburgh. London: Taylor and Walton. 1847.

We are not yet done with the original liquid. After the crystals of kreatine are deposited, there is a liquor still remaining. By adding alcohol to it, it is made to give a new deposit in white foliated crystals. These are separated by filtration, and examined, and yield a fourth new substance of an acid character, called by Liebig *inosinic acid*. This is a very remarkable element. The flavour of the meat seems to reside in it: when it is acted on by a high heat, it gives off the very smell of roasting meat. Its properties are also given.

Recurring again to the unexhausted mother liquid, and adding more alcohol, a new separation takes place; a thick sirupy substance falls to the bottom, and a lighter liquid floats above. The separate examination of these brings out additional elements. Here is found the kreatinine natural to the muscle. There is also now found *lactate of potash*; and it turns out that *lactic acid*, or the acid of sour milk, is a constant element of muscular juice, as well as the phosphoric acid that came out at an earlier stage. The lactates of flesh receive from Liebig a separate investigation.

After settling the characters of these great organic constituents—kreatine, kreatinine, sarcosine, inosinic acid—and the compounds of lactic acid, he now turns to what are called the inorganic elements, such as phosphoric acid, potash, and other alkalis, and finds a curious speculation upon the presence and mutual actions of the lactic and phosphoric acids. The great idea of the speculation is, that lactic acid is the substance that directly supports respiration, or whose consumption gives the animal heat; and that the sugar and starch taken in our food are changed into lactic acid, in order to become respiratory elements. In fact, the use of sugar is to supply the lactic acid constituent, which has to serve this and other purposes in the body. Another very refined speculation is offered by the author, founded on the fact, that the alkali contained in the flesh is potash, and the alkali contained in the blood is soda. He shows how the chemical properties of phosphoric acid and soda, which go together in the blood, would explain the process whereby nature makes the exchange of carbonic acid for pure oxygen, in the final act of the respiratory process. But this we have not space to dwell upon.

These elements do not exhaust the constituents of muscle, and it will take much additional study to follow out all their functions in the human body. Moreover, muscle, although a very important tissue, is only one out of many; and it will be necessary to go through a similar examination of nerve and other tissues before the chemical actions involved in the animal system are fully known. But in the meantime, Liebig draws some very important practical inferences from the discoveries already made.

In the first place, he shows how the boiling of meat acts upon the various constituents of the juice. We require, for the support of our muscle, not merely the fibrous matter of animal flesh, but all the array of the albumen, lactates, phosphates, kreatine, &c. already mentioned: if any of these are allowed to escape, we are deprived of some needful element, and our system suffers. Now, cold water can dissolve the great mass of these important ingredients, so that if meat is put into cold water, and slowly boiled up, the water will have carried off all the albumen and several other substances, and the remaining beef will be a kind of husk, insufficient to nourish the system, unless the water it has been boiled in is taken at the same time in the form of soup. To boil beef without losing the nutritious and savoury elements, Liebig gives the following directions:—The water is, in the first place, to be put into a brisk boiling state; into this boiling water the meat should be plunged, and allowed to lie for a few minutes; it is then taken out, and cold water is to be poured into the boiler till the heat be reduced far below boiling, or to about 160 degrees; the meat is then put in again, and kept in the water at this temperature for two or three hours. Everything is in this way effected

that can render the flesh pleasant and wholesome as food. The contact with the boiling water at the outset coagulates the albumen of the flesh all round the surface of the meat, and closes up its pores with a solid wall, that none of the internal juices can pass through, and the meat is preserved in all its integrity while undergoing the action of the heat.

On the other hand, when we wish to have a rich soup, we must take means for thoroughly extracting the various elements of the fleshy juice, for these elements are the essential portion of a soup. A perfect soup would be a mixture of all the soluble constituents of the muscle—in fact, Liebig's original mother liquor, which he wrought upon to bring out all the various substances already enumerated. Accordingly, the plan of making soup is as follows:—

‘When one pound of lean beef, free of fat, and separated from the bones, in the finely-chopped state in which it is used for beef-sausages or mince-meat, is uniformly mixed with its own weight of cold water, slowly heated to boiling, and the liquid, after boiling briskly for a minute or two, is strained through a cloth from the coagulated albumen and the fibrine, now become hard and horny, we obtain an equal weight of the most aromatic soup, of such strength as can be obtained even by boiling for hours from a piece of flesh. When mixed with salt, and the other usual additions by which soup is usually seasoned, and tinged somewhat darker by means of roasted onions or burnt sugar, it forms the very best soup that can be prepared from one pound of flesh.’

An extract of meat thus prepared is found to be an invaluable provision for an army in active service. Administered along with a little wine to wounded soldiers, it immediately restores their strength, exhausted by loss of blood, and enables them to sustain the fatigue of removal to the nearest hospital. Of course what is so useful in this extreme case must be useful in thousands of minor occasions of bodily prostration. The loss of strength means the loss of the substances that support vitality, such as these very ingredients of fleshy juice. The fleshy fibre itself is wasted more slowly than the substances that float in the liquid that invests it; so that, in fact, a supply of these matters has a more instantaneous action than any other refreshment. We can thus explain the effect of soups upon convalescent patients. No doubt the perfect soup of Liebig's description would be found to have a far greater strengthening power than the generality of those in common use.

There is one other principle of very great consequence stated in the volume before us. It is, that the gastric juice of the stomach, which dissolves the solid food into a liquid pulp, has nearly the same ingredients as the juice of flesh; so that the power of digestion will be very much affected by the supply of the constituents of juice to the system. Hence a good flesh-extract soup, besides giving materials to the muscle, provides the solvent liquid of the stomach, and facilitates digestion. To people suffering from indigestion in the sense of deficiency in the gastric juice, the supply of this material is the natural remedy. Another useful hint is also suggested by this connection of stomach and muscle. The digestion of the food, and the exertion of the muscles, consume the same ingredients, so that both operations cannot well be sustained together beyond a certain limit. Moreover, it naturally follows that rest during one operation will cause increase of energy in the other. During the height of the digestive action, muscular exertion cannot well be afforded, unless there is a great overplus of the common aliment. It is well known that when digestion is weak, rest after meals is necessary, and that excessive exercise unfits the stomach for its work. The explanation now afforded may supply practical wisdom on this head to all men.

Liebig has also pointed out the effect that the salting of meat has on the precious constituents of its juice. The salt withdraws a great portion of these dissolved matters, which are thrown away with the brine. The

injuriousness of a long course of salt provisions is thus distinctly accounted for. He also gives some suggestions as to the mode of salting meat without abstracting the ingredients of the juice.

In these investigations, Liebig has made use of flesh derived from a great range of animals, and has determined the comparative richness of each in the various substances in question. He has tried the flesh of ox, roedeer, horse, hare, fox, fowls, fishes, &c. In this way he is likely to furnish, what has been sought for in vain by other methods, a comparison of the nutritive qualities of the different kinds of food. No man that understands the real difficulty of settling such a point, can put the slightest faith in any of the tables of the comparative digestibility or nutritiveness of substances that have hitherto been put forth in books of medicine or dietetica.

JOSEPH TRAIN'S ACCOUNT OF THE ISLE OF MAN.*

THE name of Mr Train has become widely known, in consequence of the acknowledgment of Sir Walter Scott of the obligations he lay under to him for hints towards sundry of the Waverley Novels. Now passing into the vale of years, after a creditable fulfilment of all the common duties of life, he appears to us as an admirable specimen of the genius of self-taught and self-raised men. While possessed of strong poetical tastes, he has gone beyond the ordinary range of his class in a zealous cultivation of historical antiquities, of which we have here goodly proof in two volumes, embracing all that can be desired of the past and present of the Isle of Man. We delight to see the worthy veteran successfully bringing so laborious a task to a close.

The very peculiar history of this little outlying portion of the empire; its long possession of an independent race of princes; its retaining even till now institutions proper to itself—render it an object of curiosity beyond any similar space of British ground. Mr Train has done all that we should think possible in recovering its early annals, and throwing them into an intelligible narrative: a sad view they give of bloody wars and popular sufferings. A portion of his work, devoted to the superstitions, the manners and customs of the people, is more attractive to the general reader. Statistics, however, and even the natural history of the island, are not overlooked. The author seems to have aimed at exhausting the subject in all respects, and he has pretty well succeeded in his purpose.

Man comprises two hundred square miles, much of it hilly and waste, and about fifty thousand inhabitants. With lighter taxation than England, it returns about £70,000 of revenue. The people are Celtic, and speak a language resembling the Gaelic of our Scottish Highlanders. They have retained old customs and superstitions longer than any other people under the British crown. Will it be believed that the kindling of Baal fires—that is, celebrating the anniversary of the pagan god Baal or Bel—was observed on the 1st of May 1837? Or that a trial, equivalent to a trial for witchcraft, went on before a jury of Manxmen in December 1843? On this occasion, while a poor woman was in the course of being asked if she ever came in *any shape or form* to do John Quine an injury, a wag let loose a rabbit in the court, when all became extreme confusion, and the jury, with eyes staring, hair on end, and mouths distorted, exclaimed, 'The witch! the witch!' nor was the uproar quieted till one of the crowd seized and killed the animal. There still survives in this island, in the same latitude with the county of Cumberland, a fairy doctor of the name of Teare, who is resorted to when all other aid fails. 'The messenger that is despatched to him

on such occasions is neither to eat nor drink by the way, nor even to tell any person his mission: the recovery is said to be perceptible from the time the case is stated to him.' Farmers delay their sowing till Teare can come to bless the seed. Mr Train has seen and conversed with this strange pretender.

'The first time I saw him he was mounted on a little Manx pony, that seemed aware of its master having neither whip nor spur to quicken its pace, as it moved very tardily along the wayside. The seer is a little man, far advanced into the vale of life; in appearance he was healthy and active; he wore a low-crown slouched hat, evidently too large for his head, with a broad brim; his coat, of an old-fashioned make, with his vest and breeches, were all of loaghtyn wool, which had never undergone any process of dyeing; his shoes, also, were of a colour not to be distinguished from his stockings, which were likewise of loaghtyn wool.

'Mr Kelly, chief magistrate of Castletown, was kindly driving me in his gig to Port St Mary, whither also Mr Teare was proceeding; and where, he informed us, he was to remain for the night. Aware that it was not agreeable to many, even of the most intelligent Manxmen, to hear direct allusions made by a stranger to any of the superstitious observances of the lower orders of the people, I avoided as much as possible making any inquiries that might give offence. Mr Kelly seeing, however, from the nature of my questions, and from my travelling in the mountains, and associating with the peasantry, that my chief object was to become acquainted with all the existing peculiarities of the people, on our arrival at the inn generously introduced me to the great fairy doctor, as a person eminently qualified to give me all the statistical information which the island could afford. After communicating to the seer my object in visiting the island, Mr Kelly remarked with a magisterial air, "I know, Mr Teare, that by probing the secret springs of nature, you can either accelerate, retard, or turn aside at pleasure the natural course of events, but you must make oath before me, in presence of this stranger, that you never call evil spirits to your assistance." The seer assented, and the oath was administered with due solemnity by the magistrate, who, after listening to some singular stories from the doctor, departed for Castletown, leaving us to spend the evening together. There was a pithy quaintness in the doctor's conversation, and his answers were generally couched in idiomatic proverbialisms. He said he was required by his professional business to travel more than any person in the island, and when I expressed my surprise at a person of his advanced years enduring such fatigue, he replied, "The crab that lies always in its hole is never fat."

The promptings of superstition are often cruel; there is a notable instance in the Manx custom of hunting the wren on St Stephen's Day, when the populace go about with a captive bird of that species, distributing its feathers as charms against witchcraft, after which they inter it on the sea-shore. Often, again, there is a strange wild beauty in superstitious ideas, as in the following case:—'On New-Year's eve, in many of the upland cottages, it is yet customary for the housewife, after raking the fire for the night, and just before stepping into bed, to spread the ashes smooth over the floor with the tongs, in the hope of finding in it next morning the track of a foot: should the toes of this ominous print point towards the door, then it is believed a member of the family will die in the course of that year; but should the heel of the fairy foot point in that direction, then it is as firmly believed that the family will be augmented within the same period.' There was once a mighty enchantress in the island. 'By her alluring arts, she ensnared the hearts of so many men around where she resided, causing them to neglect their usual occupations, that the country presented a scene of utter desolation. They neither ploughed nor sowed, their gardens were all overgrown

* Two volumes, 8vo. Douglas, Isle of Man. Published by Mary A. Quiggin, North Quay. London: Simpkin, Marshall, and Co. 1844.

with weeds, their once fertile fields were covered with stones, their cattle died for want of pasture, and their turf lay undug in the commons. This universal charmer having brought things to such a deplorable crisis, under pretence of making a journey to a distant part of the island, set out on a milk-white palfrey, accompanied by her admirers on foot, till, having led them into a deep river, she drowned six hundred of the best men the island had ever seen, and then flew away in the shape of a bat. To prevent the recurrence of a like disaster, these wise people ordained that their women should henceforth go on foot and follow the men, which custom is so religiously observed, that if by chance a woman is observed walking before a man, whoever sees her cries out immediately, "*Tehi! Tehi!*" which, it seems, was the name of the enchantress who occasioned this law.

The supposition that fairies sometimes took away mortal babes, and left their own wretched offspring in their place, is perhaps now declined in Man, as in other places; but it was rife a century ago. Waldron, who wrote a book on Man, published in 1732, gives the following account:—"I was prevailed on," says he, "to go and see a child, who, they told me, was one of these changelings; and indeed must own, was not a little surprised as well as shocked at the sight. Nothing under heaven could have a more beautiful face; but though between five and six years old, and seemingly healthy, he was so far from being able to walk or stand, that he could not so much as move any one joint. His limbs were vastly long for his age, but smaller than an infant's of six months; his complexion was perfectly delicate, and he had the finest hair in the world. He never spoke nor cried, ate scarce anything, and was very seldom seen to smile; but if any one called him a *faery elf*, he would frown and fix his eyes so earnestly on those who said it, as if he would look them through. His mother, or at least his supposed mother, being very poor, frequently went out a charring, and left him a whole day together. The neighbours, out of curiosity, have often looked in at the window to see how he behaved when alone, which, whenever they did, they were sure to find him laughing, and in the utmost delight. This made them judge that he was not without company more pleasing to him than any mortals could be; and what made this conjecture seem the more reasonable was, that if he were left ever so dirty, the woman, at her return, saw him with a clean face, and his hair combed with the utmost exactness and nicety."

In accounts of customs from different districts, one is perpetually called on to wonder at the parities observable in many small matters. We are told by Mr Train, that "formerly weddings were generally preceded by musicians playing the *Black and the Gray*, the only tune struck up on such occasions." What this tune may be we cannot tell—probably it is not now recoverable; but what is very curious, it was the tune which was played at weddings by the last piper of Peebles, who died upwards of forty years ago.

Peel Castle, on the west side of the island, is the locality of a strange tradition, which Mr Train quotes from his predecessor Waldron. "There was formerly a passage to the apartment belonging to the captain of the guard; but it is now closed up: the reason they give you for it is a pretty odd one. They say that an apparition, called in the Manx language the *Moddey Doo*, in the shape of a large black spaniel, with curled shaggy hair, was used to haunt Peel Castle; and has been frequently seen in every room, but particularly in the guard-chamber, where, as soon as the candles were lighted, it came and lay down before the fire, in presence of the soldiers, who at length, by being so much accustomed to the sight of it, lost great part of the terror they were seized with at its first appearance. They still, however, retained a certain awe, as believing it was an evil spirit, which only waited permission to do them hurt; and for that reason forbore swearing and profane discourse while in its company. But though

they endured the shock of such a guest when all together in a body, none cared to be left alone with it. It being the custom, therefore, for one of the soldiers to lock the gates of the castle at a certain hour, and carry the keys to the captain, to whose apartment the way led through the church, they agreed among themselves that whoever was to succeed the ensuing night his fellow in this errand, should accompany him that went first, and by this means no man would be exposed singly to danger; for I forgot to mention, that the *Moddey Doo* was always seen to come out from that passage at the close of day, and return to it again as soon as morning dawned; which made them look on this place as its peculiar residence. One night a fellow being drunk, and by the strength of his liquor rendered more daring than ordinarily, laughed at the simplicity of his companions; and although it was not his turn to go with the keys, would needs take that office upon him, to testify his courage. All the soldiers endeavoured to dissuade him; but the more they said, the more resolute he seemed, and swore that he desired nothing more than that the *Moddey Doo* would follow him as it had done the others, for he would try whether it were dog or devil.

"After having talked in a very reprobate manner for some time, he snatched up the keys, and went out of the guard-room. In some time after his departure a great noise was heard, but nobody had the boldness to see what occasioned it, till, the adventurer returning, they demanded the knowledge of him; but as loud and noisy as he had been at leaving them, he was now become sober and silent enough, for he was never heard to speak more; and though all the time he lived, which was three days, he was intreated by all who came near him to speak, or if he could not do that, to make some signs by which they might understand what had happened to him, yet nothing intelligible could be got from him, only that, by the distortions of his limbs and features, it might be guessed that he died in agonies more than is common in a natural death. The *Moddey Doo* was, however, never after seen in the castle, nor would any one attempt to go through that passage; for which reason it was closed up, and another way made. This accident happened about threescore years since."

In zoology, the island has, or had, some peculiar features. The native sheep, called the *Loaghtyn*, of mean appearance, with high back, narrow ribs, and tail like that of a goat, finds a fit associate in the poor little stunted pony. There was once a peculiar variety of the wild boar in Man—called the *purr*—of a gray sandy colour, spotted with black. It ran wild in the mountains, and was a destructive creature. "The last *purr* had a den in the mountain of South Barrule, whence he sallied forth almost daily into some of the surrounding valleys in search of prey. In summer, a fold was no barrier to his killing and carrying off both sheep and lambs. In winter, impelled perhaps by hunger, he became so daring, that every adjoining farmyard was the scene of his depredations. At last the people rose to drive the enemy from his stronghold, and besetting him with the fiercest dogs that could be procured, they succeeded in hunting him over the high cliffs of Brada Head, where he was killed by falling amongst the rocks, ere he reached the sea below." It is a little known, but curious fact, that the cats of the Isle of Man have no tail, and at most a mere rudiment of caudal vertebrae. They are called *rumpies*, and are excellent mousers. Mr Train, after keeping one for four years, expresses his belief that it is a hybrid animal, between the cat and rabbit; but, from the decided diversity of these species, we feel inclined to pronounce very confidently that no such union could take place.

In agriculture, the Manxmen are, or at a very recent period were, much behind their fellow-countrymen of Britain. Their field implements were extremely rude, and they carried manure to the field and brought home their crops in creels on the backs of horses. Mr Train, however, alleges that they were willing to do better;

and he relates the following curious anecdote, with which we conclude:—‘That the Manx were acquainted with the process of preparing shell lime for building, may be inferred from its being used in the walls of the old fortifications; stone lime, on the contrary, was wholly unknown to them. In the year 1642, Governor Greenhalgh made an ineffectual attempt to introduce the practice of using lime as manure; but he had no sooner built a kiln, than it was circulated as an article of news that the deputy-governor was actually engaged in a project to burn stones for the improvement of the land. The people hastened in crowds to witness the result of this wonderful process, and probably not without some doubts of the governor’s sanity. When, however, they beheld large masses reduced to powder by the action of fire, they eagerly resolved to profit by an example from which they expected the most beneficial results. *Earth pots*, as they were termed, were raised in all parts of the island, in which every kind of stone, flint, slate, or pebble, were indiscriminately subjected to the process of burning. As might have been expected, their efforts were fruitless; but for the ill success which attended their exertions, they were at no loss to find an infallible cause—that the governor had intercourse with the fairies, by whose agency his minerals were converted into powder, whilst those of the more upright native islanders were only condensed to a greater degree of hardness. Of this curious fact many evidences still remain. Large quantities of calcined stones are frequently found in different parts of the island.’

OCCASIONAL NOTES.

TRICKS OF TRADE.

SOME late circumstances transpiring through the newspapers, or through judicial investigation, are calculated to give rise to very serious reflections. First, we have an ultra cheap system of transit on the river Thames, producing an explosion by which many lives are sacrificed. Then, we find the linen-draper meeting to denounce a system long carried on by the makers of thread and tape, whereby it happens that a reel of one of these articles labelled as containing a hundred yards—‘warranted’ to do so—yields only ninety, or eighty-eight yards, or perhaps is deficient as much as 25 per cent. Think of a poor woman who makes a meagre livelihood by dealing in tape and thread, who unwittingly retails these reels in yards to different customers, on an understanding that they each contain a hundred, while they are short of that amount by more than the value of her supposed profit! Oh, shame of shames! Next, a member of a ‘respectable’ grain firm at Glasgow is sentenced to four months’ imprisonment, and a fine, for selling a large quantity of oatmeal to the Highland Destitution Committee, adulterated with an inferior stuff called *thirds*, which is not oatmeal at all; this being described in the defence as a practice of the trade! Taking these as but chance liftings of a veil which conceals much more to the like purport, it must be owned that they create a very painful feeling regarding the state of commercial conscientiousness amongst us. It would appear as if men were driven by competition to adopt dishonest expedients for the purpose of obtaining business and making that business profitable. The days of *reality* seem to be past, and those of delusion and imposture come in. It requires, however, only exposure and punishment to check this system, for it is only when one is found to gain an advantage by cheating, that the others are tempted to it; and there must still be a sufficiently full consciousness that just trade is the more pleasant in carrying on, where it can be done without loss. We therefore hope that every effort will be made by those in authority to detect such practices, and visit them, where proved, with sharp punishment. A few trials of ‘respectable’ delinquents would go a great way as a warrant that one-hundred-

yard bobbins really contain a hundred yards, and that oatmeal is actually oatmeal.

THE ‘HAERLEMMEER MEER.’

In the lately published number of the Edinburgh Review will be found an instructive article on that social and physical phenomenon—Holland. We refer to it more particularly for the account which it presents of the plans now in course of operation for draining the Lake of Haerlem, as it is called in our English maps, but which is known among the Dutch as the Haerlemmer Meer, or Haerlem Sea. We well remember the sight of this vast sheet of water, when, going along the road from Haerlem to Amsterdam, we found it stretching far away to the right, and covering, as we were told, an area of seventy square miles. A broad mound or dike, on which the highway was extended, may be said to have been the boundary which prevented still further encroachments of the ocean. It is, however, on all sides carefully banked; and the annual expense incurred for these defences amounts to from L.4000 to L.5000.

The meer of Haerlem originated in a series of inundations of the sea about three hundred years ago. Numerous schemes were subsequently devised to expel the ocean, but they were either not attended to, or failed in execution. The boldest of these projects was devised by a most ingenious mechanic, Jan Leeghwater; but we believe it only went the length of employing a vast army of windmills, each working a pump; and at anyrate it was never properly entertained. The serious difficulty in the way of expelling and permanently keeping out the meer was the expense; latterly, however, since the discovery of steam power, it has been made apparent to the minds of the Hollanders, ‘that to keep dry, and to maintain the dikes around this large area, when brought into the state of a polder (dry patch of land), would not exceed in yearly expense the cost of maintaining the existing barrier dikes.’ As soon as this fact was satisfactorily established, the expulsion of the meer was determined on by the Dutch government.

‘A navigable ring canal was begun,’ proceeds the reviewer, ‘in 1840. At three distant points on the borders of the lake as many monster engines are to be erected. These, it is calculated, will exhaust the waters, and lay the bed of the lake dry, by fourteen months of incessant pumping; at a total cost, for machines and labour, of L.140,000. The expense of maintaining the dikes and engines afterwards will be nearly L.5000 a-year. The cost of maintaining the old barrier dikes amounted, as we have already stated, to about the same sum. The land to be laid dry is variously estimated at from fifty to seventy thousand acres. Taking the lowest of these estimates, the cost of reclaiming amounts to L.3 sterling per imperial acre, and that of subsequently maintaining to two shillings per acre.* Independently, therefore, of the other advantages which will attend it, there will be an actual money profit from the undertaking. The quantity of water to be lifted is calculated at about a thousand millions of tons. This would have required a hundred and fourteen windmills of the largest size stationed at intervals round the lake, and working for four years, at a total cost of upwards of L.300,000; while at the same time, after the first exhaustion of the waters was completed, the greater number of these mills would have been perfectly useless. How wonderful appears the progress of mechanical art! Three steam-engines to do the work of one hundred and fourteen huge mills, in one-third of the time, and at less than one-half the cost! One of these monster engines—of English manufacture—working, polypus-like, eleven huge suckers at the extremity of as many formidable arms, has been already erected, and tried at

* If the area of the lake be, as before mentioned, about seventy square miles, it contains only 45,000 acres, and the cost of reclaiming is still about L.3 an acre.

the southern extremity of the lake in the neighbourhood of Leyden. The annual drainage of the lake is calculated at fifty-four millions of tons, of which twenty millions will require in some seasons to be lifted in the course of one or two months. Had our railway undertakings not sprung up to rival or excel it, we should have unhesitatingly claimed for this work the praise of being the boldest effort of civil engineering in modern times.

We learn for the first time, from the Review, that as Holland produces no coal, the natives have finally resorted to steam-power with some degree of fear as to the consequences. Should they go to war with England and other coal-producing countries, how is fuel to be procured? It is to be trusted that our good friends the Dutch will keep themselves quite easy on this score; and we wish them cordially to unite with us in the following sentiments:—'Let Holland depend upon England and Belgium for the coal which is to dry her polders. Let Norway, and Russia, and Belgium, and the United States of America, depend upon the English market for the sale of their timber, their hemp, and flax, and cotton. Let England depend upon Russia, and Germany, and America for her deficient corn, and upon the world at large for outlets to her manufactures. Let railways annihilate international barriers, making the broad land as free to pass over as the sea; and let the post-office and the electric telegraph mingle by millions the kind thoughts, and the more serious reflections, and the tidings of mental and physical progress, from all the corners of the earth; and then neither the whims of autocrats, nor the squabbles of royal houses, nor disputed marriages, nor dyspeptic ministers, nor polemical differences, nor desert corners of land, will long be permitted to endanger the lives and comfort of millions of human beings.'

A CELEBRATED SIMILE.

Byron appears to have felt a little awkwardness after committing himself to admiration of Henry Kirke White, by his magnificent allusion to the young poet's fate in 'English Bards and Scotch Reviewers.' In his letter on the subject to Mr. Dallas, he still insists, though faintly, that Kirke White had in him 'poesy and genius;' but immediately qualifies this by saying that he was at anyrate 'beyond all the Bloomfields and Blackettes, and their collateral cobblers, whom Loft and Pratt have or may kidnap from their calling into the service of the trade.'

Whatever may be thought, however, of Byron's criticism, or of his ingenuousness in its defence, the verses will retain their place among the most elegant in the language, even after they have been deprived of the faint claims to originality they have hitherto possessed—

'Unhappy White! while life was in its spring,
And thy young muse just waved her joyous wing,
The spoiler swept that soaring lyre away,
Which else had sounded an immortal lay.
Oh, what a noble heart was here undone,
When Science's self destroyed her favourite son!
Yes, she too much indulged thy fond pursuit,
She sowed the seeds, but death has reaped the fruit.
'Twas thine own genius gave the final blow,
And helped to plant the wound that laid thee low:
So the struck eagle, stretched upon the plain,
No more through rolling clouds to soar again,
Viewed his own feather on the fatal dart,
And winged the shaft that quivered in his heart;
Keen were his pangs, but keener far to feel,
He nursed the pinion which impelled the steel;
While the same plumage that had warmed his nest
Drank the last life-drop of his bleeding breast.'

This fine simile we traced on a former occasion to Waller; but a correspondent goes two thousand years farther back, and finds it in Æschylus, repeated by him from still more ancient authorities—

—'Thus of old,
In Lybian fables is the story told,
That when the eagle, stricken at the heart,
Saw his own feather on the fatal dart,

The royal bird upraised with haughty pride,
"Unconquered yet we die," exulting cried—
"Ours was the deed! ourselves impelled the blow!
We fall no triumph to presumptuous foe!"'

The difference in the turn given by the ancient and modern poets to the reflections of the wounded bird would form a fine subject for the critic. The eagle of the ancient Greek exhibits the proud and masculine spirit of his age: he congratulates himself on having received the mortal blow from no meaner implement than that furnished by his own wing, and dies exulting and unconquered. In the modern version, on the other hand, produced when poetry had lost in fire what it had gained in refinement, this heroic burst is transformed into sentiment, and the dying bird laments his fate the more from having been accessory to it himself.

ORIGIN OF THE RAILWAY SYSTEM.

It is now about twenty-eight years since a thoughtful man, travelling in the north of England on commercial business, stood looking at a small train of coal-wagons impelled by steam along a tramroad which connected the mouth of one of the collieries of that district with the wharf at which the coals were shipped. 'Why,' he asked of the engineer, 'are not these tramroads laid down all over England, so as to supersede our common roads, and steam-engines employed to convey goods and passengers along them, so as to supersede horse-power?' The engineer looked at the questioner with the corner of his eye. 'Just propose you that to the nation, sir, and see what you will get by it! Why, sir, you will be worried to death for your pains.' Nothing more was said; but the intelligent traveller did not take the engineer's warning. Tramroads, locomotive steam-engines, horse-power superseded!—the idea he had conceived continued to infest his brain, and would not be driven out. Tramroads, locomotive steam-engines, horse-power superseded!—he would talk of nothing else with his friends. Tramroads, locomotive steam-engines, horse-power superseded!—he at length broached the scheme openly; first to public men by means of letters and circulars, and afterwards to the public itself by means of a printed book. Hardly anybody would listen to him; the engineer's words seemed likely to prove true. Still he persevered, holding the public by the button, as it were, and dinning into its ears the same wearisome words. From public political men, including the cabinet ministers of the day, he received little encouragement; a few influential commercial men, however, began at length to be interested in his plan. Persons of eminence took it up, and advocated it almost as enthusiastically as the original proprietor. It having thus been *proved*, according to Dogberry's immortal phrase, that the scheme was a good scheme, it soon went near to be *thought* so. Capital came to its aid. The consequence was, that in 1826 parliament passed an act authorising the construction of the first British railway, properly so called—that between Liverpool and Manchester. Four years afterwards, in September 1830, the railway was opened. What advances the system has made since, every one knows. Railways have been constructed, or are in progress, in all parts of the civilized world; philosophers have already begun to speculate on the astonishing effects which such a means of rapid locomotion must have on the character and prospects of the whole human race; by means of railways, Europe is becoming a familiar country to us all, and the planet itself an imaginable round thing; and the only question is, where will this railway-impulse end?—into what strange condition of humanity is it leading us? And the beginning of all this was the dream of a thought-

ful man, looking, about twenty-eight years ago, at some coal-wagons running along a tramroad to a wharf.

The name of this projector of a general railway system of transit is Thomas Gray, and he is still alive. We have now before us a copy of the work in which he first explained his scheme to the public. The first edition of it was published in 1820, and the title under which it made its appearance was as follows:—'Observations on a General Iron Railway, or Land Steam Conveyance, to supersede the necessity of horses in all public vehicles; showing its vast superiority in every respect over all the present pitiful methods of conveyance by Turnpike-roads, Canals, and Coasting Traders: containing every species of information relative to Railroads and Locomotive Engines.' There is now a sort of quaint historic interest in turning to this book, to see the manner in which objects familiar to us were first represented to the incredulous imagination of the public. Prefixed to it there is a plate, exhibiting carriages of different constructions, drawn along on railways by locomotives. The carriages of one of the sets strike the eye curiously, as being made on the model of a common stage-coach, with inside and outside passengers, luggage on the top, a guard behind with his horn, and actually, in one instance (though this seems done in irony), a person occupying the driver's box with a little whip in his hand. On this plate are engraved the following couplets—

'No speed with this can fleetest horse compare;
No weight like this canal or vessel bear.
As this will commerce every way promote,
To this let sons of commerce grant their vote.'

These verses at least show the enthusiasm of the projector; but one must be acquainted with the contents of the book throughout fully to appreciate Mr Gray's merits. Suffice it to say that, except in the matter of the speed attainable on the proposed roads, which experience has proved to be much greater than Mr Gray dared to hope, the case for a general railway system of transit, as here stated, is as complete as, with all our acquired knowledge of the reality, we could now make it. It may be even doubted whether we have yet completely realised the suggestions of this volume; and the system of main trunk lines laid down in it for Great Britain and Ireland, and illustrated by an engraved chart, is probably superior in some respects to that which has been actually adopted.

Railways, it is almost unnecessary to inform our readers, were in use long before the general system of transit by their means as proposed by Mr Gray. They were first used, about a hundred and eighty years ago, to facilitate the transport of coals from the north of England collieries to the shipping places on the Tyne. The first railways were merely wooden wheelways, laid in the ordinary roads to lessen the friction and render the work easier for the horse. The advantage was so great, that various improvements were gradually introduced with a view to increase it to the utmost. About the middle of last century, the following was the mode of preparing a tramroad or railway:—The road having been rendered as nearly level throughout as possible, rough wooden logs, called *sleepers*, each about six feet long, were imbedded in it transversely, at distances of about three feet. Along these were laid the wooden rails, pegged down to the sleepers, so as to form a wheelway about four feet wide. The wheels of the wagons were provided with a flange, so as to keep them from slipping off the rails. Each wagon was pulled by a single horse; and as the inclination of the road was usually from the pit mouth to the wharf, the loaded wagons had the advantage of the descent, while in ascending, the horse had to pull only empty wagons. When the difference of level between the pit mouth and the wharf was very great, it was usual to manage the transport, not by making the road of the necessary uniform inclination throughout, but by inserting here and there a steep inclined plane, which the wagons descended by their own weight, the rest of the way being tolerably level. By a contrivance introduced towards

the end of the century, many of these inclined planes were made *self-acting*—that is, were so constructed, that the loaded wagons descending pulled up the returning empty wagons. At others, the return-wagons were pulled up by a stationary steam-engine. Sometimes there was an inclined plane, terminating in a spout at the shipping place, along which the coals were shot straight into the hold of the vessel lying under the river bank.

In 1767, the experiment was tried at the Colebrook iron-works of covering the wooden rails of a tramroad with a plating of iron. The experiment was so successful, that some years afterwards rails wholly of cast-iron began to be constructed. About the year 1793, also, wooden sleepers began to be superseded by stone ones—blocks of stone laid down underneath the joinings of the rails. Till 1801, the rails were all of the kind called the *flat-rail*, or tram-plate, consisting of plates of cast-iron about three feet long, from three to five inches broad, and from half an inch to an inch thick, with a flange or turn-up on the inside. About that year, however, *edge-rails* began to be used—these edge-rails being bars of cast-iron about three feet long each, laid on their edges, the flange in this case being on the wheel.

The value of the improvements which had thus been gradually introduced during the course of a century and a half may be judged of from the fact, that on a good edge railway, such as was to be found in the beginning of the present century, ten horses could do an amount of work which, on a common road, would require the strength of four hundred. 'Iron railways were, in consequence, quickly introduced into all the coal and mining districts of the kingdom. They were employed on canals in place of locks, to raise the barges on an inclined plane from a lower to a higher level; in some cases they were adopted in preference to the canal itself; and, on the whole, they began to form an important auxiliary to inland navigation, pushing the channels of trade and intercourse into districts otherwise inaccessible, and even into the interior of the mines.' Scarcely any two of these railways were alike in all particulars.

All this while horse-power continued to be the only motive force employed, except at those inclined planes already mentioned. Thus horses and steam-engines shared the work between them. The idea of uniting the two into one, so as to produce a locomotive steam-engine, or a steam-horse, was a more recent one. Watt had, indeed, in one of his patents, dated 1784, suggested a plan for imparting to the steam-engine the animal's faculty of locomotion; but it was not till 1802 that experiments with a view to the construction of an efficient locomotive engine were commenced. The first locomotives put upon trial were those of the engineers Messrs Trevithick and Vivian. The objection to them was, that there was not sufficient adhesion between the wheels and the rails, so that, if the velocity were at all great, the former would revolve without advancing the vehicle. To remedy this inconvenience, various plans were devised, among which that of Mr Blenkinsop obtained the greatest celebrity. His plan consisted in making the rails notched, and the wheels with teeth, so that they continued to work in a rack all along the road. One of Mr Blenkinsop's engines of four-horses' power impelled a carriage lightly loaded at the rate of ten miles an hour; attached to thirty coal wagons, it went at one-third of that pace. Fortunately, however, it was soon discovered that the conclusion on which Mr Blenkinsop and others had been proceeding—namely, that the amount of adhesion was insufficient between a smooth wheel and a smooth rail—was a hasty one; and that, provided the road were tolerably level, the amount of adhesion between such a wheel and such a rail was quite sufficient to insure propulsion. Satisfied on this point, engineers devoted their attention more especially to the improvement of the locomotive itself. The difficulties of various kinds, however, which presented themselves were great; and the horses of England con-

tinued to flatter themselves that they would be able to retain the monopoly of locomotion; and that, although steam-engines might work well enough in chains at inclined planes, *they* should still have the run of the country.

Such was the state of matters about the year 1819-20, when Mr Gray appeared in the field: a great number of tramroads had been laid down in particular districts of the island, along which horses and stationary steam-engines were pulling wagons, while here and there a solitary locomotive snorted along, trying its powers. Locomotives *versus* horses, and railways *versus* turnpikes and canals—such was the question at issue. Mr Gray's merit consisted not in effecting actual improvements of construction in either locomotives or railways—that was the work of Stephenson, and other eminent engineers—but in stating the question to the country, in foreseeing the issue, and in boldly imagining the time when the whole island should be covered with a network of these tramroads, when locomotives should scamper through the country as plentiful as horses, and when canals, stage-coaches, and turnpike trusts, should be all swamped in a general iron railway. Glimmerings of this idea may have appeared before in other minds. 'You must be making handsomely out with your canals,' said some one to the celebrated canal-making Duke of Bridgewater. 'Oh yes,' grumbled he in reply, 'they will last my time; but I don't like the look of these tramroads; there's mischief in them.' What the shrewd duke foresaw, others also may have casually anticipated; but Mr Gray was the first man to realise the whole extent of the change, and to advocate it; and although this change would doubtless have effected itself in any case, yet the first man who conceived it, and called the attention of the nation to the subject, deserves distinction. To say that the change would have *effected itself*, is merely to say that if Mr Gray's mind had not conceived it so fast, five or six other minds would have conceived it more slowly.

A circumstance which favoured Mr Gray's proposal was, that about the time it was first made, or a little later, rails began to be formed of malleable instead of cast iron; the malleable possessing two decided advantages for the purpose over the cast—first, in being less apt to break; and second, in being capable of being made in greater lengths of bar.

Mr Gray, in his volume, dashes at once into the midst of his subject; and his readers twenty-six years ago must have been much surprised by such passages as the following:—'The plan,' he says, 'might be commenced between the towns of Manchester and Liverpool, where a trial could soon be made, as the distance is not very great; and the commercial part of England would thereby be better able to appreciate its many excellent properties, and prove its efficacy. All the great trading towns of Lancashire and Yorkshire would then eagerly embrace the opportunity to secure so commodious and easy a conveyance, and cause branch railways to be laid down in every possible direction. The convenience and economy in the carriage of the raw material to the numerous manufactories established in these counties, the expeditious and cheap delivery of piece goods bought by the merchants every week at the various markets, and the despatch in forwarding bales and packages to the outposts, cannot fail to strike the merchant and manufacturer as points of the first importance. Nothing, for example, would be so likely to raise the ports of Hull, Liverpool, and Bristol to an unprecedented pitch of prosperity, as the establishment of railways to these ports, thereby rendering the communication from the east to the west seas, and all intermediate places, rapid, cheap, and effectual. Any one at all conversant with commerce must feel the vast importance of such an undertaking in forwarding the produce of America, Brazil, the East and West Indies, &c. from Liverpool and Bristol *viâ* Hull, to the opposite shores of Germany and Holland; and, *vice versâ*, the produce of the Baltic *viâ* Hull, to Liverpool and Bristol.'

Again—'By the establishment of morning and evening mail steam-carriages, the commercial interest would derive considerable advantage; the inland mails might be forwarded with greater despatch, and the letters delivered much earlier than by the extra post; the opportunities of correspondence between London and all mercantile places would be much improved, and the rate of postage might be generally diminished without injuring the receipts of the post-office, because any deficiency occasioned by a reduction in the postage would be made good by the increased number of journeys which mail steam-carriages might make. The London and Edinburgh mail steam-carriages might take all the mails and parcels on the line of road between these two cities, which would exceedingly reduce the expense occasioned by mail-coaches on the present footing. The ordinary stage-coaches, caravans, or wagons, running any considerable distance along the main railway, might also be conducted on peculiarly favourable terms to the public; for instance, one steam-engine of superior power would enable its proprietors to convey several coaches, caravans, or wagons, linked together, until they arrive at their respective branches, where other engines might proceed on with them to their destination. By a due regulation of the departure and arrival of coaches, caravans, and wagons, along these branches, the whole communication throughout the country would be so simple and so complete, as to enable every individual to partake of the various productions of particular situations, and to enjoy, at a moderate expense, every improvement introduced into society. Steam-engines would answer all the purposes required by the general intercourse and commerce of this country, and clearly prove that the expenses caused by the continual relays of horses are totally unnecessary. The great economy of such a measure must be obvious to every one, seeing that, instead of each coach changing horses between London and Edinburgh, say twenty-five times, requiring a hundred horses, besides the supernumerary ones kept at every stage in case of accidents, the whole journey of several coaches would be performed with the simple expense of one steam-engine. No animal strength will be able to give that uniform and regular acceleration to our commercial intercourse which may be accomplished by railways; however great the animal speed, there cannot be a doubt that it would be considerably surpassed by mail steam-carriages, and that the expense would be infinitely less. The exorbitant charge now made for small parcels prevents that natural intercourse of friendship between families residing in different parts of the kingdom, in the same manner as the heavy postage of letters prevents free communication, and consequently diminishes very considerably the consumption of paper which would take place under a less burdensome taxation.'

Such passages as the foregoing must have surprised the public very much twenty-six years ago; the following, if we are not mistaken, will have sufficient novelty even for readers of the present time:—'The present system of conveyance,' says Mr Gray, 'affords but tolerable accommodation to farmers, and the common way in which they attend markets must always confine them within very limited distances. It is, however, expected that the railway will present a suitable conveyance for attending market-towns thirty or forty miles off, as also for forwarding considerable supplies of grain, hay, straw, vegetables, and every description of live-stock to the metropolis at a very easy expense, and with the greatest celerity, from all parts of the kingdom.'

It was not until after four or five years of agitation, and several editions of Mr Gray's work had been published and successively commented upon by many newspapers, that commercial men were roused to give the proposed scheme its first great trial on the road between Liverpool and Manchester. The success of that experiment, insured by the engineering skill of Stephenson, was the signal for all that has since been

done both in this island and in other parts of the world. Unfortunately, the public has been too busy these many years in making railways to inquire to whom it owes its gratitude for having first expounded and advocated their claims; and probably there are few men now living who have served the public as effectually, with so little return in the way of thanks or applause, as Mr Thomas Gray, the proposer in 1820 of a general system of transit by railways.

THE OLD BABOO.

THE change which is now taking place in native Indian society, is one of the most remarkable circumstances of this remarkable age. The 'permanent' form of civilisation has ceased, the stereotype is broken, and the Hindoo mind is being cast anew in a form which, if not yet European, is far from being Asiatic. Under such circumstances, a portrait of 'the fine old Hindoo gentleman, all of the olden time,' is a relic worth preserving; and the following we have rescued from a Calcutta paper ('The Hurkaru'), where it was buried some years ago in the mass of daily incidents.

The Hindoos of Calcutta are in a transition state. The dark ages are represented by sundry old men, deeply imbued with the obstinacy and credulity which have hitherto so remarkably characterised the race. They are of the *ancien régime*, and cling to old customs and superstitions with a tenacity which only death can loosen. But in the course of nature, death is daily thinning their ranks. In a few years the class will be extinct; and they will be succeeded by a body of men among whom the knowledge, the refinement, the virtues, and, alas! the vices of the Christian will flourish and abound. It may not be amiss, then, ere the last of the Old Baboos has been laid upon his pile of sandal-wood at Neemtollah Ghaut, to strike off a sketch of what at no distant period must be an extinct class.

Nilcomul Bysack, a fair average specimen of the class of men under notice, is one on whom sixty years or thereabout have done their best and their worst. He is of a middle stature, and displays a due degree of that rotundity which men of his race covet as the surest evidence of wealth and consequent respectability. In complexion he is of a hue which may be best represented by our admixture of yellow ochre and burnt senna.

The expression of his countenance is altogether that of a steady, stolid, easy-going old man; free from all passions or feelings that might interfere with the unswerving and untiring pursuit of wealth. His eyes, though dim and watery, have a look both inquisitive and acquisitive, which is increased in intensity by the use of a pair of the commonest iron-mounted spectacles.

The costume of Nilcomul Bysack, the man of many lacs, is identical in fashion and quality with that of the humblest running sircar in Calcutta. It is, in truth, a fac-simile (save only in size) of that in which he appeared when he was himself a poor running sircar, in which capacity he commenced his prosperous career. He wears a large white muslin turban, the folding and arrangement of which evince little of that fastidious care which younger Hindoos usually bestow upon this most distinctive and characteristic portion of their attire. His arms, and all the upper portion of his frame, are enclosed in an ill-fitting white muslin jacket with wide sleeves, and tied with tape points on the right breast. This is met at the waist by that seemingly very inconvenient, and certainly not very decorous, garment the *dhootie*, with its cataract of plaits falling in front down to the common yellow slippers into which he thrusts his otherwise bare feet. A *chudder*, used sometimes as a cummerbund, or girdle, sometimes as a scarf, completes his attire. He is too strict an adherent to the fashions of his ancestors to assume the white muslin surcoat, now so common among the higher classes of his countrymen; and which, when worn over the costume just described, renders it one of the most graceful, as well as most decent, that could be contrived.

Such is Baboo Nilcomul Bysack, as he may be seen any day sliding along street or office, with an old cotton umbrella under his arm; or squatted cross-legged in his little Bengalee palkee, with the hookah and lotah hanging behind it, and borne along the road by four Bengalee bearers. His dress and equipage certainly do not betray the man of wealth and substance. But as all is not gold that glitters,

so, on the other hand, there may be gold without the glitter, and thus it is in the case before us.

Our Old Baboo, as has been already intimated, began his career in the capacity of a running sircar. He was one of the many sons of a poor man; and consequently had to create his own capital, or go without it. His first experiment for that purpose was as follows:—One lucky day, as he was plodding along the Strand, he saw some boatmen engaged in hauling from the water some fathoms of a coir cable, which they had found floating down the river. Nilcomul discovered that a ready-money purchaser of their prize would be likely to make a good bargain with the fortunate finders; and as he happened just to have received his monthly taluab of ten sicca rupees, he felt an irrepressible desire to invest a portion of it as a speculation in the article before him. The boatmen asked eight rupees, Nilcomul offered four; and after less than the usual quantity of chaffering, in which the Bengalee so much delights, the rope became his for five. Another rupee judiciously applied, induced the police authorities on the spot to waive their claims of jetsam and flotsam; and a few annas more secured its conveyance to the quadrangle of Nilcomul's or rather his father's house. There, at the expense of a few more annas, it was reduced to the state of oakum, and afterwards sold so as to yield its proprietor a clear net profit of five rupees on the adventure.

The success of this, his first commercial transaction, inspired Nilcomul with a desire to engage in more extended operations, and at the same time supplied him with the means of indulging his longing. So, as money, when properly cultivated, produces money, Nilcomul went on sowing his small capital, and reaping his small profits, until both capital and profits became large. And thus, within four years from the buying of the coir cable, he was able to lend a trifle of five thousand rupees or so, at an aggregate interest of about twenty per cent. per annum. Since then, he has gone on quietly increasing his wealth; chiefly by what strait-laced moralists call usury, and for which they are disposed to condemn him accordingly. But Nilcomul easily reconciles his conscience to the receipt of the most exorbitant interest to which want can make a borrower submit, by the irrefutable argument, 'Suppose master willing to give—what for I shall not take?'

Nilcomul has been a money-lender ever since he had capital to lend. He has been no wild speculator, risking his idolised rupees on the state of foreign markets and the faith of foreign merchants. He once, and once only, made a shipment on his own account. But from the moment he invested a portion of his funds in saltpetre, till that in which he received his 'account sales,' he lived in tortures of suspense, for which the clear profit of one hundred and seven rupees, five annas, and nine pie, on the five thousand invested, scarcely compensated. Since that time, he has kept steadily to the safe and profitable occupation of lending money on the best of securities. Mortgages of houses and land, with unexceptionable guarantees, Company's paper, jewels, or even the note-of-hand of a responsible man, are things which may console even a miser for a temporary separation from a portion of his money, especially when well assured that it will in due time return to him with increase. By such safe and profitable dealings, and by rigid economy in the management of his funds, Nilcomul Bysack has become a rich man. The exact amount of his wealth it is of course impossible to state, but as it is generally said to be ten lacs, we may, according to the rule in such cases, safely suppose it about five, or £50,000.

Deep in those recesses of the Black Town, where a white face is a thing to scare children with, stands the mansion of that branch of the Bysack family of which Nilcomul is the head. It is of the kind of which there are so many specimens in those regions. Outwardly, a square donjon-keep-like erection of dark-red brick, with a turret at one corner; inwardly, it exhibits two or three tiers of wooden galleries surrounding an open triangular court. It is like most Hindoo family mansions—populous as a rabbit warren. As but a portion of its inhabitants, we may reckon up the Baboo and his wife, his five sons and their five wives, his three daughters and their three husbands; with a matter of about twenty grandchildren. Over this community Nilcomul reigns with patriarchal sway. At his expense all its members live. Other and larger communities have to support their rulers, but here the case is reversed.

Nilcomul generally begins the day by acting as caterer for the household which subsists at his cost. With the co-adjutancy of the old lady his wife, he forms a Commit-

tee of Supply, in which it is determined what provisions are required for the consumption of the day. He then summons Buloram his servant to attend him with basket and bag, and attired in soiled dhootie and chudder, and thrusting his toes into his oldest slippers, he sallies forth. On his way to the bazaar, he makes a point of inquiring at the shops he passes the current prices of oil, ghee, spices, &c. This is not from idle curiosity. He thereby secures himself against the possibility of being cheated by his servant, to whom he is obliged to intrust the purchase of such articles.

Fish, the only kind of animal food which the laws of caste allow to the Bysacks, is that to the purchase of which he first devotes his energies. Those gigantic shrimps called chingroo, being at once palatable, satisfying, and cheap, find great favour in the eyes of the economical Baboo, and of them he lays in a plentiful supply. But this is not done without much of that bargaining, the excitement of which is so pleasant to purchaser and seller. Fishwomen are fishwomen all the world over, and the pious ladies of Lalla Baboo's Bazaar are not a whit inferior to their sisters of Billingsgate in any of those oratorical excellences for which the latter are so famous. The language of the muckjee bazaar is only that of Billingsgate translated into Bengalee. Niloomul is well known to the nereids of the fishmarket, and on his approach, is greeted with some playful badinage, which he takes in very good part, knowing that he will have none the worse bargain for keeping them in good-humour.

Having satisfactorily invested part of his funds in fish, Niloomul seeks the dealer in fruit and vegetables—articles which figure largely in a Hindoo bill of fare. Here he lays in a stock of pulwul, of potatoes (which, though of foreign introduction, have found great favour in the mouths of the Hindoos), of brinjals, and of green plantains, both of which are temptingly cheap. Then he lays out two or three pice on such greens as help to fill up his basket most effectually. His last visit is to the confectioner, for there would be sour looks at home should he return without a sufficient supply of sweetmeats. His marketing being now finished, he returns quietly triumphing in his success in what is to him a pleasant occupation. Of course on the way he forgets not to keep an eye on Buloram, who might otherwise be tempted to peck at the jelahees which lie so invitingly on the top of the basket.

Having seen his purchases safe under charge of his thrifty helpmate, Niloomul sets forth on his pilgrimage to the river side. There having duly bathed, he employs himself for an hour or so in the repetition of munters, and the performance of the various motions and gesticulations which constitute so large a part of Hindoo devotion. Then having duly striped the bridge of his nose with the yellow pigment proper for the purpose, he returns home, diligently counting hurrinams on his beads to the extent of some thousands. His devotions do not conclude immediately on his arrival at home, but he continues to perform the various poojahs which are enjoined to Hindoo piety with the most scrupulous care. He fears that, were he to omit one, the dereliction would probably be punished by want of success in his affairs during the day.

Meantime the Brahmin cook has been preparing breakfast. This is not a social meal: Niloomul takes his alone; his wife reverently sitting opposite him while he breakfasts, and entertaining him with reports and remarks on household affairs, and the discussion of plans and projects for the current day.

Breakfast being disposed of, the Old Baboo masticates a beetul; indulges in a nap, for which his early labours have well qualified him; and rising about eleven o'clock, gets into his old palkee, and is borne into the commercial regions of the city.

On returning home in the evening, as he does between four and five o'clock, Niloomul's first care is to wash off the pollution which he has suffered by contact with the Feringhees and their money. After this, instead of going, as many of his newfangled compatriots do, to display himself and a smart equipage on the Strand, he piously resorts to the neighbouring Thakoorbarree, of which he is a liberal patron, and spends an hour or more in devotion.

Now comes the period of enjoyment for the Old Baboo. His religious exercises being disposed of, he establishes himself in his *bostakhasnah*, or sitting-room, and prepares to receive company. The apartment is a somewhat confined one on the ground-floor. It is furnished with a *tukhi poah* (a platform something like the *dais* of old), over which is

spread a *sutringee*, and about which are scattered eight or ten large pillows. The room is lit by two or three dim lamps in old-fashioned wall shades; and is adorned with pictorial representation of the incarnations of Vishnu. Seating himself, in an easy dishabille, on the platform, Niloomul, in the full enjoyment of *otium cum dignitate*, welcomes his favoured guests as they drop in one after another 'quite promiscuously.' There is Gosainjee the spiritual adviser; and Buttacharjee the family priest, and others, Brahmins and Bustoms, steady old-fashioned people like himself. Their conversation partakes in a great measure of a religious character. They bewail the heresy and corruption of the rising generation, and comfort and encourage each other in their adherence to the doctrines and customs of their ancestors, which must be good because they are so old. Amongst other things, Niloomul expresses his regret that he had been so far left to himself as to allow some of his boys to attend the Hindoo college. He had, indeed, withdrawn them when he found they were acquiring infidel notions; but it was too late, the poison had begun to operate! His friends shut their eyes and shake their heads and condole with him; and he finds consolation in their pity. Meantime the hookah, their sole refreshment, has been rapidly circulating, and aiding by its gentle inspiration their sober converse. At an early hour the friends retire, and then, and not till then, Niloomul takes his solitary supper. As at breakfast, so now, the old woman attends him to see his wants supplied, and to furnish him with a report of all that has passed during the day, the quarrels of the young women, the combats and insolence of the children.

Such is the dull routine of the private life of the Old Baboo, varied only by an occasional visit to some favourite suburban temple, and the one never-to-be-forgotten pilgrimage to Juggernaut, in which he was accompanied by his whole family.

SWIFT'S ILLNESS AND HIS REMAINS.

DUBLIN possesses a most respectable medical periodical of the first class, conducted by a clever young native surgeon, Mr Wilde. The numbers for May and August contain an elaborate paper by the editor, in which the ailments of Swift are for the first time (as appears) distinctly ascertained. There has been much mystery on this subject among the biographers of the famous Dean of St Patrick's; his character even has suffered a little from the obscurity. Having with great pains traced the symptoms and treatment through fifty-five years of correspondence, and drawn important illustrations from the appearances presented by the cranium when exhumed in 1835, Mr Wilde finally brings his professional knowledge to bear on the subject, which he seems to have thoroughly exhausted. Swift had no hereditary tendency to nervous disease, as has been surmised, and almost alleged. He contracted a giddiness in his twenty-seventh year, in consequence of eating a hundred golden pippins at a time at Richmond. Not long after, he contracted a deafness, from sitting on a damp seat. These were ailments, says Mr Wilde, not likely, when once established, to be easily removed from a system so nervous and irritable as Swift's. 'From this period a disease which in all its symptoms, and by its fatal termination, plainly appears to have been (in its commencement at least) cerebral congestion, set in, and exhibited itself in well-marked periodical attacks, which, year after year, increased in intensity and duration.' The brain which produced Lilliput, and bothered the Whigs, under congestion all the time!

'In early life,' says our author, 'he was of remarkably active habits, and always exceedingly sober and temperate, if we except the instance of gluttony already related. From the date of his first attack, he seems to have had a presentiment of its fatal termination; and the dread of some head affection (as may be gleaned from innumerable passages in his writings) seems to have haunted him ever afterwards, producing those fits of melancholy and despondency to which it is well known he was subject; while the many disappointments and vexations, both of a domestic and public nature, which he subsequently suffered, no doubt tended

to hasten the very end he feared.' Swift, however, according to Mr Wilde, never was at any time of his life, not even at its close, 'what is usually termed and understood as mad;' a point in our literary biography which will be acknowledged to be of no small importance.

The unfortunate wit was of course never out of the hands of the doctors. At all times, some particular portion or peculiarity of the human frame is in vogue amongst the faculty as the seat of disease. In Swift's days it was the stomach. He was therefore treated for the stomach for some half century, while all the time disease was going on in his brain. One of their medicines will excite a smile now-a-days—brandy. He was enjoined to drink this liquor in considerable quantities, till experience showed that it only made his case worse, and he resumed his usual habits of temperance. He wrote thus of physicians in 1737:—"I have esteemed many of them as learned and ingenious men, but I never received the least benefit from their advice or prescriptions. Poor Dr Arbuthnot was the only man of the faculty who seemed to understand my case, but could not remedy it."

In latter life, the sufferings from his disease were dreadful. He speaks of having felt as in Phalaris's brazen bull, and roared as loud for eight or nine hours. Mr Wilde says—That Swift was not, however, at any time, even during the most violent attacks, at all insensible, or in anyway deprived of his reasoning faculties, may be learned from the fact, that when Sergeant Bettesworth threatened his life, and thirty of the nobility and gentry of the Liberty of St Patrick's waited upon him, and presented him with an address, engaging to defend his person and fortune, &c. it is related by the most veritable of his biographers, that "when this paper was delivered, Swift was in bed, giddy and deaf, having been some time before seized with one of his fits; but he dictated an answer in which there is all the dignity of habitual pre-eminence, and all the resignation of humble piety."

'So desponding was the dean at times, and so great was his fear of the loss either of his memory or his reason, that he used to say, on parting with an intimate friend in the evening—"Well, God bless you! Good night to you; but I hope I shall never see you again." "In this manner," says Mr Deane Swift, "he would frequently express the desire he had to get rid of the world, after a day spent in cheerfulness, without any provocation from anger, melancholy, or disappointment." Upon the occasion of a large pier-glass falling accidentally on the very part of the room in which he had been standing a moment before, and being congratulated by a bystander on his providential escape—"I am sorry for it," answered the dean: I wish the glass had fallen upon me!" Lord Orrery mentions that he had "often heard him lament the state of childhood and idiotism to which some of the greatest men of this nation were reduced before their death. He mentioned, as examples within his own time, the Duke of Marlborough and Lord Somers; and when he cited these melancholy instances, it was always with a heavy sigh, and with gestures that showed great uneasiness, as if he felt an impulse of what was to happen to him before he died."

Mr Wilde adduces many passages from the writings of the friends immediately around Swift, to show that he only manifested loss of memory, and other symptoms of decay of mind, but nothing like fatuity or furiosity. One friend says of him the year before his death, that he had never yet talked nonsense, or said a foolish thing. Guardians seem to have been appointed for him, merely because of the infirmities above-mentioned. He at length died in his own house, October 19, 1745, in the seventy-eighth year of his age. His head was dissected; but all we know of the results is confined to the fact, that water was found on the brain.

Ninety years after the death of this bright genius, some repairs being then in course of being made in St

Patrick's Cathedral, the remains of Swift and his wife Stella were exhumed, and subjected to examination. The bones of Swift lay in the position into which they had fallen, when deprived of the flesh which enveloped and held them together. The skull, cut as it had been left by his own surgeons, was found entire. It was eagerly taken possession of, with a view to its being examined phrenologically, and for some days it circulated through the coteries of Dublin. 'The university,' says Mr Wilde, 'where he had so often toiled, again beheld him, but in another phase; the cathedral which heard his preaching—the chapter-house which echoed his sarcasm—the deanery which resounded with his sparkling wit, and where he gossiped with Sheridan and Delany—the lanes and alleys which knew his charity—the squares and streets where the people shouted his name in the days of his unexampled popularity—the mansions where he was the honoured and much-sought guest—perhaps the very rooms he often visited—were again occupied by the dust of Swift!'

The interior of the skull threw some light upon the mental condition of the great dean in his latter days. According to Dr Houston, 'the cerebral [inner] surface of the whole of the frontal region is evidently of a character indicating the presence, during lifetime, of diseased action in the subjacent membranes of the brain. The skull in this region is thickened, flattened, and unusually smooth and hard in some places, whilst it is thinned and roughened in others. The marks of the vessels on the bone exhibit, moreover, a very unusual appearance; they look more like the imprints of vessels which had been generated *de novo*, in connection with some diseased action, than as the original arborescent trunks.' Mr Wilde expresses his opinion that the appearances showed 'a long-continued excess of vascular action, such as would attend cerebral congestion.'

Much detail of an interesting kind is given in the paper of Mr Wilde; but for this we must refer to the journal in which it appears. The whole is eminently curious, as tracing material conditions which must have entered largely into the character of one of the most remarkable men of his century. Who can say how much of the politics of Swift—how much of his satiric and indignant writings—took their first rise in a surfeit of pippins?

SUPPRESSION OF CANTEENS.

In the following observations from the 'Times,' on the suppression of canteens (barrack taverns), our readers, we feel assured, will cordially join:—

'We have seen with great satisfaction an announcement of the intention of government to prohibit for the future the sale of intoxicating liquors in the canteen. If this regulation should be carried out, it will be found one of the best that ever was adopted for preserving the character and contributing to the happiness of the British soldier. Hitherto, the canteen has offered him ready opportunities for contracting habits of dissipation and idleness, which, indeed, he must have found it very difficult to avoid; for, being isolated from worthier means of occupying his leisure, drinking became almost of necessity his only resource. It argues a long and culpable indifference to the respectability and comfort of the lower ranks of the army, that they should have been until now abandoned to such a debasing employment of their time, when off duty, as a tap-room could afford. No care was taken to supply them with any better indulgence than that of ministering to a ruinous propensity, which proverbially brings every description of vice, as well as the utmost misery, in its train. By the regulations heretofore existing, the privilege of tempting the soldier to turn drunkard is a matter of contract between the government and the keeper of the canteen, who, having purchased his right, felt himself at full liberty to make the most he could of it. The sale of intoxicating liquors was of course the most profitable part of the trade, for a habit of drinking is rapidly acquired, and when once it seizes its victim, it speedily absorbs all his means. Thus the soldier was encouraged in a vice which was sure to transfer every farthing he possessed to the pockets of those by whom the materials for gratifying his degrading propensity were sup-

plied. We think the government will have acted most properly in prohibiting altogether the sale of intoxicating liquors; for any regulations that might be prescribed, in order to allow it under certain conditions, would almost certainly be abused.

We hope that, in the place of canteens, government will furnish soldiers in barracks with general meeting-rooms, where they could pass their leisure hours in reading or harmless recreation. Those who entertain the most sincere horror of war, will not be opposed to anything likely to improve the habits of soldiers.

TOBACCO.

Tobacco plays a more important part in this country as to the habits of the people. However used—whether smoked, chewed, or used as snuff—its action on the system is but little different. It is essentially a narcotic; and as such, it is detrimental to the power and healthiness of the nervous system—as such, it stimulates at the expense of subsequent depression and eventual loss of tone—as such, it interferes with the functions of assimilation and expenditure—and as such, is injurious to the health of the system. Tobacco exerts more marked and injurious effects when chewed, less of these when smoked, and is least deleterious when used in the form of snuff. This is only, however, a question of degree; and in the temperate climates, the use of tobacco in any way can only be justifiable when, from poverty of diet, and consequent vital depression, the effects of a habitually-used narcotic may not be undesirable.—*Robertson on Diet and Regimen.*

CRUELTY TO ANIMALS.

Cruelty to dumb animals is one of the distinguishing vices of the lowest and basest of the people. Wherever it is found, it is a certain mark of ignorance and meanness; an intrinsic mark, which all the external advantages of wealth, splendour, and nobility cannot obliterate. It will consist neither with true learning nor true civility; and religion disclaims and detests it as an insult upon the majesty and the goodness of God, who, having made the instincts of brute beasts minister to the improvement of the mind, as well as to the convenience of the body, hath furnished us with a motive to mercy and compassion toward them very strong and powerful, but too refined to have any influence on the illiterate or irreligious.—*Jones of Nayland.*

OBEYING THE GREAT CHRISTIAN PRECEPT.

The golden rule of doing to others as we would be done by, would never have led us into such wastefulness and extravagance as what you have seen. If we in the town and country, landlords and tenants, employers and employed, had endeavoured to make the material, moral, and spiritual condition of our neighbours as healthy as we would wish our own to be, we should have found our reward literally here upon earth. I have shown you the costliness of neglect; but in this, as in all other cases, we shall be deceived and led astray if we begin in a wrong spirit. If we seek merely that which is expedient, no foresight and calculation will be sufficient to guard us against error. Shrewd calculators enough there have been at Liverpool, but all their shrewdness and calculation has not prevented the waste of hundreds of thousands on ill health. Had one half of that energy and thought been devoted to their duty to their neighbour by that wealthy community, how much richer would they have been! 'Seek ye first the kingdom of God and his righteousness, and all these things shall be added unto you.'—*A Lecture on the Unhealthiness of Towns, &c. by Viscount Ebrington, M.P.*

RESTORATION OF SOUR MILK OR CREAM.

We are informed by a correspondent that milk or cream, when it has turned sour, may be restored to its original sweetness by means of a small quantity of carbonate of magnesia. When the acidity is slight, half a teaspoonful of the powder to a pint of milk will be sufficient.

VALUE OF HUMILITY.

When the two goats, on a narrow bridge, met over a deep stream, was not he the wiser that lay down for the other to pass over him, than he that would rather hazard both their lives by contending? He preserved himself from danger, and made the other become debtor to him for his safety. I will never think myself despised either by preserving peace or doing good.—*Felham.*

TO MY DAUGHTER LILY.

BY G. COOKE, AN AMERICAN POET.

Six changeful years are gone, Lily,
Since you were born to be
A darling to your mother good,
A happiness to me.
A little, shivering, feeble thing
You were, to touch and view,
But we could see a promise in
Your baby eyes of blue.
You fastened on our hearts, Lily,
As day by day wore by,
And beauty grew upon your cheeks,
And deepened in your eye;
A year made dimples in your cheeks,
And plumped your little feet;
And you had learned some merry ways,
Which we thought very sweet.
And when the first sweet word, Lily,
Your wee mouth learned to say,
Your mother kissed it fifty times,
And marked the famous day.
I know not, even now, my dear,
If it were quite a word,
But your proud mother surely knew,
For she the sound had heard.
When you were four years old, Lily,
You were my little friend,
And we had walks and nightly plays,
And talks without an end.
You little ones are sometimes wise,
For you are undeluded;
A grave grown man will start to hear
The strange words of a child.
When care pressed on our house, Lily—
Pressed with an iron hand—
I hated mankind for the wrong
Which fastened in the land;
But when I read your young, frank face,
Its meaning sweet and good,
My charities grew clear again—
I felt my brotherhood.
And sometimes it would be, Lily,
My faith in God grew cold—
For I saw virtue go in rags,
And vice in cloth of gold;
But in your innocence, my child,
And in your mother's love,
I learnt those lessons of the heart
Which fasten it above.
At last our cares are gone, Lily,
And peace is back again,
As you have seen the sun shine out
After the gloomy rain;
In the good land where we were born
We may be happy still;
A life of love will bless our home—
The house upon the hill.
Thanks to your gentle face, Lily!
Its innocence was strong
To keep me constant to the right
When tempted by the wrong.
The little ones were dear to him
Who died upon the Rood—
I asked his gentle care for you,
And for your mother good.

THE FEMALE TEMPER.

No trait of character is more valuable in a female than the possession of a sweet temper. Home can never be made happy without it. It is like the flowers that spring up in our pathway, reviving and cheering us. Let a man go home at night, wearied and worn by the toils of the day, and how soothing is a word dictated by a good disposition! It is sunshine falling on his heart. He is happy, and the cares of life are forgotten. A sweet temper has a soothing influence over the minds of a whole family. Where it is found in the wife and mother, you observe kindness and love predominating over the natural feeling of a bad heart. Smiles, kind words, and looks characterise the children, and peace and love have their dwelling there. Study, then, to acquire and retain a sweet temper. It is more valuable than gold; it captivates more than beauty; and to the close of life it retains all its freshness and power.

PRICE 1½d.

BRETT AND LITTLE'S ELECTRIC INVENTIONS.

WE have been favoured with a private view of some of the most beautiful electric applications for the communication of intelligence by telegraph that we believe have yet appeared before the scientific world. The offices of the inventors are in Furnival's Inn, Holborn, where, in several apartments, the improvements they have patented are displayed for the inspection of all interested in this wonderful application of science to the business of life. Messrs Brett and Little indeed court, rather than avoid, the investigation of the learned, and willingly afford every explanation requisite to the perfect comprehension of their whole system of electro-telegraphic communication. The principle upon which their most important invention proceeds is so simple, and promises to effect so remarkable a revolution in the electric intercourse of this and other countries, that we entertain no doubt that an account of our visit will prove acceptable, and readily intelligible to every reader.

The improvements commence at the battery. Contrary to the usual form, this instrument consists of three troughs—an upper, middle, and inferior; the upper trough contains the acid, the middle the plates, and the inferior the waste fluid from the latter. These troughs are secured in a frame one over the other: the upper one is a long box, at the bottom of which are a number of short funnels of wood filled with sponge, or some other porous material. Into this box the dilute acid is poured, and issues in continuous drops into the middle trough. The middle trough is a box similar in form to the first, also having a series of funnels at the bottom; but it is filled with sand, and contains the zinc and copper plates which form the battery, the electricity generated being carried off by a wire at each end or pole of the battery. The inferior trough is merely the reservoir for the fluid which has discharged its duties, and become saturated with zinc. In action it will be readily perceived that this instrument is at once simple and effective: the dilute acid drips gradually upon the sand in the middle trough, exerts its energies upon the metals there, and then percolates through, and makes its escape from, the battery—its place being constantly supplied by more acid from above. Thus the battery both supplies and purifies itself. It will be in the knowledge of many of our readers that the common batteries have no such arrangement either for supply or for discharge of their fluid contents. The consequence is, that a rapid and energetic electro-chemical action is generated when the instrument receives a fresh supply of acid; but as this becomes saturated with the metal upon which it exerts its influence, this action becomes enfeebled, and will

finally cease altogether. There are certainly some forms of battery in which a greater uniformity of action is secured, but the commoner ones are, without exception, subject to this serious inconvenience. The instrument before us preserves a constant and uniform action, and affords at all times a flow of electricity of equal and unchanging intensity. Securing also the perfect saturation of the acid, it is, besides being a more effective, a far more economical form than any other with which we are acquainted. Possibly it may be found on the extensive scale that the residual sulphate of zinc can be collected and sold, so as to lessen materially the current expenses of the machine.

We next visited the 'Electro-Telegraphic Converter.' This is exhibited in a small separate apartment: it has an elegant appearance—a fitting ornament even for a lady's boudoir—being somewhat in the form of a handsome jewel cabinet, made of beautiful rosewood; while its dial-plate reminded us of some of the mysterious magical instruments which tell one's fate by figures or symbols. By its side is the 'Attention Bell,' to whose imperious summons we will first direct our attention. It is enclosed in a little mahogany chest with perforated sides, covered with silk, for the passage of the sound. At each station there will be a bell, and a bell-pull. The bell-pull is a simple handle of ivory, which moves a little mechanism inside a small box, making or breaking contact between the electric wires at the telegraphist's pleasure. On moving this handle to one side, contact is made, and a current of electricity is instantly directed to the mechanism of the bell, however distant the latter may be: the telegraphist, in less than a second, could set his bell a-ringing at the North Pole, or at any other spot on the circle of the earth where his wires were conveyed. A careful attention to the contrivance by means of which this is effected will pave the way in some measure for the comprehension of the larger instrument. The stream of electricity proceeds immediately, on the handle being touched, to a coil of fine wire, in the centre of which a short piece of soft iron is placed; induced magnetism takes place in this iron, and acts upon a peculiar magnet suspended close to it, causing it to deflect or turn aside. The deflected magnet then touches a little piece of steel acting as a detent, and liberates some clock-work, which immediately strikes the bell. All this is done more rapidly than this description of it can be read. The bell is only struck once, because a spiral spring connected with the handle, as soon as the hand is removed, breaks the circuit, the magnet returns to its position, the detent falls into its place, and the clock-work stops. But if it is necessary to keep the bell ringing, it is only requisite to keep the hand upon the handle, and the clock-work continues ringing it for any desirable length of time. The advantage of this single-stroke mechanism will be

best appreciated by those who have travelled on railways—on which the other plan of call-bells is adopted—at periods when the atmosphere has been intensely charged with electricity; the current of atmospheric electricity setting loose the clock-work, and the bell continuing incessantly to give its alarm until the works had run down. The peculiarity to which we desire to call special attention is the permanent magnet, which is deflected at will by the electric current. Contrary to the general form, it is a circular ring, incomplete at the lower end, at which its north and south poles are situated; it is thus rendered astatic: its poles being equidistant from the earth, the effects of terrestrial magnetism are neutralised. A delicate spindle pierces the upper border of this magnetic ring, through which the motion of the magnet is communicated—in the present instance, to the clock-work of the bell; in the conversing instrument, to the indices of the dial-plate. Before returning to the telegraph, we may notice the 'Accident Bell.' The movements are precisely similar in this case, the only difference being in the size and tone of the bell, which is struck by a ball of hard wood. The sound of this bell is loud and far-penetrating, and strongly resembles the deep-mouthed tone of a church bell. It is proposed to supply each station with such an instrument; and it could, when properly adjusted, be tolled simultaneously at every station on the line, so as to cause an entire suspension of the traffic, until the nature and situation of the disaster were known. The train also to which the misfortune occurred would be supplied with a small portable battery and bell-handle, so that the guard might make connection with the wires, and thus call for assistance with the rapidity of lightning. The value of this application is in the ratio of its extreme simplicity and unvarying certainty. Such a means of communicating intelligence of an accident has long been wanting; and we entertain the hope that the time is near when, by the aid of such or similar means, railway disasters will be as rare as they are now frequent.

It is time we examined the 'Electro-Telegraphic Converser.' At each side of the dial-plate is a small indicator, like the finger of a clock, each of which, on touching the ivory handle beneath, may be made to move either to the right or left hand. On opening the cabinet, the secret of the apparatus is discovered. There is a similar magnetic ring suspended close to the face of a bar of soft iron, surrounded by the coil of wire through which the electric current passes. When the charge passes through this wire, it deflects the magnet either to the right or left at the operator's pleasure. The magnet, in moving, thus communicates its motion to a piece of metal shaped like a T; either end of the T-piece touches then the indicators, and so causes them to move upon the dial-plate. A good idea of this delicate, yet simple contrivance, may be gained by comparing it to the letters T and O placed in superposition. Thus $\begin{smallmatrix} T \\ O \end{smallmatrix}$, the O being the magnetic ring. It will thus be seen, if the character is moved either to the right or left, the ends of the T might be made to give motion to an indicator swinging in its centre, and so placed that the ends could touch it when moved, and leave it at liberty when the $\begin{smallmatrix} T \\ O \end{smallmatrix}$ was in a perpendicular position. The telegraph is thus worked. The operator at one station moves his ivory handle to the right, instantly the magnet at the other station deflects, the T-piece presses up the right indicator, and the communication is complete. All that we have now seen is a dial-plate, on which are two moving indicators; it remains to see what language they can be made to discourse. The dial-plate is the key to the electric tongue. The following diagram will convey a

better idea of it than could be derived from a verbal description:—

Stations.				Stations.			
1	Understand.	A	1	N	Repeat.	14	
2	Go on.	B	2	O	Wait.	15	
3	Letters.	C	3	P	Figures.	16	
4		D	4	Q		17	
5	Ready.	E	1	1	R	Code.	18
6		F	1	2	S		19
7	Yes.	G	1	3	T	No.	20
8		H	2	1	U		21
9		I	2	2	V		22
10		J	2	3	W		23
11	↑	K	3	1	X	↑	24
12		L	3	2	Y		25
13		M	4	1	Z		0

Let us suppose a conversation about to be commenced. The call-bell rings: the attendant directs his eye to the dial-plate; his distant correspondent wishes to say 'Train up.' The right indicator moves three times, the left once, there is T; the right moves once, the left once, that is R; the left once again, that is A; the left twice, the right twice, that is I; the right once is N. Then, to make sure that the word has been comprehended, the left indicator goes up once for 'Understand.' The right once, the left twice, gives U; the right three times, gives P. 'Understand?' again; and the words 'Train up,' are registered any number of miles off. To judge of the rapidity with which these words are telegraphed, they may be conceived as very slowly and deliberately spoken. If the communication is not understood, the right indicator flies up and signals 'Repeat.' When it is necessary to indicate figures, the right indicator flies up three times and informs the operator at the distant station that 'figures' are now to be telegraphed. Thus the dial-plate is actually a key to the language indicated upon it. A very little practice is requisite to arrive at dexterity in the use of this telegraph, and ten minutes suffices to learn its indications. Doubtless, after the experience of a few weeks, the telegraphist will cease to refer to the dial at all as a key; but in the event of an accident happening to him, any person could take his place, and with his steel lesson page before him do the part of a tolerable substitute. The terms have this advantage, that they are not arbitrary, and that several of the continental languages can readily be spoken by their means, without alteration of the present plan. This may be thought a trifling advantage; but in the extended operation of this system of communication, it will not be without its utility. On the other hand, we are free to confess that the language talked by this instrument is more cumbersome than could be wished. We should like to see what phonography would do for it. Rapid as may be the operator's fingers, he has a language containing many untractable words to deal with, and it will probably become necessary to make such alterations in the system of terms as will obviate these difficulties; and it would be easy to effect this modification. The indicators have nothing to be desired; they are beautifully sensitive, simple, and instantaneous in action; and they have this great superiority over the needles of Wheatstone and Cooke's telegraph and others, that they are not magnets themselves, but may be made of bone or wood, or any other appropriate material: the derangements attendant on magnetic needles are thus obviated. On the whole, we believe the instrument to be in advance of those at present in use, and we think we are safe in promising for it a very

wide, and a very lasting reputation and adoption. We have repeatedly used the term 'simple' in describing it, but we should be conveying a wrong impression if it were understood that there is an absence of nice workmanship about the apparatus. On the contrary, the motive powers are adapted with exquisite delicacy to each other, and display that beauty of execution which, so far as our experience has gone, is the peculiar attribute of our British mechanics.

We were then shown into a large apartment, around the sides of which are ranged, all in communication with each other, seventeen telegraphs similar to that we have described. In our imagination we beheld a whole line of electric telegraph with its seventeen stations compressed into one room. Ten coils, equal to a thousand miles, of uninterrupted wire communicated between these telegraphs, yet the distance was as nothing to the electric current; and the instant the handle at one extremity was touched, up flew the indicator virtually distant ten hundred miles! Here is the revolutionising element of the present age, long elaborated in the cell of the philosopher, now given forth to alter the very aspect of human affairs! In this apartment was noticeable also a remarkably useful little invention attached to the telegraph, called the 'Deflector.' It consists simply of a little handle, which either insulates or connects the telegraph with the common wire of communication. Thus, if an instrument is deranged at one station, this will not interfere in the least with the others; the 'deflector' is pulled down, and London can still talk with Birmingham, although Wolverton, Tring, and all the rest are disordered. Two or three instruments were thus purposely put out of order; the 'deflector' was turned, and all went on just as before. Two batteries, each containing thirty-six pairs of plates, generated the power which moved the whole seventeen telegraphs through the distance equivalent to a thousand miles!

The inventors have also turned their attention to securing a more perfect method of insulation of the wires at their supports. This is thus effected:—A stout curved iron bracket is secured to the post, and carries on its upper end a glass or porcelain cap, through a knob on the top of which the wire is drawn. The cap is secured by lead to the iron bracket. The sides of the cap project about an inch all round beyond the iron, so that however wet they may become, the water will drip from them without establishing a connection between the wire above and the post below. In connection with this plan is another for tightening the wires when requisite, without at the same time interrupting the course of the electric current along the line. A steel band is fastened around the porcelain cap, which serves to hold firm the pulley with its toothed wheel and catch, by means of which the wire is drawn tight. As the porcelain cap is perfectly insulated, it follows that any mechanism fastened to it must preserve the same character. Atmospheric electricity has always had an inclination to dispute possession of the wires with its relative of chemical origin, and very frequently interrupts for a considerable time the working of the ordinary electric telegraphs when the charge is very strong. Messrs Brett and Little have contrived a conductor which is intended to divert the atmospheric current, and carry it peaceably away into the earth, thus allowing the galvanic current to fulfil its duties uninterrupted. As if to leave nothing incomplete, they have finally invented a beautiful electric clock. The permanent magnets in this instrument are placed at the end of a pendulum; and by their continuous deflection and reflection give motion to it, which is regulated by a train of fine wheels in the upper part of the clock. It is said to keep time admirably.

The number of wires requisite for the telegraph and bell is two only—one for each. The system is therefore one of vast economy when contrasted with those which require a wire for each station; and this is a feature of it which, above all others, appears likely to

render its adoption universal. We have been minute in our description of these improvements, principally with the desire to render our notice of a most important instrument—the electric telegraph—clearly understood by all who have a desire to learn the mode of operation of this mighty modern civiliser; and from the feeling that a general account of such a subject, however interesting, is uninteresting and unsatisfactory. At the same time, we would have it understood that no *ex cathedra* opinion is here intended to be pronounced upon the merits of other systems of electro-telegraphic intercourse; * the comparisons instituted being merely such as would suggest themselves to the most ordinary observation. Yet simplicity and utility are such close relations, and in these improvements they appear to have met together in so many directions, that we cannot help expressing our favourable inclination to their side.

THE FALL OF THE JANISSARIES.

'Who is this that cheapens pistols, when he rather needs a coat of mail?'

On hearing these words, pronounced in a low significant tone, the handsome young soldier turned quickly, and beheld near him two female figures shrouded in dark-blue mantles, and long yashmaks, or veils of white muslin. One of them, however, chanced to be in the very act of adjusting her veil, and thus allowed the yuz-bashi, or captain—for such his scarlet pelisse, and the golden star embroidered on his jacket, bespoke him—to catch a glimpse of a youthful face of ravishing beauty. The eyes were fixed on the ground, and a deep blush suffused the rounded cheeks. In another instant the veil was replaced, and the two muffled figures moved on and mingled with the throng, leaving the soldier in a state of extreme astonishment and perplexity.

The principal bazaar of Constantinople presented that day, as usual, a scene of great brilliancy and animation. The numerous arcades, with rows of shops on either hand, were crowded by people of all classes and every race of the East. Grave Turks, in flowing robes and turbans of various hues, shuffled slowly along, followed by slaves who carried their masters' purchases; Persian and Arab traders, Bedouin chiefs, Armenian merchants, Greek islanders, Arnauts from Albania, Mangrebins from Northern Africa, Toorkomans, Khoords, Tartars, and now and then a Frank of some western nation, all added, by their varied costumes, to the picturesque liveliness of the shifting panorama. Women, whose large languishing eyes were alone visible from within the muffled folds of their vestments, flitted incessantly from shop to shop, displaying quite as much fondness as their western sisters for the delightful trouble of bargaining. Rich young Osmanlis, mounted on handsome steeds, with splendid housings of velvet and gold, rode slowly along in the central avenues; and an araba, or carriage, like a huge cage, all lattice-work and gilding, occasionally stopped to allow one or two shrouded figures to issue forth and join the moving throng.

One customary element of variety, however, was wanting, the absence of which excited no little remark. Very few of the Janissaries—whose crimson pelisses, white turbans, red shawl-girdles, and silver-mounted weapons, usually made a conspicuous appearance, as they swaggered through the crowd—were now to be seen. The cause of their absence was no secret. This was the 14th of June 1825, a year and a day memorable in the annals of the Ottoman empire. On the previous day the Grand Vizier Selim Mehmed Pasha, and the celebrated Aga Pasha Hussein, commander of the forces, had assembled the Janissaries in their great square—called the Etmeidan, or 'Place of Meat,' because they there received their daily rations of soup—and had announced to them the new regulations to which they would be required thenceforth to submit.

* See a description of Cooke and Wheatstone's telegraph in No. 75, new series.

These regulations, which affected not merely their organisation, but also their pay and perquisites, their dress and their weapons, were all of a nature to be highly distasteful to the members of that lawless and intractable corps. The precautions of the sultan and his ministers, who had previously gained over or put out of the way many of the leading and most dangerous characters, prevented any open expression of feeling. The Janissaries listened in sullen silence, and retired quietly to their *kislas*, or barracks, when the ceremony was over. The grand vizier beheld this apparent submission with great satisfaction, and congratulated his fellow-minister on the easy success of their master's favourite project. But the aga pasha, better acquainted with the character of his old comrades, shook his head and said, 'It will not be done without much blood.'

This day, the 14th, was appointed for the first drilling of the new companies which were to be drawn from each *orta*, or regiment, of Janissaries, and placed under Egyptian officers of the army of Mehemet Ali. Those of the corps who were not in the companies were collected either in the *Etmeidan*, or in their barracks, anxiously discussing the nature and probable effect of the new regulations, and the course to be pursued by the body at the present crisis. Thus it was that very few of them made their appearance that day in the bazaar; and their place was but poorly supplied by the soldiers of the regular troops—the *seymens* (infantry), *topjees* (artillery), *bostanjees* (seraglio-guard), and *galionjees* (marines), who were present in considerable numbers, and in their ungraceful summer uniforms of white cotton jacket and trousers, with the red cloth *fees*, or scull-cap, and leathern belt, made anything but a pleasing appearance in the eyes of the Mussulmen beholders. Their officers, however, in their embroidered jackets, and the scarlet mantles which they were allowed to retain, were seen to more advantage. Of this number was the young soldier who has been already mentioned, and who was at once known by his uniform to be a captain of the corps of gunners. Nor did those who were familiar with the various races of the East fail to perceive in the tall and well-set figure, the bold military bearing, the keen blue eye, chestnut locks, and classically-moulded head and features, the marks which denoted his Circassian or Georgian blood.

'Who is this that buys a bridle when he more requires a spur?'

The voice was the same that had before struck his ear; and on turning, he again beheld the lovely face, over which the *yashmak* was just falling. This time the large dark eyes were fixed on him for a moment, with an expression of timid anxiety. The soldier stood and gazed at the retreating forms with still greater astonishment than before. The women were evidently of the higher class; and the words which had been uttered seemed to imply some knowledge of and interest in him. Yet he had been but four months in Constantinople, and of that time the greater part had been spent in his barracks at Tophana, out of which he had hardly an acquaintance. If it were a mere frolic of two laughter-loving damsels, making their sport of the foreign soldier, why did she who partially unveiled her face assume an expression so little akin to mirthfulness? And why did her companion, who, he felt assured, was the one that had spoken, keep her countenance carefully concealed?

While pondering upon this mystery, and pretending to be absorbed in the examination of some Farangee shawls, which were displayed upon the stall of an Armenian merchant, he caught sight of two muffled figures, whose approach caused his heart to beat with a kind of instinctive presentiment. This time his hand was slightly touched, and a soft voice murmured beside his ear, 'To-night, before the mosque of Raghil Pasha.' The figures passed slowly on, and the soldier followed at a little distance, until he saw them enter a carriage, which immediately drove away. The young man, how-

ever, easily kept it in sight, until it passed out of the gate of the bazaar. Here a number of Jew porters were seated, waiting to offer their services to any one who might seem to require them. Dropping a coin into the hand of one of them, he said, 'Tell me, Jew, know you whose carriage it was that just now passed the gate?'

'Truly, effendi,' replied the Jew, 'I know it well, for it is one often seen in the bazaar. It is the araba of the Chorbajee Osman, of the seventeenth *orta*.'

'Osman, a chorbajee* of Janissaries,' said the soldier to himself, as he drew his mantle about him, and moved slowly away. 'I have heard of him as a favourite leader among his comrades, and a violent partisan of the old institutions. But how can I have become known to any in his harem? There is some mystery, and I will not renounce the adventure until I know more. At all events, there can be no harm in spending an hour or two before the mosque of Raghil Pasha.'

Thus meditating, the young man was proceeding in the direction of the *Etmeidan*, when he encountered a brother officer, who was hastening rapidly towards the port. 'How, Soujouk Saduk,' said the latter, 'are you not for Tophana? Have you not heard the news?'

'What! Have the Janissaries risen?'

'Not yet,' replied the other: 'but the *Etmeidan* is all in commotion. An Egyptian officer has struck one of the men in his company, and all the rest have thrown down their arms and torn off their new uniforms. The *ortas* are assembling; and there will be burning and bloodshed, if something is not quickly done to appease them. I am going to inform the *topjee bashee*.†'

'I will wait and learn more,' returned Saduk, 'and will follow you in a few hours.'

With these words he took leave of his companion, and directed his course through the most unfrequented streets leading towards the mosque of Raghil Pasha, which was beyond the barracks of the Janissaries. It was now sunset, and he made a wide circuit, in order to allow the night to close in before he reached the place of rendezvous. The few persons whom he met on his way hurried by with looks expressive of fear and agitation. He could not doubt that some calamitous event was apprehended; and knowing that an outbreak of the Janissaries was almost always preceded or accompanied by extensive conflagrations, he easily understood the anxiety of the citizens.

On reaching the mosque, he took post in an obscure angle within its shadow, and remained there motionless for two or three hours. At length, just as he was about to quit the spot, with the conviction that he had been the subject of a very annoying practical jest, a veiled female figure hastily approached the mosque, and, after a moment's hesitation, came towards him. Uncovering her face sufficiently to let him perceive that she was an Abyssinian slave, the woman inquired, 'Are you the *yuzbashi* who buys pistols and bridles, as though he were still a rider on the hills of Atteghai?'

'I am he whom you seek,' replied the young man, much surprised at the latter part of the question.

'Then,' continued the negress, 'I am sent to bid you follow me to the presence of a daughter of Atteghai.'

Atteghai is the name which the natives of Circassia give to their country. Saduk at once concluded that some female of his nation, the slave, or perhaps the wife of the Chorbajee Osman, desired to speak with him, for the purpose of making inquiries respecting the friends whom she had left in her native land. With this idea, and excited by the hope of once more seeing the face of the beautiful young houri whom he had met that morning, he bade the messenger lead on without delay. The negress obeyed, and after a walk of some length, through several narrow by-streets, she stopped before a small postern door. Opening this with a key, she introduced him into a low, dark passage, and pro-

* An officer answering nearly to our colonel; the word, however, means literally, 'master of rations,' or soup distributor.

† Chief or general of the artillery.

ducing a small lantern from beneath her mantle, directed him to move forward as noiselessly as possible. In this way they passed through several rooms, and at length the slave, drawing aside a curtain, said, 'Enter, effendi, for the mistress awaits you.'

Saduk advanced, and found himself in a small apartment, furnished in a costly and luxurious style. A divan of crimson-velvet encircled three sides of it; on this, and on the Persian carpet, were heaped numerous cushions, covered with red cloth and morocco. The ceiling was painted in fresco; and from the centre hung a lustre of four lights, which illumined the apartment. A veiled figure was seated at the upper end of the room, and a voice—the same that he had heard in the bazaar—said in Turkish, '*Khosh geldin, Cherkess*'—('You are welcome, Circassian.')

Before he could reply, the veil was drawn aside, and the soldier beheld, to his astonishment, what he would have said was the same face that he had seen in the bazaar, but with the addition of some fifteen or sixteen years to its age. The features and expression were the same. The eye was as large, dark, and languishing; but the sparkle of youth was gone. The cheek was as beautiful in its outline, but without the glow and smoothness of early years. Was it possible that his momentary glimpse could have so much deceived him?

As he stood thus embarrassed, the lady, who seemed rather to enjoy his perplexity, said with a smile, in the Circassian tongue, 'Sit, my friend, while I speak a few words on a subject near to my heart. You are a son of Atteghai, of the family of Soujouk, and the tribe of Natukaitas. This I have heard from those who have made inquiries respecting you.'

'It is true, lady,' replied the young man, 'however you have learned it.'

'I, too, am a child of Atteghai,' continued his hostess, 'of the tribe of Shegakeh. Yours is a great tribe, and a noble family, but mine is obscure and poor. Yet perchance you may have known the Dar Khaldeer of Malakoy?'

'Unhappily,' replied the young man, 'I know too little of my native land. When I was a boy of fifteen, the Muscovs* and Cossacks crossed the Kouban, and ravaged all the neighbouring valleys. The Natukaitas assembled, and drove them back over the river; but my father and my elder brother were killed in the battle, and I was wounded, and taken prisoner. They carried me with them to Tscherkask, where my wound was healed, and afterwards I was sent to the military college to receive the education of a Russian officer, in the expectation that I would do them good service in the war against my own country. Seven years I remained at the college and in the Russian army, and at length I was sent to fight against my brethren of Atteghai. But I laughed at the beards of the Muscov, and escaped, and fled to the army of my own people, and fought among them until our enemies were driven once more from the land. But when I returned home, my heart was heavy, for there were none to welcome me. My mother and my brothers were dead, and our uncles had taken or sold our property; so, rather than make ill blood and disension in the family, I said to myself—"I understand the science and the discipline of the Franks: I will go to Stamboul, and offer myself to the sultan, to serve in his new army. Perhaps I may find favour, and rise to honour, as many others of my countrymen have done." So I came hither four months ago, and presented myself before the padishah; and when he heard my story, and especially that I knew the art of founding cannon, he was greatly pleased, and made me a yuzbashi at once. This is my history, hanoum;† and thus it is that I know so little of my country, and cannot inform you respecting your friends, for which misfortune I am greatly grieved.'

'So be it,' said the fair Circassian with a sigh; 'they are under the protection of Allah. If it be their fate to

be well and prosperous, they will be so; and if not, who can alter it?' With this philosophical reflection her disappointment seemed to be assuaged, for she proceeded in a different tone: 'Tell me, my young friend, did you see my daughter's face in the bazaar when I bade her put aside her yashmak? And did she please you?'

'Was she your daughter?' asked the young man. 'Truly she is a houri—the loveliest of maidens. I have never seen her equal. Happy will be the man who shall possess such a light of his harem!'

'Can you not guess, my friend,' asked the lady with a smile, 'what a mother means when she allows her daughter to uncover her face before a man?'

'Is it for me that you intend this happiness?' asked the youth, at once astonished and delighted. Then, as the thought of his situation occurred to him, he continued in a despondent tone, 'But, alas! what can I say to the chorbajee? What shall I offer as the dowry of his daughter?—I, a poor yuzbashi, with nothing but my mantle and my sabre?'

'You are rich in the favour of the sultan,' replied the lady. 'Think you not that all these matters are known in the harems of Stamboul as well as in your barracks at Tophana? You have the knowledge of Frank arts of war, which the sultan prizes above everything else. In a year you will be a bin-bashi (a colonel of artillery); in five years you will be a bey; in ten years, inshallah—please God—a pasha. I will answer for it, that when your messenger comes to the chorbajee, he will send back words pleasant to your heart. Even now, you can do more to win his friendship than if you could offer him the dowry of a pasha's daughter. You know that the evil advisers who surround the sultan, and pervert his mind, have persuaded him to take away the ancient privileges of the Janissaries, and alter their laws and customs, which were established by the great and wise Sultan Urkhan, and the holy derviah Hadji Bectash. But the Janissaries are strong, and will maintain their rights in spite of traitors and evil counsellors; and when they meet in all their ortas, with their camp-kettles borne before them, and require the restitution of their old laws and privileges, and demand the heads of their enemies, be assured that they will obtain both the one and the other. But whether they will prevail without much fighting and bloodshed, is another matter. Allah only knows. But this, dear Saduk, is what I would teach you, that you may know how to win the favour of the chorbajee. Of all the troops of the nizam djedid, there are none which are not as dust, as bosh (nothing) in the eyes of the Janissaries, save only the artillery. Most of these, as you know, were formerly Janissaries, or friends of the Janissaries, and will be loath to fight against them. It is their officers alone who are strangers and enemies to the Janissaries. If now there could be found one officer of the topjees—one yuzbashi—who, in the hour of conflict, would say to his men, "Do not fire upon your brethren, the children of Hadjee Bectash," they would all obey at the word, and the victory would be secure to the good cause without more blood. Surely, Saduk, dear friend, child of Atteghai,' she said, bending forward, and looking imploringly into his darkening face, 'you would not fire upon my husband—upon the father of my daughter Shereen?'

'This is a snare!' exclaimed the soldier, rising hastily from his seat, and gathering his mantle about him. 'What dust is this that you would have me eat? Shall I dishonour my father's grave? Shall I break my oath to the sultan for a handsome face? Is this becoming a daughter of Atteghai, to mislead her countryman to disgrace and ruin? Know that for seven years I have carried my life in the hollow of my hand, ready to throw it away at the first warning; but my faith I have kept secure, holding it a thousand times dearer to me than life. This is the law of Atteghai. Have you never heard the history of Mehemet Gherrai, my ancestor, how he gave himself up to death to redeem his word? Farewell, hanoum; I truly believe that your

* Muscovites, or Russians proper

† Lady

daughter knows nothing of this deception, else she would have been with you. For her sake, and the sake of our common blood, I pardon you this evil design, and may hereafter do you good.'

So saying, before the dame could recover from her confusion, he hastily thrust aside the curtain which concealed the entrance to the room, and seizing the slave by the arm, drew his poniard, and bade her show him the way to the door. The terrified negress obeyed without hesitation, and Saduk presently found himself in the street. Taking, as near as he could judge, the direction of the port, he hurried forward until he reached the aqueduct of Valens. Here, while he stood concealed in the shadow of an arch, he heard the tramp of a body of men approaching, and presently about a hundred soldiers, in the Janissary uniform, completely armed, passed at a rapid pace within a few feet of him. From the course which they pursued, he had no doubt that their object was to surprise their aga, who was especially obnoxious to them, from the part which he had taken in favour of the new regulations. This, then, was the commencement of the insurrection. As soon as they were out of hearing, he turned and hurried in another direction towards the Ayasmah landing. On arriving, he roused a boatman from his slumbers, and bade him row as rapidly as possible to Tophana. Twenty minutes brought them thither; and the young man hastened directly to the quarters of his commander, the topjee-bashi. The latter had directed his slaves to awaken him on the arrival of any important intelligence, and Saduk was quickly ordered before him. When the commander heard his statement, he said, 'You bring great news, yuzbashi. This must go directly to the padishah. We will proceed to Beshiktash together in the calque which brought you hither. Beybars,' he continued, turning to his orderly in waiting, 'tell Kara Jehennem to make sure that his gun-carriages are in good order, and that his men are staunch. I foresee,' he added, 'a day of bloody work, in which we topjees shall have to bear the heaviest share.'

So saying, he proceeded with Saduk to the landing, and put off in the calque for Beshiktash. They were half an hour in reaching the palace, where they found that the sultan, as became a sovereign whose empire was trembling in the balance, had been up all night, engaged in close consultation with his ministers. The grand vizier, the mufti, the aga pasha, the Janissary aga, the capudan pasha, and other great officers of state, were present in the council. The topjee-bashi was admitted at once, and Saduk was presently summoned to the council-chamber. He found the sultan sitting on a pile of cushions at the upper end of the apartment, while his ministers stood near him on either hand. Mahmoud's dark-blue eyes glittered with vindictive pleasure, and his naturally sallow cheek was flushed with joyful excitement. 'Ha!' he exclaimed, as Saduk approached, and made his military obeisance, 'it is the Cherkess who has brought the good news. You have done well, yuzbashi: it shall not be forgotten. At what hour did you see these dogs of Sheitan, and how many were there of them?'

'Asylum of the world!' replied the Circassian, 'it was shortly after midnight, when your servant saw about a hundred of the rebels, on their way seemingly to the dwelling of his lordship the aga.'

'The curse! the miscreants!' exclaimed Mahmoud. 'You did well, aga, to remove your harem in time, for nothing will be sacred to these wretches. You are all witnesses, pashas, that it is they who have begun the conflict, and not I. This day shall decide who is to govern henceforth in Stamboul—the sultan or the Janissaries. If it be these dogs, I will retire to Asia, and leave the city and the western empire to them. But wherever I am, there I will be king. Come, pashas, now that the work is commenced, our place is in the city. Let every one perform his part, according to the plan which we have sanctioned.'

With these words the council broke up. The sultan

and his principal ministers proceeded immediately to the seraglio, and walked from thence in solemn procession to the imperial mosque of Sultan Ahmed, near the ancient Hippodrome. Here a ceremony of great importance took place. The Sandjak Shereef, or sacred standard of Islam—made, it is said, of the apparel of the Prophet, and only produced on the most momentous occasions—was brought out from the treasury, in which it had lain for fifty years, and set up on the pulpit. Standing beneath it, the sultan, the mufti, and the ulmas—the three heads of the Mohammedan faith—pronounced a solemn anathema upon the rebels, and devoted the whole body of the Janissaries to destruction. The news of this proceeding quickly spread through the city, and produced a decisive effect. The mass of the population had previously been wavering between their devotion to their sovereign and their ancient sympathies for the rebellious troops. But when the influences of religion were enlisted in favour of the former, there was no longer any hesitation: the great majority of the citizens came forth in a tumultuous throng, and swelled the number of the forces which were advancing from all sides against the insurgents.

The latter, after sacking the palaces of the Janissary aga and the grand vizier, and making an ineffectual assault upon the seraglio, had retired to their square, the Etmeidan; and there having inverted their camp-kettles, according to their usual custom when in a state of revolt, they appointed a deputation to lay before the sultan their final demands—namely, the restoration of all their ancient privileges, and the death of the four ministers whom they considered their chief enemies. But while thus engaged, they neglected, with unaccountable infatuation, to take any precautions against the approach of the various corps of regular troops which were gradually occupying every avenue leading to the Etmeidan. Thus, when the Janissaries received the positive refusal of their demands, together with the alternative of submission or instant destruction, they found themselves hemmed in on all sides by the hated forces of the nizam djedid. A sense of their dangerous position then first seized them, and they made a furious and simultaneous effort to break down the living barriers which enclosed them, with the intention of spreading themselves over the city, and setting fire to it in every quarter.

The principal rush was directed towards a narrow street, occupied by a body of flying artillery, with two guns loaded with grape. The leader of this body was an officer noted for his great size and strength, his swarthy and forbidding countenance, and his relentless determination, all of which traits had procured him the appellation, by which he was usually known, of Kara Jehennem, or the 'Black Infernal.' It was supposed that the dread and respect which the topjees entertained for him would serve to counteract their well-known sympathies for their former comrades. Thus far the expectation had been fulfilled, for the men had fought with vigour in repelling the attack of the Janissaries upon the seraglio. But now, when the mighty mass came rolling towards them, calling on the sacred names of the Prophet and Hadjee Bectash, and shouting to the gunners the watchwords of their ancient fellowship, the hearts of the latter failed them, and they drew suddenly back from their guns, carrying their officers with them. In another moment the pieces would have been in the possession of the insurgents. It was the crisis, if not of the Ottoman empire, at least of the reign of Mahmoud. Kara Jehennem, who stood in front of his troops, with his yataghan in one hand and a pistol in the other, when he found himself thus left alone by their retreat, took his resolution with the unhesitating boldness of his character. He shook his sabre, with a terrible imprecation, at his recreant soldiers, and then, springing to one of the guns, fired his pistol over the priming. The Janissaries were close upon the piece when it was discharged, and the effect of the grape upon their dense column was tremendous. The whole

mass recoiled in confusion, which the discharge of the second gun, by another hand, turned to a headlong flight.

'*Aferin, Cherhess!*'—('Well done, Circassian!')—exclaimed Kara Jehennem; 'that shot has made you a colonel. Come on, dogs, cowards, sons of burnt fathers!' he shouted to the topjees. 'Your guns to-day, or the bowstring to-morrow.'

The gunners needed no further menace to make them return to their duty, and the guns were quickly manned and brought forward to take part in the deadly shower of grape and musketry which was now pouring, with fearful effect, upon the rebels in the Etmeidan. Presently a cry was raised among the latter, 'To the kiasas—to the barracks!' The barracks of the Janissaries adjoined the Etmeidan, and the revolted troops, now taking refuge in them, defended themselves there with desperate resolution. The aga pasha sent to inquire of the sultan if he should endeavour once more to make terms with the insurgents before proceeding to the last extremity. The answer was brief and decisive—'Set fire to the kiasas!'

The stern command was unhesitatingly obeyed. In a few moments the barracks were enveloped in flames; but not even the prospect of the dreadful and inevitable death which awaited them could induce the Janissaries to sue for the mercy which they had before rejected, and which they probably felt would now be refused them. They fought on, with the fury of despair, until the greater number were buried in the burning ruins. A portion of them sallied forth, and attempted to cut their way through the line of their enemies. In the conflict which ensued, Kara Jehennem fell with a bullet through his hip. 'Die, dog!' shouted an old chorbajee, rushing towards him with uplifted yataghan; 'down to jehennem, where you belong!'

'Not yet, Uncle Osman,' replied the 'Black Infernal,' and raising himself on his left elbow, he fired his pistol at the Janissary, saying, 'Take that, old friend, for your good wishes.'

The chorbajee stopped suddenly, and struck his hand to his side; then springing like a tiger upon the ranks of the topjees, he cut down two men by successive blows of his yataghan, and fled swiftly up the street, towards the mosque of Raghil Pasha, closely pursued by a party of the soldiers. All resistance was now at an end, but the work of destruction did not cease. Every Janissary who was found within the walls of Stamboul, whether concerned in the late revolt or not, was put to death without mercy. The bowstring and the Bosphorus completed what the cannon and the sabre had begun; and within twenty-four hours, that formidable body, which for four centuries and a half had been by turns the bulwark and the scourge of the Ottoman empire, was utterly annihilated. Its very name was made accursed, and a heavy penalty denounced upon any one who should utter it. Twenty thousand men are supposed to have perished in consummating this brief but sanguinary revolution, for such its objects and its consequences entitle it to be called.

During the conflict, Saduk had distinguished himself both by his courage and presence of mind. But he felt no disposition to take part in the massacre which followed; and was about to withdraw from the scene, when a sudden recollection flashed upon him, and caused an immediate change of purpose. Collecting a few of his men, he hastened towards the dwelling of the Chorbajee Osman, which he had no difficulty in discovering. He arrived just in time. The old Janissary, mortally wounded by the pistol-shot of Kara Jehennem, had fled to the privacy of his harem to die. In ordinary times, even the executioners of the law do not venture to violate this sacred refuge; but the solemn anathema pronounced upon the rebels removed all scruples of this nature, and Osman's pursuers had just broken into the apartment, where the affrighted women were clustered in speechless horror about the dying man. Saduk's appearance saved him from the last indignity of the

bowstring, and preserved the females from insult. In gratitude for this service, the old chorbajee, by a will pronounced on the spot, as the Moslem law allows, bequeathed to the young man all his wealth, on condition that he continued to extend his protection to Shereen and her mother. This condition being anything but an onerous one, the trust was promptly accepted by the youthful soldier. The will, it is true, as made by a rebel who had forfeited his property by his guilt, would have been of no avail but for the favour of the sultan, who not only confirmed it, but also bestowed upon the Circassian the rank which Kara Jehennem had promised him. Shereen, it is hardly necessary to add, became the wife of the fortunate adventurer; and her mother, with the third of her late husband's ample fortune, was able to fulfil a long-cherished vision, of returning in splendid state to the land of her nativity.

To revert for a moment to the more important subject of our narrative. It has been remarked by many writers, that after the destruction of the Janissaries, the character of Sultan Mahmoud seemed to undergo a decided change for the better. His previous reign had been marked by numerous instances of the treachery, cruelty, and rapacity which we have learned to consider inseparable from the nature of Oriental despotism. In his after-life he showed himself not only a liberal legislator—which might proceed from mere selfish policy—but also, on many occasions, a really benevolent, well-meaning ruler; and in spite of the political misfortunes which clouded his later years, he succeeded in securing the affection of the mass of his people, and particularly of the Greek rajahs, and other subject races, to a degree in which no other Turkish sovereign ever possessed it. If, therefore, in the destruction of the Janissaries, Mahmoud showed himself sanguinary, treacherous, and unrelenting, it is but fair to remember that they themselves, by the character which their fierce, lawless, and bigoted disposition imposed upon his government, had fostered in his mind the very vices from which they afterwards suffered. Viewed in this light, the catastrophe assumes the aspect of a simple moral retribution, and we lose our commiseration for the sufferers in our sense of the justice of the punishment.

THE EXEMPLARY IMMIGRANT.

We suppose few of our readers have ever seen or heard of the 'Sydney Tracts,' nor were we aware of their existence till one was lately brought under our notice by a person from New South Wales. They are small brochures, written and issued at Sydney, partly with the view of improving the tone of mind of the immigrant classes of Australia, and inducing them to addict themselves to habits of steady industry, and partly to afford correct information to intending emigrants at home. The number before us consists of short narratives, likely to be beneficial among the parties for whom they are designed; and to aid in the professed object of the undertaking, which is worthy of all praise, we beg to offer the following account of a humble but exemplary immigrant, who some time ago arrived in Sydney:—

'Scarcely had the ship *Brilliant* arrived in the Sydney harbour, when Mr and Mrs Dampier went on board, accompanied by their cousins the Croakers. They found three hundred persons in high spirits; their long voyage was over, they could see the Land of Promise, "the Poor Man's Paradise;" but in less than half an hour these poor creatures had lost their spirits; for they listened to Mr Dampier, and believed his statement. "The country was overstocked, wages were falling, provisions were dear, rent ruinous, employment difficult to be found; the more money you got, the poorer you'd be; in fact, it would have been better for them to have remained at home to starve than have come here to do so." Man after man left the deck, and went below to give way to their feelings of disappointment and despair. John Lord remained, and listened; he heard all the Croakers had to say of this land of starvation. Now

John Lord was a shrewd and observing man, and he remarked to his wife that the Dampers and Croakers looked in good condition, far removed from any symptoms of starvation, and that they were all well dressed. "You know, Janet, I never would allow myself to believe all that was said at home in favour of the colony, nor will I now believe all that is said against it." He tried to raise the broken spirits of his wife; failing in this, he endeavoured to raise his own. "I'll e'en see in the morning, and judge for myself," said John; and early in the morning he was shaved and dressed, ready for the first opportunity to get on shore. John did not put on his Sunday coat, but his working-jacket; for he was wise enough to know that if you want work, you must be ready to do it. He had been what is called a handy man at sea, and the steward was glad to oblige him—he left the ship in the first boat. It was six o'clock when he landed, and he had in his pocket twopence-halfpenny. He gathered comfort from observing that the men he met, who were on their way to work, had every appearance of being a well-fed set. When near eight o'clock, he observed women make their way to the butcher's shop: he saw them hand their plates, and ask for, and pay for, their two pounds of chops, their shilling fry, their beefsteak. He was astonished. Beef for breakfast!—he would not believe it. He followed one woman home; on the table was a loaf, tea, sugar, and butter. He saw her reach the frying-pan, and he went to a distant spot to watch her movements. He saw her husband, a labouring man, enter and partake of his meal; the children too. "Well, well," said John, "if the people of this country are starved to death on such fare, 'tis a queer country I am come to, for I have passed twenty-six houses, and heard the hissing of the frying-pan at seventeen." He thought of his wife and children; he longed to give them a feast; and quickening his pace, vowed if there were work in Sydney he would find it. He was now near the Commercial Wharf; the Paramatta steamer was just in; there was a gentleman at the gate of the yard with a hat-box and carpet-bag, and he offered a man a shilling to take them to the Royal Hotel. "A shilling!—before he would take a shilling for what was worth two, he"—John Lord was looking on. He saw the gentleman start to carry his own bag; he followed quickly, offered his services, and was accepted. He reached the Royal Hotel; he received his shilling; and with a fresh supply of spirits he started. He had not gone far, when at a grocer's store he perceived a dray loaded with sugar; the master stood at the door with an impatient look. "Can I help the man in with the bags, sir?" "Yes, and look sharp about it." With good-will John went to work, and received another shilling. "Can you give me another job, sir? Shall I scrape the floor for you, sweep your yard?" "Have you anything you want done?" asked the master at his foreman. "The potatoes, sir, would be the better for looking to." This was the third job. Off went John's jacket; he tucked up his sleeves, and went to work with spirit; picked out the potatoes quickly, stowed away the bags neatly, swept the place, and received for his work two shillings and sixpence. With four shillings and eightpence-halfpenny in his pocket, he ventured to have his hair cut, "for I should like to look decent." He had scarcely left the shop, when he saw the gentleman from whom he had received his first shilling: he made up to him in a respectful manner, and inquired if he had any occasion for his services? "Not now; but if you are at the Royal at four o'clock, you can take my bag to the steamer." John was punctual; but besides the bag were several parcels to carry, and the gentleman paid him one-and-sixpence. He now thought of returning to the ship, but he went first to the market: he bought for his children one dozen of peaches, for which he paid twopence. "I'll give them one treat anyhow." He purchased for Janet a quarter of a pound of tea, one pound of sugar, and two loaves of bread, and then went merrily on. He went into a butcher's shop and pur-

chased four pounds of beefsteak, and to this he added six pounds of potatoes. He had expended for his family's comfort three shillings and elevenpence. He left the ship in the morning with twopence-halfpenny, and he returned with two shillings and threepence-halfpenny. Janet was delighted with his account of Sydney, and soon prepared the feast. John Lord saw all prepared, his wife's lightened look, his children's joyful faces. For eight years Janet had been the faithful partner of his cares; and for the first time he felt that, blessed with health, want would not enter his dwelling. Feelings, thoughts of comfort, a certainty of being able to provide his Janet with more than the bare necessities of life—comforts were within his power, luxuries within his reach. He tried to eat, but he could not. He had been proof against sorrow; but the near view of domestic comfort, the certainty of being able to provide for his family, made his heart swell with grateful feelings, and for the first time in his life he felt *too happy*.

The following morning he was up at daybreak, and was off with the first boat. His industrious efforts were successful; and by seven o'clock he had earned two shillings. He went to the Royal Hotel—no job. He then went to the grocer's, and was employed for three hours. From place to place he persevered; and this day he made five-and-sixpence. In a few days he was well known to twenty respectable persons as a man who came to this colony to work. In a week he felt justified in taking a small furnished kitchen, for which he was to pay six shillings per week. The day he was able to take his family from the ship was one of proud satisfaction to him. His heart rejoiced; he had been fortunate. All his children—three—were with him; his Janet, too, was overcome with feelings of grateful recollections on entering his tiny home. He knelt; his prayer was a silent one, but it was registered by Him who reads the heart. For three weeks he did well at job work; when his second friend, the grocer, engaged him as a working man about the stores for twenty-five shillings per week. A settled place, sure pay, John knew how to appreciate. He was not a man that required another to look after him, and his master soon perceived it: he was thoughtful and careful too; in fact he performed the duty of a servant faithfully. He had a keen eye to his master's interest. He was soon remarked as being the first man on the premises in the morning. When evening came, if there was still work to do, he did it. You could not tell by his countenance that it was six o'clock. One week he had had more than usual to do, and rarely left the stores before nine. On Saturday night, when the men were paid their "extra," he was called in; he was the last man paid; he and the foreman were alone; he handed John the "extras." "Do you take me for a sharper, sir? I am not the man to count minutes with a good master." And pocketing his twenty-five shillings, he left the office with a consciousness of having acted rightly. The following week he was told, that as he made himself so useful, the master would rather he should go into the kitchen and take his meals with the servants than go home. This was a saving to John, and an accommodation to his master. To the servants in the house he was civil and obliging. If a large pot required to be lifted off the fire, he was ready to do it. A bucket of water he always carried in with him; in fact, he had so much method and good temper, that all acknowledged he did the work of two. A few weeks after this, the woman who washed for the family complained that two shillings per dozen did not pay her. The kitchen-maid spoke to the mistress about John's wife. She was sent for; the offer was made, and gratefully accepted. Janet went home, making happy calculations. Twelve dozen a week—oh, she could manage. If her three children went to school, she had only them to cook for. She set about her work cheerfully: she found it pay her well; for she could now put into the savings' bank one pound from the washing-money a week. For many weeks she had de-

posited seven shillings regularly. About ten weeks after this, John was made storekeeper, and his wages were raised to thirty shillings per week. In the store he gave great satisfaction. He allowed no sugar to run to waste. When he saw a hole in a bag, he mended it. He was a favourite with the foreman, for he gave him no trouble; and about this time he told his master of the extra money. This circumstance raised John in the estimation of his master; and on going through the stores, he expressed himself as being pleased with the order that was observed, in a way that was gratifying to John. He ordered him to put a bag of rice in the hand-cart, a bag of sugar, and a quarter chest of tea. "Take them to your own home, John, for I am very much pleased with your good conduct." This gift John gave to Janet with great satisfaction; for the praise of a master sounds grateful to a servant's ear. He remained in the same service sixteen months from this; when his master, having made a fortune in this country, went, like many others, home to spend it. When the men were paid their last week's wages, Mr Wilkie said to John, "You have behaved yourself so well, that if I can do anything to serve you, I will. What do you think of doing?" "Why, sir, as I was for some time a gardener, and I know now something of the climate of this country, I think I shall lease some land at Botany, and have a pony and cart, and take my vegetables into Sydney for sale." "I have some land at Newtown; and if you like it, you shall have it. You can go and see it, and my agent will tell you the terms: but stay, I will give you a note to him; for I know you will improve the property, and you shall have it on easier terms than any one else. We will now settle accounts. I find you have never been paid for extra hours; and the foreman tells me, for the last eighteen months, you have made seven days and a half every week, so that I owe you for one and a half day's labour for every week during that time: this will be enough to buy you a pony and a cow." "Sir," said John Lord, "you have been a good master to me; you have never given me a cross word; it did my heart good to see you thrive; you must not now, sir, at the last moment, vex my heart; I have saved money enough to buy me all I want." "How much have you?" John pulled out his pocket-book, and handed the savings' bank paper to him, and the entries ran thus:—

Nine weeks, at 7s. per week,	L.3	3	0
Sixty-eight weeks, at L.1, 10s. per week,	102	0	0
Interest, at 10 per cent.,	6	6	0
	L.111	9	0

The master looked thoughtful; it seemed strange to him that a man who had been so careful of every sixpence should refuse extra money. He could not understand a peasant's pride, a labouring man's idea of honour. It was gratifying to Mr Wilkie to find that *one* servant had saved money—that he would leave in this colony one whose first step in life was owing to him; and he rejoiced at his industry and economy. In a few days John Lord was settled at Newtown, on terms that were favourable and just. The lease was for seven years; and if during that time, or at the expiration of that time, he could pay a fixed price, the house and property were to be his own.

'When John Lord first saw Janet take tea in her new habitation, he thus expressed himself:—"Now, Janet, you must not say another word about washing. Your work is now confined to your own family; and the day will come, Janet, when you need not do that: I'll work hard for it anyhow. See these arms, Janet!" And as he raised himself up, with feelings of gratitude to the Giver of all good, and with so many proofs before him of the benefits attending on honesty and industry, the group formed a subject for a painter. His Janet, his affectionate Janet, had thrown her arms around his neck, and her head rested, weeping, on his shoulder. Her tears were kissed away by one who thanked God he had emigrated to Australia. But the

day for Mr Wilkie's departure had arrived, and this respected servant went to say farewell. They respected each other. Their hands met. When worth joins the compact, what matters the skin? When John Lord returned home, after seeing his master on board ship, at his door he saw a horse and cart, in his paddock a cow—his master's farewell gift.

'In this tale, which is founded on fact, I deal not in impossibilities; I speak not of midnight visions—of dreams of domestic comfort; but I speak of what is *within the reach* of every man who will tuck up his sleeves, go to work, and try for it.

'That John Lord's house and land will soon be his own, there can be no doubt; for a man who gets up at five o'clock, and goes to work—a man who allows his arms to swing easy in their sockets—is certain of getting a place of his own; but those men who come here, intending to *talk* of work, and saunter about with their hands in their side-pockets (holes made to hide idle hands), will never attain this—in fact, to speak in plain English, *they are better at home.*'

THE LOST VELASQUEZ.

ADVENTURES OF A CONNOISSEUR.

MR SNARE'S pursuit of proofs in favour of the authenticity of a portrait of Charles I., purchased by him at Radley Hall, which he alleges to be the original sketch painted by Velasquez at Madrid in 1623, affords so many curious illustrations of unexpected coincidences and cumulative evidence, that a brief notice of his exertions may not be without interest. We shall chiefly follow Mr Snare's own account in the order of his discoveries.

It is well known that in 1623, Charles, then Prince of Wales, accompanied by his father's favourite, George Villiers, the celebrated Duke of Buckingham, visited Madrid with the avowed object of wooing and winning the Infanta. We are informed by Pacheco that his son-in-law, Velasquez, the great Spanish painter, had the honour of receiving a hundred crowns for taking the portrait of the royal suitor. It is probable that this likeness was designed as an acceptable offering by the bold knight-errant to his lady-love; but what really became of it, and whither it strayed, when he returned wearied and disgusted to his native land, history has not recorded even incidentally. It is not at all likely that so bitter a memento was retained in his own possession, and far less likely that an object so unpalatable to the excited feelings of the nation was located in any public gallery. Mr Snare adduces very probable grounds for supposing that it was committed to the custody of Villiers—grounds fully corroborated by his future tracing of the pedigree. This haughty nobleman had imbibed a taste for pictures in Spain, and left at York House a splendid collection as a memorial of his taste and perseverance. In a work written by the Lord Bishop of Lichfield and Coventry, and published in 1693, we are expressly told that Charles, on his return from Spain, came to York House after leaving Portsmouth past midnight on the 6th October. Probably the picture was then left there in some private apartment, and afterwards gradually fell out of mind. How long it remained in the duke's splendid gallery, it is impossible to say. There was a sale of pictures on the assassination of the first duke. Again, when the second duke fled to the continent, to escape the vengeance of the Parliament, he sold part of his paintings to raise money for his personal support. A catalogue of these is still extant, compiled by Vertue, the eminent engraver, and prefaced by Horace Walpole; but it does not include the Velasquez portrait, and indeed contains few portraits of any sort, probably from a wish to retain family remembrances. Subsequently, the Parliament sold a part of the remaining pieces, the number of which may be conjectured from the Scriptural subjects being so numerous as to call for the particular notice of the Parliament:—

'Ordered, That all such pictures and statues there (York House), as are without any superstition, shall be forthwith sold for the benefit of Ireland and the north.

'Ordered, That all such pictures there as have the representation of the second person in the Trinity on them, shall be forthwith burned.

'Ordered, That all such pictures there as have the representation of the Virgin Mary on them, shall be forthwith burned.'

Either at, or before the death of the second duke, a fourth sale took place. In 1697, York House was burned down, and several streets were subsequently laid out on the grounds, the name and title being preserved, as Pennant tells us, 'in *George, Villiers, Duke, and Buckingham streets*.' It is possible the portrait may have been in the house even at the date of the conflagration.

Having premised this, we shall now follow Mr Snare's personal exertions. Mr Snare is a bookseller in Reading, who has long indulged, privately, in pictorial speculations, partly for profit, partly for pleasure. In the course of his dealings, he had obtained great practical acquaintance with the best portraits of our monarchs, and amongst them of Charles I.; and had been particularly struck with the notice in Murray's 'Handbook of Spain' of the lost portrait of that prince by Velasquez. Subsequently, he paid a visit to Radley Hall, then occupied as an academy by Mr Kent, and adorned with a large collection of paintings. Amongst them was a portrait, in which Mr Snare recognised the features of Charles. Mr Kent attributed the figure to Vandyke, and the background to his cleverest pupils; but the picture-dealer was strangely struck with the aspect of it. Hanging high on the wall, covered with dirt, and dimly visible, it had all the charm of mystery for him. He had never seen it before, and a dreamy feeling came over him that this was the lost painting by Velasquez. He went home, and pored over all the books and authorities likely to enlighten him. On the 25th of October 1845, the pictures in Radley Hall were advertised for sale, and Mr Snare attended the auction. The sight of the connoisseurs assembled in the room struck terror into him; he resolved to give £200 rather than lose the coveted treasure; but experienced a species of disgust and disappointment in finding it knocked down to him at the paltry sum of £8. He returned on the Saturday after to remove it, but too late in the evening: the door was locked. This obstacle recalled all his former eagerness. Impatient he waited for the day; but the delay was 'more than he could endure,' and he made an attempt to enter by the window, which ended, as might have been expected, in his being taken before a justice under suspicion of felonious designs. At length the treasure was safely lodged on Mr Snare's premises; and surely never Corydon so courted Phillis, even in the days of 'sighs,' and 'flames,' and 'darts,' as the Reading bookseller did the supposed Velasquez. There were all the signs of the tender passion. He put it in all lights—he moistened it with turpentine—he ran for his wife to admire it with him—then he became alarmed lest the turpentine should injure the paint. 'I was quite beside myself,' says he, 'with enthusiasm. I could not eat, and had no inclination to sleep. I sat up till three o'clock looking at the picture; and early in the morning I rose to place myself once more before it. I only took my eyes from the painting to read some book that made reference to the Spaniard whom I believed its author, or to the Flemish artist to whom, by vague report, it was attributed.'

Mr Snare now set out on his journey to establish its reputation: his practical experience, however, taught him that portraits seldom travel far from their original locality, and on this account he resolved to commence his search for traces of the Velasquez on the site of York House. On this several streets had been built, consisting of private mansions. At their erection, the middle class possessed no taste for pictures; the proper places to look to, therefore, were either the alleys tenanted by the brokers, or the mansions of the nobles.

The former had long departed; the loftier tenements alone remained. Mr Snare searched the works which treat of London—as Stowe, Maitland, and Pennant; and in the last writer he found mention made of the house of the Earl of Fife, as standing on the site of the palace of Whitehall, of which York House formed a part. In recording the works of art which adorned Fife House, Pennant mentions—

'A head of Charles I, when Prince of Wales, done in Spain when he was there in 1623 on his romantic expedition to court the Infanta. It is supposed to have been the work of Velasco.'

Here was the beginning of a clue. To trace his picture to Fife House was now the object of Mr Snare's exertions. On application to Mr Kent (Radley Hall), he found that he had received the picture from his wife's father, a Mr Archer. It came into Mr Archer's possession between 1806 and 1812, and was purchased by his partner, a Mr Charles Spachman, who was an excellent connoisseur in paintings, and resided for many years in 34 and 39 Gerard Street, Soho. Mr Kent referred for further information to Mr Anthony of Lisle Street, Mr T. Parker, an artist, an intimate friend of Mr Spachman, and Mr Foote, a picture-cleaner employed by him. Mr Spachman and Mr Foote were dead; Mr Anthony and Mr Parker remembered nothing which bore immediately on the subject. The undaunted Snare, however, was not to be baffled. He sought the undertaker who had conducted the Earl of Fife's funeral; but to no purpose. He then inquired after the upholsterer who had removed the furniture from Fife House, and found that the Fife family had employed for years a Mr Marshall of Soho Square, who formerly lived in Gerard Street, only a few doors from Mr Charles Spachman. Here was a glimpse of light! But, alas! Mr Marshall was dead: his workmen, when hunted out, remembered nothing: Mr Brown, cabinetmaker, of Dean Street, Soho (formerly Mr Marshall's foreman), could only refer to an old woman, who had lived many years with Mr Marshall, and knew more about his affairs than anybody living. This aged dame affixed her signature to a paper, declaring that she remembered the removal of the pictures from Fife House to Mr Marshall's, at 29 Gerard Street, in the year 1809; and that she also remembered Mr Charles Spachman, who lived at 39 Gerard Street in that year—that he was a picture-dealer, and had dealings with Mr Marshall. Mr Snare, in pleasurable excitement, hurried to search Mr Marshall's books: they had been sold as waste paper! Our hero, however, was worthy of his illustrious prototype Curie, who hunted poetic manuscripts in unmentionable localities. He was informed by Mr Crisp, print-seller, of Newman Street, who the parties were who had bought the books; and on recovering the precious fragments from Mr Porch, the cheesemonger of Goodge Street, and Mr Painter, the tobacconist of Edward Street, he found entries proving that pictures belonging to the Fife family passed in numbers through Mr Marshall's hands, and that Mr Charles Spachman had dealings in pictures with Mr Marshall even prior to the death of the Earl of Fife. The next object was to confirm the possession of this particular picture by the earl. The servants of Mr Burr of Mapledurham House appearing to look upon the picture with peculiar interest, Mr Snare discovered that this was owing to one of them being the son of a Mr Grant, who had lived for many years in the service of the earl. Mr Grant, on being appealed to whether Mr Snare's painting had ever been in Fife House, wrote in reply a letter, in which he mentions as many as four persons, independently of himself, who remembered having seen it there, though none of them could tell how it came into the family. The testimony of the earl was alone wanting, and even that, by and by, was forthcoming. In the course of his inquiries, Mr Snare found, in Lowndes's 'Bibliographer's Manual,' the following notice:—

'FIFE, LORD. A catalogue of Lord Fife's coins and medals. 1796. 4to. Privately printed.'

He was immediately led to believe that a catalogue of the paintings would also be in existence; and on further investigation, he at length discovered a quarto pamphlet, entitled,

'Catalogue of the Portraits and Pictures in the different Houses belonging to the Earl of Fife. 1798.'

The document bore no printer's or publisher's name, being evidently intended for private circulation; but any suspicion that might thence arise, was afterwards completely set at rest by the discovery of a reprint of the same catalogue, in the possession of Colonel Tynte of Halsewell, dated 1807—the only alteration being a slight addition to the preface. Colonel Tynte remembers having been shown his splendid galleries by the earl himself, who, then almost blind, appeared to know the histories of his paintings in the minutest parts. Indeed the preface to the catalogue evidences the care which the venerable nobleman must have taken to ascertain their authors, their dates, and their pedigrees. On the thirty-eighth page, under the head, 'First Drawing-room,' the following entry occurs:—

'Charles I. when Prince of Wales. Three-quarters. Painted at Madrid 1625, when his marriage with the Infanta was proposed.

—Velasquez.
This picture belonged to the Duke of Buckingham.'

Pennant, indeed, speaks of the portrait as a head; but this may be owing to confused recollection, especially as there appears to have been in the 'Little Drawing-room of the hall' a head of Charles I. by old Stone. As if to make everything complete, Mr T. F. Masnard writes, in a letter to Mr Snare—

'I have great pleasure in informing you that Mr Wilson of Welbeck Street, Cavendish Square, has been to see the portrait, and recognised it as having seen it at Mr Marshall's in Gerard Street, hanging up in the front parlour with two others, one on each side. I have seen Mr Yates, senior, of 13 Old Bond Street, who perfectly recollects seeing the portrait of Charles at Mr Spachman's in Gerard Street, both gentlemen speaking positively.'

Mr Snare has adduced very sufficient reasons against the impression that Vandyke was the painter of the portrait; for although that great artist was in England for a few weeks in 1620, there is no proof that he exercised his art in the service of royalty till 1632, when Charles was too old for the portrait in question, and when any allusion to the Spanish match would have been an insult to the nation. With respect to the work of Velasquez, it is casually mentioned by the person who accompanied Amelot, the ambassador-extraordinary into Spain, in his 'Lives of the Most Famous Painters,' and by the poet Hayley, who was, in Miss Mitford's opinion, a very great Spanish scholar, in a note to Epistle i. of his 'Essay on Painting.' It is, however, merely mentioned. Cumberland, in his 'Anecdotes of Eminent Painters in Spain,' alludes to it less vaguely. He states that Prince Charles 'did not sit to him (Velasquez), but Velasquez took a sketch of him as he was accompanying King Philip in the chase.' Pilkington reproduces this statement in words almost similar. As this description did not tally with the appearance of Mr Snare's portrait, he immediately surmised that Cumberland must have in some way fallen into error, and that most probably he did so in his rendering of his Spanish authority into English. He supports this view by very ingenious reasonings. Pacheco seems to have been Cumberland's authority; and on turning to his rare work, 'Arte de la Pintura,' a copy of which is in the British Museum, the following is found to be the allusion to the portrait of Prince Charles:—

'Hiso tablè de camino uno bosquezo del Principe de Galles, que le dio cien escudos.'

An imperfect Spanish scholar might conclude that Velasquez had taken a sketch of Prince Charles on the road or on the way; but the proper rendering stands—

'In the meantime he also took a sketch of the Prince of Wales, who presented him with one hundred crowns.'

There is, however, still another difficulty that arises out of the notice by Pacheco. He denominates Velasquez's portrait of Prince Charles 'a sketch,' while the one in question is a fine painting upon canvas. The term 'sketch' is very vaguely applied by artists; but, speaking generally, it may be used in reference to any picture to which the artist had not put the finishing touch. The question then comes to be—Did Velasquez make his sketches? Mr Ford, in his 'Handbook of Spain,' answers this very demand:

'He seems to have drawn on the canvas, for any sketches or previous studies on paper are never to be met with.'

These words characterise, Mr Snare tells us, the painting in its every lineament—its colour, its handling, its rapidity of execution. True, it is something better than the trifling sketch of a commonplace artist; but the price paid Velasquez—one hundred crowns—shows that it must have been excellent. The following extract from the office-book of the Lord Chamberlain the Earl of Pembroke, is proof that the prices paid by Charles for paintings were not very extravagant:—

'July 15, 1632.—A warrant for a privy seal of L280, to be paid unto Sir Anthony Van Dyck for divers pictures made for his majesty—viz. for the picture of his majesty; another of Monsieur, the French king's brother; and another of the ambassadress, at length, L25 a piece. One of the queen's majesty, another of the Prince of Orange, and another of their son, at half-length, at L20 a piece.'

It is necessary to inquire whether the characteristics of the picture denote the author, the date, and the country ascribed to it. In Buchanan's 'Memoirs of Painting' we find the following remarks by M. Hacquin of Paris, an artist of vast experience in this particular topic:—

'M. Hacquin observed that Velasquez and Murillo have painted their pictures upon red earthy preparations, with which the Spanish canvas has almost uniformly been charged, and which hides their first process. Velasquez, who was aware of these red grounds rendering the shadows too opaque, has often introduced a light colour over them before he began to paint, &c.'

This ground can still be seen to have covered the canvas on which the portrait was originally painted, and the coarse texture of the cloth can still be detected. The pigments give decisive evidence of their belonging to the Spanish school, and are exactly similar to the pigments used in the authenticated works of Velasquez—'the Water Seller,' in the possession of his Grace the Duke of Wellington; the portrait of Philip II., in the Dulwich Gallery; and a whole-length portrait, the property of the Earl of Ellesmere. Mr Snare thus describes the painting itself:—

'Prince Charles is depicted in armour, decorated with the order of St George; the right arm rests upon a globe, and in the hand is held a baton; the left arm is leaning upon the hip, being partly supported by the hilt of the sword; a drapery of a yellow ground, crossed by stripes of red, is behind the figure, but the curtain is made to cover one half of the globe on which the right arm is poised; the expression is tranquil, but in the distance is depicted a siege, numerous figures being there engaged in storming a town or fortress.'

The warlike costume may at first appear objectionable, but there still remain scraps of proof of the very costume in the picture being that worn by the prince at Madrid. Nicholl's 'Progresses, &c. of James I.' contains a letter by the king to his son, when at Madrid. It says—

'My babie shall resasse his tilting stuffe now bravely set forth, and fit for a wooer; but, in good faith, the weather will be so hoatte thaire before ye can use it, that I wolde wish ye rather to forbear it, for I feare my babie may catch a fever by it.'

Aikin's 'Court of James I.,' vol. ii., contains another letter to the Prince and Buckingham, in which he says—

'Kirke and Gabriel will carry Georges and garters to you both with speed; but I dare send no jewels of any value to either of you by land for fear of robbers.'

The jewels, however, were afterwards sent by Sir Francis Steward, and amongst them—

'A fair sword, which was Prince Henry's, fully garnished with a *dyamondes* of several bignes.'

It is worthy of note that the hilt of the sword in the picture sparkles as if jewelled. The drapery, which covers half of the globe, is a rich yellow damask, with streaks of red; these are the national colours of Spain. What can this symbol signify? It is quite evident that it was intended to mean something, for it may be discovered that the globe and drapery were after-thoughts, the clouds having in the first design been continuous behind the head. In the 'Memoirs of George Villiers, first Duke of Buckingham,' p. 17, we are told that on the arrival of the Prince and marquis—

'He (Olivarez) then complimented the marquis, and told him, "Now the Prince of England was in Spain, their masters would divide the world between them."'

In the first volume of the 'Journals of the House of Commons,' we find the following, at p. 270:—

'When arrived at Madrid, discovered first to Bristol, Duke went with Olivarez in a garden, where Olivarez much magnified the journey of Prince. Must be a match, and divide the world between them.'

In Rushworth's 'Historical Collections,' vol. i. p. 120, we find it stated, in 'Buckingham's Narrative,' 'that the Conde (Olivarez)

'Said, that now, without all peradventure, it must be a match, and we must part and divide the whole world between us.'

Here, then, is the riddle read: the prince leans on the globe, while the national drapery of Spain covers the half of it in its brilliant folds.

We do not enter on the artistic merits and characteristics of the painting, as clearly displaying the peculiar style and genius of the Homer of Spanish art. We have confined ourselves altogether to those minute and curious confirmations of Mr Snare's original impression, which perhaps together compose one of the most striking and interesting cases of circumstantial evidence that could be found in regard to the pedigree of any other portrait whatever.

THE SHEPHERD OF THE FRENCH PLAINS.

FROM the days of Theocritus down to those of Berquin, the perpetrators of eclogues, idyls, and pastorals have taken incredible pains to denaturalise the character of the shepherd. They have represented a race of individual coxcombs, redolent of musk and quintessences, who, with pastoral pipe, contend for musical prizes, talk familiarly with their fawns, languish in despair for unregarding beauties, carve their tormentors' names upon the barks of beeches, and with flower-wreathed crooks keep guard over flocks whiter than snow, and ornamented with favours and ribbons. They have placed, one and all, their fantastic creations in the midst of such exquisite and fairy scenery, that it was asked, with some show of reason, of the Chevalier Florian, a pastoral writer of no mean celebrity—who was, moreover, a lieutenant-colonel of dragoons, and gentleman's gentleman to the Duke de Penthievre—why he did not quit the sword for the crook, and the court of Louis XVI. for the enchanting theatre of his heroes and heroines.

What a pity it is that the reality does not respond to the reveries of the bucolic poets! What gallant knights are Sylvander, Hylas, Menalcas, Celadon, Thyrsis, and Myrtillus! What charming and fascinating creatures are Lydamia, Chloe, Delphira, Daphne, Sylvia, and Amaryliss! How delightful it would be to live in the bosom of this elegant society of shepherds and shepherdesses, who would be the most seductive of mortals,

were they not unfortunately the most unreasonable of reasonable beings!

Such as we see him, however, at the present day, in all his native simplicity, the shepherd is not less poetical than the delicate heroes of Fontenelle and D'Urfé. Behold him in the centre of the plain, wrapt in his long blue mantle, his crook in his hand, his figure tall, tawny, and sunburnt; the head overshadowed by a huge leathern hat, beneath which his long plaited hair hangs negligently down. With what royal gravity he advances at the head of his flock! What activity in his quiet calmness—what attention in his apparent indifference—the alertness of intelligence combined with an almost absolute immobility of form! What authority has he acquired over the entire troop, each one of which obeys the least sound of his voice! With what precision, perceiving a straggling sheep, does he launch the admonitory lump of earth which drives the wanderer back! With what dexterity he employs the hook which adorns the extremity of his long houlette, to separate from the flock a sheep whose soundness he has reason to suspect! Then his dogs, as they go and come, how cheerily they reply to the sonorous names which he has given them—Champagne, Corporal, General, Major! How carefully they restrain the flock within the limits assigned! So active and vigilant are they, that it is no uncommon thing to see a flock of three or four hundred sheep, under their superintendence, defile by a path scarcely four feet in width, through a field of young corn, without injuring a single blade. It has been the custom, from time immemorial, for the shepherds in France to date their contracts with the farmer from St John the Baptist's Day. Their wages are rather high, for upon them depends the ruin or the prosperity of their employers. They are privileged servants, and treated with respect by the whole household, including the master. The shepherd never takes his meals at the common table, but has separate rations, among which must not be forgotten the field-cake—a sort of dumpling-shaped loaf, called in Normandy a *brichet*. He performs his function in his own way, and is exempt from all other farm labour, with the exception of some occasional co-operation in the fabrication of bread for the daily consumption of the family. It is not unusual to find him on Sunday transformed into a precentor or sacristan, and in the house of prayer consecrating to the praise of his Maker a voice rendered hoarse and sonorous by long exercise against the wind and the tempest.

In the temperate parts of France, the shepherd leads his flocks to pasture about an hour or so before noon, when the dew has dried up. If the heat is very oppressive, he seeks the shadow of some hospitable foliage, stretches himself upon the green sward, and trusting in the vigilance of his dogs, indulges in slumber, soothed by the murmurs of a brook, the warbling of the birds, and the far-distant voices of the village chimera. When the welcome coolness of evening has refreshed the scorched herbage, the sheep are allowed to disperse and feed at liberty. The clattering of their horny feet is heard mingled with the tinkling of their little bells; and their guide, alone in the face of tranquil nature, arouses the echoes with songs bearing the impress of that melancholy which is the source and seal of popular melody.

After sheep-shearing, which takes place in the month of June, the shepherd quits the farm for the fields, where he establishes his domicile during the summer and the autumn. An enclosure of hurdles is the asylum of the flock during the night; and at no great distance arises the refuge of their guardian. This is a species of habitation nowhere mentioned in Theocritus, and as dissimilar to the garlanded grottoes of the dealers in pastoral as anything that can well be imagined. The residence of the actual French shepherd is simply a wooden cabin mounted on wheels, sometimes three, sometimes four, and possesses undoubted advantages over both shed and sheiling, and all stationary abodes.

whatever it may be supposed to lose in regard to the picturesque. In the interior are a bed, an old carbine, a brace of pistols, and the necessary ammunition. On a shelf are a number of pots and bottles, containing the drugs and medicaments which go to make up his curative appliances. Suspended on tenter-hooks around the cabin are the bleached skulls of animals, which, being placed on the ground during the dark and moonless nights, serve him as guide-posts through the gloom. Upon the walls are pasted his favourite ballads, a picture of Our Lady of Liesse, the pictorial history of Pyramus and Thisbe, and some coarse-coloured engravings from the pedlar's stock. In one corner a mass of dogs-eared relics of old books are fast going to decay: these are all of the marvellous and mysterious school of literature—dream-books, prophecy almanacks, astrological predictors, and the like. The possession of these strange documents has given him a reputation among the ignorant and superstitious for supernatural power, which he is at no pains to contradict, as it probably secures him from the annoyances of a too familiar companionship with his admirers. The simple fact, and it is one that will not admit of denial, is, that the shepherds as a body exhibit a marked superiority to the rest of the peasants. They are more gentle, more affable, more polite—merely because they are better informed. The opportunities of solitude and reflection must occasionally result in the improvement of the thinking faculties; and when a man is secluded in some mountainous and romantic retreat for weeks together, without seeing a human countenance, it is hardly to be wondered at that he should discover resources in himself which society might never have drawn forth. There can be no doubt that the world is largely indebted to the labours of this class in departments foreign to their profession. Warriors and conquerors, astronomers and poets, artists and mathematicians, have left the flock and the fold to delight and instruct, or to subdue and destroy their fellow-men. Without going back to remote antiquity, when a kingdom was a pasture-ground, and its shepherds were princes—without mentioning King David or the older worthies, whose history is a part of our faith—the annals of all times will supply us with numberless instances of genius, intelligence, and enterprise originating in the exercise of this peaceful and contemplative calling. Pope Sixtus V., Saint Turibius, Bishop of Dol, the celebrated Yakowsky, the Parthian leader, and a great number of other illustrious men, commenced their career as keepers of flocks. It was in the fields, under the shade of the secular tree of the fairies, that Joan of Arc, musing o'er the woes of France, first resolved on the deliverance of her country. If Jaimeraï Duval, professor of history at Luneville, and Peter Anich, the astronomer of Innsbruck, had never kept watch over their flocks under the starry vault of heaven, it is certain they would never have acquired fame by the solution of celestial problems. It was in playing the *galoubet* (French flute), while his flocks were pasturing, that the musician Carbonel acquired the germ of that marvellous superiority upon this instrument, the theory of which he has consigned to the Encyclopædic Dictionary. Giotto, the Florentine artist, Elias Mathieu, the Flemish landscape painter, imbibed their love of nature from the study of her majestic beauties in the capacity of shepherds; and in our own day, Henri Mondeux, a young herdsman, native of a village in Touraine, has astonished the learned world by his wonderful attainments in mathematical science.

The shepherds themselves entertain a high opinion of their profession. On inquiring of one of them what had become of his coadjutor, who had disappeared from the farm, 'Ah,' replied he with a sigh, 'he has sadly disgraced himself; he has turned carrier.' Another being asked what he would do if he were rich, 'If I were rich,' said he, after considerable reflection, 'I would ride in a coach to the pastures.'

The functions of a shepherd require not only a sound

bodily constitution, proof against all temperatures, but also an amount of practical knowledge not readily attained. An expert botanist, he seeks for his charge the chalky hill-sides where grow the trefoil and wild thyme, and carefully shuns the deadly poppy and other unwholesome plants. He knows that a pasture too uniform and abundant inflames the blood; that herbage too moist and rank entails abdominal disease. An able veterinary, he readily cures accidental wounds; he anoints the sheep after shearing with a mixture of butter, sulphur, and hogs'-lard; he scarifies tumours, and prevents the scab by inoculation. Nay, sometimes, proud of his success in the cure of animals, he applies his experience to human patients; and in the character of village quack, performs his lucrative but forbidden office so long as he can escape the intervention of the procureur du roi.

The dark nights of autumn, when winter is approaching, are the seasons of trial and peril to the shepherd. At this period the wolves, driven by hunger and care for their young, make no scruple of attacking the fold, in defiance of their guardian and his watchful dogs. No sooner do these, by their bayings, apprise him that a wolf is approaching, than he seizes his firearms, and advances against the marauder. The ravager, goaded by famine, in spite of the light which hangs at the cabin door, makes straight for his prey. *General* and *Major* fly at his throat with a valour that does credit to their names. A terrible combat ensues, which generally terminates by a brace of slugs from the shepherd's carbine through the brain of the uninvited guest. During the autumn of 1837, a shepherd of Livoncourt, in the department of the Vosges, named Moissonnier, had lost many of his sheep. One evening as he was leading his flock to water, he saw a gigantic wolf come out of a thicket, ascend the course of the stream for a short distance, and then plunge into the water and swim towards his charge. Moissonnier waits for him on the bank, prevents him by heavy blows of his crook from ascending the slope, and pierces him with many wounds. Unfortunately, the hook of his weapon becomes entangled in the flesh of the animal, and Moissonnier is drawn into the Saône. The combat continues in the midst of the water, and the courageous shepherd finishes by drowning his formidable antagonist.

About the time of All Saints' Day, the shepherd returns to the farm, but the winter does not interrupt his labours: he prepares the litters, attends to the wants of the breeding ewes, and leads his flock to the fields whenever the welcome sunshine softens the rigour of the season. Towards Christmas he passes whole nights with the suffering mothers, and receives the lambs in the folds of his mantle. According to an old usage, he places the first-born in a little crib bedecked with ribbons, carries it to the midnight mass, and with crook in hand, and wearing his tempest-torn mantle, returns thanks to Him whom shepherds were the first to worship in the stable of Bethlehem. This reverend custom is, however, fast going to decay, with many others we would fain see preserved. The profession of shepherd was a long time hereditary. His crook, his carbine (rusty, but sure), even the sheep-bells, were transmitted from sire to son, and preserved as sacred relics. But the chain which bound the present to the past is breaking link by link. The shepherds are losing their old tradition, fraternising more and more with the rustics of the village, and participating in the progress of modern society. Yet a few years, and we shall see their cabins fitted up with patent iron bedsteads (warranted), a percussion gun, the works of Voltaire, and books of the fashions. We have already seen one with spectacles and an umbrella! Shade of Theocritus! what say you to this?

Two varieties, sufficiently distinct from the shepherd, are the swineherd and the goatherd. The first follows, rather than directs, to the dense recesses of the forest, his undisciplined bands, always discontented, always grumbling, and sometimes rebellious to the extent of

trampling under foot and devouring their guardian. The goatherd accompanies his mountain troop through the showery morn, or beneath the burning sun—the capricious herd following their natural instincts, and susceptible of little discipline, choose their own path, and leap from crag to crag, and roll in the dewy grass, or bask in the sun, according to their 'own sweet will.' Their guide, if such he can be called, is as active, as fantastic, as independent as themselves. In the Pyrenees he has often secret connection with the contrabandists, or engages as a guide to travellers through the defiles and over the summits of the misty mountains.

At the close of 1823 there lived in the valley of Luchon a poor goatherd named Juan, the son of a soldier of the Empire, a lad of quick eye, supple limbs, and fearless heart. One evening while tending his goats, he heard the distant report of musket-shots proceeding from the Spanish territory. He ran to a rising ground, and perceived a guerilla party who had surprised a French detachment, and were mercilessly pursuing the scattered fugitives. The captain, closely pressed by two Spanish peasants, painfully climbed the rugged declivity. Juan drew his weapon, and barred the passage.

'Are you not a Frenchman?' said the captain, amazed.

'That is not the question just now,' said Juan. 'Surrender, or you are a dead man.'

The captain was soon overtaken, and disarmed by the two Spaniards, who recognised Juan, having seen him often at the village of Venta, near the French frontier.

'Well done, my lad!' cried one. 'But for you this scoundrel would have escaped; you shall share the booty.'

They immediately began plundering the prisoner, whose sword and portfolio were transferred to the goatherd. They prepared to kill their victim, when Juan interfered. 'Dead men are good for nothing,' said he. 'It strikes me that if we took this fellow to the alcalde at Venta, we should get a good reward.'

'He is right,' replied one of the peasants. 'What think you, Perez?'

Perez approved the proposition, and they commenced their march. At the end of a few minutes the little troop was enclosed in a long defile on the edge of a profound abyss. Juan, who knew every path on the mountain, advanced first, followed closely by the captain, the two Spaniards forming the rearguard.

At the narrowest part of the route, the young goatherd, turning suddenly, repassed the prisoner, and pushed one of the Spaniards over the precipice. The second cocked his blunderbuss, but Juan seized him by the legs, and they both rolled together from rock to rock. In the fall, Juan seized the projecting limb of a tree, plunged his knife in the bosom of his adversary, and returned an instant after to complete the safety of the captain, whose deliverance he had accomplished with such unparalleled audacity.

A LATE MEETING OF AGRICULTURISTS.

We gather some interesting indications of the progress of agricultural improvement in England, from the account given of a meeting which lately took place at Drayton Manor. Among other speakers on the occasion, we observe that Mr Meehi, of Tiptree Hall, in Essex, took part in the proceedings. We remember visiting Tiptree Hall a few years ago, shortly after it had come into the possession of its new proprietor, and while everything was in a raw untried condition. The thick clumsy fences had just been removed; a marsh had been only in part dried up; and the drains could scarcely be said to be in full operation; all, in short, was 'in expectation.' On this account we have read Mr Meehi's account of his experiences with more than ordinary interest, and are glad to find that in

amateur farming—his main business being in London—he has fully realised expectations.

'The result of his improvements at Tiptree,' he went on to say, 'had been to double the produce of his farm and of his labour. A portion of it was formerly a swamp, not producing 5s. per acre. He had been interested this year, by a gardener in the neighbourhood, to let those four acres to him at an annual rental of 1.5 per acre. He had removed three and a half miles of unnecessary banks and fences. Taking the arable acreage of the United Kingdom, he thought they might safely dispense with 500,000 miles of unnecessary fencing, which, with its timber, displaced much food and labour. He considered the agriculture of this country in a very backward and unsatisfactory state compared with its manufactures. The agricultural mechanical appliances were rude, costly, and unprofitable. The farm buildings generally were bad, and uncentrically placed, causing a national loss of some millions; each ton of produce or manure costing an average carriage of 6d. per mile, renders the position of the buildings an important national consideration. Wagons were a most unphilosophical contrivance. It was quite clear that a long, light, low cart, on two wheels, having an area of capacity equal to a wagon, and only costing half as much, was a much more sensible and profitable mode of conveyance. The question was not now an open one, having been thoroughly discussed and decided upon at the London Farmers' Club; therefore the sooner the wagons were got rid of the better.' After alluding to various points of farm management, he came to that on which it would almost be impossible to speak too strongly—the universal waste of manures. 'He considered the waste of the liquid portions of the manure in most farmyards a great national calamity. It was a great mistake ever to allow water to fall on manure. Water was a very heavy article. A thousand gallons weighed 10,000 lbs., and were expensive to cart. He had heard farmers say when rain was falling that they should then litter their yards, and make manure! Straw and water, in fact. He found in practice that animals did well on their own excrements and straw under cover; that they consolidated the mass until it was four feet thick, when it would cut out like a good dunghill, and be fit to carry on the land. But if rain water were allowed to wash this mass, an injurious effect resulted both to the animal and to the manure. He could not afford to allow his manure to be well washed in the yards by drainage from the buildings, and afterwards to be washed, dried, and mangled by putting it out in heaps and turning over. It was a waste of time and of money. He found that his crops grew better with unwashed manure. A farmyard should be like a railway terminus—covered in, but amply ventilated. There was comfort and profit in keeping everything dry. It did away with the necessity for water-carts and tanks: the liquid portions of the excrements being just sufficient to moisten the straw and burnt earth, or other absorbent material. He admired, and practised to a certain extent, the Rev. Mr Huxtable's system of placing animals on boards, and concluded with the observation that good high farming was by far the most profitable; and that the starvation principle was a losing game. If we borrowed from the earth, we must repay, or we should soon find an empty exchequer.'

The plan of keeping animals on boards above alluded to is next described by the Rev. Mr Huxtable. 'From a want of a sufficient supply of straw from my farm,' said he, 'I determined to place my milch and store cattle on boards, as wood is an excellent non-conductor; and after a series of devices, I have succeeded in making them tolerably comfortable, so that I am now no longer dependent on my straw for the quantity of cattle which I keep. I am only limited in the number of animals which I keep by the amount of green food grown. In like manner, but with a variation of arrangement, the sheep were placed on small boards about three and a half inches wide, with an interval of about seven-eighths of an inch between each, to permit the manure to fall freely into properly-prepared tanks below. This is by far the most successful provision which I have made. Of 1000 sheep so placed, I have never had one lame. The pigs, in like manner, when fattened, sleep on a boarded stage above their feeding place, and except in very cold weather, require no straw for litter. Thus I have dispensed with a large expenditure of straw, which my cereals (half the farm) could not sufficiently provide. But I hear

some one exclaim, "What do you make of your straw?" First of all, a good deal is still required for bedding the horses, and the young stock which are in loose boxes; and as they never tread the green fields, they require a great quantity of white bedding. Secondly, a great deal is wanted for food, being mixed with the green leaves of the root crop and the mashed turnips. Thirdly, a ton per acre is used in making clover and vetches into imperfectly dried hay, with a due admixture of salt to arrest fermentation. These uses fully take up all the straw which I grow. I think the methods employed in preparing the manure from the "boarded" cattle deserve mention. First the liquid manure flows into large tanks; below them is another, which I call the mixing tank, for in it the manure is diluted with water to any degree which the state of the weather may require—the rule being that, in proportion to the increase of temperature, must be the increase of dilution; that is, the hotter the weather, the weaker should be the manure applied. In order to avoid the expensive and often injurious water-cart, I have laid down over the highest part of my farm a main of green elm pipe, of two inches diameter, bored in the solid wood; at every hundred yards' distance is an upright post, bored in the same manner, with a nozzle. A forcing-pump, fixed at the mixing tank, discharges along these pipes, buried two feet in the ground, the fluid with a pressure of forty feet; of course it rushes up these pierced columns, and will discharge itself with great velocity through the nozzle; to this I attach first of all forty yards of hose, and therewith water all the grass which it can reach. To the end of this hose another forty yards of hose is attached, and a still larger portion of the surface is irrigated, and so on for as many forty yards as are required. When enough has been irrigated at the first upright, the nozzle is plugged, and the fluid is discharged at the next hundred yards' distanced column, and so on. For this application of the hose, I am entirely indebted to that most able man, Mr Edwin Chadwick: the green elm pipe is my own contrivance. The cost of the prepared canvas hose, which was obtained from Mr Holland of Manchester, was 1s. a yard; the wooden pipes cost me only 1s., and being underground, they will be most enduring. By an outlay of £30, I can thus irrigate forty acres of land; and see how inexpensive, compared with the use of the water-cart and horse, is the application! A lad of fifteen works the forcing-pump; the attaching the hose and its management require a man and a boy. With these, then, equivalent to two men, I can easily water two acres a day, at the rate of forty hogheads per acre of the best manure in the world; I say *best*, because all chemists will assure you that the liquid contains the principal nitrogenous and soluble salts, and therefore is far more valuable than the dung; and it is plain enough to every man, though he be no chemist, that plants can only take up the manure in a liquid form. The principal use which I make of the hose is to water the clover, and, above all, the noble, but much-decried Italian ryegrass, which comes the earliest, and grows the longest, of all the grasses; and I feel confident that, with such appliances as I have mentioned, you may secure fifty tons per annum of this milk-giving, fat-producing, muscle-making grass.

The narration of these experiments demonstrates, we hope, a growing intelligence in England on the subject of agriculture; and it will be read everywhere with satisfaction.

THE PRINCE IN SPITE OF HIMSELF.

[We extract the following from a little volume called 'Popular Tumults,' which appears to be a reprint, although not acknowledged as such, of a work with the same title published by Mr Knight in 1836.]

A SINGULAR adventure, which exhibits the character of the people in the remote parts of the kingdom in a strong light, occurred in another district of Puglia. A few Corsican emigrants, who had left their island when the French occupied it, and had taken refuge in the kingdom of Naples, happened to be, in the early part of February 1799, in the town of Taranto, whence they intended to sail for Sicily. But the wind being contrary, they found themselves detained until messengers from the republican government established at Naples reached the place. The town acknowledged the new authorities. The Corsicans then thought

it prudent to quit Taranto quietly, and, crossing the Iapygian peninsula, try their chance at Brindisi on the Adriatic coast, where they might meet with a passage for Trieste. After walking on foot through part of the country, they stopped for the night at the village of Montesi, where they asked for lodging at the house of an old woman. There was a rumour afloat at the time that the king's eldest son, the hereditary prince, was concealed somewhere in the country. One of the Corsicans, it appears, either as a joke, or in order to insure better treatment, hinted to their hostess that the prince was one of their party. The appearance of the strangers, and their language, were different from what those villagers had been in the habit of seeing and hearing. The old woman ran to one of her relations, a substantial farmer in the place, named Girunda, and told him the news. The latter came immediately to pay his homage to his royal highness, and was directed to one of the youngest of the party, who was thought to bear some resemblance to the royal family. Girunda knelt before him, and offered all he had, and all he could dispose of. He then withdrew for the night. Being left to themselves, the Corsicans, and especially he who had been thus, without his consent, proclaimed a prince, began to reflect seriously on the probable consequences of this freak. French detachments were known to be approaching in that direction. Our party, therefore, thought prudent to make their escape in the night, and pursue their way towards Brindisi. The old woman, as soon as she missed them in the morning, went to inform Girunda, who, mounting his horse, followed by some of his men, went to seek after the fugitive prince, giving at the same time the alarm to the country around. The news spread like wildfire; the population ran to arms—the village bells were ringing. 'The king for ever! Down with the republic!' was shouted from a thousand mouths. At last the Corsicans were overtaken at the village of Mesagna, not far from Brindisi; they would fain have undeceived the people, but they perceived it was now too late. The pseudo-prince was obliged to assume his new honours with the best face he could. He praised the loyalty of the people, gave directions to the local authorities to introduce some regularity into their tumultuary movements, especially if they intended to oppose a successful resistance to the French; and then, as a measure of security, he removed his head-quarters to the castle of Brindisi, where, reflecting on the dangerous predicament on which he stood, having against his will usurped a title for which he would be called to account, yet judging that the insurrection thus raised might be of service to the king, he bethought himself of the expedient of proceeding himself to Sicily to give the first information of the event. He told the people that he had positive orders from his royal father to repair to him; that he would soon return with reinforcements; and meantime he would leave them two of his companions as his lieutenants, to organise the defence of the province. He did so, and was reluctantly allowed by the natives to sail. Having proceeded to Palermo, he stated candidly to the king and queen all that had happened, and he had the satisfaction of having his conduct approved of, and a pension allotted to him, which he continued ever after to enjoy. He afterwards held a commission in a foreign corps in the British service. I met him many years after at Naples, where he had taken up his residence since the peace, and he confirmed all the circumstances of this singular story. He must have been a very young man at the time he extricated himself with so much judgment from the difficult position in which he was placed. The two lieutenants he left behind with Girunda proceeded to arm the peasantry; they roused the whole province of Otranto and that of Bari, and thus established the insurrection in Puglia. They were, however, defeated by the French at Casamassima, when one of the leaders was taken prisoner; but the other, named De Cesare, escaped into Basilicata, where he joined the Calabrian insurrection, led by Cardinal Rufo.

FACTS FOR THE CURIOUS.

THE suspension-bridge over the Danube at Pesth, designed by Mr Tierney Clark, and now nearly completed, is 1200 feet long, in three spans; the centre span being 600 feet, the side spans 300 feet each. The chains were made in England; the granite for the piers was brought in immense blocks, some of them from twelve to sixteen tons weight each, from Linz, in Upper Austria. The contractor for the cofferdams, &c. was an Englishman, as were the principal workmen, and all the machinery has been supplied from this country. The total cost of the erection, according to the 'Builder' newspaper, will be about L.600,000 sterling.

Paris newspapers announce the discovery of a vein of platinum in the metamorphic district of the valley of the Drac, department of Isère, which is expected to be worked with advantage. Hitherto this precious metal, which combines with incomparable hardness the lustre of gold and silver, has only been met with in the Ural Mountains, and its scarcity has always rendered the price very exorbitant.

In August of the present year, the south-east coast of England, from Margate to Brighton, was visited by one of the most numerous flights of insects on record. 'They consisted,' says one observer, 'of at least five species of lady-bird (*coccinella*), and they came in such dense numbers, as for miles along the coast to resemble a swarm of bees during hiving. The sea destroyed countless myriads of them; the grass and hedgerows, and every crevice that afforded shelter from the wind, were coloured with their numbers; and for many miles it was impossible to walk without crushing hundreds beneath the tread. The insects evidently came from the east, from the direction of Calais and Ostend.' Another observer, in order to give some idea of the extent and quantity of these little visitors, mentions that five bushels were swept from the Margate pier, and nearly the same from that of Ramsgate harbour.

M. Fleurian de Bellvue states, as the results of his observations and inquiries on the effects arising from stagnant water, that in marsh lands which are covered with water to a considerable depth during the great heats of summer, the inhabitants of the localities in which they exist are not more unhealthy than in other localities; but that where the stagnant water is of slight depth, the decomposition is attended with frightful consequences, and the mortality is great. Drainage either to dry the lands effectually, or to concentrate the surface water into one common reservoir of considerable depth, are the preventive means recommended.

In his 'Voyage to the Southern Seas,' Sir James Ross states that while in latitude 15° 3' S. and longitude 23° 14' W., he tried for, but did not obtain, soundings with a line of 4600 fathoms, or 27,600 feet. This is the greatest depth of the ocean that has yet been satisfactorily ascertained, but there is reason to believe that in many parts it is still deeper. The depth of the ocean, as contrasted with the height of mountains—the highest of which do not exceed 28,000 feet—is a desideratum in terrestrial physics of great interest and importance.

'There is no reason,' says a writer in the Athenæum, 'for our eating one or two of the numberless edible funguses—mushrooms, truffles, &c.—which our island produces, and condemning all the rest as worse than useless, under the name of "toad-stools." It is not so on the continent of Europe, where very generally the various species of fungi are esteemed agreeable and important articles of diet. The great drawback on the use of these esculents in this country is, that some are poisonous, and few persons possess the skill to distinguish them—with the exception of one or two species—from those which are edible. In the markets at Rome there is an "inspector of funguses" versed in botany, and whose duty it is to examine and report on all such plants exposed for sale. The safety with which these vegetables may be eaten has led to a very large consumption in that city, where not less than 140,000 lbs., worth L.4000 sterling, are annually made use of. This in a population of 156,000! We cannot estimate the value of funguses in our own country for an article of diet as less than in Italy, nor believe that the supply would be in a less ratio. If this be correct, the value of the funguses which are allowed to spring up and die, wasted in Great Britain, would be about half a million sterling in each

year.' Admitting our culpable neglect of the mushroom family, we cannot find data for the above estimate, unless the writer means to furnish us at once with the climate and pasture wastes of Italy—a gift, part of which, even with all its mushrooms and truffles, we are not gourmands enough to envy.

THE DREDGING SONG.

BY ROBERT GILFILLAN.

[Nothing in the romance of music can be finer than to listen from the beach, on those fine autumnal mornings, to the song of the Newhaven fisherman plying the oar and hauling the oyster-dredge.—Sept. 30, 1847.]

HURRAH! for the oyster-dredging song,
Ye pilgrims of the deep;
The autumn winds are fresh and strong,
Why, then, your moorings keep?
The morning's mists fast clear away—
Night's reign of darkness o'er—
Up sail!—up sail! 'twill soon be day,
Then leave the slumbering shore!

The ocean wanderers court the gale
Which roars from sea to sky;
But we who raise the tiny sail,
The active oar must ply!
With early breeze we sweep the seas,
With steady stroke and slow;
The sea-birds high above us fly,
And the oyster sleeps below!

There's glory in the golden field,
When the sickle glances bright;
But not like the joys the waters yield,
When their treasures come to light!
Our hands were made for the bulky wave,
Our hearts are firm and strong;
And we launch our bark—be it light or dark—
Hurrah for the dredging song!

—Scotsman.

GOVERNING PRINCIPLES OF RELIGION.

Those who cry down moral honesty, cry down that which is a great part of religion—my duty towards God, and my duty towards man. What care I to see a man run after a sermon, if he cozen and cheat as soon as he comes home? On the other side, morality must not be without religion; for if so, it may change, as I see convenience. Religion must govern it. He that has not religion to govern his morality, is not a dram better than my mastiff dog; so long as you stroke and please him, and do not pinch him, he will play with you as finely as may be. He is a very good moral mastiff; but if you hurt him, he will fly in your face, and tear out your throat.—John Selden.

CHAMBERS'S EDUCATIONAL COURSE.

To this series of elementary treatises the Editors have now added a set of Twelve prepared Copy-Books, written and constructed by Mr William Dickson, writing-master in Edinburgh; the first six of which will be issued on Saturday next, and the remainder in a few weeks hence. At the head of each page a line is printed for imitation by the pupil; while on the covers such directions are given as will enable the private student, in the absence of a master, to perfect himself in that most necessary branch of education, the art of Penmanship. In the preparation of the lines, care has been taken to avoid every refinement of engraving inconsistent with practical writing; and neither, as is sometimes the case, are difficulties as to junctions and combinations associated with the early and more simple exercises. The whole set of Books, in short, is constructed on a plan which, it is hoped, will insure progressive and satisfactory improvement. The series embraces Plain, Current, and Ladies' Hand, also Ornamental Writing.

The Books (price Sixpence each), like other works in the Educational Course, may be procured from any bookseller.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 98 Miller Street, Glasgow; W. & OAK, 147 Strand, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 203. NEW SERIES.

SATURDAY, NOVEMBER 20, 1847.

PRICE 1½d.

A DAY IN YARROW.

'I HOPE the weather will hold up—it looks a little gloomy; and if the rain should come down on the open calash'—

'Don't speak of it. The glass is rising in a very determined-looking way. As for these clouds—pooh! we have always plenty of them sailing about the sky; they are as good as a parasol, and we should feel uncomfortably hot in Scotland without them. Ah, there they go, floating along the heavens, breaking into fantastic groups, and thinning off beautifully to the east. Keep your mind easy: there will be no rain—not a drop.'

It is not difficult to persuade a party going on a pleasure trip that they are to have surprisingly fine weather. My complimentary observations on Scotch clouds were therefore considered quite satisfactory by the English members of the expedition: and so off we set from Edinburgh, a happy little band of tourists. The horses bounded on their way, as if anxious, like everybody else, to get out of town. We soon left Braid Hills and the Pentlands behind; and the blue mountains of the south rose in tumultuary masses on the horizon.

Proud as a Scotsman is of his clouds, with their occasionally glowing and varied tints, he could at times be persuaded to give away a few of them, or to take blue sky in exchange; but nothing could induce him to part with a single hill, glen, loch, river, or burnie. Nature has given him all these to keep and love, and he has loved them so strongly, that for generations without number he has fought for them, and sung songs about them, and they have been to him things which he is never tired of visiting and expatiating upon. Some districts of Scotland, however, are more beloved than others. Hills, and valleys, and streams are not in themselves objects of veneration: that which imparts to them unspeakable charms, is an association with the moving events of history, with the lives of distinguished men, with circumstances over which poetry has bewitchingly thrown her mantle. The district which commands a large share of this enshrined reverence is a tract comprehending the vales of Tweed and Yarrow—the classic ground of Scotland, as one may call it—a scene of natural beauties—a spot where much of the simplicity of ancient manners still exists, along with the thriving industry of modern innovation—the country of

'Green hills and waters blue,
Gray plaids and tarry woo.'

Tourists and travellers, ye are not wise to rush past this pleasing bit of auld Caledonia! Edinburgh for fine houses, the Highlands for grand scenery, but if you have a soul for the poetic and classic, take a range through

the land of Scott and Hogg—loiter among the hills, and vales, and by the water sides of Peebles, Selkirk, and Roxburgh shires. Thither we are now bound. We are going to my own dear river the Tweed.

At the very starting from Edinburgh—face straight south—we traverse scenes rich in historical association—the heights of Braid, on which James IV. marshalled his forces, the flower of Scotland, before setting out for Flodden—the plains of Roslin, where the heroes in 'ye times of old' rolled back the tide of English invasion. Now clothed in the rich abundance of autumn, these plains are succeeded by the high grounds which bound the vale of the Lothians; and then do we enter on the pastoral region, which spreads away in successive ranges of round swelling hills to the Borders. Leaving the land of coal-pits, limekilns, and highly-cultured fields, we drop down upon a scene of Arcadian sweetness, in the midst of which we come to the pretty little town of Peebles, embowered among wood-clad heights; and there, flowing by its side, we catch the first glance of the pure and sparkling Tweed. It may be partiality; but somehow we have never seen any stream at home or abroad half so 'bonny' as this river. For one thing, the Tweed is left what nature made it. Its waters are 'never drumly.' From top to bottom it runs over its original and appropriate bed of rounded pebbles—some of them white 'candies,' which you can see as clearly at a depth of a dozen feet as if they lay scattered around you. Then the banks are all grassy. Green herbage, and wee white gowans, and heather-bells, and 'siller saughs wi' downy buds' adorn its margin. At one place we have a haugh, on which cattle are seen luxuriantly ruminating; next we have clumps of trees—a policy—amidst which stands a modern mansion; and last of all, at a great many turnings, we come upon the spectral gray ruin of an old Border keep, whose walls, harder than the rock on which they are perched, bid defiance alike to time and tempest. What volumes of stories could be told about these curious old castles!

One of them, Neidpath Castle, is associated with my remembrance from the days of infancy. There, just a mile above Peebles, on a precipitous knoll overhanging the river, it stands as I used to see it forty years ago—mirrored, with its bartizan and wallflowers, on the surface of the waters—unchangeable. Generation after generation for ages has looked on that gaunt apparition: all are gone, and yet it remains; and who can doubt that it will remain when we and many generations after us are swept into eternity? Flesh and blood, what poor weak things ye are! With all your craft and pretensions, stone and lime keep the stage long after you have disappeared! And no wonder. The walls of Neidpath are twelve feet thick; and one shudders as he is conducted through the dungeons, impenetrable to the light of day, albeit the keeper, in her

good-humoured Doric, reminds you that there is now nothing in the world to fear. By way, however, of letting her visitors know what sort of social economy used to prevail langsyne—expecting of course that we should all be very thankful that we did not live five hundred years ago—she relates the tragedy of a poor man having been confined in one of the cells till he died of hunger: ‘and there,’ she adds, pointing to a stone, ‘was the puir gangrel body found wi’ his fingers half eaten off—aih, it was an awfu’ like thing!’ Quite true, my good woman—a very ‘awfu’ like thing!’ we are well rid of ‘auld langsyne.’

Below Peebles, the valley of the Tweed is adorned with many thriving plantations, and assumes the softness of an Italian landscape. Here also the mansions of the ‘lairds’ improve in general character, giving token of a substantial resident proprietary. While driving on our way through this sylvan district, let us recall an anecdote of a family whose residence is in the neighbourhood.

One fine summer day—two hundred years ago—as Murray, the laird of Blackbarony, was strolling down the brae from his house, he saw the laird of Hayston, mounted on a white pony, approaching as if with the intention of visiting his mansion. After the usual greetings, Murray asked Hayston if that was his intention. ‘Deed it’s just that,’ quoth Hayston; ‘and I’ll tell you my errand. I am gaun to court your daughter Jean.’ At any other time Murray would have had no objection to the visit; but at present, he had his own reasons for declining the honour—the truth being, that Jean’s only pair of shoes were at the mending. He accordingly gave the thing the go-by, by saying that his daughter was too young for the laird. ‘E’en’s you like,’ said Hayston, who was somewhat darty, and thereupon took an unceremonious leave of Blackbarony, hinting that his visit perhaps would be more acceptable somewhere else. Blackbarony went home, and immediately told his wife what had passed. Her ladyship, on a moment’s reflection, seeing the advantage that was thus likely to be lost in the establishment of her daughter, and to whom the disparity of years was no objection, immediately exclaimed, ‘Are ye daft, laird? Gang awa’ immediately, and call Hayston back again.’ On this the laird observed, ‘Ye ken, my dear, Jean’s shoon are at the mending.’ ‘Hoot awa, sic nonsense,’ says her ladyship; ‘I’ll lend her mine.’ ‘And what’ll ye do yoursel?’ ‘Do,’ says the considerate dame; ‘I’ll put on your boots. I’ve lang petticoats, and they’ll never be noticed. Rin and cry back the laird.’ Blackbarony was at once convinced by the reasoning and ingenuity of his wife; and as Hayston’s pony was none of the fleetest, Blackbarony had little difficulty in overtaking him, and persuading him to turn again, the laird having really conceived an affection for his neighbour’s daughter. The visit was paid; Jean was introduced in her mother’s shoes; the boots were never noticed; and the wedding took place in due time, and was celebrated with all the mirth and jollity usually displayed on such occasions. The union turned out happily, and from it are sprung and lineally descended the family of Hayston. Such is an old-world story of Tweedside.

At six miles below Peebles we arrive at Innerleithen—the St Ronan’s, as it is alleged, of Scott; here the soft and more charming scenery ceases, and then comes a tract, all about Elibank, brown and pastoral: sheep dotting the hills—little tributary glens, solitary and seemingly out of the world, yet not disconnected altogether with human weal and wo; for in a bend of the

hill stands a lowly thatched ‘bigging,’ exactly the sort of cot that turned out a Buchanan and a Burns, and, we will be bound to say, inhabited by a decent, God-fearing family.

Crossing the Tweed by a bridge at Innerleithen, we are close upon Traquair, but turning to the left, we in the meanwhile pursue our way down the right bank of the river to Elibank—an old castle and a modern mansion. Traditional legends, the subjects of ballads, here also. But these were not our aim. We came by invitation to have a ramble down to Ashiestiel and all ‘thereaway,’ with the promise to boot, if we had a mind, of peeping into a grouse pie. Such a day! Scene—the sun shining gaily overhead—brown heathy hills all around—a party from whom bursts of merriment go sounding down the valley—and at intervals, if you chose to listen, the gush of the Tweed heard from amongst the greenwood. A mile or two below Elibank, we arrive at the mansion of Ashiestiel, where Scott spent some of the happiest years of his life, and wrote some of his most pleasing poems. Situated in what was formerly a part of Ettrick Forest, and still popularly known by that name, though scarcely a vestige of the old timber remains, the poet’s descriptions convey a vivid picture of the spot:—

‘The scenes are desert now, and bare,
Where flourished once a forest fair,
When these waste glens with copse were lined,
And peopled with the hart and hind.
Yon thorn, perchance, whose prickly spears
Have fenced him for three hundred years,
While fell around his green companions—
Yon lonely thorn, would he could tell
The changes of his parent dell,
Since he, so gray and stubborn now,
Waved in each breeze a sapling bough;
Would he could tell how deep the shade
A thousand mingled branches made;
How broad the shadows of the oak,
How clung the rowan to the rock,
And through the foliage showed his head,
With narrow leaves and berries red;
What pines on every mountain sprung,
O’er every dell what birches hung,
In every breeze what aspens shook,
What alders shaded every brook!
“Here in the shade,” methinks he’d say,
“The mighty stag at noontide lay;
The wolf I’ve seen, a fiercer game
(The neighbouring dingle bears his name),
With lurching step around me prowling,
And stop, against the moon to howl;
The mountain bear, on battle set,
His tusks upon my stem would whet;
While doe, and roe, and red-deer good,
Have bounded by, through gay greenwood.”

Following the course of the river downwards, the banks close in at Yair, where

‘Scarce can the Tweed his passage find;’

and returning from this spot, we arrived at Elibank, where we spent a most agreeable afternoon. But it was necessary we should be on our way; and where should we all pass the night? How nicely some things in this queer world come about! Our calash is bowling along. A field with reapers is in sight.

‘Capital stooks these—what a harvest there will be this year! Let us have a look at what is going on.’

And just as the carriage stops, the master of the reapers heaves in sight.

‘As I’m a living man that’s my old friend, the farmer of ——. Here he comes.’

‘No possible!’ cries the farmer, as he approaches, surprised with the spectacle of a parcel of Edinburgh acquaintances in the Forest.

‘Quite possible; here we are on our way to Tibby Shiels’s for the night. How far, ken ye, is it to Tibby’s?’

'Tibby Shiels! Ye's no gang a fit to Tibby's the night. I'll warrant it's sixteen miles to Tibby's; and it'll be dark afore ye get frae amang the hills. Na, na; ye maun a' tak a bed at Juniper Bank. What wad the guidwife say if she kenned ye gaed past the door?'

'But look at all these ladies!'

'Houta, never mind; we've plenty up-pittin' for the hale o' ye. And the leddies, I'm thinkin', will be the maist welcome. Weel, what a strange thing to meet you here!'

Who could resist such persuasives? The preliminaries were speedily settled. We sorned during the night at our friend's house. I think we got to bed somewhere about twelve o'clock, after a tremendous amount of talking—the ladies entertaining the guidwife with town news, and the guidman, whose farm was half pastoral, giving me such an insight into the subject of sheep, lambs, dinmonts, wethers, hirsels, wool, shepherdas, and colliers, that I almost felt inclined to pitch pen and paper to the dogs, and take up the trade of store farmer.

The sheep-farming of the south of Scotland—to give form to our gossip on the subject—is a peculiar sort of thing, and is carried on over an extensive region, by rather a peculiar sort of people. If anybody has a notion of buying land, I should by all means recommend him to get hold of a cluster of Scotch hills. There they are the same yesterday, to-day, and forever; needing no enclosing, fencing, building, draining, or any other processes which pick the pockets of ordinary landed proprietors. Snow, rain, and sunshine are their sole appliances, and these nature bounteously imparts. Nor have the tenant farmers any heavy responsibilities. A considerable number of the farms are conducted entirely by resident shepherds, the master possibly living fifty miles off, and only requiring to visit his flocks at distant periods. But whether near or far away, the farmer resigns pretty nearly the whole management to his shepherds. Theoretically, these auxiliaries are in the capacity of hired servants; but practically, they are a species of subordinate partners in the concern; and left so much to themselves, this becomes an indispensable arrangement. The Scotch shepherd is an educated, religious, and highly trustworthy being. Living with his wife in a small thatched house in a remote glen, and his occupation being more of the character of watching than working, he has a large share of time on his hands, becomes a diligent reader, and as for power of argument on kittle points of theology, is a fair match for a bishop. The disposition to argle-bargle on religious topics is no doubt an unpleasant feature in the Scotch character; yet, after all, as everybody must have his weaknesses, I should incline to prefer a peasant metaphysician to a peasant nothing-at-all—a shepherd whose mind keeps criticising all the week long on last Sunday's sermon, to a labourer in a smock who keeps thinking only of bacon or beer. Talking of this, I am reminded of an anecdote of a Scotch shepherd, which gives one an idea of the character. A minister engaged in making a periodical visitation to the houses of his parishioners, was addressed by a venerable worthy—'Noo, sir, since ye've speered sas mony questions at me, will ye allow me to speer aye at you?' 'By all means, John; go on.' 'Weel, then, will ye tell me whether it's a greater sin to steal at mid-day or at midnight?' 'How can you ask so silly a question, John?' replied the minister. 'I shall give you no answer to it.' In the course of years, the minister was summoned to attend John on his deathbed. The veteran of the hills was at the last gasp; but something seemed to lie on his mind. 'If there be anything troubling your conscience, John, I hope you'll tell me what it is,' said the minister. 'I have naething particular, sir, except yon question you never answered.' 'What question?' 'The question

as to whether it's a greater sin to steal at noonday than in the dead o' night.' 'I cannot imagine,' answered the clergyman, 'why you should consider there is any difference in the sin, at whatever hour it be committed.' 'Ah, sir, I have ye noo,' replied the dying rustic with a gleam of satisfaction. 'Ye're clearly in the wrang; for he that steals at mid-day has only ae sin to answer for; but he that steals when it's dark thinks to cheat God, and that makes the theft a double sin!' With this delightful victory over the minister, John died in peace.

Besides their love of polemics, the southland shepherds are great politicians, and take a considerable interest in the moving events of the day. The expedient by which they carry on their literary correspondence is curious. There being few houses in the compass of their extensive walks, they have certain well-known appointed places among the hills where newspapers and letters may be deposited. By this means a newspaper or magazine will be handed on from hand to hand, and read over a district of fifty miles. These post-offices, as they may be called, are usually the dry cleft of a rock, or a recess within a particular whin bush, not likely to be stumbled on by strangers.

Hogg, who spent his early years as a shepherd, has pictured many traits of this class of men—their meetings at night to discuss social and ethical questions, their endurance of fatigue during snow-storms, and their generally primitive way of living. I think, however, that he has not recorded the manner in which they frequently rise in their profession. What a shepherd realises, put it altogether, may not be worth more than fifty pounds a year; yet look how he manages. A free cot-house; three loads of meal per annum; the grass of a cow; peat fuel free, if there be any, and the driving of coal, if there be none; and the keep of ordinarily forty-five sheep—a pig also, kept by the guidwife—are about the whole of it. In the country, however, there seems to be a blessing in the manner of living. Wants are limited, luxuries are scarcely thought of, and therefore little money is required to be given out. Nine sheep are sold every year, as they come to perfection; and as many lambs are left to make up the deficiency. The sale of these sheep, also of a certain number of lambs, and likewise of a quantity of wool, forms the cash-bringing-in principle. What is there to pay for but 'schooling to the bairns'—a thing never omitted—and occasionally a new gown or coat; the bulk of the garments being of homespun material. Economy!—how badly the world would get on without thee! What a useless animal the man who habitually spends all he makes, in comparison with him who keeps adding to the capital of society! Shepherds occasionally rise to be farmers; and when such is the case, they usually help each other. Half-a-dozen acquaintances will lend their whole savings to a neighbour, on the occasion of his taking a small farm; and how creditable to have to tell that these loans are usually given without any kind of written acknowledgment.

The possession of a stock of sheep is indispensable to a shepherd seeking employment; and whatever be the number he possesses, it is a necessary arrangement that a portion of them shall mingle with each flock under his charge, by which means he is furnished with the strongest inducement to take care of the whole of the sheep on the farm. Sheep are sold in detachments at fairs and trysts, and always according to quality. A good is not mixed with a bad lot. As the shepherd's sheep are sold along with those of the farmer, and are afterwards accounted for, the shepherd has here another strong inducement to be careful; because the more sheep of his own which can be draughted into the good lots, the more money he receives. On this account he is as anxious as his master to improve the general breed on the farm, and to secure the flocks against injury or deterioration. I was curious to know how a shepherd is able to realise a stock at his outset in life. He commences while a boy. Employed first as a humble

assistant on a farm, his master, by way of rewarding his diligence, will probably give him a ewe lamb; and failing this present, he receives a lamb from his father. This lamb is his first venture. It feeds with his master's flocks, and its increase in due season is his property. In a few years, by means of this increase, and also by a rigid economy in wages, which enables him to buy a few sheep, he gradually attains a full stock, and then payment to him in money ceases. Now the owner of forty-five sheep, each with a distinctive mark as his property, he feels all the satisfaction and importance of having an investment liable to increase, and which care and perseverance may improve. When he leaves his place, he does not take his sheep with him. His master or his successor must buy his stock of animals, and let them remain, because sheep have curious ways about them, and don't like removals. Day by day, for a series of years, flocks range in the same unvarying circle; always coming round by the sweet low-lying pastures at noon, and nibbling their way to the higher grounds at night. With respect to the social character of sheep, a stranger looking at a hill-side might suppose that, dotted like white specks over it, the sheep had no connection with each other. Quite a mistake. They form distinct societies among themselves; and those which constitute one group of acquaintances never willingly mingle with another.

Within the last forty years a great change has taken place in the breeds of sheep pasturing in these regions. Formerly, the small or black-faced animal was universal; but now, for the sake of finer and longer wool, the Cheviot, Leicester, and other white-faced varieties are more common. The old Scotch sheep may be said to have been better adapted for a hilly country than the heavy and refined creatures of modern days. He was a capital climber, could 'loup a dike' like a hunter at a steeple-chase, and, according to my friend's account, he possessed a particularly happy knack of eating whins—prickly furze—'without jaggling his mouth.' This latter point of character, from long habit, was apparently engrafted on the instincts of the animal; for a young black-faced lamb, without instruction, would take quite naturally to the nibbling of whins, and do the thing so discreetly, that it escaped any sort of injury.

With such chat the night was pleasantly spent; and even in the morning before starting I was able to squeeze out an additional budget of pastoral statistics. However, the time approaches for parting; and with many kindly adieus, we are on our way for Yarrow.

The road we took was by Traquair, the ancient seat of an earl of that title, with a scattered village adjoining. Up the valley of the Quair, a small tributary of the Tweed, our calash proceeded at a fair pace, passing on our right the scene of the old lyric, 'the Bush aboon Traquair,' till we got immersed among the hills, and nothing met the eye but bare round-topped mountains, wild and solitary. Up and up we went, till, reaching the height of the country, we descended by a southern slope to the vale of the Yarrow.

Suddenly the Yarrow, a silvery streamlet, is seen winding down the hollow. We can at first scarcely understand how a thing so small, and with so little of the garniture of nature around, can have excited such a variety of poetical emotions. Yet no river in Scotland, not even the Tweed, has been the theme of so many successive poems—generally, however, of a doleful or pensive kind, referring to acts of strife, or appropriate to

'The grace of forest charms decayed,
And pastoral melancholy.'

First we have the old ballad describing an unfortunate brawl on the banks of the Yarrow between Scott of Tusshielaw and his brother-in-law one of the Scotts of Thirlstane, in which the latter is slain.

'Oh stay at hame, my noble lord!
Oh stay at hame my marrow!
My cruel brother will you betray,
On the dowie howms o' Yarrow.'

How far the rhyme of 'marrow and Yarrow' may have induced poets to make the vale of Yarrow the scene of their ballads may be left to conjecture. 'Marrow' is a good Scotch word, signifying a match—any two things not properly paired being said to be 'not marrows'; and it would seem that this was too excellent an idea in connection with Yarrow to escape poetic seizure. Thanks to this, perhaps, and also to the old ballad, Hamilton of Bangour has bequeathed the fine effusion beginning,

'Busk ye,* busk ye, my bonnie, bonnie bride,
Busk ye, busk ye, my winsome marrow;
Busk ye, busk ye, my bonnie, bonnie bride,
And think nae mair o' the braes o' Yarrow.'

Other ballads involve in their respective imagery the howms or holms of Yarrow, with the adjoining scenery, in which some of the old Border castles still figure. Finally, in consequence of these poems, old and new, Mr Wordsworth contracted a veneration for the vale—a feeling so high, that he refused in 1803, during a tour in Scotland, to enter Yarrow, lest the sight of it should dispel the agreeable vision cherished by fancy. He consequently wrote his fine poem of 'Yarrow Unvisited.' In 1814, making another tour in Scotland, he ventured into this fairyland of poetic fiction, and commemorated the result of the experiment in the kindred poem of 'Yarrow Visited,' commencing with the well-known lines—

'And is this—Yarrow? *This* the stream
Of which my fancy cherished
So faithfully a waking dream?
An image that hath perished!

Oh that some minstrel's harp were near
To utter notes of gladness,
And chase this silence from the air,
That fills my heart with sadness!'

Entering Yarrow by the route from Traquair, we have immediately before us the farm of Mount Benger, of which Hogg was some time tenant; and beyond, on the opposite side of the vale, Altrive Lake, a house of respectable appearance, in which the poor shepherd terminated his earthly career. By an opening among the hills in this direction, a road proceeds to Ettrick, a kindred valley on the south. In turning to the right up the Yarrow, we have an almost immediate view of the chief beauty of the district—St Mary's Loch, a fine sheet of water several miles in length, fringed with a white pebbly beach. Passing the old tower of Dryhope, once the residence of the beautiful Mary Scott, the Flower of Yarrow, and the poetically as well as religiously-consecrated burying-ground of St Mary's Kirk, the drive is delightful, particularly if the day be warm and sunny, as it was on the present occasion. We are now in the bosom of the Vale of Yarrow; and bound for the general centre of attraction at Tibby Shield's, we pass the opening into Meggetdale, also possessing scenes celebrated in tradition and Border minstrelsy.

Pity we have no time to go up the Megget; but it is approaching noon, and Tibby's cozy hostelry is now in sight, nestling among a few trees at the head of the lake. We must get on our way, for we have much work before us; and that vulgar affair, dinner, even in a land of poetry, must be thought of. Behold us, then, driving up to Tibby's. Erected on a slip of meadow land, with a small garden around, her little domicile may be considered quite an oasis in the desert; nor could it have been placed with better effect. To the east stretches St Mary's Loch, while a similar sheet of water, the Loch of the Lowes, bounds it on the west. Not properly speaking 'a public,' for Tibby would not expose herself to promiscuous intrusion 'by taking out the license,' the establishment—a neat slated house, with a surprising amount of stowage—answers all the purposes of a wayside inn; and nowhere will the angler or knapsacked tourist find such a place of comfortable repose.

* Busk ye—dress or adorn yourself.

'Well, Tibby, ye'll not recollect me?'

'Aih, I do that,' replied the worthy dame, in the mellifluous dialect of the Forest, as she bustles forward. 'I mind o' you real weel; and I am sae glad to see you. Will ye a' come in by?'

'Not at present, Tibby; we are going to the Gray-Mare's Tail; and you will be so kind as prepare dinner for us before we come back.'

'I'll do that.'

And so, with this arrangement, off we went on a walking excursion to see one of the greatest natural curiosities of the south of Scotland. The Gray-Mare's Tail, be it known to those who never heard of the thing before, is a streamlet from Loch Skene, a solitary sheet of water, among the higher mountains, which dashes down a rocky and precipitous ravine, and forms a waterfall of some two hundred feet. Pursuing the Vale of Yarrow to its extremity on the west, we descend into the Vale of Moffat Water, down which, at the distance of a mile, we come upon the cataract. Rain had fortunately been falling among the hills, and the Tail was in prime order—a grand stream of foam and spray leaping from point to point in snowy masses, till it was lost in the gurgling abyss beneath. Loch Skene, whence the rivulet proceeds, is reckoned to be one of the gloomiest mountain tarns in Scotland. I had visited it the previous summer, and will ever retain a forcible recollection of its appearance—silent, dark, and desolate. Difficult of access, and surrounded by savage mosses and hills, it was in its lonely sublimity a thing to be associated in the imagination with the fabled and inapproachable 'Waters of Oblivion.'

Back to Tibby's at four. The fowls and gigot excellent; but a greater treat was a renewed chat with the good-natured hostess.

'Tibby, ye'll often be rather lonely here, I suppose?'

'Ay, we are that. Sometimes in winter we dinna see a livin' cratur for three months. But we maunna compleen. There's generally plenty visitors at this time o' the year.'

'I've heard that you have sometimes as many as five-and-thirty in a night.'

'That's only about the twalt o' August, when the shooters come up among the hills.'

'But you have not beds for so large a number?'

'That's true; but after a' the beds are filled, they just lie on the floor, or onygate. We do what we can to mak' them comfortable.'

'And you have been here many years? It will now be a considerable time since your husband died?'

'Ay, it's a lang time; but Providence has aye been kind to the widow and the fatherless. I'm thankfu' I've been spared to bring up my family, as it was my duty to do.'

'And you always prefer keeping your own name?'

'Ou ay; folk a' ken me best as Tibby Shiels; and I daresay, when I'm dead and gane, this place here will still be ca'ed Tibby Shiels's.'

'I understand there's been a grand wedding over at Lord Napier's.'

'A grand waddin', indeed; there hasna been the like o't in Ettrick for a hunder years I daresay.'

And so we had Tibby's account of this great local event, with a lot of gossip besides, until it was time to depart. We did not bid good-by without regret at the necessary shortness of our visit; and I feel bound to add, for the general enlightenment of mankind, that if anybody does not know what to do with himself, and can put up with the fare of the hills, and wishes to get out of the reach of post-offices and other sources of harassment, he should go and rusticate at Tibby Shiels's.

Our drive down Yarrow was accelerated by the approach of nightfall; but a sufficiency of light remained, as we issued from the hills at Selkirk, to show that the scenery had changed its character, and that we were again entering on the soft landscapes of the Tweed. Next day was devoted to a series of visits to places abounding in interest and beauty: Abbotsford—the

ruined abbeys of Melrose and Dryburgh, in the last of which lie the remains of Scott—and finally Kelso; the whole a chain of spots over a tract of twenty miles, in one of the loveliest districts in Scotland. But all this has been again and again described, and from me requires no repetition; so—to draw a long story to a close—here ends A DAY IN YARROW. W. C.

THE JAGUAR HUNTER.

THE pioneer settlers in the southern states of America are often exposed to danger from the attacks of wild animals. This is more particularly the case in approaching the tropical regions. The squatters of Texas relate many fearful tales of conflicts with panthers and wolves. In the states of the Mexican union, however, the ferocious jaguar, or South American tiger, is met with, which commits fearful ravages among the numerous herds of cattle and horses, from the breeding and sale of which many large proprietors derive a princely income. I was once staying for a few weeks at one of these estates, where a jaguar had for some time kept the whole establishment in alarm, and escaped all attempts made for its destruction. At last, on the return of a hunter, who had been absent on a distant expedition, all apprehension as to further annoyance ceased; for such were the courage and skill of the new-comer in attacking these animals, as to have gained for him the name of *Bermudes el Matasiete*, or 'Killer-of-Seven.' On the night following his arrival, he invited me to join him in watching for the intruder, and appointed the rendezvous at the *Ojo de Agua*, a fountain at the foot of a slope stretching gradually away till it met the forest.

Soon after sunset I strolled towards the place agreed on. A tall cedar stood near the fountain, its lower branches dipping into the water as it bubbled away to the bottom of the valley. Behind the cedar rose the knotty trunks of a group of mahogany-trees, interspersed with flowery sumachs. On the opposite side, a little glade was formed by a cluster of ash-trees, at the entrance of which I found the hunter lying at his ease upon the grass, enjoying the coolness after the extreme heat of the day, with his blue-barrelled rifle at his side. I congratulated him on the choice of so picturesque a site for the rendezvous. 'I am delighted,' he replied with a smile, the whole meaning of which I did not at first comprehend, 'that the place is to your taste, but you will see before long that it is better chosen than you think.'

We had not long been seated when a second hunter appeared, a tall Canadian, his rifle in one hand, and leading a lame colt by the other. After exchanging a few words with Bermudes, he tied the limping animal to the stem of the cedar by a long and strong cord, and then came to sit down by our side on the moss. I was at a loss to understand the object of these preparations, and of the fires which had been kindled in various directions. On questioning the Mexican, he rose, and conducting me to the edge of the fountain, showed me several formidable footprints in the damp soil. 'Those marks,' he continued, 'were made yesterday—of that I am certain. The jaguar, therefore, has not drunk for twenty-four hours, and for twenty leagues round there is not a drop of water but what is here on the estate. The fires yonder will scare the animal in that quarter; while thirst and the scent of the colt will certainly bring him here in the course of this night.'

The logic of this reasoning appeared to me irresistible; and I found myself, quite unarmed, suddenly transformed into a tiger hunter. At first I thought my best course would be to make a quiet retreat; a mixture of curiosity and self-esteem, however, induced me to stay. The Canadian was stretched at full length on the bank, snoring loudly. Bermudes beckoned me to sit down by his side, and to pass away the time, gave me an account of his numerous adventures. As we had yet four hours to wait before the animal could be expected to make his appearance, I sat patiently listen-

ing, while the hunter went on with his tale. For an hour no other sound save that of his voice and the loud breathing of the sleeper disturbed the silence. All at once the colt started and reared in alarm, and the dry bushes crackled with so dismal a sound, that I could not repress a shudder. 'Did you not hear a howl?' I inquired of Bermudes, who shook his head and laughed as he answered, 'When you have once, only once, heard a tiger's roar, you will never again be likely to mistake for it the humming of mosquitos. In a few hours you will be as well instructed on this point as I am.'

It was a false alarm: all became quiet as before, while the hunter continued the history of his exploits. But a second interruption followed; the colt began to utter a cry between a shriek and a moan. 'Is it mosquitos this time,' I asked, 'that so terrifies the poor animal?'

'Probably not,' rejoined Bermudes. 'Listen!'

'Hold—look yonder!' I said, pointing to a young poplar that rose above the surrounding trees; 'it is not the wind which shakes that tree while all the others are motionless.'

'It is the jaguar,' said the hunter after a pause. 'At present he is playing the brave, but his hour is not yet come; and for the moment he is more afraid than you are. Do not think, however,' he pursued, 'that tiger-shooting has no dangers. You will be able to judge how much another hour without drinking will have exasperated the animal. I have seen many a brave man turn pale at their frightful roar.'

Having expressed my uneasiness at being unarmed, my companion promised to furnish me with a weapon when the fitting moment should arrive, and resumed his recital where he had left off. But as the night grew darker, the interruptions became more frequent, and by and by a distant growl was heard, followed by a plaintive and menacing howl. 'I was mistaken,' said the hunter, coming to a pause; 'instead of one tiger there are two. Males never attack in company; and should it be male and female, we shall have a double warning, for Providence, which has given a rattle to the most dangerous of serpents to announce its approach, has also given to wild animals eyes that glisten in the night, and roaring voices to proclaim their attack.'

This assertion was far from agreeable, but the danger was still distant; the moment had not yet come when thirst makes these animals forget the involuntary dread which they have of the presence of man. All was again quiet in the woods, whose gloomy depths were thrown into shadow by the moonlight. The Canadian had risen from the grass, and leaned drowsily against the tree, smoking a short pipe, with his rifle between his knees. I had learned enough of the course of the stars to know that the hour was at hand for which we had so long been watching. Bermudes again spoke:—'It is time now to think of you,' he said. 'Do you not perceive that the silence becomes more and more profound around us, and that the odour of the plants has almost changed? Under the influence of the night they exhale a new perfume. When you have lived longer in the desert, you will learn that each hour of the day, as well as of the night, has its peculiar signification. At each hour, as one voice becomes silent, another makes itself heard. At present ferocious beasts salute the darkness, as to-morrow the birds will salute the dawn. We are near the hour when man loses the imposing influence of his look—at night his eye becomes dim, while that of wild animals brightens and pierces the deepest gloom: man is the king of day, but the jaguar is king of darkness.'

After uttering these words with a grave emphasis, the hunter rose, and fetching a bundle from the place where it had been deposited, unrolled two sheepskins covered with their wool, and, drawing his knife from its sheath, observed, 'You see your arms!'

'And what, in the name of wonder, do you expect me to do with that?' I inquired. 'I hoped at least for a rifle.'

Bermudes proceeded to explain that, on such an occasion, a rifle could be intrusted to those only who were sure of their aim. 'You will roll these skins round your left arm,' he continued, 'and take the knife in your right hand; then you put your right knee to the ground, and rest your protected arm upon the left knee. In this manner the arm defends your head and body while your stomach will be shielded by the knee; the tigers have an ugly habit of trying to disembowel their enemy with a stroke of their paw. If you are attacked, you present your arm, and while the animal's tusks are buried in the wool, you rip him up from flank to shoulder with one plunge of the knife.'

'All that appears to me incontestable,' was my answer; 'but I would rather hope that two hunters red as you will not miss your tiger. For my part, I shall hunt, as you call it, with my hands in my pockets; that will be more original.'

Failing the armour of sheepskins, the hunter urged me to take the knife, which I accepted. The two associates then primed their rifles, and we waited without exchanging a word. The lower part of the forest was now in profound darkness, while the little space around the fountain was brilliantly illuminated. We were sheltered by the drooping branches of a large mangrove, forming a kind of natural arch. Twenty paces in front reclined the colt, whose instinct was to be the hunters' guide. Presently I saw the animal raise its head with evident signs of uneasiness, which were not after succeeded by broken cries of terror, and efforts to escape from its fastenings. These attempts being useless, it remained trembling in every limb: a breath of terror seemed to pervade the atmosphere. All at once a cavernous roar from the neighbouring heights pealed in echoes through the woods; the colt hid its head in the grass. A deep silence followed: the two hunters crept from the shelter, and I heard the double click as they cocked their rifles.

An instant after, a terrible roar again burst upon our ears: a form of light colour darted through the air upon the colt, which had crouched down in terror: there was a noise of crashing bones, followed instantaneously by the report of Bermudes's rifle.

'Your knife!' he cried to his companion, who was preparing to fire. 'Look up; that is for you!'

I turned my eyes in the direction indicated by Matasiete, as he took the Canadian's knife. High up among the branches of the cedar I saw two large eyeballs shining like burning coals, watching all our movements: it was the second jaguar, whose tail was lashing the foliage, and beating off the dried moss from the branches in showers. The Canadian stood motionless with his eye fixed upon the two fierce-gleaming lights in the tree. Meantime the wounded jaguar sprang in one leap close to Bermudes, where the moonlight showed the furious animal. The blood was streaming from one of his legs, shattered by the ball. Collecting himself for a last rush, the animal lowered his head, beat the air, and howled in fury; his blazing eyes seemed to expand to twice their ordinary size. Bermudes stood self-possessed, on the defensive, holding his knife forwards. At length the tiger leaped; but his muscles were weakened by the wound, and the hunter, stepping aside, buried his knife in the monster's heart as he fell. There was a terrible yell—a struggle of agony—and then all was over.

'Whether or no,' exclaimed the brave Matasiete, 'there is a skin badly torn, to say nothing of my own, at the same time showing his arm lacerated by a horrid gash. He had scarcely finished, when a second roar was heard in the direction of the cedar: it was answered by the report of a rifle: a noise of rending branches followed by a heavy fall, announced the skill of a practised marksman. The Canadian had aimed between the glowing eyes. When the two hunters, going round to the other side of the spring, had found the body, their shouts of triumph gave me to understand that the Canadian's accurate eye had not been deceived.'

It was not without a feeling of compassion that I approached another victim of the slayers and slain—the dead colt. The poor animal lay stretched upon the grass; a bleeding wound at the back of the head, and another on its nose, showed where the tiger's claws had fallen; the complete fracture of the vertebrae of the neck proved death to have been instantaneous. Already cold and rigid, the first jaguar lay near: I measured it with my eye, but at a distance, when the two others arrived dragging the female, whose skull had been shattered by the ball: this time, at least, the skin was unbroken.

Bermudes complimented me on my courage, in what he persisted in calling tiger-hunting. I, however, disclaimed anything like bravery. The hunters seemed disposed to pass the night near the booty which they had so well earned; and preferring the open air to my close chamber, I agreed to keep them company if they would light a fire. My wish was soon gratified; we stretched ourselves on the moss near the blazing wood, and before many minutes had elapsed, were sound asleep.

On awaking the next morning, I found the two companions with their shirt sleeves tucked up to the elbow, and stained arms, busily engaged in flaying the two jaguars. When they had completed their task, which was performed with the dexterity acquired by long practice in similar operations, they threw the skins over their shoulders, and we all took the way to our original quarters, where our arrival was hailed with prolonged congratulations. Bermudes and his comrade received the usual reward of ten dollars for each skin; and the 'Killer-of-Seven' would now have to add another number to his surname.

COMMODORE THUROT.

IN the year 1727, at Christmas, a man named Thurot came to one of the churches in Boulogne with an infant to be baptised. It was then customary for ladies of rank to attend churches at Christmas time, in order to stand as sponsors for infants belonging to the humbler classes. One named Madame Tallard came forward to offer herself as sponsor for Thurot's child. The ceremony was proceeding, when Madame Tallard was surprised to observe tears streaming from the eyes of the father. She inquired the reason, and learned that his wife, the mother of the infant, was just then receiving the last rites of sepulture in the churchyard. Touched by the incident, the kind-hearted lady did not leave the church without making the poor man a present, and requesting that, if the child should live till she returned to Boulogne, he might be sent to see her.

Thurot, though now in comparatively humble life, was the son of parents who had moved in a superior rank. His father was a gentleman named Farrell, who had been a captain in the army of James II. in Ireland, and following the fortunes of that monarch, had become a member of his household at St Germain. There a gentleman of good connexions condescended, poor as he was, to marry him. The displeasure of relations, the loss of employment and means of subsistence, followed. The husband came to an early grave, and the lady survived him but a few months, having first, however, given birth to an infant, who was taken charge of by her relations, and brought up under his maternal name. This was the father of the infant of whose history we are now to give some particulars.

Young Thurot grew up under the care of his father at Boulogne. Madame Tallard continued to have a regard for the child, and permitted him to be the occasional playfellow of her own son. When he was fifteen years of age, one Farrell, the captain of a smuggling vessel, became acquainted with his father, and claimed relationship with him. This man told Monsieur Thurot that the O'Farrells were a flourishing family in Connaught: he himself was a prosperous gentleman, and he offered to take charge of the boy, and make his for-

tune. Thurot having agreed to this proposal, the youth was fitted out at the expense of his Irish cousin, and sailed with him for Limerick.

Touching at the Isle of Man, then the grand entrepôt of the contraband trade, young Thurot became disgusted with the conduct of his relative, and declined to proceed further in his company. While waiting for a vessel in which he might return to Boulogne, his handsome and sprightly appearance attracted the attention of a gentleman of the island of Anglesey, who had come to Man upon some smuggling business, being extensively engaged in that traffic. With little persuasion, the young man entered his service. He was soon initiated into the mysteries of the smuggling trade, and repeatedly visited Ireland on business intrusted to him by his master. One whole year of this early period of his life was spent on smuggling duty at Carlingford, where he acquired a knowledge of the English language. At length, tiring of this way of life, and anxious to learn something of his Irish relations, he set off for Dublin with only a few shillings in his pocket. The adventure ended in his being glad to engage himself as a nobleman's valet, in which capacity he served for nearly two years, when some irregularities in his own conduct led to his being discharged. He then went to the north of Ireland, and re-engaged in the contraband trade, for which his active enterprising genius was peculiarly fitted. It must be said in his favour, that, while his irregular education had furnished him with no protection against this demoralising career, which was then followed by thousands of apparently respectable persons, he conducted himself throughout all its rough scenes with a degree of both honour and generosity hardly to have been expected, and which could only be owing to his own natural good qualities.

War breaking out between Britain and France, it would appear that Thurot engaged in a privateer of his own country, and in this capacity became a prisoner of war in England. It was in the year 1745, when Marshal Belleisle was about to be discharged from captivity in our country, that Thurot effected his escape under extraordinary circumstances. Having left his prison, he concealed himself in the country by day, and came to a port on the southern coast at night. Here his object was to lay hold of some little unoccupied vessel in which to sail for France. Swimming about the harbour with great precautions against being observed, he came at length to a small smuggling bark, which he thought well fitted for his purpose. It lay, however, beside a larger vessel, to which it was attached, and it had no sails. The danger was, of course, that some person in the larger vessel would detect him before he could get it set adrift. Nevertheless this bold adventurer actually climbed the shrouds of the larger vessel to possess himself of a sail; returned with his prize, set free the little bark, and got clear off without detection. In two days, half famished, yet in the highest spirits, he entered the port of Calais. This strange adventure made him an object of public curiosity; nevertheless, the bark which he thought he had made his own was appropriated for the government. Thurot was reduced to despair. It chanced, however, that the lady of the Marshal Belleisle had come to Calais to meet her husband, then about to be set at liberty in England. Thurot was introduced to her to tell his own tale. At her intercession the marshal took up his case, and in the long-run Thurot obtained possession of the vessel, together with the friendship of that eminent commander. It is alleged that this was the first step of advancement made in the world by one who was subsequently to become a figure in history.*

In the course of his subsequent smuggling career Thurot visited Scotland. He sailed as master of the *Annie* of Leith, in one voyage from Leith to London.

* This anecdote appears in a rare book, entitled 'A Series of Letters, Discovering the Scheme Projected by France in 1750, &c. By Oliver Macallester, Esq.' 3 vols. 4to. 1767. We cannot say much for the authority, but the story may nevertheless be true.

He also spent a few years in the Metropolis. A gentleman some years afterwards recollected meeting him occasionally at this time at a club which was principally frequented by Frenchmen. One night a few of these persons launched forth into abuse of the English and Irish, to which Thurot listened patiently for some time without remark. At length, finding them become more scurrilous, he very calmly got up, and led two of them by the nose out of the room, after which he coolly returned, resumed his chair, and entered upon a new and more agreeable subject. Such was Thurot. It is not surprising that, when he returned to Boulogne, and resumed the contraband trade, he rose to be, as it were, its king; for even among the rudest people the superior morale always tells. Wrong on the general point as to the rectitude of smuggling, Thurot was right at least in all the included particulars. It is said that at one time his transactions as a smuggler reached a sum equal to twenty thousand pounds annually. At length, the government paying a vigorous attention to these malpractices, Thurot fell under heavy penalties, and was taken into custody. For some time he was confined in the common prison at Dunkirk; afterwards he was taken to Paris, and required to make discoveries for the future prevention of smuggling. He was now indebted to the good offices of M. Tallard, son of his godmother, also to Marshal Belleisle, who had a special love of men of ardent and enterprising character. It could, however, be no common smuggler whose prosecution ended in his being appointed to the command of one of the king's ships; for such was the case. Thurot, after all, preferred the command of a privateer, in which he did good service at the beginning of the seven years' war. During the year 1758, the doings of the Marshal Belleisle privateer in the seas between England and Norway were the subject of general remark. This was M. Thurot's vessel. In it alone he repulsed a couple of English war vessels off the Red Head, leaving them in such a state as to be unable to follow him.

Much excitement was produced in England in 1759, by intelligence of a large naval armament, including flat-bottomed boats, which was preparing in the French harbours. The design of the armament was kept a profound secret; but no doubt was entertained that it was intended to invade the British shores. It is now known that Prince Charles Stuart was to have accompanied it, on an arrangement favourable to France, in the event of his recovering the throne of his ancestors. For a part in the enterprise, Thurot was recommended to the French cabinet by that reputation for boldness, skill, and prudence which he had acquired in inferior capacities. He was accordingly appointed to command a squadron of five frigates, with which he was to sail to the Irish coast, and thus make a diversion, while the main fleet, under Admiral Conflans, should make directly for the southern shores of England. While this commission was actually in his pocket—without, however, his knowing his special destination—he appeared to be fruitlessly waiting for court favour. The ministers even affected to discourage his applications for employment, though secretly, perhaps, spending hours with him in their closets, taking advantage of his knowledge of the British coasts, and scheming out the particulars of his enterprise.

It is remarkable that no part of the plan met with any success, excepting what was under the care of this offshoot of the house of O'Farrell. Detachments of the English fleet blocked up the French ships in their harbours for months. When at length Conflans took to sea with a large fleet, he had scarcely left Brest when he was attacked by Sir Edward Hawke, and completely overpowered. Before this event, Thurot had broken through all obstacles at Dunkirk (October 17), and with his five ships sailed for Norway, a point from which he was afterwards to move as further instructions might direct. He had with him, besides the usual crews, upwards of 1200 land forces.

Though pursued by Commodore Boyes, Thurot got

safe to Gottenburg in nine days; after staying there a short time, he proceeded to Bergen, on which voyage he lost company of one of his vessels in a storm. Sickness, a consequence of imperfect victualling and other bad arrangements, beset the expedition. They nevertheless set sail towards the end of January for Ireland. For weeks they beat about in the North Sea, suffering much from the weather, and greatly disheartened by want of provisions and sickness. Another of the vessels now parted company, and was no more heard of. With the remainder of his squadron, Thurot appeared off the island of Islay, on the west coast of Scotland (February 16, 1760), being resolved to make an attempt to obtain some supplies of provisions. Mr Archibald Macdonald and Mr Godfrey Macneil, two gentlemen of the island, went out to them in a small boat, thinking they were British vessels in distress. They soon found them to be foreign ships, but for some time did not discover them to be the squadron which had held the British coasts in such anxiety during the winter. The commander, a young man of small stature, but elegant form, with dark intelligent eyes, and apparently of frank and affable character, came up and addressed them in English. He wished them to take his vessels to a safe harbour, which they consented to do, and conducted them accordingly to Aros Bay, near the south entry to the Sound of Islay. The visitors were treated with the greatest civility in the commander's own cabin. Then a council was held, at which it was determined to make a landing on the island in order to obtain provisions. Two hundred men accordingly went ashore, accompanied by Messrs Macneil and Macdonald, who interceded to induce the country people to bring cattle, poultry, and meal, to be disposed of to the strangers. So extreme was the condition of these poor men, that they dug up potatoes and cabbage, and ate them raw with the greatest avidity. From Mr Campbell of Ardmore they obtained forty-eight bullocks, seventeen bags of oatmeal, and other articles; as to payment, the French officers generally seemed willing to make little or none, but Thurot obliged them to render full compensation, bringing out the royal commission to show that they were to commit no unprovoked hostilities in Scotland. Of the whole sum due, a part was paid in coin; for the rest, bills were granted on the French king's banker at Paris, and these were afterwards duly honoured. The whole conduct of Thurot showed a humane, liberal spirit, far removed from that of his associates, and such as could not but inspire a deep regret that he should have come to Britain as an enemy. It was only now that he and his fellow-officers heard of the downfall of the hopes of France in the utter defeat of Admiral Conflans' fleet. When this was mentioned by the Islay gentlemen, the Frenchmen dropped their knives and forks from their hands, and sat mute for some time.

Thurot nevertheless determined to strike a stroke in Ireland, both because such had been his instructions, and because they could not now get directly back to France for want of provisions, all they had obtained in Islay being only sufficient for six days. On the third day from his arrival in Islay Sound he set sail, and on Thursday the 23d reached Carrickfergus. This town, and its ruinous castle or port, were now garrisoned by one hundred and eighty raw troops, under Lieutenant-Colonel Jennings. These men were exercising near the town, without any apprehension of approaching danger, when the strange vessels appeared, and immediately landed about a thousand men. The British soldiers withdrew to the town, closely followed by the French. Some gallant efforts were made to defend the gates, and keep out the enemy; but in vain. The French quickly obtained possession of all but the castle, where the forces were now concentrated. Here some smart skirmishing took place; but it was quickly found that the British were unprepared for such a determined resistance as their officers were willing to have made. They were deficient in the main element—ammuni-

tion; and the fort had a breach in it of fifty feet long. Jennings therefore capitulated, on the proviso that the town should not be plundered, and that the English soldiers should be exchanged as prisoners for so many of the French. A considerable number of the French fell in the action, and the general was wounded in the leg.

On the 22d, the invading party sent a flag of truce to Belfast, demanding certain provisions, and threatening to burn both that town and Carrickfergus in case of a refusal. The demands were complied with. Some severe measures were actually taken with Carrickfergus, on the plea that provisions were concealed and refused. Meanwhile the Lord Lieutenant at Dublin (Duke of Bedford) was taking measures effectually to repulse the French; and Thurot found it advisable, on the third day of his possession of the town, to take once more to his frigates. The very day of his departure, Captain Elliott of the *Eolus*, with the *Pallas* and Brilliant in his company, entered Carrickfergus harbour in quest of the French squadron, having been ordered on this duty by the Lord Lieutenant.

Thurot had sailed for the coast of Scotland, and he was lying between the Isle of Man and the Mull of Galloway, when, on the second morning—only a week from his so far successful descent on Ireland—the English squadron bore down upon him. Instantly weighing anchor, he stood out from the Scotch coast, to save himself from being embayed; but he was quickly overtaken, and brought to an engagement. It was a short, but fierce and bloody fight, ending in the complete triumph of the English, who took all the three French vessels. In the Marshal Belleisle a hundred and eighty men were killed and wounded; in the other two vessels a hundred and sixteen. Their decks were described as a frightful scene of slaughter. Amongst the slain was poor Thurot himself, much to the regret of enemies as well as friends; for it was generally known that, though a dangerous, he was a generous foe, and many anecdotes redounding to his honour were in circulation. So perished, at three-and-thirty, a man who, in happier circumstances, might have been a benefactor to more nations than his own, but whom the base conditions of his time and place enabled only to be known to us as a bugbear in a less uncompromising shape than usual.

Elliott's victory created general satisfaction, for it put an end to a sense of personal danger, which had been almost universally felt. It almost appeared, however, as if Thurot were the hero of the day. A hundred stories were told of him. It was asserted that he was not a Frenchman. He was English—Irish—Scotch; his fighting for France was but the mistake of fortune. A poet involved these ideas in a Latin epitaph, the turn of which rested on a misinformation as to his place of sepulture. It was said that he had derived bravery from England, vigour from Ireland, powers of endurance from Scotland—from Louis nothing but weapons. These nations contended for his remains; so that it was determined that he should have a grave in Mona, at an equal distance from each. The fact is, that the body of Thurot had been consigned to the sea after the action. It came ashore on the lands of Mochrum, in Galloway, fully clothed, with his insignia as a commander, and sewed up in the silk-velvet carpet of his cabin. Under the care, and at the expense of Sir William Maxwell of Monreath (father, we presume, of the beautiful Jane, Duchess of Gordon), it received honourable burial in the churchyard of Kirkmaiden, the most southerly parish in Scotland (alluded to by Burns in a well-known verse—

'Frae Maldenkirk to Johnie Groat's').

It is a pity that Sir William did not complete a line of conduct essentially generous, by raising a stone to distinguish the grave of Thurot. Mr Train says—'On visiting the old kirkyard of Kirkmaiden lately, I could not find any person who could point out Thurot's grave, except one old man, and I thought even he acted with

uncertainty. It moved me much when I thought that he whose name had filled with terror many of the inhabitants of some of the seaports of Great Britain and Ireland, whose defeat was celebrated with all the rejoicing that could be manifested for the most important victory, and whose name will go down to posterity with the reputation of an intrepid warrior, should thus be laid in a remote corner of the island which he threatened to conquer, without the spot being exactly known where his remains had crumbled to dust.'

FOSSIL FOOTMARKS.

AMONG the interesting and instructive facts which geologists have derived from fossil remains, there are none more extraordinary than those presented by footmarks of extinct animals. Geology gives us, as must now be generally known, a faint outline of the history of creation—showing one period when no animals higher than fishes existed, another when the only addition to this state of things consisted of reptiles, and finally, a time when mammalian animals were ushered into the world, man being, to all appearance, a crowning addition after the component materials of the earth had come into their present arrangement.

In the earlier stages of the animal creation, the most numerous fossils, after shells, are those of fishes. Wherever fossils have been searched for in the strata which bear them, they have always been found in greater or less abundance; some strata, as the old red sandstone and magnesian limestone, being remarkably rich in organic remains; while the new red, and others of the secondary period, are comparatively barren. It appears as if, by the elevation of the land in this latter period, a great breadth of low sea beaches was thrown up, which would be alternately covered and laid bare by the diurnal tides; and in some instances shallow lakes, estuaries, and lagoons were formed. The shores of these would naturally be the resort of such animals as were then in existence in search of food; their tracks would remain, together with ripple marks and the impressions of rain drops, and afford to the existing generation invaluable evidence respecting the earth's inhabitants and certain natural phenomena in ages so remote.

Nevertheless, when it was first announced that the footmarks of quadrupeds and bipeds had been found on the relics of these ancient beaches in the new red sandstone, the observers were looked upon as dreaming enthusiasts. 'Every one,' writes Professor Ansted, 'will remember the astonishment which Robinson Crusoe is represented to have felt at the sight of a human foot-print on the island which he thought deserted; and scarcely less surprising or interesting was the first discovery of these indications of animal existence in a rock so barren of fossils as the new red sandstone, and in a formation in which, till then, there had been no suspicion of the existence of any animals more highly-organised than fishes.' About the year 1830, Dr Deane of Massachusetts observed several extraordinary footprints in a sandstone quarry on the borders of the Connecticut river. He directed the attention of Professor Hitchcock to the appearances, who drew up an interesting memoir upon the subject. The first specimens were in square slabs, taken from a quarry of flagstones, presenting four distinct and perfect tracks of a large bird; the lower stone bearing the depression, and the upper stone the impression, precisely as they would appear if formed in soft mud, and suddenly hardened. Other specimens were soon discovered; similar footmarks were noticed on the stones of the side walks in several of the towns

and villages of Massachusetts; and the quarries visited from which they were taken. Some were found in red shale, in gray micaceous sandstone; and others in a hard sandstone composed of clay and sand. The strata lie at various degrees of inclination, and the footmarks vary in size from very small to incredibly large.

The impressions first examined by Professor Hitchcock were those of an animal with two feet, each provided with three toes; in some instances a fourth toe projected behind in the manner of a spur; and in others all the toes were in front. It was remarked that some of the larger impressions showed traces of a hairy or feathery appendage extending several inches to the rear. The shape of the toes varied: some were straight and tapering, some crooked, and others round and blunt. The bird to which the largest foot belonged had evidently been of great size and weight; for on cleaving some specimens of the tracks crosswise, the clay was found depressed to a depth of three or four inches. By careful separation of the slabs, other specimens were obtained in relief, from which the structure of the foot could be better determined than by the cavities.

Much pains was taken to determine whether the impressions were isolated, or had been produced by an animal walking. In one instance ten tracks were found following each other in regular succession, leaving no doubt of their being continuous steps. They might have been traced farther, had a greater space of the rock been quarried. It was clear, as the row was single, that the marks had been made by a biped, and at a time when the strata were in a horizontal position. 'Sometimes,' in the words of the observer, 'different species of animals, and different individuals, have crossed one another's tracks so often, that all is confusion, and the whole surface appears to have been trodden over; as we often see to be the case where quadrupeds or ducks and geese resort, upon the muddy shores of a stream or pond.' In a small slab recently described to the Geological Society by Dr Mantell, there are rows of consecutive symmetrical marks made by two different birds. 'There is a rare peculiarity displayed in these larger impressions, that adds greatly to their interest: it is the markings of the papillæ, and folds of the cutaneous integument, which are very distinct. The three rows of footprints embrace fifteen impressions, and exhibit the articulations of the toes perfectly. The surface of the stone is pitted by rain drops, from a shower which must have fallen before the birds walked over the soft mud and made the footprints. There are also indistinct traces of the trails of worms, and of an annelide.' Another slab taken from the same locality as that just described, showed among the bird tracks and rain drops the marks of a leaping animal, supposed to have been a species of kangaroo.

When these phenomena were first discovered, so much incredulity was manifested, that the greatest care was required in investigating them, and many elaborate arguments were expended before scientific men would be convinced of their genuineness. After satisfactorily ascertaining that the tracks were those of a biped, an eminent zoologist demonstrated that they could only have been made by a bird. The bird, it was then said, must have been one of the *Grallæ*, or Waders; and during a dry summer, Professor Hitchcock saw similar marks on the muddy bed of the river, where it flows by the side of the quarries, made by snipes; these had been baked hard by the sun, and perfectly resembled those on the sandstone slabs.

The earliest specimens were classed as thick-toed and slender-toed; of which eleven varieties were described, under the general denomination of *Ornithichnites*, or Stony-Bird Tracks. The largest of these (*Ornithichnites giganteus*) must have belonged to a stupendous bird. It has no hinder toe, and measures fifteen inches in length, with an addition of two inches for a claw. Some idea of the prodigious size of the bird may be inferred from the length of its steps; the ordinary walking stride was four feet, which might be increased on occasion to six. A gregarious habit is supposed to be indicated by the existence of parallel tracks of four of these giants walking side by side. Another species, the *Ornithichnites ingens*, like the former, was three-toed, with a foot from fifteen to sixteen inches long, having the tarsal appendage before noticed reaching eight or nine inches backwards from the bird's heel, and which may have been similar to that now seen on bantam fowl and some species of game. The ordinary step was six feet, and the bird was so heavy, as to sink deeply into the mud at every stride. 'Indeed,' writes Professor Hitchcock, 'I hesitate not to say that the impression made on the mud appears to have been almost as deep, indicating a pressure almost as great, as if an elephant had passed over it. I could not persuade myself, until the evidence became perfectly irresistible, that I was examining merely the track of a bird.' What a variety must there have been in the gradations from this monster down to the little bird which left the smallest tracks; a foot one inch in length, and a stride of three inches!

The valley of the Connecticut appears to have been in remote times a large estuary, and it has been shown that these footmarks were made on the borders of a shallow expanse of water. The larger birds would sometimes wade into the water in search of food; and supposing the surface to remain placid, layer after layer of soft mud would be quietly deposited in the deep-sunk tracks which they left, until the whole was filled up, yet without obliterating the impression of the birds' feet. In some instances a concreting process has taken place, so that, on separating the layers of stone, a perfect *fac simile* of the foot is obtained. The very perfection of the specimens shows that they cannot have been exposed to atmospheric influences, such as would have been the case had they been formed on mud left dry by the tide. Subsequently to the filling up of the tracks, they have been sunk to a depth of some hundreds of feet, and hardened into stone. Since that period, and while the oolitic, cretaceous, and tertiary groups of rocks were being deposited, they have been upheaved to the position in which they are now found. Their discovery may be regarded as one of the most interesting pages in the physical history of the earth.

The marks have been found in a district extending more than eighty miles along the banks of the Connecticut river; they include fourteen new species, among which some, from their resemblance to the tracks of saurians, have been called *Sauroidichnites*. Fossils are, however, abundant in other parts of the American continent. The state of Ohio is rich in specimens, both animal and vegetable; among the latter, the date, bamboo, and bread-fruit tree, besides others indigenous to the country, have been found at a depth of four hundred feet below the surface, in many instances with the most fragile and delicate leaves uninjured. The great Pittsburg coal seam, which covers an area of 14,000 square miles, abounds also in fossil plants; tracks resembling those of the cheirotherium, dog, and some species of reptiles, have been found in it. Of these no satisfactory explanation has yet been given, but some consider that we thus possess proof that reptiles and

fishes were not the only air-breathing animals in existence at the time that the forests of sigillaria and lepidodendra were growing.

Fossil footmarks have also been met with in England, Scotland, Saxony, and various parts of Europe. In 1824, some specimens were dug up in Cheshire, but remained undescribed until the discovery of others in a quarry at Storeton, near Liverpool, in 1838. The miners, when the slabs were first laid bare, supposed them to be impressions of a human hand, to which they bear a great resemblance, and from which circumstance the animal to which they belong has been named the *Cheirotherium*. By the labours of Professor Owen, this animal has been made out to be a species of reptile allied to the frog and salamander, but with very great inequality in the extremities—the hind-foot measuring twelve inches in length, and the fore-foot not more than four inches. The name now given to it, from the structure of its teeth, is *Labyrinthodon*. Slabs and casts of its footmarks, and of those of birds, are exhibited among the other interesting specimens in the geological gallery of the British Museum. Other tracks as well as those of the *Cheirotherium* have been found in the Storeton quarries. According to a paper read before the Geological Society, 'many large slabs are crowded with casts in relief, some of which are supposed to have been derived from the feet of saurian reptiles, and others from those of tortoises. Occasionally, the webs between the toes can be distinctly traced. It is impossible to look at these slabs and not conclude that the clay beds on which they rested must have been traversed by multitudes of animals, and in every variety of direction.' Some further researches, made in the same quarries during the past year, have brought to light the footprints of birds, from a small size up to two and a half inches in length. Mr Cunningham, the discoverer, observes in his description—'The feet had three toes; the intermediate space between two impressions is ten inches; and, so far as they go, the impressions are right and left. There can, I think, be no doubt of the animal that produced them having been a bird, and probably one of the *Grallæ*. . . . This discovery I consider important, as proving beyond a doubt the existence of warm-blooded animals in this country during the period of the deposit of the new red sandstone. I have long looked for something of the kind, and am now hoping to discover some of the large *Ornithichnites*.' Across other slabs found in the same district runs a grooved mark, as though formed by the tail of an animal trailing on soft mud: some were covered with a network of cracks, and dotted with rain drops. 'These appearances go to prove, that if some of the tracks have been formed under water, others have been exposed at repeated intervals to the hardening effects of the sun, and the further deposition of silt by water, which has thus produced a succession of layers.'

Footprints have been seen also in the sandstone of Shropshire; and in the south, near Hastings, tracks sixteen inches in length, supposed to be those of a bird, occur in the hardened beds of sand. Every new discovery has helped to dispel the scepticism with which the original supposition was received, as to the tracks being those of warm-blooded animals. The advocates of a particular theory contended that the prodigious impressions in the sandstone of the valley of the Connecticut were those of some hitherto unknown saurian with trifid feet. Mr Lyell's recent visit to America has, however, set the question at rest. In company with Professor Hitchcock, he went to examine the footprints, and writes—'The waters of the Connecticut being low, I had an opportunity of seeing a ledge of rock of red shale laid bare, on which were imprinted a single line of nine footsteps of *Ornithichnites giganteus*, turning alternately right and left, and separated from each other by intervals of about five feet. At one spot there was a space, several yards square, where the entire surface of the shale was irregular and jagged, owing to the number of footsteps, not one of which could be traced

distinctly, as when a flock of sheep have passed over a muddy road; but on withdrawing from this area, the confusion gradually ceased, and the tracks became more and more distinct. The professor informed me, that since he first announced his belief, in 1836, that these impressions were referable to birds, he had observed above two thousand footprints, probably made by nearly thirty distinct species, all indented on the upper surface of the strata, and only exhibiting casts in relief on the under side of the beds resting on such indented surfaces.'

While travelling in Georgia, Mr Lyell had seen the process by which the recent footprints of animals—racoons and opossums—were preserved on the sea-shore, by the drifting in of fine-blown sand, which, under pressure, would have concreted into a hard mass. And after viewing the tracks in the quarries on the Connecticut, the secret of their formation was revealed to him on the shores of the Bay of Fundy. 'When I arrived in this region,' he tells us, 'it was the period of the lowest or neap tides, so that large areas, where the red mud had been deposited, were laid dry, and in some spots had been baking in a hot sun for ten days. The upper part of the mud had thus become hard for a depth of several inches, and in its consolidated form exactly resembled, both in colour and appearance, some of the red marls of the new red sandstone formation of Europe. The upper surface was usually smooth, but in some places I saw it pitted over with small cavities, which I was told were due to a shower of rain which fell eight or ten days before, when the deposit was still soft. It perfectly recalled to my mind those "fossil showers" of which the markings are preserved in some ancient rocks, and the origin of which was first correctly explained to an incredulous public by Dr Buckland in 1838. . . . I saw several other examples during my tour of similar phenomena, particularly in a bright red deposit of mud thrown down at the mouth of the Patuxent, at Baltimore, of which I was able to bring away some consolidated layers.' But the muddy shores of the bay were marked with the more interesting tracks of annelides and of birds, the latter 'in regular sequence, faithfully representing in their general appearance the smaller class of *Ornithichnites* of high antiquity in the valley of the Connecticut. These recent footprints,' continues Mr Lyell, 'were those of the sandpiper, a species common to Europe and North America, flights of which I saw daily running along the water's edge, and often leaving thirty or more similar impressions in a straight line, parallel to the borders of the estuary. The red mud had cracked in hardening in the sun's heat, and was divided into compartments, as we see clay at the bottom of a dried pond, and I was able to bring away some pieces to England.' The markings on some of these pieces, which have been deposited in the British Museum, are most perfect, and fully exemplify the mode in which the ancient fossil *Ornithichnites* were formed.

Various opinions have been expressed as to the size and height of the birds whose feet left impressions so enormous. The African ostrich is the largest bird known at the present day: its height is from seven to nine feet, weight eighty to one hundred pounds, and the total length of the foot ten inches. Reasoning from analogy, the conclusion is, that the *Ornithichnites giganteus* and *ingens* were double the height and size of the ostrich. A bird of this gigantic stature, rivaling our camelopard in height, would be a fitting companion for the enormous quadrupeds which existed contemporaneously on the earth! At the first thought, such things appear beyond the bounds of probability; but nature herself has furnished evidence in their favour by the fossil bones recently exhumed in New Zealand. Mr Owen, in a communication to the Zoological Society on these interesting remains, gives the name of *Dinornis*, or 'Surprising Bird,' to the animal to which they belonged. The largest of this species, *Dinornis giganteus*, when living, was ten feet six inches in height; and another, the *Dinornis struthoides*, equalled the modern ostrich in

size. The footprints of the *dinornis* were of the trifid character, as described of the American *Ornithichnites*: the dimensions of the feet were in some instances similar; the natural consequence is, that there is no longer any room for scepticism as to the true character of fossil footmarks in the Connecticut sandstones.

In 1844, subsequently to Mr Lyell's visit to America, other specimens of footmarks were found at Turner's Falls, in Massachusetts. They were impressed on glossy shales imbedded in sandstone. One of the slabs contained above one hundred tracks made by four or five varieties of birds: it was besides pitted all over with fossilised rain drops. The claws, joints, and integuments were clearly exhibited. Some of the prints were made by a short, heavy bird; others, of a smaller size, with a longer stride, were supposed to be those of a wader similar to the heron; others again showed a foot six inches in length and width, and a stride of twenty-nine inches. The bird to which the latter belonged must have been of great weight, as the bed of mud was depressed to a considerable depth.

Any remaining doubt as to the tracks being those of birds was removed, by the discovery at the same time of coprolites, or the fossilised excreta of those animals, in hard calcareous rock in the same district. The place where these were met with had evidently been much resorted to by the birds, as shown by their numerous tracks. 'In the midst of them were found a few egg-shaped flattened bodies, about an inch in diameter and two inches long, of a dark colour, and considerably softer than the enclosing rock, which is very hard and compact. When broken crosswise, they usually exhibit a more or less perfect concentric arrangement, and are sometimes a little convoluted. They adhere so strongly to the rock, that their precise external appearance has not been determined. In the inside of this mass small black grains may be seen resembling small seeds, the black matter of which is carbonaceous. When this is burned off, the remainder of the fossil has been found, on analysing it, to consist of phosphate and carbonate of lime. It is supposed that the black grains are seeds which have passed undigested through the intestines, and have assumed in the passage such positions as these foreign bodies would, and often do, in the fæces.

'A remarkable and beautiful result has been obtained by the application of the power of chemical analysis to these fragments. These are found to contain uric acid in the proportion of about one-half per cent; and from the circumstances under which it occurs, it is concluded that the coprolite must have been dropped by a bird rather than any other animal. It also appears that the animal was in all probability omnivorous—a conclusion suggested by the analysis of the coprolite, and confirmed by the probable presence of seeds, as above alluded to.'

The high importance of the study of fossils as a means of throwing light on the early history of our planet is clearly shown by the facts brought forward in the foregoing account. We may conclude in Professor Ansted's words:—'It is strange that in a thin bed of fine clay, occurring between two masses of sandstone, we should thus have convincing, but unexpected evidence, preserved concerning some of the earth's inhabitants at this early period. The ripple mark, the worm track, the scratchings of a small crab on the sand, and even the impression of the rain drop, so distinct as to indicate the direction of the wind at the time of the shower—these, and the footprints of the bird, are all stereotyped, and offer an evidence which no argument can gainsay, no prejudice resist, concerning the natural history of a very ancient period. But the waves that made that ripple mark have long ceased to wash those shores; for ages has the surface then exposed been concealed under great thicknesses of strata; the worm and the crab have left no solid fragment to speak to their form or structure; the bird has left no bone that has yet

been discovered; the fragments of the reptile are small, imperfect, and extremely rare. Still, enough is known to determine the fact; and that fact is the more interesting and valuable from the very circumstances under which it is presented.'

A NIGHT AT HOME.

BY LEITCH RITCHIE.

WHEN I was still only on the threshold of manhood, I found myself a unit in the mighty population of London, and it is hardly possible to convey an adequate idea of the loneliness of my condition. In a desert island one may be solitary enough, but the feeling of solitude cannot always be present; whereas in London, even the measureless and endless crowd which the provincial sees whirling around him, is a constant remembrancer that he is *alone*—

'Alone, alone, all, all alone,
Alone on the wide, wide sea.'

When little more than a boy, I had said to my mother, with the hero of many a fairy tale, 'Mother, bake me a bannock, and roast me a collop, and I will go and push my fortune!' And my mother, who never could refuse me anything, and who, besides, had a strong notion that the Metropolis was the best field for such preternatural talents as mine, had readily, though tearfully, complied. I was, then, in London, without a friend, without an acquaintance, without a prospect; and (my resultless letters of introduction being all delivered) I felt sometimes as if I were a shadow moving among substantial forms, and sometimes as if the world around me, and all that it inherit, were but the phantasmagoria of a dream.

One day, when going into my lodgings, I found that a hackney-coach had stopped at the door, and I looked with languid curiosity into the window of the vehicle. The passengers were an elderly lady and gentleman, and a young woman, apparently their daughter; and I observed them with the more attention, that I thought I heard them pronounce my name as they gave a packet to the coachman to deliver at the house. Not that I thought it was really my name—that was impossible; for although I sometimes received letters by the post, the post is not one of the persons of society like people who come in hackney-coaches, and I was known in the house only as the young gentleman in the two pair. But the surprising coincidence of the sound resembling my own name made me look fixedly at those who pronounced the word; and in fact I continued to look—and to see what I looked at too—long after the hackney-coach had disappeared.

It was the young woman who had chiefly arrested my attention; and the circumstance was owing to her appearing in the likeness of an ideal being that had haunted me for years. I thought I knew her, just as one frequently recognises a scene beheld for the first time as something already garnered in his memory. It is usual to talk of such matters as 'recollections of a former state of existence,' but my perceptions were not of so dreamy a nature. The young woman was a piece of flesh and blood, belonging exclusively to this present world—and so was I; and besides, it turned out that she had actually brought me a packet from my mother, a service which as yet had been rendered me only by the post.

To some persons it will seem ridiculous that my thoughts continued from that moment to dwell upon the young woman; but the fact is, the phantoms of my imagination resolved into her, and she became like a religious image in whose material form men worship ideas of beauty and holiness. I was just in that state of solitude which is favourable to such superstitions;

and so conscious was I withal, that I never could bring myself to ask my mother a direct question about the bearers of her packet.

My mother, on her part, gave herself no trouble to understand the hints with which I coasted round the delicate subject, for indeed she had other and far more pressing calls upon her ingenuity. The affairs of our family had been going back for some years, ever since my father's death, and our moderate property was much diminished by litigation. The few freehold acres, however, on which our unpretending, but genteel and comfortable house was built, were still entire; and these we determined to preserve to perpetuity; and in order that we might do so more conveniently, to grant some building leases if we could find tenants. All these matters were discussed at full in my mother's letters; but, to say the truth, I found them neither very interesting nor very intelligible. All I knew was, that I was to make a fortune somehow or other for myself; that my paternal acres were to be multiplied threefold; and that I was to meet again the lady of the hackney-coach. This was clear enough, although I sometimes wondered how it was to begin to come about; and so I went on dreaming, and castle building, and growing more and more solitary every day, till at length I was recalled home, for the purpose of commencing in Scotland—under the auspices of some relations, since I could not manage it myself—the serious business of life.

I left London without regret. The young woman was but an idea, and that was easily transported. The Egeria of the two pair could haunt me as well in the north as in the south; nay, much better in a room trellised with woodbine, and looking over a romantic river, than in a bare brick box, staring for ever and ever with its dead eyes at other bare brick boxes staring at it.

A journey like mine was no trifle at that epoch, especially to one who travelled, for the sake of economy, night and day on the top of the coach; and by the time we had completed two-thirds of the last hundred miles, I had some doubt as to whether I should ever recover the use of my cold cramped limbs. We were now resting for breakfast at an inn which was only thirty miles in a straight line from the place for which I was bound; but the distance was still greater to the town where the coach stopped, and where I should require to pass the night, if I completed my journey by the vehicle. It occurred to me that a walk of thirty miles, which I had never considered a hardship, would, under present circumstances, be a blessed relief; and I pleased myself likewise with picturing the joyful surprise my sudden appearance would give my mother, who did not expect me till the following day. Having made the necessary arrangements, therefore, with the coachman about my luggage, I bade adieu to my fellow-travellers without regret, and striking into a by-road, commenced my solitary journey.

It was some time before I recovered the free use of my limbs; but the morning was fine, and the air bracing, and by and by I felt a sensation of enjoyment to which I had long been a stranger. The road led through a finely-varied country, where hill and valley, woods and waters, were intermingled in endless succession. It was quite a field-day for a dreamer like me; for in such circumstances the thoughts receive an unconscious impulse from the scenery, and assume new forms and colours with the changes of nature. I felt this when the flatter part of the route terminated in an extensive moor, for gradually the *couleur de rose* which had tinted my imagination faded away into the sombre hue of the desert. The secret perhaps was, that I was tired. For more than a year, my only exercise had been in street rambling; and the heights and hollows of this mountain path, after a few hours' stout walking, tried me severely. Then it came on to rain; and being without the slightest shelter on the moor, I was soon wet to the skin. This would have been a trifle; but as it was necessary, whether wet or dry, to rest, I sat down after the rain was over; and at length got up, stiff, shiver-

ing, lame, and faint. The fact was now obvious: the unaccustomed journey had been too much for me—I was unwell; and instead of having to wander on, for a dozen miles more, over a wild and dreary road, I felt that it would be better if I could say to my mother—

'Oh mother, mother, mak' my bed soon,
For I'm sick at the heart, and fain would lie down.'

I was now tempted to commit what I ought to have known to be a folly. I determined, after receiving some information at a hut, to forsake the road, and take a short cut to my destination. How terribly long these short cuts always are! Before I reached the end of mine, I was ready to sink from fatigue; and indeed, if it had not happened that the last few miles led over familiar ground, I must unquestionably have made the heath my bed, 'with the bracken curtain for my head,' for darkly and sternly the night came down upon my solitary path. But I now knew every inch of the ground; and I could have named every height and hollow of the hills as their outline was dimly visible against the dull sky behind. So I stumbled on painfully, but surely; and at length recognised those well-known chimneys which, to a stranger, would have appeared but a filmy spot upon the night.

I was at length at the door. I knocked—louder—louder: no answer. After listening for a few moments, I was beset by a mystic terror: was my mother dead? But presently I recollected that I was not expected home that night, and that it was now past the hour of her going to bed; and as I knew that my wild fancies were the effect of fever, my fear assumed a new direction. If I could but get in without awaking her! A night's rest, I was sure, would recover me; and in the morning my mother would really have the joyful surprise I had pictured, and not be horrified, as she would be to-night, by the sight of her only son, weak, ghastly, and hardly able to speak. I coasted round to the lattice of my own apartment, holding by the wall for support. It was unbolted. I was able to open it; and joy giving me a momentary strength, I crept into the room, and groping my way, went to bed.

As I felt myself sink upon the soft pillow—in my own house, and with my mother in the next room—a sweet feeling of satisfaction stole over my senses, which seemed to still the throbbing of my temples; and my imagination, with one parting whirl—which comprehended the young woman, and the two pair, and confounded them with present persons and localities—was just about to yield to the influence of sleep, when a circumstance occurred that made me doubt whether I was still awake. Whether I saw the door open, or felt it, I cannot tell; but I knew that it opened, and that the appearance of a human being entered, slowly and noiselessly, and approached the bed. It was now standing between me and the window; and I could see by the outline, and some details of the figure, that it was that of a man or boy, in a long dress, reaching to the feet. It looked at me intently; it bent over my face, as if to observe my features, and then, without uttering a word, it disappeared by the window.

This strange apparition, whether real or unreal, spoiled all. What I wanted was rest—rest of body and mind; and now my imagination, instead of yielding to sleep, aroused itself with a morbid energy which made me tremble for my senses. I thought the figure I had seen was *myself*. Owing either to the imprisoned moon having obtained more power, or simply to my eyes having become accustomed to the gloom of the apartment, I had been able to detect—or now supposed I had done so—a resemblance in age, and figure, and even in the dim features that had bent above mine. This, I thought, was my 'Double'—for I had read of such things—and that it had gone forth to visit the premises, and greet the old familiar places. Nay, as a faint sound now and then met my ear, I fancied that I was conscious of what it saw and felt; and when a low whine proved that it had reached the dog-kennel, I

patted my old favourite as he licked my hand, and praised the instinct by which, after so great a lapse of time, he had known my footstep in the dark.

There mingled, however, with this fancy a not less strange suspicion that it was untrue; for in fact my burning skin and throbbing temples gave a terrible reality to my condition. But presently the veil that concealed the world of shadows appeared to be entirely rent away, and the 'Double' was a mere commonplace fact in comparison with the extravagances that followed. As for myself, I rocked like a pendulum between two distant parts of the country. One moment the noise of the wheels and voices of London was in my ears, and her phantom population floated past me; the next I knew myself to be on the spot where I really lay, but surrounded both with the living and the dead, all mocking and grinning, and laughing and sobbing, in the wildest confusion. My breath came thick; I felt as if the spectral crowd would suffocate me; I commanded them, in rage and terror, to begone; and at length, in a feeble broken voice, I called for help. At that moment my delirium was at its height.

'I come!' cried a voice from without; and at the word a hushing sound ran round the room, and as a small faint light appeared at the door, the phantoms that had haunted me disappeared like morning mists before the sun. It was of course the young woman of the hackney-coach. Shading with her hand the tiny taper she carried, she looked towards the bed where I lay shrouded in darkness, and I saw that a faint cold smile illumined her face, 'like moonlight on a marble statue.' Her complexion was startlingly pale, and yet her hair as black as night, and the contrast conferred upon features that were chiselled in the most exquisite Grecian mould a fitting character of preternatural beauty. She advanced a step, and then, seeming to hesitate, set down the taper on a table in the corner of the room behind the door, and glided slowly towards the bed, her footfall giving no more sound than a moonbeam.

As she came nearer and nearer, my eyes closed involuntarily; and when she sat down by the bedside, I felt a faintness steal over me, that was like the parting of soul and body. But the next moment she took my hand in hers, and the touch of her cool fingers sent a thrill to my bosom which recalled me from death.

'You have been far away!' said she in a low voice, while the words seemed to drop in liquid melody upon my heart. 'But you have now come back: you are in your own bed, in your own house, and with none near you but those to whom you are dear—oh, how dear! Will you promise never to go away again?'

My soul promised; but my lips, although they moved, were mute. The fountain of sound seemed dried up within me; my mouth was parched by the fever that burned in my veins; and I could not have uttered a word if a dagger had been pointed at my throat.

'You know how your mother loves you,' continued she: 'you know how I love you; you know how Ponto loves you—poor dog, I heard him whine a little while ago! He was dreaming that he licked his master's hand. Will you promise never to go away again?'

I made a mighty effort to speak; but I only shook the bed with the convulsion.

'Alas!' said she, 'you will not answer. You do not even comprehend me—unhappy girl that I am!' And I felt some warm soft drops fall upon my hand, which she still held within hers.

It would be vain to attempt to describe my sensations. I was cunning, however, in the midst of my happiness, for I was not mad enough to refrain from at least doubting its reality; and when by and by I could have spoken, I would not hazard a word, lest the sound of my own voice should dissipate the blessed illusion. For the same reason I did not dare to press her hand, even when my fingers became strong enough to do so; for I would not feel that it was unsubstantial. All I desired was to lie there and thus for ever and ever.

But at length the exorcised spectres returned one by one. First came the mother, slowly and noiselessly, and gliding up to the bed, she subsided like a cloud into a chair on the side opposite her daughter, and stared at me. Then came the father in the same fashion, and he planted himself upright at the foot, and stared at me too; and they both stared at me, as I could feel (for there was not light enough to see), with dull and marble eyes. I was troubled by the gaze. It disturbed the sacredness of my communion with her, and it likewise gave me, fevered as I was, an increasing suspicion of the unreality of the whole scene. What could bring this tribe of London people to our Scottish home? Would it not be more natural for my mother, who was only in the next room—

And my mother answered to the summons. The idea had hardly been formed in my spirit-compelling brain, when the door again opened, and she glided into the room.

'What are you gathered about the bed for?' said she in a low voice.

'Hush! hush! hush!' replied the watchers: 'he is come back!'

'I know it.'

'He is asleep.'

'I know it; but how do you?'

'See! see! see!' said the phantoms.

'See! There is nothing there: surely alarm has turned your brains!'

'He is in this bed, but we must not disturb him with the light.'

'God be with us!' cried my mother; 'what a tale is this?' And at the holy name they all started up, and I expected to hear the 'whirr' of their departure.

'It is not ten minutes,' continued she, 'since I heard Ponto whine, as if caressing some one; and throwing open the lattice, I looked out, and with mingled joy and terror saw the wanderer returned. Poor lad! he would come in; and seeing that my opposition only fretted him, I yielded, put him to bed, and leaving him fast asleep, came here to tell you.' At this recital I felt one of the sudden changes of delirium, and could hardly hold from laughing at the idea of my mother being deceived by my 'Double.' But the effect upon my strange visitors was very different.

'Merciful Providence!' cried the elder lady; 'I fear there is a trial preparing for you. Since it is true that such appearances do come, they can never come in vain. Unhappy woman, it is a wraith you have seen!'

'Silence, wife!' interposed the old gentleman. 'Our kind friend has an excuse for her delusion in the natural feelings—she saw with her eyes only what her heart looked for; but your idea is sheer nonsense.'

'You all appear to me to want an excuse,' said my mother. 'Tell me, my sweet Isabel—you who never forget anything but self, and never misapprehend anything but your own goodness of nature—tell me what is the meaning of this extraordinary scene?'

'I can only say,' said Isabel, in a voice that seemed still more rich and soft when heard after other voices—'I can only say that he returned not long ago; that I watched him into his room; that I followed instantly, and sat down by his bedside; and that he is now lying asleep before us, with his hand in mine, and his thick irregular breathing, the effects of his harassing journey, only too audible.'

'Then God help us all, and save our wits! for there is nothing more certain in this world than that I have just left him asleep as you describe, and that I had some difficulty in extricating my hand from his to come away without awaking him.'

'Stop, madam!' cried the old gentleman, 'as my mother was about to run to the corner of the room for the taper—Did you expect your son to-night?'

'No, not till to-morrow. It is physically impossible that he can arrive before the middle of the day to-morrow.'

'Then the mystery is explained: it was your own son you put to bed—not mine!'

Here was an explanation indeed; but one that was far beyond the reach of my poor fevered brain. It appeared that it was not I who was lying in the bed before them, but somebody else! If I was not myself, who was I? I would thank them to tell me that, or else leave me alone with Isabel. It was dreadful to be nobody at all. I would go back to London. I was in London. It was at me the brick boxes stared with their dead eyes, and no longer at one another. They turned as I turned; they followed as I flew; they surrounded me everywhere; everywhere I could see the mass extending back to an immeasurable distance: and all staring, staring, staring at me. Their myriad cries were in my ears; but the intonation was lost in the roar of carriage wheels, and it was some time before I could understand what they said: till at length their united voice, compelling, as it were, all other sounds to join it, the whole staring world cried out—'Who are you?—who are you?—who are you?' Suddenly a shrill scream penetrated through the mass of sound, which at once died away in the 'hush' I had before heard running round the apartment; and in a moment my senses rallied, and by the light of the taper, which some one now held above my face, I saw my mother bending over me. 'My son, my son!' she cried; 'what a heart have I that did not tell me it was you!'

'Mother, what is this? Tell me where I am? Am I not in our own house?'

'You are—but not in the house. Do you not remember the building lease? This is the new dwelling that was built while you were away, close to ours, and uniform with it. But you are ill, feverish, faint. Not a word more to-night; but try to sleep. I see it all without explanation: you came in by the window, as you often used to do; and our tenant's son, a most amiable lad, but alas! of weak intellect, who had strayed away from his distracted friends—'

'Who are they?' said I pointing, and feeling myself again begin to wander.

'They are his father and mother. Do you not remember their delivering a packet to you in London?'

'But there was another here: where is she? I heard her name: it was Isabel. I cannot see her—I must see her.'

'And so indeed you will, every day. She is even now preparing your medicine. She will be a sister to you, my own Ronald—a sister worthy of the name—as she is to her poor unhappy brother. And you must love her—you must be sure to love her. Will you promise?'

This time my effort to reply to the question succeeded; and murmuring 'I will!' I sank into insensibility.

It has often occurred to me, that if the above circumstances had not been explained, they would have formed good grounds for the conversion of the whole party to a superstition that has now passed away. But in reality there was nothing strange even in the coincidence of the poor young man entering the room about the same time with myself, for it was at the usual hour of his going to bed. He had frequently wandered away from his friends; but this time his absence had been so long, as to throw them all into alarm, and almost despair. Their journey to London was entirely on his account; but after many consultations, they gave up hopes of his recovery, and brought him back to Scotland. There he lived a harmless and perhaps happy life for three years after the strange interview I have described; and then, to the surprise and horror of his friends, his dead body was one day found in the river.

And what became of Isabel? Did I redeem my promise to love her? Were we married? Alas! alas! these questions could be easily disposed of in romance; but in a narrative of real life, they are of a kind which can rarely be answered without pain. I will not answer

them at all. Suffice it, that the 'serious business' I intended to commence in Scotland turned out, after two or three years' trial, a joke; and that I returned, in pursuance of my destiny, to the brick boxes of London.

RISE IN THE WORLD.

At an entertainment lately given at Merthyr, in Wales, Mr Crawshaw, one of the most influential ironmasters of the principality, gave the following graphic account of the rise and progress of his family, and of the gradual rise of the iron trade in Wales:—'My grandfather was the son of a respectable farmer at Normanton, in the county of York. At the age of fifteen, father and son differed; my grandfather could not agree with his father—the reasons are unknown to me—and my grandfather, an enterprising boy, left Normanton for London, and rode his own pony up. When he got to London, which in those days was an arduous task of some fifteen or twenty days' travelling, he found himself as destitute of friends as he possibly could be. He sold his pony for L.15, and during the time that the proceeds of the pony kept him, he found employment in an iron warehouse, kept by Mr Bicklewith. He hired himself for three years for L.15, the price of his pony. His occupation was to clean the counting-house, to put the desks in order for his master and the clerks, and to do anything else that he was told to do. By industry, integrity, and perseverance, he gained his master's favour, and in the course of a few months he was considered decidedly better than the boy who had been there before him. He was termed "the Yorkshire boy;" and the Yorkshire boy, gentlemen, progressed in his master's favour by his activity, integrity, and perseverance. He had a very amiable and good master, and at the end of a very short period, before he had been two years in his place, he stood high in his master's confidence. The trade in which he was engaged was only a cast-iron warehouse, and his master assigned to him, "the Yorkshire boy," the privilege of selling flat-irons, the things with which our shirts and clothes are flattened. The washerwomen of London were sharp folks, and when they bought one flat-iron, they stole two. Mr Bicklewith thought the best person to cope with them would be a person working for his own interest, and a Yorkshireman at the same time. My grandfather sold those articles, and that was the first matter of trading that ever he embarked in in his life. By honesty and perseverance, he continued to grow in his master's favour, who, being an indolent man, in a few years retired, and left my grandfather in possession of the cast-iron business in London. That business was carried on on the very site where I now spend my days, in Yorkyard, London. Various vicissitudes in trade took place in the course of time. My grandfather left his business in London and came down here, and my father, who carried it on, supplied him with money almost as fast as he spent it here, but not quite so fast; and it is there I spend my time, engaged in selling the produce of this country; and you know to what an extent the iron produce of this country has risen up. My grandfather established the ironworks at Merthyr and Cyfartha; but my father was not left the whole of the Cyfartha establishment—he was only left three-eighths of it, but by purchase he obtained the whole of it, and by his benevolence I have succeeded to it. During my time the concern has not, and I hope it never will be, diminished. From what I have mentioned, it will be seen by the rising generation that by industry, integrity, and perseverance, wealth and rank may be attained, even although starting from humble circumstances; at all events, any young man who is industrious, honest, and persevering, will certainly be respected in any class of life he may chance to move in.'

IMPROVEMENT IN TOASTS.

On the subject of toasts at public entertainments, the following observations occur in the Literary Gazette:—

'What strikes us on all these "re-unions" is, that it so rarely happens that the services of the greatest benefactors of mankind are recognised. The science which improves every moment of man's civilised existence, and the literature which refines, elevates, and adorns it, are as if they were not. The little immediate is felt and panegyrised, the mighty universal has no grateful eulogy. The material is far ahead of the intellectual in the national mind. The army and navy—they fight for us, and, like cowards or

women, we never fail to thank them for getting their heads broken and saving ours. The church prays for us, and we are a professing religious people, who even over our cups must remember the good offices of the clergy. If any members of government, or any eminent lawyers, are present, we drink them fearfully, the former for not taxing us more, and the latter for not hanging us. But the illustrious historian, the immortal poet, the wonderful inventor of gas, or steam, or superhuman machinery, the pure teacher of morals, the great philosopher, the glorious sculptor or painter—the brightest luminaries of their own time, and the lights of future ages till time shall be no more—nobody ever dreams of toasting them or their works. Why should not science, or literature, or the arts be standing toasts among intelligent persons? The periodical press does now and then (as we have noted in this instance) win the compliment; but this seems to be simply because it is the most practical and least exalted of any branch of letters. Yet it is potential as well as forthwith applicable, and therefore it is “soft-sawdred.” It can give a good turn or a buffet within a few hours, and therefore is its tongue hallowed, and its operators propitiated. Far be it from us to say that such unctuous honours are not due to it; the wielders of the pen are in anyway equal to the wielders of the sword, and the influence of the periodical press is enormous in all things, be they small or great—a street row, or a national quarrel, a vestry or general election, the stability of a police constable, or the popularity of a prime minister. It is the mysterious *we* that commands awe and glorification; though the “*we*” in many cases (far removed from that in question), may be an ignorant blockhead or an impertinent pretender. After all, the query is—Among a people boasting so much of their intellectual progress, why should not science, literature, and the fine arts take their place as standing toasts at our public and national entertainments?

We would add—Is not the whole system of toasts ridiculous? The noisy demonstrations on such occasions are significant of anything but good taste or advanced intelligence.

INDIAN SUPERSTITION.

In illustration of the belief of the [Canadian] Indians in a special Providence, the following story may be worth telling. Some three or four years ago, a party of Saulteaux, being much pressed by hunger, were anxious to cross from the mainland to one of their fishing stations, an island about twenty miles distant; but it was nearly as dangerous to go as to remain, for the spring had just reached that critical point when there was neither open water nor trustworthy ice. A council being held, to weigh the respective chances of drowning and starving, all the speakers opposed the contemplated move, till an old man of considerable influence thus spoke:—‘You know, my friends, that the Great Spirit gave one of our squaws a child yesterday. Now, he cannot have sent it into the world to take it away again directly; and I would therefore recommend our carrying the child with us, and keeping close to it, as the assurance of our own safety.’ In full reliance on this reasoning, nearly the whole band immediately committed themselves to the treacherous ice; and they all perished miserably, to the number of eight-and-twenty.—*Sir George Simpson's Journey.*

ADVICE TO WIVES.

A wife must learn how to form her husband's happiness; in what direction the secret of his comfort lies; she must not cherish his weaknesses by working upon them; she must not rashly run counter to his prejudices. Her motto must be, never to irritate. She must study never to draw largely upon the small stock of patience in man's nature, nor to increase his obstinacy by trying to drive him; never, if possible, to have *scenes*. I doubt much if a real quarrel, even if made up, does not loosen the bond between man and wife, and sometimes, unless the affection of both be very sincere, lastingly. If irritation should occur, a woman must expect to hear from most men a strength and vehemence of language far more than the occasion requires. Mild as well as stern men are prone to this exaggeration of language; let not a woman be tempted ever to say anything sarcastic or violent in retaliation. The bitterest repentance must needs follow such an indulgence, if she do. Men frequently forget what they have themselves said, but seldom what is uttered by their wives. They are grateful,

too, for forbearance in such cases; for, whilst asserting most loudly that they are right, they are often conscious that they are wrong. Give a little time, as the greatest boon you can bestow, to the irritated feelings of your husband.—*The English Matron.*

USELESS FANCIES.

Having searched into all kinds of science, we discover the folly of neglecting those things which concern human life, and involving ourselves in difficulties about questions that are but mere notions; we should confine ourselves to nature and reason. Fancies beyond the reach of understanding, and which have yet been made the objects of all the disputes, errors, and superstitions that have prevailed in the world—such notional mysteries cannot be made subservient to the right uses of humanity.—*Socrates.*

CHAMBERS'S INFORMATION FOR THE PEOPLE,

A NEW AND IMPROVED EDITION,

IN A HUNDRED NUMBERS, AT THREE-HALF-PENCE EACH.

TEN years have now elapsed since the publication of the ‘*INFORMATION FOR THE PEOPLE*’; and so great have been the advances in various departments of knowledge during that period, that a new edition of the work, embracing numerous discoveries and improvements, seems eminently desirable. Impressed with this consideration, and desirous of rendering the work still more deserving of the reputation it has been so fortunate as to attain, we propose, on Saturday the 4th of December, to commence the issue of a new and revised edition.

To those who are not acquainted with the work, it may be necessary to offer a few explanations. Designed in an especial manner for the People, though adapted for all classes, it comprises their subjects on which information is of the most importance; such as the more interesting branches of science—physical, mathematical, and moral; natural history, political history, geography, and literature; together with a few miscellaneous papers, which seemed to be called for by peculiar circumstances affecting the British people. Thus everything is given that is requisite for a generally well-informed man in the less highly educated portions of society; and nothing omitted appertaining to intellectual cultivation, but subjects of professional or local interest. It will be understood, then, that the ‘*INFORMATION FOR THE PEOPLE*’ is not an encyclopædia in the most comprehensive meaning of the word, but rather a cyclopædia embracing only the more important departments of general knowledge. The ruling object, indeed, has been to afford the means of *self-education*, and to introduce into the mind, thus liberated and expanded, a craving after still farther advancement.

Such has hitherto been the character of the ‘*INFORMATION FOR THE PEOPLE*.’ In the new edition now to be issued, there will be some useful improvements. Subjects, the interest of which is past, will be omitted or greatly condensed, and others of a more enduring and important nature will take their place. All the scientific treatises will be carefully remodelled, and new discoveries introduced. So much new information on various matters will be added, that the work will be more encyclopædic than it has hitherto been. In the Index will be found an explanation of, or reference to, almost every subject necessary in ordinary circumstances to be known. The appearance of the work will be improved by leaving out the general title of each sheet; and whenever it appears desirable, the subjects will be illustrated by additional wood-engravings.

A sheet will appear every Saturday, price *Three-half-pence*, till the whole, extending to One Hundred Numbers, are issued. A Part, containing four numbers, stitched in a cover, will appear monthly, price *Sevenpence*. When completed, the work will form two handsome volumes, royal octavo, with engraved title-pages, price *Sixteen Shillings* bound in cloth.

W. AND R. C.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 26 Miller Street, Glasgow; W. & O. 147 Strand, London; and J. M'GLASHEAN, 21 D'Olier Street, Dublin.—Printed by W. AND R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 204. NEW SERIES.

SATURDAY, NOVEMBER 27, 1847.

PRICE 1½d.

FIRESIDE TYRANNIES.

Nothing is more common in the circle of one's acquaintance, than to find grievous suffering inflicted upon families by the unreasonableness, bad temper, and tyrannical disposition of some member of the flock, or, as it may be, upon one by the same qualities in the rest. Almost all other sources of misery become insignificant in appearance when contrasted with this class of woes, for there is none from which a refuge or even temporary shelter is more difficult of attainment. It is like being chained to a stake for a continual infliction of torment.

The good are the most submissive to such evils. Possessing least of the spirit of resistance or reprisal, and perhaps venerating the very source of their vexations, they are apt to suffer on and on, rather than even let their troubles be known, till sometimes spirits and health give way, and they sink into the grave victims to a fireside pest. Another thing telling sorely against this order of sufferers, is their shrinking dread of that notice of the world which follows upon anything like a *fracas* in domestic matters. Anxious to maintain respectable appearances, they chasten their faces into an air of pleasantry or indifference, while the canker is slowly eating its way into their hearts. How many cases of this kind would come into view, had we an Asmodeus to uncover the abodes of men, and tell us how matters actually stood with them!

Most persons will be disposed to sympathise in the feelings which prompt this submissiveness, and to admire the heroism of the sufferers. All must feel, too, with what delicacy and caution they would require to consider and treat such cases, lest they should, by an attempt to rescue the sufferer, break ties which it might have been better to keep inviolate, or induce a light feeling regarding the ties of relationship in general. It nevertheless appears that we may be carried too far by our anxiety to preserve family bonds unbroken, and that, while due reverence is paid to the rule, some allowance ought to be made for exceptions. It certainly is a fact in nature, that the various individuals of a family are constituted with very different tempers and dispositions. Some are morose and sedate; others kindly and cheerful. Some tend to adopt views on the more solemn class of subjects very different from others, and are thus led off into very peculiar likings and associations, to which the rest have no sort of affinity. Some are naturally dogmatic and overbearing, must always have their own way, and manifest a constant disregard for the feelings of others; while their associates, from the cradle, are as remarkable for their gentle dispositions and habitual denial of self. Such being the case, it seems unreasonable to expect that consanguinity should necessarily bind a group of mortals to intimate and constant association. True, it is

well when unity can be maintained, and no one can be insensible to the duty of bearing and forbearing to the very uttermost, in order to preserve even the semblance of peace, since the semblance is almost the first requisite to the reality. Yet, again, if it shall appear that a total incompatibility exists, and that more evil is incurred than avoided by the consequent suffering, then we would plead that humanity not only sanctions, but calls for a dispersion or separation. Let those who cannot live happily together, try to live happily apart; and let society regard any apparent eccentricities of the kind with that tolerance which is demanded with regard to all the relations of life, by the very diversity of nature which the Creator has seen fit to implant in us. It certainly can be no true offence to A, who lives in harmony with his circle of relations—they happening to be amiable—if B, having some who are of contrarious temper, cannot do so. B, in these circumstances, seems rather entitled to the sympathy and support of A in any attempt he may make inoffensively to remove from the annoyance.

The first contention which every worthy person must feel in such cases is with himself. He shrinks from the idea of such upbreaks, as violative of very sacred associations. It may be asked if these sacred associations are fittingly maintained, or can be maintained at all, under a sense of constant wrong and insult, or at least under continual innocent suffering? Does it not seem better that we should avoid the harassment, and endeavour to cherish the attachment to better purpose in a different sphere of daily life? But then he is not less solicitous that the world should have no occasion for remark about his family history; which, it may be feared, is as much as to say, he prefers appearances to realities. He has no objection to see a relation act a barbarous part, though himself is the victim of it; but he decidedly protests against the world knowing of it. The only evil is in the barbarity being published. This seems anything but a satisfactory morality. Surely the evil lies mainly in the fact itself and its direful consequences. Admitted, again, that delicacy calls for concealment as far as possible, but assuredly not beyond a certain point. When this is exceeded, we would say let the world know, if it must know, that another case has occurred of the eccentricity of the affections or of unendurable temper. It knows that such things have been, and must be, and the most flagrant exposure of anything of the kind will not be thought of beyond nine days.

Very often a feeling intervenes, that it is a duty to submit to every infliction from the hand of a near relative. From the depths of the soul a voice proclaims the awfulness of the tie, and seems to put a stamp of impiety upon the slightest approach to resistance, or even to remonstrance. While revering the beauty of

this feeling, we deprecate its being allowed too much sway. It may be moderated by considerations allied to its own manner of viewing the subject. For example—It has pleased Providence to form us very differently, though we have been thrown into the same fireside circle. Such diversities of nature, often leading to similar results, are to be seen in almost every such circle. For anything I can truly tell, they may be designed rather as a disperse agency, to make men spread over the earth, than as a thing which individuals ought to suffer from with patience, that they may preserve their original associations unbroken. A submission destructive of peace and happiness may therefore be more of a contravention of the divine or natural dictate in the case, than an obedience to it. At any rate, amongst all the freaks of moral speculators, it has never been asserted or expected that we are to make a duty of sufferings, the infliction of which is merely dependent on the wantonness, or wickedness, or unhappy temper of a fellow-creature. Such a thing could never be a human duty, because there is no adequate good end to be attained by it.

But, it will be said, society has an interest in the decent preservation of the appearance of peace among relations, and particularly those whose connections are of the more endearing kind. Any violent wrench given to these ties is painfully felt in the world, and is apt to afford a bad example. This is true to a great extent: on the other hand, it may be said that no individual can be expected altogether to sacrifice himself for sentimental, and, after all, negative good to society. This were to go against the first principles of self-preservation. It may be, too, that society is concerned about many things which are able fully to protect themselves, being founded on the primary dispositions of human nature. There never has been the least appearance as if the holding of firesides together in harmony were a matter of ticklish nicety. As well fear for the return of seed-time and harvest, as fear for the maintenance of the domestic affections. This assurance, in which they stand as a general fact, may well enable us to see, without great discomposure, or any fear for the tenderness of our own hearts, an occasional eccentric case—an unfortunate fellow-creature perhaps roused out of habitual gentleness to remonstrate or rebel against some intolerable visitation from those of his blood. It is, besides, far from certain that there is not more evil to the world itself from some of the restrictions which it would impose on the victims of the domestic ties, than there would be from any reasonable amount of freedom which it might allow to them. It may, after all, be doubted if society has any right to complain, or to impose the penalty of its displeasure, in any such case. Punishment is for those who commit positive wrong, not for those whom the accidents of nature and the conventional arrangements of society have brought into unhappy situations, which it would cost them the entire comfort of their existence to submit to.

If society is to interfere at all, it ought, we think, to interfere for the doing of justice between the parties. Were it to shake off cant and cowardice, and protect in all cases the innocent sufferer, without regard to supposed ulterior effects upon itself, it might perhaps do some good; anyhow, it would be acting a right and manly part on its own account. Let it do so, however, without any enthrallment from superstitious views of relationship. There is no obligation of this kind which is not mutual. No one can acquire a right by

blood or connection, in any form, to tyrannise over another, unresisted, unresented. The apparently most sacred ties are absolved by thorough injustice and cruelty. Pretensions to an absolute and irresponsible power to inflict unmerited suffering merely because sustentation is also afforded, are now fit only to lie beside the divine right of kings to govern wrong, and similar absurdities. Wrong in all imaginable circumstances deserves resistance, and he who abuses a power drawn, or supposed to be drawn, from nature, as truly breaks the compact with his subjects, as a king when he infringes on the constitution. We repeat, then, that society will only be a just judge in this class of cases if it scouts everything like a pretension to be wantonly wicked, harsh, and cruel, or even simply petulant and vexations, on the strength of natural ordinance. Nature has put, as a morality over all, that of love. There is no trace amongst the higher chapters of her code of a sanction to the behests of tyranny, or those emanations of petty spite, jealousy, and unreasonableness which so often make parlours into little representations of hell, and break generous hearts on the iron gratings of the world-prison by which they are environed.

THE ITALIAN'S DAUGHTER.

A STORY OF THE ENGLISH POOR.

'Cast thy bread upon the waters, and thou shalt find it again after many days.'

IN one of the midland counties of England there is a district the name of which we shall not give, but merely allude to its characteristics, by which it may easily be discovered. It has risen up within the last century, until, from a few clusters of poor cottages, the seat of a manufacture of trifling importance, it has become one of the wealthiest, most populous, and most intelligent communities within the three kingdoms. The five or six small hamlets have grown into towns, whose boundaries meeting, have all merged into one mass of habitations; so that but for the diversity of name which each portion still preserves, it might be considered as one large city of manufactures, such as Manchester or Birmingham. But like most newly-risen places, this region still presents anomalous mixture of town and country: for instance, between two colonies where the manufacture is carried on, a few green meadows, yet unbuilt upon, will intervene; and the tall chimney of 'the works' sometimes casts its smoke upon a penny corn-field or a blackberry hedge. Alternately the eye views green wooded undulations and hills covered with red brick houses, as if town and country were struggling together for the mastery. But as soon as the habitations are left behind, the ruralities of the place triumph, and the naturally beautiful face of the country is seen in all its luxuriance.

On a little hill up which the road wound, just without the town, was a row of cottages inhabited by working people. But it is with one only that we have to do. Its inmates sat or lolled outside the door, enjoying the cool summer evening. They were a mother and some half-dozen children, of all sizes and ages. Mrs Sutton was a comfortable-looking, middle-aged woman, clad with tolerable neatness. Whether she ever had been pretty, was a matter entirely traditional: probably she had, for the place to which she belonged is remarkable for the good looks of its damsels in early youth; but the wear and tear of eight-and-thirty years had entirely obliterated Mrs Sutton's beauty, if she ever had any. She stood tossing her youngest hope, a babe of three months, and watching the two eldest playing at marbles. They were sturdy boys, save that their faces had the paleness which was the result of their work in the day; a circumstance which never fails to strike a visitor to this earthenware region, where the workpeople all ac-

quire the same pallid hue. Yet it is not unhealthy; and it imparts to the young girls a delicate beauty, which, though fleeting, is still very attractive while it lasts. Mrs Sutton's little maidens were an evidence of this fact: two fairer and more delicate blossoms never grew up in a labourer's home than did the twins Edna and Keziah.

And here—to account for such extraordinary appellations—we must premise that Scripture names of the most out-of-the-way character are at a premium in the neighbourhood of which we write—the boys being all Enochs, Calebs, or Obadiahs; the girls all Miriams, Jemimahs, or Naomis, with a sprinkling of such ultraromantic and half-sacred cognomens as Thyrsa, Zillah, or Kosanna. And having our pet theory of nomenclature, we cannot but observe how these things mark the character of the early inhabitants of a region which was once the stronghold of Wesley and his followers; how the descendants of these saintly-named children have gradually advanced with the tide, until their ultra piety has left no vestige save in a Christian name.

But we are wandering from Mrs Sutton. She, good soul, was wandering too, at least her eyes were, for she was watching up the hill a couple who seemed both weary and waysores. They were a young woman, and a man who might have been any age from twenty to forty, for he had the hard saw features which never show the progress of time. Still less would years be marked on his low and ungainly figure, which was stunted and almost deformed, forming a strong contrast to the tall and upright form of his companion. This ill-matched pair came near Mrs Sutton's door, and then the man, after whispering to his fellow-traveller, addressed the good dame in broken English, which she could not understand. She looked inquiringly at the other.

'My husband'—Mrs Sutton could not help a slight start, and glance of surprise at the man, as the young woman said this—'my husband means that we are very tired, and would be glad of a lodging for the night, if you can give us one, or direct us elsewhere. We can pay you,' she added with a half smile, seeing the doubtful expression of Mrs Sutton's face. But to do the latter justice, we must say that it was caused as much by her surprise at hearing the young wife speak in good English, mingled with a natural feminine curiosity to know the reason that any Englishwoman could marry such a man.

Perhaps this latter quality, added to her good-nature, made her assent to their request, at all events partially.

'You can sit down and rest,' she said, 'and I'll get you some supper; but I can't promise more till my "master" comes home'—*master* being the—shire equivalent for husband or guidman; and, alas! sometimes the title is only too true. But in this case it was a mere form of speech, as every one knew that Mrs Sutton was both *master* and mistress herself in her own house.

So the two wanderers sat down, and soon the cottage-hearth was blazing with a friendly brightness, which is at the will of the poorest labourer in this plentiful land of coal. Oh, there are no such fires out of—shire! The foreigner bent over his supper in hungry taciturnity, occasionally darting glances from his large, bright, black eyes, that seemed the more piercing from the dark bushy eyebrows under which they gleamed, and, in conjunction with the long matted hair and the yellow skin, made Mrs Sutton feel rather uncomfortable. All true-born Britons hate foreigners. But her motherly and womanly sympathy was excited by the weary and sickly look of the young wife, who had all an Englishwoman's claims to compassion; and Mrs Sutton only resolved that, whatever her 'master' said, the strange wayfarers should have a night's shelter under her roof.

They did remain; and before noon on the following day, Pietro Ponti—that was his name, he said—had so

ingratiated himself in the favour of the children, as to win a few kindly opinions from the mother herself; while his gentle wife was liked so much, that Mrs Sutton almost felt it a relief when, after paying for their lodging, they requested to occupy it for another day or so.

'She is such a mild, soft-spoken young creature,' was Mrs Sutton's confidential observation to her husband John, after the first day passed with their inmates—'she seems almost a lady. I wonder what on earth could have made her marry that ugly little fellow!'

And probably the good dame's curiosity would have led her on to direct questionings instead of vague wonderment, had she not been withheld by a certain reserve and refinement which marked the young woman's deportment, and caused the labourer's wife to treat her with unconscious deference. Yet she was not proud, for she always helped Mrs Sutton in her domestic duties without any reluctance or awkwardness.

At last Pietro spoke of proceeding onwards; and then the anxious looks of his wife loosened Mrs Sutton's tongue. She boldly asked whither they intended going.

'I—I hardly know,' said the wife timidly; when Ponti, in his broken English, explained that he was an Italian, who gained his living by catching bullfinches and larks, and teaching them to sing, in the hope of meeting purchasers.

'A pretty way of making a fortune!' thought Mrs Sutton; and then she said, 'Well, master, if such is your trade, you may as well follow it here as anywhere: you will find plenty of birds in the fields hereabouts; and as your wife seems comfortable, why, suppose you were to stay with us?'

This proposal caused a consultation between the husband and wife, if a consultation it could be called, where Pietro had all the talk to himself, and his helpmate meekly acquiesced. It ended in an assent to the offer, and the Italian and his wife were fairly established in the Sutton family.

'I am really glad you are not going, Mrs Ponti,' was the hearty exclamation of the kindly hostess to her young friend the first time they happened to be alone. 'I wonder your husband could think of dragging you up and down the country.'

'He never thought about it, I believe,' was the deprecating reply. 'But,' added the wife, while her cheek flushed and her head drooped, 'I am glad to stay here for the present. I would not like going among strangers now.'

'Ah no, no, poor girl!' quickly answered Mrs Sutton: 'but have you no mother—no aunt?' She repented of her words ere they were well uttered; for the girl burst into a fit of weeping so violent, that all the consolatory endearments that women of all ranks instinctively use to one another in time of affliction were employed by Mrs Sutton in vain. At last the wife of the Italian grew calmer, and said without tears, though in an accent of the deepest sorrow, 'I have no relatives, no friends in the wide world, except my husband.'

'Poor thing—poor thing! But you know, my dear, a good husband is something, and he seems very fond of you.' Mrs Sutton tried hard to say this, as if she really believed the fact.

'Yes—yes, Pietro is very kind,' answered the young woman, faintly smiling. 'I thought so, or I would not have married him. Shall I tell you how it was?'

Now this was the climax of all Mrs Sutton's wishes; but she had self-denial enough to say, 'Not if it troubles you, Mrs Ponti.'

'I wish you would call me Anne,' said the girl, taking her hand: 'you are the first woman who has seemed to love me since my mother died.' And here she began to weep afresh, but soon recovered herself so as to tell her story: how that she came from York; that she was an only child, and fatherless; and had been left utterly friendless and helpless on her mother's death.

'It was during her illness,' Anne continued, 'that Pietro Ponti, who lived in the same house, showed us much kindness. He was so much older than I, he treated me as a father would a child, and helped me out of all my troubles. When I was quite broken-hearted, I heard that he was going away on his usual rounds, and I went to him to ask his advice as to how I could support myself. My poor mother had been a dressmaker; but I was too young to take her business, for I was only seventeen. I felt that I must starve or beg, for I had no money. Then Pietro talked to me quietly and seriously, and told me that there was but one way in which he could maintain me, and save me from poverty—if I would marry him. He said this doubtfully, almost afraid that I would be angry; but I was not, for I saw tears in his eyes when he spoke of my youth and beauty being thrown away on a poor deformed creature like himself. I knew it was all his kindness; and I told him how grateful I was, and that, if he would let me think of it for a week, I would indeed be his wife. Pietro asked me if I had any other love—any one I preferred to him; as then he would never make me wretched. But I said no; there was no one who seemed to me so good and kind as he. And so, at the end of the week, I married him; and he has ever been a good husband to me. I fear I hardly love him as he deserves; but indeed I try; and I do obey him in all things.'

To this long story Mrs Sutton had listened without a word. As Anne ended, the good woman pressed her hand, bade 'God bless her!' in rather a husky voice, and muttering a hope that she would stay long with them, and be very happy, went about her household business. But all that day Mrs Sutton's voice—at times raised sharply enough—sounded softer than usual; and when Pietro Ponti came in to supper, the best portion of the meal, and the warmest corner of the fireplace, were kindly, though abruptly, pointed out as his own to the little deformed Italian.

Two or three months passed, and Ponti and his wife became like members of the family. The bird-catcher pursued his trade successfully, being taken to the woodland haunts for miles round by the younger Suttons, with whom he was an especial favourite. They Anglicised his name, and christened him Peter, which appellation was soon given him by the whole family. And ten times better than even Peter did they all love the pretty Anne, who seemed so young, that she was almost a playmate for the children. But a continual shadow of pensiveness darkened her face, though not detracting from its mild beauty. Her husband was always kind, yet still there was a perpetual yearning—a restless void in the girl's heart. How could it be otherwise? She never uttered a word of complaint, or even of sadness; but often, when she sat preparing for the little being that was soon to give her new ties of love, Anne would let the work fall from her hands, while her dark-blue eyes, so dreamy in their depths, were fixed on vacancy, as if looking wistfully into the dim future. Good, plain Mrs Sutton, could not understand these fancies, and sometimes wished that Anne would think less and talk more—it would be much better for her.

Birth and death came hand in hand together. The babe lived—the mother died! Kind-hearted Mrs Sutton closed the eyes of the poor young creature who had so twined round her honest heart. She had tended her with a mother's care until the last; when she saw how peaceful and beautiful the dead face looked, the good woman dried her tears.

'Poor thing—poor thing! she has nothing to trouble her now! Perhaps it is as well—God knows best!'

And then Mrs Sutton heard the wail of the little motherless babe, and thought not of the dead, but of the living. With motherly care she took the helpless child to her bosom, and nourished it as her own.

'Charley is six months old now,' she said to her husband. 'He is strong and healthy; I shall turn him away, and take this poor little creature, who wants the most.'

And so she nursed the babe, and became a mother to it in the stead of her who had now no need of the comfort of a child to love. Many a time, when the little one grew older, and began to laugh and crow in her arms, Mrs Sutton would think of its dead mother; how her heart would have leaped to feel the bliss of maternal love—the tiny twining fingers—the kiss of the little soft lips. But then she would remember that a child's love is not all-sufficient, and that, perhaps, it was well for poor Anne that she lived no longer.

Whether the widower grieved much for the loss of his sweet young wife, it was impossible to tell. The Italian was always of a reserved disposition; and when the first shock was over, he seemed to return to his old habits much as if nothing had happened. His taciturnity rather increased; and sometimes, after spending the day out in the fields, he came home, silently took his place in his own warm corner, and uttered not a syllable until it was time to go to rest. He rarely noticed his child, except that when Mrs Sutton began to talk to him about the name of the babe, hinting that, as a matter of course, the little one should be christened Anne, Pietro shrank from her with an expression of acute pain, and at once said it should not be so—that the child should be called Ginevra.

'Jenny what?' cried Mrs Sutton, aghast at this foreign appellation.

'Ginevra!' said the Italian, lingering on the melodious syllables with seeming fondness, as if it were a name long unuttered, but most dear, and saying it over and over again, coupled with the tender and musical diminutives of his own language. All this was incomprehensible to the worthy woman, and she tried again to protest against 'so unchristian and heathenish a name.' But the only answer she gained was the distinct repetition of the name, in a tone so firm, that she saw it was useless to dispute the father's will. As a contest of words between herself and the foreigner would have been highly unprofitable to both, Mrs Sutton wisely yielded her point, probably for the first time in her life. So the babe was christened Ginevra; but Mrs Sutton, as if determined to make the baptismal name void, gave to her nursing the pet diminutive of Jenny; and Jenny she was called evermore by the household.

The child grew up as a younger sister in the family: no one seemed to look upon her in any other light. She learnt to call her nurse 'mother,' and John Sutton 'father;' while the appellation she gave to her own, was 'Peter,' like the rest of the children. Nor did the Italian seem to care for the abolition of these parental ties; he treated his own daughter as he did the little Suttons, with neither more nor less regard than he had ever shown to them; only that he always called her Ginevra, sometimes adding to it sweet diminutives, such as Ginevretta; but these seemed not meant for the child, but as tokens of loving remembrances awakened by the name she bore.

In truth, as the little girl grew older, no one could have guessed her Italian descent. She looked, spoke, and was in all respects an English child, with her soft blue eyes and brown hair, like her mother's—her true mother—now so utterly forgotten, whose very existence was unknown to the child whose life had been her death. Once or twice Mrs Sutton tried to explain the truth to Jenny; but the mystery was too great for the little girl's mind. And besides, Mrs Sutton loved her nursing so much, it was as pain to remember she was not her own child; so at last she let the matter rest.

Time passed on, and Jenny became of an age to go to school; and to school she was accordingly sent, with her foster-brother Charley; her father never interfering in the matter at all. Indeed, from the child's birth, he had seemed to give her up entirely to the Suttons. She was clothed and fed by the honest labourer with his own children; and not a murmur did worthy John Sutton, and his equally worthy helpmate, utter, with regard to the little one thus quartered on them, and dependent on their bounty. In everything she was to

them as their own. Oh! there are noble hearts in the dwellings of the English poor! and good deeds, of which the greatest philanthropist might be proud, are often concealed under thatched roofs, and highways, and hedges, unknown and unchronicled; but they will be chronicled one day we trust.

When Jenny was ten years old, her father died. They found him one morning lying dead in his bed, in the little room where he slept, and where he taught his birds; for they had often heard him at daybreak whistling and talking to them in his own tongue. The little birds were now warbling joyously, carolling in the sunshine over the pillow of the dead man. Poor Pietro! in life they had been his only companions, and they were the only witnesses of his death. The same kind hands which had laid the wife in her grave now laid her husband beside her; but there was little mourning for him. He came a stranger, and was a stranger to the last. For some time Pietro's trade had not prospered, and he had owed subsistence to the charity of those whose inmate he had been so long. Now, but for John Sutton, the Italian might have found a parish grave.

The only treasures left by Pietro Ponti were his birds, a silver crucifix, and a little Italian book, in which was written the name he had given his daughter—Ginevra. It might have been his mother's, a sister's perhaps, some early memory still dearer; for the human heart is the same all over the world, and the deformed bird-catcher might have loved as well as the noble and fair, perhaps more truly. But nothing more was ever known of the father of Ginevra Ponti. After a time, Mrs Sutton explained to her adopted child as much as she knew herself, and then clasping Jenny in her arms, told her that she need think of it no more, for that she was henceforth her own daughter.

Two years or more passed away; the sons and daughters of Mrs Sutton grew up; one girl married; two boys went away; another turned out ill, and gave many a gnawing care to his parents. It was a hard time for trade, and anxieties came heavily upon John Sutton; yet he never complained of the additional burden which he had in his adopted child: the idea never crossed his mind, or his wife's either. They seemed to think that Jenny was always to live with them; to send her away would be like parting with their own. That any one should claim her seemed equally improbable; but strange things happen sometimes.

One day a visitor, who was not exactly a lady, but very well dressed, came to inquire for Mrs Sutton.

'I wanted to speak to you,' she said abruptly. 'My name is Mrs Dalton.' Mrs Sutton started; for it was that of the Italian's wife. 'You seem to know my name?'

'I have heard it before,' answered Mrs Sutton.

'I don't belong to these parts,' said Mrs Dalton, in a tone that, if not exactly refined, sounded honest and straightforward; 'but in crossing the churchyard, I saw a stone with the name of Anne Meredith Ponti. Now I have been long looking for my brother's child, of whom I only know her name was Anne Meredith Dalton, and that she married a wandering Italian called Ponti. The sexton sent me to you for information.'

A little incensed at the imperative tone of her visitor, Mrs Sutton related all she knew.

'It must have been my niece,' said Mrs Dalton musingly. Mrs Sutton began to speak of poor Anne—what she was like in person; but the latter stopped her quickly—'You need not describe her, as I never saw her; but let me look at the child.'

Jenny came, was admired, for she was indeed a beautiful child; and at last acknowledged by Mrs Dalton as her grandniece, in favour of her mouth and nose, which were, she said, exactly those of a Dalton. The lady, who bore the epithet of Mrs by courtesy, for she was an old maid, finally declared her intention of taking away her niece to educate, and adopt her as her own. Mrs Sutton was perfectly overwhelmed. To

part with Jenny, her darling Jenny, was a thing dreadful to imagine. She burst into tears, snatched the child to her bosom, and ran away with her out of the house.

But with calm reflection came the thought of the injury she might be doing to Jenny's interests in thus keeping her to share the poverty which was coming darkly on, when she might be made a lady of by one to whom she was bound by ties of kindred. The simple-hearted but upright woman thought of all this, until she was well-nigh bewildered; and then she had to convince her husband too. The end of it was, that the adopted parents of the little Jenny consented to Mrs Dalton's proposition.

'If she should come to any harm,' cried the poor woman, folding her darling to her heart in the agony of a parting which Jenny could hardly comprehend—'if you do not teach her what is right, and be kind to her, I shall never forgive myself.'

Mrs Dalton promised with an earnestness and sincerity which was proved by her moistened eyes and softened voice, that she would try to be as good a mother to the orphan as the excellent woman who had nurtured Jenny for so many years. And then she gently took the child away the very same week, for she would hear of no delay; and Jenny's sweet face was seen no more among those of her adopted brothers and sisters. From the far distant and luxurious home to which she was taken came her childish letters, every line of which was wept fondly over. But year by year they grew less frequent; and at last they ceased. A neighbour once passing by the place, told how he had seen a young girl whom he thought was like what little Jenny used to be; and though the relation brought a few tears to Mrs Sutton's eyes, and a pain to her heart, at the thought of her darling having forgotten her, still both soon passed away. The poor have no time for much sentiment, and Mrs Sutton was engrossed by her own thickly-gathering cares.

It is all very well for political economists and theoretical philanthropists to talk about the wisdom of laying up for old age, and providing against the evil day; but for a labouring man, whose weekly earnings only suffice to provide weekly food for the many little mouths that must be filled, the matter is extremely difficult. Many and many an honest man, who has brought up a large family, which has not required his care, is thrown upon parish charity in his old age. It was not quite so bad as this with John Sutton; but still, when all their young nestlings were fledged, and had gone out into the wide world—some for good, and some for evil—the old parents were left solitary and poor.

'Ah, if Keziah had but stayed!' lamented the poor old mother, when the prettiest of the twins went away one fine morning, and secretly married a worthless young man, leaving her parents deprived of the few comforts which her earnings, as the last of the flock, had brought them.

'Children always turn out so,' angrily said John Sutton. 'And we that were fools enough to bring up another man's child too: much good we have of it.'

'Don't say that, John,' answered Mrs Sutton, and her voice was gentler than it had once been: trouble softens much sometimes. 'I will never believe it was poor Jenny's fault; and anyhow, we did what was right, and that ought to be a comfort to us.'

It was years since the name of the Italian's daughter had been mentioned by the Suttons. The wounded feelings of the old man had brought the subject up now, and his wife could not drive it from her mind. Her own daughter's unkindness made her think of the little gentle creature whom she had loved so much, and who had ever been willing and dutiful, far more so than her own wild troop of children. As the old woman knelt before her hearth, kneading the dough for the tiny loaf which was sufficient now for their weekly need, her thoughts went back twenty years, wandering, by a course of ideas which, if not romantic, was at all events

natural, to the pile of bread she used to bake when the cottage was alive with merry children, now scattered far and wide. Then, in her fancy, she saw little Jenny standing by her side, burying her round rosy arms in the dough, as she was so fond of doing, until the good woman stopped to wipe her eyes, which these old memories made dim.

'Poor Jenny, if she could but come back, and be as she used to be. But that's quite impossible,' thought Mrs Sutton with a heavy sigh.

Life is more full of strange coincidences than we are aware. How often, on meeting unexpectedly some dear long-lost friend, do we remember that our thoughts had, only the day before, with a curious wilfulness, persisted in bringing up the very face we were so soon to see, and we laugh, and say what an odd chance it was! Wise mortals, as if there were such a thing as chance in this world!

Little did Mrs Sutton think, that when she and her good man went to rest that night, it would be with the happy knowledge that the dear lost Jenny was once more sleeping under their roof. While they sat at their homely tea, the latch was lifted, a young girl's face appeared, and a sweet voice said, 'May I come in, mother?' It was not the erring Keziah; it was not the other twin, Edna—her home was beyond the Atlantic; but it was the child of their adoption, the long-lost Jenny.

The old couple forgot all in the delight of welcoming her. They were never weary of looking at her and admiring her, now grown a tall and graceful woman, like what her mother had been. But the sadness that had darkened the face of poor Anne was not found in her daughter's. Content beamed in the looks of sweet Jenny.

After the first joy was passed, Mrs Sutton said mournfully, 'But we shall not have you long; maybe you will not stay with us, Jenny: you are a rich lady now, I suppose?'

Jenny put her arm round the neck of her old nurse, and whispered, 'Dear mother, I am not rich indeed; and I will never go away from you again, if you will let me stay.'

And then she told at length, what we must relate in a few words, that her aunt, a dressmaker in a large city, had educated her, though she was not kind; and as Jenny grew a woman, made her cease all communication with her old friends, whom the girl thought were dead, until accident brought to her the news of their troubles.

'Then,' said the young girl, deeply blushing, 'I thought how wicked and ungrateful I must seem to you; and I asked my aunt to let me come and see you, and help you, if I could, for I was able to earn a good deal; but she refused. I could not rest. I was very miserable; and when I heard that Keziah had gone away, and you had no child left, I asked again to be allowed to come; and so,' added Jenny, while her tears began to flow, 'my aunt turned me away, and I came here.'

'And how did you come—all alone, poor child?' cried the mother.

'I walked almost all the way, for I had hardly any money. Oh, mother, I am so happy! And you will let me be your child, and work for you, and live as we used to do? I have never forgotten you; indeed I have not.'

And the beautiful, refined, but still simple-hearted young woman embraced again and again her adopted parents, and moved about their poor and homely dwelling as cheerfully as if she had never seen a richer one. But the cottage did not long remain thus poor; Jenny's skilful and patient industry soon gained plenty of work in her own business; and though, as she said truly, she did not come back a rich lady, but a penniless girl, and could requite her benefactors not with showers of gold and silver, but with the labour of her hands, the young girl brought a blessing with her. Their own

children had left John Sutton and his wife desolate in their old age; but the adopted one was to them in the stead of all the rest. The good deed of these humble but most noble hearts had brought its reward at last fourfold.

AN ANTIQUARY'S GLEANINGS.

We have before us a singular volume*—the first appearance in print of manuscript notes, made by a Fellow of the Royal Society in the seventeenth century. The work appears to consist of occasional jottings and recollections carried over a series of years, and was doubtless a favourite production of the author, as he made a 'fair copy' with his own hands, and presented it to the Royal Society: another original is preserved in the Ashmolean Museum, Oxford. The book is a curious mixture of imperfect science and superstition, with here and there some useful hints and common-sense observations. Some of the facts recorded throw light on the manners, customs, and modes of thinking of the age; and a selection of a few of the more striking may serve a purpose with readers of the present day beyond the mere amusement of an idle half hour. Among these we find echoes, sounds, fairy rings, farmed stones, fatalities of families and places, accidents, &c.

The author, John Aubrey, sets out by telling us that—'Till about the year 1649, 'twas held a strange presumption for a man to attempt an innovation in learning; and not to be good manners to be more knowing than his neighbours and forefathers. Even to attempt an improvement in husbandry, though it succeeded with profit, was look't upon with an ill eye. . . . 'Twas held a sinne to make a scrutinie into the wales of nature.' It is a little remarkable that so much of what was true of 1649 should be equally applicable to 1847. Aubrey, however, was an inquirer, and, as he says, could not resist his desire for natural knowledge. 'It may seem nauseous to some,' he writes, 'that I have rak't up so many western vulgar proverbs, which I confess I do not disdeigne to quote; for proverbs are drawn from the experience and observations of many ages, and are the ancient natural philosophy of the vulgar, preserved in old English in bad rythmes, handed down to us.'

Following the preface is a letter from the celebrated naturalist Ray, who tells Aubrey he considers him 'a little too inclinable to credit strange relations.' Among the strange relations, we read that—'According to the severall sorts of earth in England (and so all the world over), the indigenae are respectively witty or dull, good or bad. . . . In North Wiltshire, and like the vale of Gloucestershire (or dirty clayey country), the indigene or aborigines speak drawing; they are phlegmaticke, skins pale and livid, slow and dull, heavy of spirit; hereabout is but little tillage or hard labour, they only milk the cowes and make cheese; they feed chiefly on milke meates, which cooles their braines too much, and hurts their inventions. These circumstances make them melancholy, contemplative, and malicious; by consequence whereof come more lawsuites out of North Wilts, at least double to the southern parts. And by the same reason they are generally more apt to be fantasies: their persons are generally plump and feggy, gallipot eies, and some black; but they are generally handsome enough. It is a woodseer country, abounding much with serore and asuhere plants, as sorrel, &c. which makes their humours sowre, and fixes their spirits. In Malmesbury hundred, &c. (the wet and clayey parts) there have ever been reputed witches. On the Downes, the south part, where 'tis all upon tillage, and where the shepherds labour hard, their flesh is hard, their bodies strong: being weary after hard labour, they have not leisure to read and contemplate

* The Natural History of Wiltshire: by John Aubrey, F.R.S. (written between 1686 and 1691). Edited and Illustrated by Notes, by John Britton, F.S.A. Published by the Wiltshire Typographical Society. 1847.

of religion, but goe to bed to their rest, to rise betime the next morning to their labour.'

This, it must be confessed, is singular philosophy; in another sentence we are told that the eyes of the people of Norfolk decay very speedily, in consequence of the dryness of the air, while on the adjoining page is the truly rational remark—'I have oftentimes wished for a mappe of England, coloured according to the colours of the earth, with markes of the fossiles and minerals,' which may be regarded as one of the earliest hints at what are now common—geological maps. Aubrey then goes on to speak of the damage done by 'Oliver's wind,' the hurricane commonly reported to have blown at the time of Cromwell's death, but which Thomas Carlyle shows was four days earlier. He describes echoes and sounds as moving in spheres similar to the circles produced from the fall of a stone into water; and relates of a petrifying rivulet near Devizes, that it 'seems to prove that stones grow not by apposition only, as the Aristotelians assert, but by susception also; for if the stick did not suscepe some vertue by which it is transmuted, we may admire what doth become of the matter of the stick.' Then we read—'My Lady Coeks of Dumbleton told me that ladies did send ten miles and more for water from a spring on Malverne Hill, in Worcester-shire, to wash their faces, and make 'em faire,' followed by thirty-two 'queres for the tryall of minnerall waters,' among which are—'How much heavier 'tis than brandy? How it boyles dry pease? How blood lett whilste the waters are dranke lookes, and how it changes? In what time they putrefy and stink?'

It seems to have been the practice at that time, as it is now, to secure the presence of a great personage at the commencement of any important undertaking. Thus we read—'On Munday morning, the 20th September (1669), was begun a well-intended desigene for cutting the river (Avon) below Salisbury, to make it navigable to carry boats of burthen to and from Christ Church. This work was principally encouraged by the Right Reverend Father in God, Seth, Lord Bishop of Salisbury, his lordship digging the first spitt of earth, and driving the first wheelebarrow.' The tides of the Severn served as 'weather prognosticks' to the dwellers on the banks of the river:—

'If it raineth when it doth flow,
Then yoke your oxe, and goe to plough;
But if it raineth when it doth ebb,
Then unyoke your oxe, and goe to bed.'

In the chapter on 'soiles,' we read that 'wet and dirty lands, to poore people, who have not change of shoes, the cold is very incommodious, which hurts their nerves exceedingly. Salts, as the Lord Chancellor Bacon sayes, do exert (irradiate) raies of cold. Elias Ashmole, Esq. got a dangerous cold by sitting by the salt sacks in a salter's shop, which was like to have cost him his life. And some salts will corrode papers, that were three or four inches from it. The same may be sayd of marble pavements, which have cost some great persons their lives. Edmund Waller, Esq. the poet, made a quare, I remember, at the Royal Society, about 1666, whether Salisbury Plaines were always plaines? In Virginia, the natives did burn down great woods, to cultivate the soil with maiz and potato-roots, which plaines were there made by firing the woods to sowe corne. They doe call these plaines savannas. Who knows but Salisbury Plaines, &c. might be made long time ago, after this manner, and for the same reason? ... As to the greene circles on the downes, vulgarly called fairy circles (dances), I presume they are generated from the breathing out of a fertile subterraneous vapour. (The ringworm on a man's flesh is circular. Excogitate a paralismes between the cordial heat and the subterranean heat to elucidate this phenomenon.) Every tobacco-taker knows that 'tis no strange thing for a circle of smoke to be whiff'd out of the bowle of the pipe; but 'tis donne by chance. If you dig under the turf of this circle, you will find at the rootes of the grasse a hoare or mouldiness. But as there are fertile

steames, so contrarywise there are noxious ones, which proceed from some minerales, iron, &c. which also, as the others, appear in a circular form.' The phenomenon of fairy rings was explained by the celebrated Wollaston forty years ago: he shows it to be caused by the decay and annual growth of certain species of fungi.

A curious botanical fact is recorded—'The spring after the conflagration at London, all the ruines were overgrown with an herbe or two, but especially one with a yellow flower; and on the south side of St Paul's Church it grew as thick as could be; nay, on the very top of the tower. The herbalists call it *Ericoleirs Neapolitana*—small bank cresses of Naples.' This plant, it appears, had never before been seen about London, except near Battle Bridge. The next may be set down among feats of the marvellous—'Edmund Wyld, Esq., R.S.S., hath had a pott of composition in his garden these seven yeares, that beares nothing at all, not so much as grasse or mosse. He makes his challenge, if any man will give him xxii. he will give him an hundred if it doth not beare wheate spontaneously; and the party shall keep the key, and he shall sift the earth-composition through a fine sieve, so that he may be sure there are no graines of wheate in it. He hath also a composition for pease; but that he will not warrant, not having yet tried it.'

We are informed, under the head 'minerals and fossils,' of the means resorted to by an eminent physician for making aperient pills:—'In the parish of Great Badminton, in a field called Twelve Acres, the husbandmen doe oftentimes plough up and find iron bullets as big as pistoll bullets; sometimes almost as big as muskett bullets. These bullets are Dr Th. Willises aperitive pills: he puts a barre of iron into the smith's forge, and gives it a sparkling heat: then thrusts it against a roll of brimstone, and the barre will melt down into these bullets; of which he made his aperitive pills. In this region is a great deal of iron, and the Bath waters give sufficient evidence that there is store of sulphur; so that heretofore, when the earthquakes were hereabouts, store of such bullets must necessarily be made and vomited up.' In the next paragraph we read that the holly may be taken as an indication of the presence of coal below the surface, as that tree 'delights in the effluviu of this fossill.' 'I doe believe that all chalke was once marle; that is, that chalke has undergone subterraneous bakings, and is become hard: e. g. as wee make tobacco-pipes. The millers in our country use to putt a black pebble under the pinne of the axis of the mill-wheele, to keep the brasse underneath from wearing; and they doe find by experience that nothing doth weare so long as that. The bakers take a certain pebble, which they put in the vaulture of their oven, which they call the warning stone; for when that is white, the oven is hot. There was a time when all pebbles were liquid. Wee find them all ovalish. How should this come to passe? As for salts, some shoot cubical, some hexagonal. Why might there not be a time, when these pebbles were making in embryone, for such a shooting as falls into an ovalish figure? Anno 1665, I desired Dr W. Harvey to tell me how flints were generated. He sayd to me that the black of the flint is but a natural vitrification of the chalke; and added that the medicine of the flint is excellent for the stone, and I think he said for the greene sickness; and that in some flints are found stones in next degree to a diamond.' Here we see the great discoverer of the circulation of the blood, with all his philosophy, approving remedies for disease which the most ignorant would now not dream of.

In a subsequent chapter on plants, Aubrey, while relating that wild strawberries were plentiful in certain parts, says—'I have heard Sir Christopher Wren affirm, that if one that has a wound in the head eates them, they are mortall. Methinks 'tis very strange; and adds, 'Quære, the learned of this?' Then we are told that meadows producing yellow flowers are better than those which grow white flowers, as the latter 'are produc't by

a cold hungry water;' and that 'tobacco is onely in gardens for medicine; but in the neighbouring county of Gloucester it is a great commodity.' In a memorandum appended to this, the author says—'Mr Michael Weekes, of the custome-house, assures me that the custom of tobacco is the greatest of all other, and amounts now (1688) to four hundred thousand pounds per annum.' At the present time, the tobacco duties produce about three and a half millions annually. The cutting down of the forests seems to have caused much popular discontent; on the destruction of Pewsham Forest, by the Duke of Buckingham, the 'poor people' made a rhyme—

'When Chipnam stood in Pewsham's wood,
Before it was destroyed,
A cow might have gone for a groat a yeare—
But now it is denied.'

'The metre,' observes Aubrey, 'is lamentable, but the cry of the poor was more lamentable. I knew several that did remember the going of a cowe for 4d. per annum. The order was, how many they could winter they might summer; and pigges did cost nothing the going. Now, the highways are encombrd with cottages, and the travellers with the beggars that dwell in them.' When describing 'reptiles and insects,' the author gives the following as a remedy for the plague and other diseases:—'Take twenty great fatt toades: in May they are the best: putt them alive in a pipkin, cover it, make a fire round it to the top, let them stay on the fire till they make no noise,' &c.; and says that it is recommended by Dr Thomas Willis. The prejudice against rooks and crows is not a modern error. The parliament in James I.'s reign passed a bill authorising the destruction of the birds, on which Aubrey writes—'I have heard knowing countrey-men affirme, that rooke-wormes which the crows and rooks doe devour at sowing time, doe turne to chafers, which I think are our English locusts; and some yeares wee have such fearful armies of them, that they devour all manner of green things; and if the crows did not destroy these wormes, it would oftentimes happen. Parliaments are not infallible, and some think they were out in this bill.'

The 'aire' of Wiltshire was considered favourable to longevity; if, however, the following couplet were true, the morals of the people were questionable:—

'Salisbury Plain,
Never without a thief or twain.'

That the reputation of cattle-dealers was as questionable when Aubrey wrote as it is said to have been in later years, we may infer from what is observed respecting one of their tricks. 'Some cow-stealers,' he writes, 'will make a hole in a hott lofe newly drawn out of the oven, and putt it on an oxes horn for a convenient time, and then they can turn their softened hornes the contrary way, so that the owner cannot aswear to his own beast.'

'Travelling to Stonehenge in that day must have been somewhat of an adventure. Among other 'weather prognosticks,' we have—

'When the hen doth moult before the cock,
The winter will be as hard as a rock;
But if the cock moult before the hen,
The winter will not wet your shoes' seams.'

After this, there is an anecdote of Wren which deserves quotation. 'It ought never to be forgot,' writes Aubrey, 'what our ingenious countreyman, Sir Christopher Wren, proposed to the silke-stocking weavers of London, anno domini 16—; namely, a way to weave seven paire or nine paire of stockings at once (it must be an odd number). He demanded four hundred pounds for his invention; but the weavers refused it because they were poor, and besides, they said it would spoile their trade. Perhaps they did not consider the proverb, that "Light gaines, with quick returnes, make heavy purses." Sir Christopher was so noble, seeing they would not adventure so much money, he

breakes the modell of the engine all to pieces before their faces.'

Under the head of agriculture are mentioned the first watering of meadows, and manuring land with 'soap ashes.' The wages of a 'seedsman' were L5 yearly, and of a 'servant-maid' from L1.10s. to L2. The fall of rents was attributed to 'the decay of the Turkey-trade;' and it was debated whether 'it would not be the better way to send our wooll beyond the sea again, as in the time of the staple? For the Dutch and French doe spin finer, work cheaper, and dye better.' Through such darkness as that shown by our quotations has science and every branch of industry had to struggle to their present degree of perfection. While looking back with a smile on the follies of our ancestors, we will do well to remember that for them the folly was wisdom, and that our own knowledge may at some future day appear equally deficient to our successors.

LABOURING SOCIETIES.

It is a mistake to suppose that labouring for a common stock is a notion of modern times. It has been acted upon in many countries at various stages of history. The North American Indians were found living under a system of communityship, and in a perfect equality. The Caribbees of the West India islands, in like manner, laboured the land in common, and drew each from public granaries what he required. The institutions of this nature formed by the Jesuits in Paraguay, form one of the most singular chapters in history. The mass of the people, amounting to 300,000 families, were content to work under the care of their religious superiors, receiving in return such supplies of necessaries as were deemed suitable to their deservings, while the aged and otherwise disabled were likewise handsomely provided for. This system lasted for several ages, and was only broken up by the intrusion of the Portuguese government. It appears that in India, Ceylon, and some other countries, such communityships existed in more or less perfect form in early ages.

Amidst all the changes of dynasties and governmental systems which have taken place in Europe since the middle ages, there have survived certain patches (if we may so call them) of the working population, which held by old primitive arrangements of the nature of Communityship. The accounts we have of them seem to lead the mind back into the very first forms of society. One is found in the province of Nivernois, in France, though dwindled away into a mere speck. Once it comprehended a large district, where all the people worked together on land held as common property, under masters whom they elected. An old writer, speaking of them, says—'In these communities, the children are prized who can yet do nothing, from the expectation of what they will perform in future; those who are in vigour, for what they do; the old for their advice, and for the remembrance of what they have done.' Now there is but one family which keeps up the old system—one named Jault, said to number less than forty persons, but possessing property worth L8000: they live amicably in one house, having a large hall for meals, and separate apartments for each married couple and their children, after the manner of certain charitable foundations in our own country.

The Gothic nations in ancient times had a system of common ownership, of which we are supposed to have a faint trace in England in the unenclosed commons—may we add, in Scotland, in those pastures and hill bogs which still belong as common property to the inhabitants of burghs? The system was developed in great vigour in the province of Friesland, the most northerly district of Holland. There the land was divided into portions called *theels*, part of which were held by individuals, part by the public. An individual's *theel* went to his youngest son, or, failing sons, to his daughter, while the other sons were provided for out of the *theels* held in common. No head of a family could have more

than one, nor could he sell his theel. Whether as a consequence of this mode of living or not, at least contemporaneously with it, the people exhibited a remarkable spirit of independence, exempt from feudal and priestly domination, and possessing a house of parliament, while there was as yet no such thing in England. They held the emperor in no fear, and allowed of no dignitaries among themselves. Their common greeting to each other was, 'Health, thou noble freeman!' These moral characteristics remind us much of those of the North American Indians under a similar arrangement. It has been well remarked that the Frisians show how little exclusive liberty is to the mountains; for here she flourished in almost unparalleled vigour among the fens of the Netherlands.

In France, but more in Italy, there is a system of farming known by the name of *Metayer*, or *Mezzeria*, which is as yet little known amongst us, though exceedingly remarkable. It may be said to reign chiefly in Tuscany. There it has survived the Roman domination and all subsequent vicissitudes, and is still almost the only plan of cultivation in use. Under this arrangement, the owner of the soil provides the land, houses, utensils, and seed, while the tenant contributes the labour. Out of the crop there is set aside a sufficiency for next year's seed, and for the support of the cultivators and their cattle; the remainder is divided between the proprietor and cultivator. The money arising from the sale of cattle is in like manner divided. With these benefits, and raising clothing for his family, which they work up with their own hands, the metayer peasant possesses a degree of animal comfort such as is rarely matched, and perhaps nowhere exceeded, amongst the labouring classes in the various countries of Europe. Though under no permanent engagement with the landlord, they generally remain on the ground from generation to generation. The system, however, has its drawbacks. The cultivator, living in a home apart from his neighbours, has little intercourse with them; and accordingly, prejudices and ignorance mark the tribe in an especial manner. In such a system of small farms, the benefits of science fail to be taken advantage of. It has even the effect of limiting the local range of industry in a surprising manner; for the plains of Tuscany, though the most fertile portion of it, are, in comparison with the hills, in a state of neglect, merely because extensive combinations of labour are there necessary. Tending, moreover, to the production of nothing beyond what is required for local consumption, it admits of no comforts which require the intervention of commerce.

According to Dr Bowring—'The erroneous self-sufficing principle pervades everything, even to the extent that a single field should produce everything, that one man should do everything: there is no such thing as division of labour—no intermediate branch of occupation. The same individual who has planted a vine, or sown his field, must sell the final produce to the consumer; the labour of the Tuscan proprietor is therefore so complicated, that it is impossible to get through it. The result of all this is, that out of the gross produce, the net revenue to the Tuscan proprietor is most miserable. The gross produce in itself is large—very large in proportion to the natural productiveness of the soil; but it is small considered in relation to the expenses incurred, to the capital absorbed, and to the labour bestowed upon it. Regarding man as an instrument of labour, our agriculture is costly in the extreme; but under any other system, man would do less, and cost more. The cultivator is always on the spot—always careful; his constant thought is, this field is my own. He works for his own advantage, not as a mercenary, nor as a slave or machine; his loss of time is the least possible, as he has the distribution of his hours, and chooses his opportunities: while proceeding to his field, he pulls up the weeds, he gathers together the manure that may have fallen on the roads, which contributes to the increase of his dunghill; the amount of labour

bestowed by the cultivator would prove too costly to the proprietor if obliged to pay for it; it would not answer his purpose. It is always ruinous in the end to cultivate land in Tuscany by day-labourers: on the other hand, were the labourer to be paid his wages in money, they would prove inadequate to his support. Under the existing system, if his profits are small, they are direct, and in the shape of produce, his household wants are fully and completely supplied, and at no expense. It is not possible for the cultivators to make a rapid fortune, but the better class of them possess their little capital of money. The marriage portions they give their daughters are a proof of this: these are considerable, and always increasing. It is true the landlord frequently assists; and not only the head of the family, but the other members also, both girls and boys, to whom they leave slight bequests by way of dowry, or who enter into small speculations, have all a little stock of money laid by. It is, I consider, the great and only advantage of Tuscan economy, that it insures the subsistence of a large number of labourers, and insures this in a mode independent of men and events, and free from the vicissitudes of commerce and the uncertainties of trade or of ruinous changes.

'The labourer in general is happy and virtuous; the unvarying nature and quietude of his life, and the dependence, free from all servility, in which he stands in relation to his employer, foster his habits of morality, whilst they maintain his dignity as a man. . . . The peasantry is beyond dispute the best class in Tuscany, and all the good that is said, and has been said of the Tuscans, is due to the peasantry. A peasant who should be reduced to work as a day-labourer would feel himself miserable and degraded; it would be a descent from a high elevation in the social scale.'

America is said to contain upwards of a dozen societies who labour for a common good. They are mostly of German origin, and profess a religious basis for their union. The most noted community of the kind is that of the Rappites, which took its rise, rather more than forty years ago, in a German congregation which had emigrated under the care of their pastor, Mr Rapp, and which was first led to this mode of life by the text in Acts iv. verse 32, as to the early believers having 'all things in common.' The Rappites were first settled in Pennsylvania; they were miserably poor, and encountered great difficulties, particularly from their own ignorance. Their plan, however, prospered, and in 1814 they sold their possessions for 100,000 dollars, and migrated to a place called Economy, on the Ohio, where they speedily acquired immense wealth, much more indeed than, with their habits, there is any occasion for. It appears that this body has been held together by the influence of their pastor, Rapp, who contrived from the first to make them believe that they are exalted above all the ordinary people of the world. Ignorant, puffed up with self-conceit, and perhaps misled by the very success they have met with in the realisation of wealth, they submit to a whim of their superior, positively forbidding marriage. A restraint so contrary to nature, and not upheld by any strong religious sanction, must of course be precarious, and it remains to be seen, now that Rapp is dead, whether the society will long subsist in its present form. Meanwhile there is no reason to believe that the opulence is owing in any peculiar degree to their exemption from the charge of young families, for it appears that hosts of children under widowed mothers are quartered upon them. Miss Martineau reported, a few years ago, that what was vital in the Rappite system was dreadfully incumbered with what was dead. 'Their spiritual pride,' she says, 'their insane vanity, their intellectual torpor, their mental grossness, are melancholy to witness. Reading is discouraged among them. Their thoughts are full of the one subject of celibacy; with what effect, may be easily imagined. Their religious exercises are disgustingly full of it. It cannot be otherwise; for they have no other interesting subject of

thought beyond their daily routine of business; no objects in life, no wants, no hopes, no novelty of experience whatever. Their life is all dull work, and no play.'

The Rappites, with all the faults of their system, have possessed one requisite of high importance—a community of sentiment on religious and other dissociating questions. Diversity in these respects appears to have been the main cause of the early dissolution of the society established by Mr Owen in Indiana. Where no such blight occurs, communities established in countries not too far advanced in the possession or employment of capital, seem to thrive, as far as the production of the prime necessities of life is concerned.* Within the last thirteen years, the Oberlin Institute took its rise in the state of Ohio, in a band of forty young men, who withdrew from the Presbyterian College, Cincinnati, on account of their strong feelings in behalf of the negroes. Resolving to found an institution where the blacks should receive all the advantages of education, and be treated as the equals of the whites, they repaired to the forest, and cleared ground by the work of their own hands. With scarcely any capital, they soon reared a settlement in the wilderness, though of a very rough kind. Persons of their own sentiments, and of both sexes, joined to make common cause with them for the negroes. When told there was no accommodation for them, they would answer, 'We will provide for ourselves, if you will let us stay.' When poverty was felt, the members gave up the use of animal food—liquors they had never used. One would lend even his clothes to another when it was necessary. Some, however, came with money, which they threw into the common stock. A farmer of their neighbourhood, touched by their generous views and their sufferings, drove over a cow to them—the only gift he could bestow. Another took in seventy of them as free boarders: his wife sank under the heavy charge thus put upon her, but she died without regret for the sacrifice she had made. Long since, the principal difficulties seem to have been overcome, and the institute comprehended a preparatory school, and a university of twenty-six professors, with four hundred pupils. The labour of all, for three hours a day, sufficed to give all a temperate and healthy maintenance—the young women attending to household and dairy duties, and to the making and mending of clothes. After existing about four years, the possessions of the society were estimated at 65,000 dollars.

In our own country, attempts to establish co-operative societies have not hitherto met, in any case, with assured success, chiefly perhaps because of the difficulty of applying human energies in that variety of modes which would put the system on an equal footing with the prevailing arrangements. A set of men of various professions and trades go to settle upon and work a piece of land, and live both industriously and frugally; but the individuals soon discover that they do not realise so much as by salaries or wages in the usual way. Their projects accordingly fall to the ground. It is different in America, where the contrast is only between the individual or the society setting to the clearance and cropping of land, and where the local isolation must also be favourable to the keeping up of a united spirit. How far it is possible to make even the most partial changes from the one system to the other, in a country where all old arrangements are so inveterately fixed and rooted as in ours, we shall not take it upon us to pronounce; but we think the question an interesting one, and believe it would be satisfactory to many well-meaning persons to see it fairly subjected to the test of experiment. On the other hand, we are far from believing that human nature is such as only to be excitable to exertion by the rewards of the individual selfhood. The common objection, that men will not labour

so hard for a common as for an individual interest, seems to us greatly overstated. The actual history of labouring societies shows no defect of this kind: even the Irish peasantry were transformed by Mr Vandeleur into an active as well as peaceable community, when a group of them knew that they were working for themselves as a body. The experiment in this case, as is well known, failed from causes entirely apart from the question of work and the economy of its performance. Our present system is perhaps unmatched for the production and storing of wealth; but no one can pretend that the wellbeing of the great mass of the community advances in proportion. Its one great point of failure is in sustaining the spirit and morale of the labourer. Its very interference for the succour of the helpless, is of a nature that degrades while it relieves. In these particulars, it does not seem favourable to the development of the best parts of man's nature. It is also attended by a discontent not at all calculated to give rest to the comforts of those in whom the wealth of the country is centered. The whole circumstances being considered, we certainly see no occasion to object to the trial of a system giving even the faintest promise of different results.

THE CHAMBER OF MYSTERY.

An architect of Vienna, having occasion to visit the country-house of a nobleman of that city, accepted the hospitable invitation he received, and determined to remain as a guest for several days. The first day was passed in business, and he retired to bed somewhat exhausted, but his thoughts still occupied with the improvements in the house that were contemplated. He could see, however, that the room allotted to him was handsome and commodious, though not large; and at length he suffered his head to sink upon the pillow with the sigh of satisfaction with which we take leave of the world for the night,

* And draw around a wearied breast
The curtain of repose.'

But when he was just sinking to rest, an uneasy sensation, he knew not of what nature, stole over him. He persuaded himself that the air was close—that he perceived a faint smell; and he lay for some time considering whether he was not suffering from fever. The question was speedily answered: for the bed began to move. Presently it was near the window—so near, that he could look out, could see the trees in the garden below, and could observe the outline of a summer-house, which had attracted his attention by its classical proportions in the forenoon. He was of course surprised, nay, terrified; but when he stretched towards the window in order to ascertain that all was real, the scene grew dimmer and dimmer, and at length disappeared. And no wonder: for the bed was receding to its old position—and did not stop there. He was presently at the door. He might have touched the panels with his hand. He felt his breath come back, and the air grew more confined. He would have got up to ring for assistance, but persuaded himself that he was too weak, and would fall down before reaching the bell.

The bed again moved; and this time it took up its position in the very middle of the fireplace. This was the sheer frenzy of fever, for the fireplace was of course not a fourth part of the size of the bed itself. Yet he saw distinctly the walls of the chimney surrounding him; and he even felt that one of the feet of the bed rested upon a dog-iron, so as to disturb its level. But he had no time for more minute observation; for presently the bed emerging from the chimney, began to rise with slow undulations towards the roof; and there it continued to swing, as he imagined, for hours together, till his alarm sank gradually into lassitude, and he fell into a deep though short and unrefreshing slumber.

The next morning the visitor appeared at the break-

* See An Outline of the Various Social Systems and Communities which have been founded on the principle of Co-operation. London: Longman and Co. 1844.

fast table, pale, wearied, and dispirited. He was not well. What was the matter? What could be done for him? 'Nothing,' he replied to all their interrogatories. He had not slept; but the air would revive him. He would take healthful exercise during the day, and that would be better than medicine. It turned out as he expected. He recovered his spirits; he was delighted with his hosts, and they with him; and he was thankful that he had been prevented by shame from mentioning the absurd fancies by which he had been beset during the night. At the usual hour he retired again to bed, comfortable in mind and body, but feeling the want of sleep, and looking forward gratefully, by anticipation, to at least eight hours of sound repose.

He did not enjoy one. The same fever, the same fancies, the same inexplicable movements of the bed—these were his portion during the night; and in the morning the same dead eyes, the same colourless cheeks, the same listless attitudes, betrayed to his sympathising friends that he had passed another wakeful and wretched night. But he still preserved silence as to the details. He was thoroughly ashamed of his absurdity. The impressions of the first night had doubtless remained to scare him on the second. He had gone to bed thinking of his former sufferings, and they had been renewed in his imagination. In this way he accounted for the continued illusions that had perplexed him; and he determined, at a third trial, to grapple with them manfully, and compel repose by the aid of reason.

All was unavailing; and on the third morning his entertainer, alarmed by his ghastly looks, determined to bring him to explanation.

'You can no longer conceal it,' said he; 'you have found something disagreeable in the room; and I reproach myself with having allowed you to be put into an apartment which certainly bears a bad name in the house.'

'What do you mean by a bad name?' asked the guest.

'I mean that it is famous for its sleepless lodgers, for its waking dreams—and worse than that. There is not a servant in the house who would enter it alone after nightfall for a year's wages.'

'That is all very well for the servants; but I know you laugh at these ignorant fancies; and you know me too well to suppose that I would treat them otherwise than with pity and contempt. Tell me at once what you believe: but first listen to a narrative of my adventures;' and the guest related to his host at full length the story of his three ill-omened nights.

'I cannot tell you what I believe,' replied the latter, after musing for some time; 'for, in point of fact, I do not know what to believe; but your experience tallies strangely with what I have heard on the subject before from more than one of my friends. I am more perplexed than ever.' It was agreed, however, on the proposal of the architect, that a minute examination of the premises should immediately take place, and the whole family proceeded in a body to the chamber of mystery.

The first thing that struck the examiner was, that the chimney was choked up with rubbish, so that no current of air could take place through a channel on which so much depends. Proceeding to the window, he found it heavy and massive, and so completely bedded, that no force could raise it. It appeared, on inquiry, that this was its original defect; that the servants had at length given up all attempts to move it; and that the woodwork had swollen so much, through the effects of damp, that the whole window, so far as the access of the external air was concerned, was merely a prolongation of the wall. The door was in like manner found to be singularly heavy and close-fitting; and in addition, it was constructed so as to shut spontaneously the moment the person who entered removed his hand. In fact, the room, however elegant in appearance and furniture, was contrived throughout in the most elaborate manner, so as to be as unwholesome as possible. Still this did not account for the illusions with which it

was haunted, and the architect ascended to the external roof of the house.

Here he found that the apartment in question was covered by a massive work of tiles, wood, and lime, so as to leave a small garret, into which there was no opening either by door or window. This, in its connection with the other circumstances we have described, proved to be the solution of the mystery; for the mephitic gas engendered in the garret, penetrating through the mouldy woodwork of the antique ceiling, into a place whence it found no egress, and where it could mingle only with foul air, was in reality the nocturnal spectre which haunted the room. The effect of this gas upon the brain, in exciting a temporary delirium, is well known; and in the present instance, the result of what was done to remedy the evil left no doubt.

The door and window were opened, the chimney was cleared, and two openings were made in the roof. During the last-mentioned operation, it is worthy of note that when the tools of the workmen penetrated for the first time into the garret, the mephitic vapour which escaped had such an effect upon one of them, that he must have fallen from the roof had he not been caught hold of by his comrades. After the alterations were made, the architect retired to bed for the fourth time, and enjoyed an excellent sleep, together with a great part of the arrears of the three preceding nights. From that moment the room lost its reputation as a Chamber of Mystery.

CONVERSATION ON ASTRONOMY.

WE have perused with much pleasure a newspaper account of a conversation on the past and present state of astronomical science, which took place a few weeks ago at the Royal Manchester Institution. Mr P. Clare was in the chair, and commenced with the following observations:—

It was satisfactory, said he, that the committee had selected for their consideration that evening a branch of the science which pointed out more prominently than any other the wisdom, omnipotence, and glory of the Deity. Although there was no science more perfectly understood than astronomy, yet there was none that contemplated bodies more in number, larger in magnitude, or at greater distances from us. It did not enter so much into a consideration of the properties or nature of the bodies which constituted the great machine of the universe, as it was an inquiry into that delightful harmony by which all created bodies were preserved in their right places, and kept therein with so much order and regularity. It had from a very early period of time engaged the attention of the most learned and talented men of all countries, and been cultivated with a zeal and perseverance to which it was eminently entitled. Having briefly sketched the history of this science from the earliest period to the current century, the chairman observed that it had taken a period of nearly four thousand years for the science of astronomy to arrive at its present state; but we might hope, that with the assistance of such very accurate instruments as were now made, the farther progress of this science would be more rapid; and it was encouraging to reflect, that by the assistance of telescopes of highly-magnifying power, adapted to instruments divided with great accuracy, many very important discoveries had been made within the present century. Indeed, within the compass of last year, not only was another small planet discovered, which has been called *Astræa*, but a large one, called *Neptune*, which might at present be said to be the outermost of the solar system, revolving at a distance of thirty millions of miles from the sun. To these might be added two other small planets discovered this year—one named *Isis*, and the other *Hebe*—belonging to the same group with *Astræa*. But one of the greatest triumphs of astronomical research within the present century was the discovery, by the late Professor Bessel, the distinguished Prussian astronomer, of the parallax of the star 61 Cygni, and the no less important discovery, by our late most excellent and laborious astronomer, Mr Thomas Henderson, of the parallax of Centauri, by which discoveries it has been ascertained that the nearest of the fixed stars cannot be at a less distance than 20,000,000,000,000 of miles.

The Rev. H. H. Jones then read a paper on the supposed determination of a central sun by Mädler. The last twelve months, he proceeded, might, without figure or exaggeration, be designated the 'annus magnus' of astronomical discovery. During that period, comets, planets, satellites, and unnumbered thousands of starry orbs, had been discovered; but by no means the least interesting achievement of the present period, if it should be confirmed, was that of Professor Mädler, said to be the result of seventeen years' patient study and observation. The presumed discovery was that of the position of a central sun, around which the various systems composing our sidereal heavens are all in a state of orbital circulation. Mädler considered Alcyoné, one of the brightest stars in the centre of the Pleiades, either to be this sun, or to occupy the locality of the great focus of sidereal attraction; and he concluded that around this common centre of gravitation, thirty-four millions of times as far from us as we are from our own sun, our whole solar system performed a complete revolution in 18,200,000 years. This conception was a most magnificent one; and if, as was possible, it was a fact, it was undoubtedly the greatest fact that was ever presented in a tangible shape to the human mind. After reading a portion of the Report of the Royal Astronomical Society upon this subject, Mr Jones said, that while he by no means repudiated the probability of Mädler's hypothesis, neither was he disposed to receive it with implicit confidence in its truth. The idea that the solar system had not only a rotatory, but a progressive motion, or a motion of translation in space, was not new. Captain Smyth, president of the Royal Astronomical Society, thought that Lucretius referred to this motion; but he (Mr Jones) thought that the language of this writer, who flourished in the century preceding the Christian era, was so vague, as to leave it in doubt whether he entertained anything like the modern idea on this subject. But after the discoveries of Newton, the hypothesis became widely prevalent, and gradually assumed a more definite aspect. Dr Halley, who died in 1742, distinctly recognised it; Lambert, who wrote in 1761, completely anticipated Mädler's general views; and Flamsteed, Mayer, Dr Wilson, Herschel, and Mosotti, had all speculated more or less upon the subject. The idea of progressive movement amongst the sidereal systems seemed to have been derived from two or three different sources. First, it was thought highly probable that our own sun, and consequently the solar system, had a motion of translation in space, and then, by analogy, all other systems. It was supposed that if all bodies in the free space gravitated towards each other, all must be in a state of motion; and when it was shown that the sun revolved upon its axis, it was immediately concluded that the same impulse which produced rotation must also produce a motion of translation in space. On such an assumption several mathematicians calculated in what point a globe must be struck to make it whirl round and move forward with certain given velocities, and found that, to cause our earth by a single impulse to turn on its axis in twenty-four hours, and move forward in its orbit at its known velocity, the point of percussion must be twenty-five miles from the centre. Though, mathematically considered, this was no doubt a very interesting question, when adduced as an explanation of celestial phenomena it was a sheer absurdity. The most plausible reason for believing that the solar system had a progressive motion in space, was the fact of an apparent change in the relative positions of some of the fixed stars. Impressed with this idea, Sir William Herschel made many observations, and ultimately concluded that the solar system had a motion of translation towards the star Zeta in the constellation Hercules. Bessel, however, stated that there was no point in the heavens towards which he could discover any such tendency. More recently, Ageland had revived the investigation; and his conclusions, though by no means free from difficulties and doubts, nearly coincided with those of Herschel. Mädler, however, was not merely unwilling to abandon the hypothesis, but had made some specific additions to it, distinctly stating the amount of distances, velocities, and periodic times, and pointing out the precise locality of the great central sun. The solution of this question depended entirely upon the precise determination of the places and proper motion of the fixed stars; and this could only be done by the united aid of excellent instruments, numerous observers, and the lapse of long periods of time. The particulars which demanded attention in all exact astronomical observations were re-

fraction, precession, nutation, aberration, obliquity of the ecliptic, the uncertainty of ancient observations, instrumental imperfections, personal equation, and sidereal parallax. Upon these the learned speaker made some important observations, and proceeded to say that inattention to a single particular just specified, would be sufficient to vitiate the whole process of calculation in a case like the present. It was not from prejudice, timidity, or instinctive antipathy that he (Mr Jones) demurred to the reception of Mädler's hypothesis, but because he believed that the data from which it had been deduced were quite inadequate for the purpose. If, however, Mädler should be finally able to maintain his views, we should think him a much greater man than we otherwise should have done had we not been aware of the obstacles with which he had to contend.

The chairman said, that Mr Jones spoke doubtfully of the observations which had been made by Mädler being applied correctly to the investigation of the very important question of a central sun; we should, however, remember how very correct views had been taken, on matters of astronomy, upon very little evidence. Pythagoras took a very correct view of the solar system, with no strong evidence to support his view. The promulgation of Mädler's supposed discovery would cause persons to investigate, more than they otherwise might have done, the exact situation of many stars, and particularly the position relatively to each other of those stars which were called double and treble stars, in order to see if they maintained the same relative position for a number of years. Even then, if nothing important immediately resulted from Mädler's views, they might in this way be productive of advantage to the progress of astronomy.

Mr Charles Pountney said, that if the whole sidereal heavens were in a state of revolution round a central sun, that implied a periphery or external circumference, beyond which there was either finite or infinite space. All our ideas and observations went to show that space was infinite; but if it was in a state of revolution round a centre, there must be a periphery. Would they, then, limit the sidereal heavens to a finite orb, or say that infinite space revolved round a single centre? If it was said that it did not revolve round one centre, but that there was another centre beyond that that we could see, then there might be a great many centres; and if so, there was no necessity for the very one contemplated by Mädler.

Mr Atkinson thought that Mädler professed to have discovered, not 'the' central sun, but 'a' central sun. Mädler's idea was not to limit infinite space, but that the different bodies in space were arranged in groups, each revolving round its own centre of gravity. The central sun which Mädler believed himself to have discovered, was the centre around which the stellar group, of which our solar system was a part, revolved.

The chairman did not think that, if it could be proved, as Mädler had suggested, that there was a centre around which the stars which we observed, or could observe, moved, that that implied a limit of the universe. The universe was not limited to what we could conceive. He believed Mädler meant by the central sun, the centre of the stars that we could see. The Rev. H. H. Jones said that Mädler expressly designated his discovery the discovery of 'the' central sun. Mr Atkinson thought that neither Mädler nor any one else could say, with their means, that they had discovered 'the' central sun.

The Rev. H. H. Jones said that Mädler, in his paper, contended that the stars were pretty uniformly distributed through space; and it was evident that he meant what he said, for his whole reasoning was founded on that very supposition. In consequence of the stars being thus pretty uniformly distributed, he supposed that they formed a large spherical mass; and that the law of gravitation, as applied to them, would probably be not inversely, as the square of the distance, but as the distance—the law of gravitation which prevailed with respect to particles of matter which had entered beneath the surface of the sphere to whose centre they were attracted. He thought Mr Pountney took a correct view of the fundamental principles of Mädler's theory, and he could not see how the objections which Mr Pountney had raised could be well answered upon the principles which Mädler had laid down. He thought that Mädler meant that the stars were pretty nearly at uniform distances from each other, or his inference respect-

ing attraction, to which he (the lecturer) had referred, would not be correct. It was indeed singular that Mädler should have thought thus, for it was almost impossible to look at the heavens on a fine night, and believe anything of the kind; the stars appeared grouped in various clusters throughout the whole hemisphere, as far as they were visible. Though Mädler's theory appeared based on one assumption after another, unsupported by rigid observation, there was no doubt that that astronomer was a very clever man, and one of great genius and acquired knowledge; and if he were there that evening, he (Mr Jones) would thank him for startling the slumbers of the scientific world with the projection of this great and mighty theory, which afforded employment both for the imagination and the intellect, and kept us from a state of intellectual stagnation. He (Mr Jones) liked a good bold theory; a person might do nothing but collect large masses of facts together; but where was the utility of these, unless some master mind could be found to form an induction, and deduce principles from the facts?

The chairman said, that when a person of Mädler's attainments propounded a hypothesis, we should treat it with the degree of respect due to his talents and learning, though we should receive his suggestions only in the same way as those of Pythagoras, or any other talented man. Great discoveries too often did not receive that attention which their investigation deserved. Mr Adams of Cambridge pointed out to the astronomer royal and the professor of astronomy at Cambridge the probability that there was a planet beyond Uranus; but they paid no regard to him till their attention was drawn to the subject by a foreigner, and the honour of the discovery was given to another individual.

Mr Henderson thought that neither Mädler nor any one else was justified in making propositions respecting infinite space. All his conclusions must be inductions resting on the observation of stars within the range of our own vision. He thought Mädler meant by the central sun the centre of the whole stars that came within the sphere of our vision. Our idea of infinity was one that we could not get rid of; and it was safest, in the absence of any positive knowledge of Mädler's opinion, to conclude that he meant by the central sun, merely the centre of what we saw. The idea of a central sun was one to which the human mind would always naturally turn, until we saw something to contradict the general course of nature. The whole course of our observations tended to show that the bodies in space were in motion; all the bodies within our own system were moving at inconceivable velocities, and it was therefore only a result of the tendency of the mind to generalisation and deduction to suppose that all the stars we saw were in motion likewise. We were also led from the analogy of our own system to conceive of this motion as a circular one. Mädler had, therefore, *a priori* reason on his side. The great thing was the verification of the hypothesis by actual mathematical measurement; and the difficulties which Mr Jones had shown to be inherent in that question, were such as almost to amount to an impossibility; though it was perhaps rash to say this, considering the rapid progress we had made in the last century.

After some further conversation on the subject, the party separated. We need scarcely add, that though it is not by this kind of discussion that the severer truths in science are to be elicited and established, yet much good may be done by exciting further interest, and thereby leading to more rigorous examination. For a more minute account of M. Mädler's hypothesis, the reader is referred to No. 163 of our current series.

THE ELEPHANT KRAAL.

[The following account of the capture of wild elephants, we give in an abridged form from a recent number of a Ceylon paper.]

We left Kandy at two o'clock for Kornegalle, a distance of twenty-three miles. The road was most beautiful, and some of the views were more splendid than anything I had seen before in Ceylon, particularly one from Mr Villier's estate at the head of the Gallegeddra Pass. When you first come in sight of the low country, the road winds along the brow of a mountain, and arrives suddenly at an opening, where you look down a lovely valley surrounded with magnificent mountains, covered with verdure to their very summits. The only thing wanting to make it perfect is water; but this is the

case in all our Ceylon views. As we approached Kornegalle, the road put me much in mind of home—the meadows at each side of us, with the cattle grazing on them, were quite familiar scenes, and drew us back in imagination to dear old England. It was dark before we reached our destination; but the road was illuminated with the fire-flies, which are extremely beautiful in this part of the country. One of these lovely little creatures was secured, and placed on a watch, and its light was so strong, that we were able to ascertain the hour. We arrived at Kornegalle, and started next morning at half-past five o'clock on horseback for the kraal, about twenty miles distant. For the first hour or so it rained so much, that we were not able to remark the country we were passing through; but about seven o'clock the sun appeared, and it became very pleasant indeed. The road, or rather bridle-path, lay through paddy fields for the first six miles, and was admirable ground for a good roadster. The next four were through a thick jungle, which, the sun being strong, shaded us very pleasantly. The flowers were lovely: the magnificent exoria grew in abundance, also one of the 'bottle-brush' tribe, of the most beautiful blue. I remarked a very handsome yellow flower, very like a laburnum, only much larger, which hung gracefully in bunches over our path. We crossed a lovely river, called the Dedra-oya, about four hundred feet wide: all here was gentleness and peace: several beautiful trees drooped over the water, and bathed their graceful branches in it. We reached the kraal about nine o'clock: the latter part of the road lay along the bed of the Kimbool-wanya, which at this time of the year was quite dry. Our English friends would have been highly amused had they caught a sight of our suddenly-created village of kraal bungalows, which was constructed entirely of the leaves of the talipot palm: our rooms were hung with red and white cloth; and our furniture very much in the Robinson Crusoe style.

In front of the governor's bungalow a kind of triumphal arch was erected, most tastefully ornamented in the native fashion with plantain leaves, cocoa-nuts, pine-apples, &c. There were eight bungalows altogether, also a bazaar, and several native huts, so that we had quite a village of our own: all this was erected by the natives in a few weeks. Next morning, as we were going to breakfast, we were startled by the trumpeting of an elephant, which appeared to be just at our elbow; but our alarm was soon over, as one of our party came and told us it was only one of the tame elephants brought for our inspection. She stood just outside our door, with the mahout or rider on her shoulders, and appeared perfectly tame, eating oranges and plantains from our hands, and seeming to enjoy them very much. It was wonderful to see her place a great cocoa-nut, husks and all, in her mouth, and crush it as a nut-cracker would a filbert. It is a very old elephant, and has been in the possession of government more than forty years. It is valued at two thousand rupees.

Before I proceed further, it is necessary that I should give a brief description of the kraal itself, and the manner of capturing the elephants. About an acre of jungle is formed into a square enclosure, leaving only a small opening to let the elephants enter; the palisades round this enclosure are about eleven feet high, and at one end two wings extend into the jungle for some hundred yards on each side of the opening, so as to form a long wall screened by the forest, the use of which is to prevent the elephants, should they hesitate in entering the kraal, from escaping at either side. An elevated stand is erected on one side of the enclosure for the spectators. It is about twice as high as the palisades, so that we looked down into the kraal: I believe kraal is a Dutch word, which signifies an enclosure. The men who drive the elephants into the snare are out for several days before the exhibition takes place, in search of the animals, which come down at this time of the year (July) for a plant called kooranna, a kind of flax, which is then ripe. When they discover their destined vic-

times, they light their fires and torches behind them, to drive them on towards the entrance of the kraal, always keeping in a circle to prevent them from returning. They are thus forced close up to the mouth of the enclosure, where they are detained for the final 'drive,' when they are compelled to enter. The moment they are in the kraal, the entrance is closed up, and they are safe inside, where they keep charging all round the enclosure, but are repulsed by the beaters. These people, when they see the elephants approaching the fences of the kraal, scream with all their might, and this frightens them so much, that they turn to some other point, where they meet with the same reception. Two thousand people were employed in this kraal; and the principal part of these came without any remuneration, as to a national sport; indeed, if they were offered any, they would leave the kraal, and return to their homes affronted.

We were told that the drive was to take place after tiffin, so at two o'clock we all marched down to the kraal. At length, as we were talking and laughing together, we were startled by a scream rather than a shout from the crowd round the stand; and on looking round, we saw the people evidently very much alarmed, running here and there, and throwing each other down in their fright. In a few minutes all was quiet again, and we were told that it was only one of the wild elephants that had separated from its companions, and was trying to break the line and escape. Hour after hour passed slowly away, and still no sign of the elephants. It became quite dark about half-past six o'clock, and we were allowed no lights, for fear the animals might be frightened, and turn back. I must here remark that the elephant's eye is constructed like that of the cat: it therefore sees much better at night than in the day-time. We were not only obliged to sit in darkness, but also in silence, as their hearing likewise is very acute. In this state we sat till half-past eight o'clock, when in one instant the whole place was lighted up, and silence was broken by the most deafening shouts, which even now are ringing in my ears: a crash was heard, and eighteen elephants tumbled into the kraal, which they rushed round and round, charging here and there in their anger and fright. The enclosure, however, was rapidly surrounded by crowds of the beaters, and a chain of fires blazed up on all sides, so that escape was hopeless, and after a vain rush at every point, the poor frightened herd collected quietly in one corner under a thick jungle, and stood wearied and at rest.

Next morning we breakfasted early, in order that we might have more time to spend at the kraal. When we arrived at the stand about ten o'clock, all the elephants were together in a corner as before. They had covered themselves with dust in their first rage, but now they appeared quite stupefied and overcome. There were two tiny little ones among them, which always ran between their mothers' legs; and it was extraordinary to see the care the elder ones took not to touch them with their large clumsy feet.

Soon after we arrived, the entrance to the kraal was cautiously opened, and about six or eight tame elephants entered, with their mahouts or riders. This seemed to startle our wild friends a little, for they immediately formed themselves into line, and prepared to make a charge. The tame ones were quite prepared for this, and continued to advance, throwing down several large trees, and crushing them under their feet, which had the effect of intimidating the others, who instantly retired to their former position. One or two of the tame elephants now advanced towards them, followed by the noosers, to commence the capture. The moment the wild ones saw them approaching, they made a charge, when one of the men threw a noose round the hind-leg of one of the largest, the other end of the rope being made fast round the neck of the tame one, who pulled it with all her might. The victim made prodigious efforts to escape, but all in vain; and at last he threw himself down on the ground in despair, when

one of the tame elephants coming behind him, actually pushed him up with its tusks, to his hopeless and final discomfiture. He now gave himself up for lost, and allowed himself to be bound without further resistance. His hind-legs were fastened together, and then bound to a strong tree: his front feet were treated in the same manner, with the exception of not being tied together. When he was quite secured, he again threw himself down on the ground, and lay there for two or three hours in exhaustion and despair. He covered himself with dust, which he collected and scattered with his trunk; and from time to time he inserted his trunk into his throat, and drew from some receptacle there a supply of water, with which he moistened the whole surface of his skin. It would thus seem as if the elephant, like the camel, is provided with a reservoir of this kind; but whether similarly situated, I am unable to tell. This elephant was altogether half an hour in being caught and secured, though, owing to the excitement, we could scarcely believe it was five minutes. In this manner sixteen of the elephants were noosed and made fast; and so completely subdued were they, that most of the spectators entered the kraal to pull out the hairs from their tails, to get made into bracelets, rings, &c. as little souvenirs of the day. It really was one of the most melancholy sights I ever witnessed, to see those poor creatures, the true lords of the forest, there at our feet, humbled to the very dust, some lying down as if dead, others leaning against the trees, apparently in all the stupor of despair at the loss of their liberty, and all with their spirit, hope, and courage entirely lost. Even one which was loose seemed quite stupefied; for though several times unfeelingly tormented, it never moved an inch, but appeared as if in a dream.

When returning to Kornegalle, we were most fortunate in having the pleasure of having for a companion Dr Gardener, the eminent botanist, in whose company the most insignificant plant or flower had some interest, in relation to which he has always something instructive to tell. On our journey back to Kandy, he discovered the upas tree growing within a few miles of Kornegalle. It was not known before that it grew in Ceylon. In returning to Kandy, I must say that I really felt very glad to feel myself once more out of the range of our jungle friends—the elephants; and that for several days afterwards I imagined every sound to be either the trumpeting of the animals or the cries of the beaters. A kraal, however, is, in my opinion, the only sight worth seeing in Ceylon, combining at once novelty, excitement, wonder, and instruction.

PANIC.

ON the unreasonableness, in most instances, of commercial panic, and its injurious effects on general society, we find the following useful observations in a late number of the 'Globe' newspaper:—

'An evil which may be said to overtop every other, is groundless alarm, and this every sensible man of business ought to do his best, by every means in his power, to allay. It is the men of limited observation and small discretion with whom these panics originate, and who principally propagate them. These abound in every commercial circle; and though little noticed, and generally harmless in ordinary times, their united action at periods of difficulty, when they do give tongue, and get listened to, has a most formidable effect upon the state of credit. Let but one or two men of this class see those of better discretion, before whom they have been used to stand rebuked, puzzled and troubled by the aspect of commercial affairs—let a word or two fall upon their ears fitted to excite general alarm, and away they go, puffed up with the novel power to excite attention, talking and writing in all the varieties of manner excited folly can assume, and doing all they can to make their neighbours and correspondents stand aghast—because while they do this they can inwardly revel in the delicious consciousness of a degree of social power denied to them at all other times. To do these persons justice, they seldom have, we believe, any distinct perception either of the mischief they do, or of the vileness of

the office they are performing. It will be observed that it is only when the more discreet order of men—the natural rulers of society—have committed themselves by some gross and general imprudence, and by abusing, have for a time lost possession of their power, that the herd of shallow wittlings and sheer fools obtain an opening to play these pranks. In truth, they wield a retributive power in some respects analogous to that of the public executioner. Their betters—for the most part, though not entirely, by a culpable disregard of invariable laws which, though imperfectly known, might doubtless be better known if better attended to—have brought themselves into difficulties apparently inextricable. When the soundest judgment is fairly puzzled, all are much upon a level. The wisest can do nothing, and the most foolish can do as much. And then, every voice being equally listened to, the majority in numbers are for the time uppermost, and we discover what it is to be ruled by an instinctive combination of the weak, the ignorant, and the timid. The shorter their reign—and we wince under it now—the better. And there is nothing easier than their deposition.

Let every man, not only in business, but out of it, resolutely close his ears to rumours of every kind. Let all inquire as much as they please—nay, industriously search after and assure themselves to the utmost of every fact which concerns their own pecuniary interests; and let all to whom questions of this description are addressed answer them with the frankness best betokening honesty. But let all who are not yet destitute of self-respect, and who would not render themselves justly liable to be set down either as weak, babbling fools, or malignant knaves, now avoid, as they would the commission of a heinous crime, the giving currency to reports of the good foundation of which they are not themselves assured. Better fling a blazing torch into your neighbour's house, than mutter innuendoes against his credit. If it concerns you, inquire into it; and when you have discovered a fact, whether it be for or against him, out with it, for the truth can do no harm. If it does not concern you, leave it to those it does. To repeat a mere surmise is, in most cases, to take part in the manufacture of a lie, for the gossiping weakness that prompts the repetition, craves, and can seldom deny itself, the gratification of adding some little to its strength; and though the first inking may have been born of a fact, the chances are a thousand to one against the final assertion, rumour-built and folly-fastened as it is, bearing any decent resemblance to the truth.

AUTUMN.

BY W. MOY THOMAS.

THE wheat is garnered in the red-tiled barn,
And the waste ears begin to spring again,
No power is in the feeble-breathing morn
To sweep the mists along the stubble plain;
The dew hangs, like a lately-fallen rain,
On the nut-loaded borders of the wood,
And on the hedge flowers in the rutty lane,
And on the thankful sparrow's winter food,
The powder-bloomed sloe, and berries red as blood.

The misty sun keeps red until the noon,
And turneth red again before the day
Is three hours older; and the large round moon
Keeps her ruddy countenance alway;
And when the stars are seen, wine-red are they,
Even from the clearest zenith looking down;
And where the mists awhile have crept away,
And the fair earth doth make her beauty known,
No other tints hath she but crimson, gold, and brown.

Sometime a lazy wind comes from the south
Slow journeying, soars a league from morn till night,
O'er the light grass-seed, singing in the drouth,
Where the free cricket ever hides from sight;
Or on a poppy field it doth alight,
And sleeps awhile, then to the wood goes forth,
Entangled, struggling on, or stays its flight
With the rich bramble-fruit borne down to earth,
And rousing thence, moves on to warm the aged north.

A pleasant life hath that same autumn wind,
Fed with all odours that on earth are found;
Its only toil to wander out and find
What fingered chestnut leaves are most embrowned,
To make a russet clothing for the ground
Against the early snows: and many a trick
In wanton idleness it plays around,
Upon the white-thorn bushes spreading thick
The hay that looely hung around the bulky rick;

And often turns aside to linger round
A granary, until they open the door,
When, sauntering in, it makes a cooling sound
Among the crevices, and evermore
Twirls the light husks around the thrashing-floor,
Whereat the sleek brown mouse shrinks back in fear,
Until the memory of the golden store
O'ercomes his fright, and venturing not too near,
He carries to his hole a single shrivelled ear.

Then to the smoke-enwrapped and toiling town
Before it bears the feathered thistle-seed,
That long bewildered wanders up and down
To find the road that to the fields doth lead;
Till in a current drawn with sudden speed
Through some high factory window, opened wide—
A gentle spirit from the daisied mead!
The dirt-grimed workman rests his toil beside,
And of the woods and fields long muses flimzy-eyed.

Or slowly wandering up the hazy stream,
Vexes its placid course with wrinkles small,
And from the surface drives the clumsy bream
Into safe covert 'mong the rushes tall:
Yet gentler service sometimes doth withhold;
When the faint dying scholar makes a sign
To raise his chamber window, it doth fall
Upon his fevered brain like food wine,
And with refreshing rattle lifts the caseous vine.

But sometimes, day by day, the hazel tint
Grows deeper on the mass of forest trees,
And not a single breath from heaven is sent
To cool the ruddy fruits, that by degrees
Wax ripe and riper in a dreamy ease;
And bursting, trickle down, a honeyed rill,
To tempt from sweetest flowers the buzzing bees,
That buzz no more till they have had their fill;
Then laden, travel hitherward, buzzing louder still.

And so the dead leaves hang upon the stem,
Because there is no gentle stir of air,
Although the softest wind had scattered them,
And left the myriad branches dry and bare,
Till the sharp north wind cometh unawares,
And half relieves the laden orchard-bough;
And like hoar death, that kills the good and fair,
Lays autumn's loveliest bells and blossoms low,
And sudden winter falls wherever it doth blow.

But now a-many golden hours must pass
Ere gray October's frosty latter days
Knit cold November in the general mass,
And shrouding all things in a yellow haze,
Among the minds of men much doubting raise
Where autumn ends and winter doth begin:
And still with us the chilly swallow stays,
And round the rain-spout flutters out and in,
Nor dreams of Biscay's shore or southern Limousin.

WHO CANNOT BE RICH?

A Polish woman, who has a stall in the Franklin market, found herself, about five years ago, a widow with four young children, and an estate of just one dollar and fifty cents in money. She did not, however, turn her steps towards the almshouse, nor spend her time in begging from door to door. Though embarrassed by a very poor knowledge of our language, she immediately invested her capital in some articles which she could sell, and commenced operations, employing her children as she could for her assistance. For a year or two past she has had the market stall. A few months ago she learned that the owner of a good farm of seventy-five acres, in one of the central counties of the States, was very desirous to sell his farm for money. She examined the farm, found a good house, barn, &c. and fifty acres under cultivation. Her small store had grown to *twelve hundred dollars*, all safe in the savings' bank, and she offered it for the farm, and it was accepted, for it was all in cash. The Polish widow now has her country estate, where she has been spending some months; though, unwilling to retire as yet, she has returned and resumed her stall. What a fine provision for herself and family has she secured by five years of determined effort! What proof has she made that this is the land where all may be rich who have health, and where they only who have it not are proper objects of charity!—*New York Journal of Commerce.*

RECLAMATION OF GIPSIES.

While an effort has been making to reclaim the Scottish gipsies, by means of education and otherwise, at Yetholm, we are glad to learn from the following paragraph in the

'Poole Herald,' that the reclamation of this interesting race from vagrancy is receiving attention in England:—'A substantial, chaste, and commodious building is now completed at Farnham, and was opened a few days since, for the education of orphan gipsy children, and for the younger branches of those gipsies who have large families. All will here be taught to read and write. The girls will be trained to the various household duties, and fitted to go out to service. The boys will be carefully instructed, and when arrived at a proper age, apprenticed to some useful trade. The building is capable of accommodating twenty-four children, but as yet rooms are only fitted up for half that number. The meeting was most numerous and respectfully attended, there being present between four and five hundred persons, comprising many of the principal residents of that part of the country.'

CONCLUSION OF THE MISCELLANY.

THIS day we issue the concluding numbers of CHAMBERS'S MISCELLANY OF USEFUL AND ENTERTAINING TRACTS—the work being completed in 177 numbers, or twenty volumes. The design of the work, as far as we proposed to carry it out, being fulfilled—namely, the furnishing of a variety of tracts on instructive and entertaining subjects, likely to prove useful in their sphere, and calculated to supersede in some measure sheets of a demoralising tendency—it has been thought fit to bring it to a close. As far as the MISCELLANY has gone, there has been nothing to complain of with respect to circulation. During the currency of the work, since its commencement three years ago, the weekly impression has varied from 80,000 to 100,000; but including reprints, which are constantly going on, the average impression of each sheet of 32 pages has been 115,000. Of some sheets, which appear to have been peculiarly popular, the impression has been upwards of 200,000. The tract, 'Life of Louis Philippe,' has been put to press thirteen times, and the various impressions have amounted to 280,470. The total number of sheets of the work printed till the present hour is 18,000,000, the whole forming 38,125 reams. The weight of the entire mass printed has been 387 tons. The cost of the work for paper has been L.25,766; for printing, L.11,545; and for binding, L.16,248. The money paid to authors for writing has in most instances been L.10 per sheet, or altogether L.1450; and for wood-engravings the outlay has been about L.500. Of miscellaneous disbursements no account need be taken. The price paid by the public for the work has been L.100,000. The profits dispensed among the bookselling trade may be estimated at L.38,000. Of the general sales, the bulk has been chiefly in volumes. The quantity of volumes done up at each issue has usually filled two wagons; total number of volumes done up, 1,300,000. The larger proportion of these have been disposed of in or from London as a centre; the circulation has been mainly, where we were most desirous it should be, in the manufacturing and commercial districts of the country.

Our reason for presenting these facts, we hope, will not be misunderstood. They are offered as not uninteresting statistics in a department of popular literature, and with the view of showing, in a few figures, what must be considered a prevalent tendency in the public mind. That we have not been so fortunate as reach to a large extent the more humble and laborious classes, is readily allowed; at the same time, our aims have been invariably in that direction, and the distribution of so vast a quantity of literature, accessible from its cheapness, and at least not prepared without anxiety as to its adaptation for popular reading, can scarcely be altogether in vain. Of this, however, the public is the best and sole judge. The only thing for which we claim any credit, is having practically established the fact, that a periodical which neither has ministered to sectarian or political prepossessions, nor been the vehicle of moral pollution, has throughout maintained a circulation infinitely greater than that of any work of the same size armed with these powerful attractions.

A few words only require to be added on a point in-

volving considerations as weighty to others as ourselves. The cost of the paper employed in the MISCELLANY (L.25,766), includes the sum of L.5431, which has been paid to government as duty. We leave the candid part of the public to judge whether, even taking the work in its lowest aspect as a mercantile enterprise, it be quite right and proper that the government—for such is the fact—should reap a greater share of profit than those who have undergone the whole of the risk and toil. No doubt the price of the work might have been made higher in order to meet this exaction, but that would have so far defeated the intentions of the publishers, by limiting the sales, that the work could not prudently have been entered upon. At present, the duty is 1½d. per lb., with an addition of 5 per cent.; practically, it is 1½d. in 7d., the price of a pound of paper, or about 21 per cent. on the value of the article. As respects higher-priced books, this duty can scarcely be said to be felt; but on works of a cheap class it falls with peculiar severity, and therefore must be presumed to act detrimentally in the projection of popular and improving literature. We do not say that, had the paper duties been removed, we should have extended the MISCELLANY to a greater number of volumes, because we think that the work is of a sufficient length for all useful purposes; but we certainly would have been inclined to follow it up with some other periodical equally cheap, diversified in its character, but with similar ends in view. As the matter stands, there is so much the less encouragement for any individuals in our position to attempt to stem the flood of polluting literature which now pours from the press of the metropolis.*

Humbly trusting that something of permanent utility has been accomplished, grateful for the sympathies which these humble efforts elicit from so many of the wise and good, and grateful, above all, to that Providence by which the means of sending the winged words of instruction abroad exist, we take leave of what has been a heavy task and great responsibility, only to brace ourselves to new exertions. Maintaining inflexibly our resolution to keep within our own proper field—that of a healthful literature, combining entertainment with instruction—we contemplate, besides giving increased attention to the JOURNAL, several new, though less onerous tasks. Next week is to be issued the first number of a revised and improved edition of the INFORMATION FOR THE PEOPLE; and in about a month from the present date will appear the first of a series of small Books for children. Of this latter undertaking a prospectus will be given in our next publication.

W. AND R. C.

Now completed, as above,

CHAMBERS'S MISCELLANY OF USEFUL AND ENTERTAINING TRACTS, IN TWENTY VOLUMES, AT ONE SHILLING EACH:

Adapted for general circulation among the less-instructed classes, and for libraries in the army and navy, hospitals, prisons, schools, and other establishments. All the tracts will continue to be sold separately at a Halfpenny or a Penny each, according to size. Attention is respectfully drawn to various tracts suitable for distribution—as, for example, on the Management of Infants, Fireside Education, Tight Lacing, Cleanliness, Temperance, Life-Assurance, &c.

* * SOLD BY ALL BOOKSELLERS.

* See a recent article in the 'Daily News,' descriptive of the multiplicity of periodicals in the metropolis, the whole materials of which consist of tales of murder, lawless passion, and every other imaginable means of moral deterioration.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 98 Miller Street, Glasgow; W. & ORR, 147 Strand, London; and J. M'GLASSAN, 31 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 205. NEW SERIES.

SATURDAY, DECEMBER 4, 1847.

PRICE 1½d.

PENCILLED THOUGHTS.

It is said of Coleridge that he was a great borrower of books, and that he always returned them to their owner with the pencilled remarks he had made while engaged in perusing them. I cannot approve of the writing upon other people's books at all, even where it may be thought that the commentator surpasses the author. One may, however, do as he likes with his own; or, if the practice be objected to as one tending to deface and injure the fair body of a book, then he may indulge his humour much to the same purpose on a fly-leaf, or with a detached slip of paper. It is certainly pleasant to talk in this way with one's author, whether or not we agree with him in opinion; nay, for that matter, I am not sure if the pleasure is not a little heightened by somewhat of opposition in sentiment; inasmuch as it affords the mind an opportunity—whic[h], if it be of a superior order, it will not fail to enjoy—of trying its strength, and feeling its resources: a noble exercise, and one for which it will have had but little scope should its process of training have been that too common one which consists in specific directions to think like Mr A—— or Mr B——. We are obviously intended, by the constitution of our being, to have something of our own to rest upon; and as little children are taught at a proper age to feel their feet, in order to prepare them for going alone, so should the youthful mind be led to ascertain its powers, that it may not move in a go-cart all its days, equally afraid and unable to stir a step by itself. For this purpose, the practice of pencilling down the passing impressions which are suggested by a thoughtful book is eminently instructive.

But are not the remarks of young readers likely to be crude and profitless? Crude enough, no doubt they may be, but not profitless, supposing them to be prompted by genuine feeling, and recorded with simplicity of purpose. Nothing is profitless that comes from the heart; no, not even a mistake. We can do little else than mistake in the first steps which we take in learning anything; but these mistakes have their use, by serving as beacons to warn us against steering towards the coast where we have already suffered loss. I am intimately acquainted with a lady, now advanced in life, who traces much of her present capability of appreciating and enjoying thoughtful literature, to the circumstance of her having made some pencilled remarks in a volume of poetry, which, when she was very young, an accomplished gentleman, old enough to be her father, and an intimate friend of the family, happened to see, and borrowed of her; and which, when he returned, he accompanied by the following note:—

'DEAR MISS—I have been interested in the book

which you kindly lent me, but not so much as with the comments you have scattered through it here and there. Allow me the pleasant privilege of attempting to teach you to *think*; which you will perceive that I have made some advance towards doing, by venturing to differ from you in opinion respecting some of the poems in this volume. Please to compare our pencilled criticisms, and rub out those which, after due consideration, you believe to be erroneous.'

Greatly surprised was my friend, then fervent in the enthusiasm of nineteen or so, to suppose there could be two opinions as to the quality of the poems which she had lauded with the terms 'exquisite,' 'enchancing,' and so forth, but which the more experienced pencil of her friend had in most instances lowered down to 'poor,' 'insipid,' 'not original, and good for nothing if it were;' but, the dissatisfaction of the moment overcome, she set herself to the occupation which had been recommended to her, of comparing her thoughts with those of her friend, and gradually began to discern how much of her admiration had been the result of those mistakes which unaided and inexperienced youth can seldom do otherwise than make. 'It was the first thing that taught me to pause and reflect,' said she, 'before I gave forth an opinion upon what I was reading; and it has thus been the means of training me to habits of study, which become more and more precious with every advancing year.'

It cannot indeed be too much remembered, that it is one thing to read a book, and another to study it. And what is the life of an intellectual being worth without some object of study? In point of fact, no intellectual being does, or *can* live devoid of such an object, though it may not, and in most cases certainly does not, exist in the regions of literature. But what can we call those incitements which demand so much expense of time and thought, as to how we shall best enjoy ourselves, and appear the best in the eyes of others, but objects of study? And what are they who are engrossed by them but students, and laborious students too, though in another sort of learning than that of books? But this by the way—*Revenons à nos moutons*.

The habit of noting down our impressions as we read, by introducing us into the inner world of thought and feeling, prepares us to understand what we really do believe and comprehend, and consequently establishes a capacity for judging of the value of a book, which, in point of fact, is possessed by comparatively but few persons; the greater number of readers contenting themselves with swimming with the stream, and approving of everything that has the stamp of popularity upon it, let its intrinsic worth or worthlessness be what it may. This is not as it should be; neither is it as it would be, if reading for improvement were made more a matter of conscience, and something more were sought and

desired from the pages of works professing to be of a didactic character, than one-sided views, which the reader takes upon trust, because he is too indolent to think for himself. Were there more thinkers, there would be more earnest writers; and we should not have to complain with the celebrated essayist, John Foster, that there is so great a deficiency of what may be called conclusive writing. 'How seldom,' says he, 'do we feel at the end of the paragraph or discourse that something is settled and done. It lets our habit of thinking and feeling just be as it was. . . . We are not compelled to say with ourselves emphatically, "Yes, it is so; it must be so: that is decided to all eternity!" I want,' he goes on to say, 'the speaker or writer to settle some point irrevocably, with a vigorous knock of persuasive decision, like an auctioneer, who, with a rap of his hammer, says, "There—that's yours; I've done with it: now for the next."'

These are the kind of writers to do us good; but in default of them, it is not altogether unprofitable to take the position of the auctioneer ourselves, and knock down with our pencil the sentiment with which we cannot agree. I have sometimes seen a curious fight of this kind in an interleaved book, wherein the poor author put me much in mind of the policeman in the puppet-show, who, being sent to apprehend Punch for various misdemeanours, is knocked down himself and fearfully mauled by that personage. But lively as this combativeness may be, more edifying, and, on the whole, more agreeable is it that something of the character of sympathising friendship should subsist between the writer and reader. It seems as if it ought to be so. Yes, it seems as though one *ought* to love and esteem the fellow-creature who comes into such close contact with our spirits, and who, if he does his work aright, will awaken a response from every interior chord on which he lays his hand. And doubtless this kind of affectionate interest is excited in our minds towards the author who, by the power of his eloquence and his sense, constrains us every now and then to lay down his book, and pause upon the truth which he sets before us. We begin to wish that we knew more of this present, speaking, but invisible friend. We think we could lay open to him some of those secret springs of thought and feeling which he has so skilfully, though unconsciously, touched. We wonder whether he will ever come in our way. Perhaps not; but we should like to know a little about him. And then we remember some Mr or Mrs or Miss so and so, who either knows him, or knows somebody else that knows him; and through this channel we resolve to take an opportunity of hearing if he talks, and lives, and looks just as we expect and desire that the person *should* do whom we are so greatly disposed to love and esteem.

There is something in this kind of homage totally different from the adulation which always travels in the wake of the popular author. That is of a character which makes no pencilled notes; for it cares no more about books, or those that write them, than as it respects the wealth and fame they may obtain. It is not of this species of approval that I am speaking, but rather of that of which it may be said that it exalts those who pay it as much, or more, than those to whom it is paid; for those who deserve to be the objects of this generous enthusiasm, are usually as much distinguished by humility as by talent. There is a striking and touching passage in the life of the Danish

poet Hans Christian Andersen which bears upon this point. 'I was invited,' he says, 'by some students of Lund to visit their ancient town. Here a public dinner was given to me; and as I was in the evening in a family circle, I was informed that the students meant to honour me with a serenade. I felt myself actually overcome by this intelligence: my heart throbbed feverishly as I descried the thronging troop, with their blue caps, and arm in arm, approaching the house. I experienced a feeling of humiliation, a most lively consciousness of my deficiencies; so that I seemed bowed to the earth at the moment others were elevating me. As they all uncovered their heads while I stepped forth, I had need of all my thoughts to avoid bursting into tears. In the feeling that I was unworthy of all this, I glanced round to see whether a smile did not pass over the face of some one, but I could discover nothing of the kind.' After relating a few more particulars of what passed, he thus concludes the subject. 'When I returned to my chamber, I went aside in order to *weep out* this excitement, this overwhelming sensation. "Think no more of it; be joyous with us," said some of my lively Swedish friends; but a deep earnestness had entered my soul. Often has the memory of this time come back to me; and no noble-minded man who reads these pages will discover a vanity in the fact, that I have lingered so long over this moment of life, which scorched the roots of pride rather than nourished them.'

But once more to glance at our subject, of which I have again a little lost sight. By accustoming ourselves to pencil down our thoughts, as we travel through the pages of a book, we are likely to acquire a most invaluable art, which is that of coming to the point, and putting our remarks in the shortest possible compass; for the circumstances under which we make these passing comments are usually of a kind to prompt us to be simple and concise in our observations—and to learn to be simple and concise, both in speaking and writing, is to learn a valuable and rare accomplishment, and one which can only be acquired by exertion and experience. We do not easily, nor, whilst we are young, very willingly, perceive that those are commonly the best and most useful of truths which are presented to us with the least ornament of rhetoric; for of truth it may assuredly be said, as of beauty, that it is, 'when unadorned, adorned the most.' To believe this is a work of time, and the result of much sifting and casting away of that chaffy wordiness in which young sentimentalists are so prone to indulge, and which probably occasioned the counsel of Dr Johnson to a young author, that 'whenever he had written anything which he thought particularly fine, to be sure to strike it out.' It is worth being at some pains, however, to obtain a capability of judging rightly, and the possession of a quick and clear apprehension of the true and beautiful in thought and feeling.

It is having something of our own; and, as I have before remarked, we are obviously intended to have something of our own in the shape of opinion and feeling. In fact we can neither know nor receive anything as a truth, however we may try to persuade ourselves that we do, that is not sealed and witnessed to us as *truth* by the conviction and response of something within our own minds. We may endeavour, indeed, to approve of, and to acquiesce in, particular sentiments and feel-

ings, because we are told that we ought to do so; but love and approbation are spontaneous emotions, and can no more be imparted in a way of dictation and instruction, than the fragrance of a bed of flowers can be gathered and handed about.

There exists, in short, in most persons, a latent capability of discerning and delighting in what is good and beautiful; and whenever the hand of genius sweeps over this dormant capacity, it awakes, and joyfully responds to the touch. To place ourselves, therefore, in circumstances fitted to be thus aroused in our interior nature—whether it be by thoughtful reading or observation, or any other way to which we may be guided—is not only to do our duty, but also to aim at securing to ourselves one of the purest and most enduring of earthly gratifications.

THE YOUNG BOYARD.

THE sun was beginning to gild the tops of the lofty towers of Bucharest, the capital of Wallachia, when a young man, whom, by his short mantle and Asiatic head-dress, surmounted by a rich plume, it was easy to recognise as the heir of an illustrious family of Boyards, set out alone from his habitation, situated upon the banks of the Dumbrowitz, and took the road towards the mountains. You might have thought, by the striped carbine, inlaid with gold and mother-of-pearl, which he carried by a belt, and the indented poniard in his girdle, that the hope of surprising a chamois, or a wild deer, or of slaughtering a bear, the terror of the country, had called him thus early from his bed. You would have been deceived. He was twenty-five years old, and in love; and his age at this moment occupied his thoughts more than his passion. 'Twenty-five years,' he said half aloud; 'a quarter of a century: doubtless the best part of my existence! and what real use have I made of all this time? I have a thousand projects of happiness, without knowing how to execute them. I should be happy, nevertheless, if I had but time; but the moment of enjoyment always recoils from my grasp! My marriage with Anna is deferred for a year by order of the *vaivod*, her father. What a miserable time to wait! Marry at twenty-six! Why, I shall hardly have time to play the part of husband and father, and bring up a family, ere old age comes upon me! How fearfully short is life! Truly it appears to me a revolting contradiction to allot to man, the lord of the creation, so brief a space to reign, while different species of animals are allowed a life of centuries. Yonder stag, for instance, browsing on the edge of the crag (and he mechanically presented his carbine), may live perhaps five times as long as I.'

'Yes, if you are a bad shot,' replied a voice which seemed to rise from underground.

The young Wallachian started with surprise; then suddenly perceiving at his feet a man in tattered garments, crouching in the soil of a dried ravine, 'Who and what are you?' cried he, directing towards the apparition his instrument of death.

'Alas! merciful sir, though you should kill me, you will live no longer, and the stag will live just as long.'

'Who are you then?'

'A man who, to preserve his life, is compelled to trust it to the fury of the wild bull and the hunger of the bear.'

'Who seeks to take it?'

'Your equals.'

'What crime have you committed?'

'That of knowing more than other men.'

'Your name?'

'To tell it you is to risk much, for you carry a good carbine, and have the right of life and death over my race.'

'How can that be?'

'Merciful lord, I am a zingaro; chief of the zingari, proscribed and condemned by your laws.'

At these words the young sportsman recoiled involun-

tarily, with a gesture of contempt; for the zingari (gipsies) were a despised and wandering people, descended from the Copts and Nubians, who, by their pretensions to arts of necromancy, and dishonest practices, under the cloak of their supernatural profession, had lately fallen into total discredit, and aroused the vengeance of the government, which, finding a decree of banishment issued against the whole race of no effect, had authorised the people to put them to death wherever they might be found. It was this severe public measure which constrained the unfortunate Kaboul, the luckless inhabitant of the ditch, to take refuge in the mountains, though he was a stranger to the delinquencies of his fellows, and passed an honest life in the preparation of herbs, and in contemplating the heavens.

As we have said, at the fatal name of zingaro, Hassan Corati, our young huntsman, recoiled with aversion. Nevertheless, educated at the university of Padua, as were most of the opulent youth of his country, he had cast off the prejudices of his native land to adopt those of a foreign soil; and thus his Wallachian horror for the sons of Egypt yielded to his Italian love of the marvellous. He recollected also, that even among his persecutors Kaboul enjoyed the reputation of learning and honesty, though a vagabond. So he promised the poor wretch not only his forbearance, but protection; and recurring to his former idea, he said to the zingaro, 'You overheard the complaints I was making upon the unequal duration of life allotted to man and certain of the brute race?'

'Your weapon lies peacefully on the grass, and you provoke discussion,' replied Kaboul. 'I shall have pleasure in gratifying your wishes, and hope to show you that a miserable outcast such as I am may possess the gift of reason equally with a wealthy Boyard.' Thus saying, the ragged philosopher, ascending from the ravine, and shaking the dust and gravel from his tattered garments, made a sign to the young huntsman to be seated upon the bank, taking at the same moment an opposite place, but not forgetting, even in this desert solitude, the respectful distance that should separate a rich Boyard from an outcast zingaro. 'Let us see, my noble huntsman,' said he, 'if I understand you rightly: you complain of the brevity of life. If you can bear the truth, hear it for once from me, a beggar proscribed and despised—the cry that has escaped your lips is the cry of ingratitude against Divine Providence. Actions are epochs, and the periods of life are not measurable by the dial. Why should you be envious of the longevity of certain animals, while you possess intellect and imagination—powers which give importance to moments, and can transform an hour into an age?'

'Sixty minutes, employ them as you will, make but an hour of life,' replied Hassan with an air of disdain.

'Passed in a sleep without dreams, or in idleness without meditation, they form, it is true, but a lengthened series of monotonous periods, all similar to those which, once gone, leave but an imperceptible trace, soon mingled, confused, and forgotten with a thousand others that compose the void of existence; but arouse the faculties, occupy each instant with projects, with action, weigh every moment, and waste none, nor look upon aught with indifference, then are you happy in the present, the past leaves you pleasant memories, and the future is open to your hopes. In a word, you have lived.'

'Yes, for one hour!' sighed the young man. Then folding his arms, turning towards his companion, and fixing upon him an earnest look, half of supplication, half of command—'You, honest Kaboul, whom the country deems learned in magic science, do you not possess the secret of prolonging life?'

Kaboul replied not immediately, but burying his face in his hands, seemed to reflect profoundly; then rising from a reverie which appeared of weary length to the impatient Hassan—'I am in possession of this secret,' said he smiling; 'would you make a trial of it?'

Hassan had read of the secret of Paracelsus, and not doubting for an instant that Kaboul was the possessor of it, he leaped up, and seizing the hand of the zingaro with a sudden effusion of tenderness, his eyes sparkling with immoderate joy, and his lips quivering—'You possess it,' he cried, 'and will dispose of it in my favour!'

'Willingly. I will endow you this instant, if you wish it, with two centuries of existence.'

'Two hundred years!' cried the joyful and credulous Hassan, while he pressed the beggar to his bosom. 'Oh, my friend! my second father! Yes, my second father, for I shall owe you more than the first; for rarely do men, by the ordinary laws of nature, though favoured by Heaven, live a hundred miserable years, and you assure me of twice that space! Speak, what do you require of my gratitude?'

'Nothing. In matters of bargain and sale the price should equal the value of the object sold. What could you offer me in exchange for what I give you? Therefore the two centuries of existence shall be a gratuitous gift. But mark what I say, and never lose sight of the prerogative attached to your new life: the future will be at your own disposal, and you will grow old as fast as you desire it.'

'I shall make but little use of that.'

Kaboul parted suddenly from Hassan, and the latter saw him climb rocks, dive down precipices, and leap over torrents, all the while chanting wild songs in an unknown language. At length he returned, bearing in his hand a bundle of various herbs. 'This place is not propitious to prepare them,' said he.

'Deign to follow me into my palace,' replied Hassan; 'everything there shall be at your disposal; you shall repose and refresh yourself after your fatigue and abstinence; and in spite of your refusal, you shall not depart without a princely reward.'

Kaboul smiled. 'To prolong your life, ought I to risk my own?'

'You need fear nothing in my company. Wrap this mantle around you. Let us go by way of the river: I reside at the entrance of the city.'

Kaboul followed him. A repast was prepared for the master of the house; and after Kaboul had composed his philter, he presented it to his host, who swallowed it with confidence, and sat down to eat, in spite of his quality, with the zingaro. Let us do justice to Hassan. Assured of living two centuries, his Anna became the first object of his thoughts; but this long year of expectation tormented him perpetually, solely through the impatience he felt to be happy; and not, as before, from the fear of not having time to bring up his family. He remembered the prerogative attached by Kaboul to his wonderful gift. Having two hundred years at his command, he could well afford to sacrifice one to his mistress. Further, he longed for an assurance that the gift of the zingaro was a reality, and not a deception; and this would be a certain test. So he wished that the year of expectation should be effaced from his life, and that the day of his marriage with Anna should dawn upon him at once.

Hardly was the wish formed, when he experienced a rapid and dazzling vision, during which the events of the entire year passed suddenly before his eyes, just as when the lightning cleaves the midnight sky, a thousand confused objects are presented to our view, and disappear in an instant.

Anna was already at his side in the habiliments of a bride. The whole city resounded with cries of joy, and the beating of drums, in honour of the daughter of the Prince of Wallachia; and the bells of the Greek church, suspended, according to custom, between two cypresses, announced to the assembled spectators the approach of the happy pair.

Happy Hassan and Anna! Their days of Hymen glided away amidst the enchantments of pleasure and of love. If any untimely ceremonial interrupted at intervals their moments of delight, Hassan had but to

form a wish, and he found himself alone with his beloved, free from the trammels of etiquette. True, these were so much time blotted out of life; but who can be said to live in moments of ennui?

Time passed on: hours enjoyed and hours destroyed brought Hassan to the eve of parentage. He learned that he was about to become a father, and could not sleep that night for joy.

Just at this period the vaivod besought him to undertake a journey in his behalf to the Sublime Porte. An important affair was to be transacted with the reis-effendi. He could not refuse this service to the father of his Anna; but how could he abandon the mother of his unborn child? This once the sacrifice of three months, the duration of his commission, appeared to him as dictated by reason.

The wish formed, the dazzling vision was repeated; the three months were effaced, and our hero, proud of his sacrifice to reason and to nature, could again devote himself to his son. He resolved to deserve the honours of parentage by fulfilling its duties. Then he would call the child Hassan: his wife would love him the more. He was sure he would be a charming infant. But then his dear Anna would suffer; and could he witness her affliction? Never! It was beyond his power. He would abridge the time of trial: this time it was the voice of pity, of humanity, that spoke, and he longed to embrace his son. Again he availed himself of his prerogative, and his Anna brought forth—a daughter.

All his projects fell to the ground: he must have a son, however—a little Hassan. Again he soothed his impatience by the exercise of his prerogative, till the period of a second paternity saw his wishes accomplished. Hassan the second saw the light.

But a good father cares for everything, and never was there a better father than Hassan the first. What should he do with his son when grown up? Should he send him to the university of Padua, where he was himself educated? No; he could not be separated from his son. He would confide him to the care of the sage Asgleton, the greatest philosopher of Asia, now resident at Bucharest, who in six years' time would terminate his engagements with the court, and be ready to undertake the education of his son. Philip of Macedon had rejoiced that the gods had given him Aristotle as a tutor for Alexander, and Asgleton was a second Aristotle. His impatience and anxiety became intolerable: he longed to secure the presence of the sage, and confide to him his precious charge. At length he could bear no longer delay. 'I sacrifice these years for my son,' said he; 'let him be seven years of age!'

His family increased: a larger palace became necessary, and more spacious gardens; and he could not tolerate the slow leisure of the artificers, or the tardiness of vegetation. Thus, master of his destiny, did Hassan sacrifice the present to the hopes of the future. We need not follow him through all the variations of his changeable desires. Through the frequent gratification of his insatiable wishes, he perceived at length that his hair was turning gray, and his wife growing old. What had he done with his youth? He had squandered it away, a sacrifice to his impatience of suspense. However, a vast career was still open to him; and with matured age other passions took possession of his heart, and these in their turn entail new sacrifices of his time. In the mad career of ambition, fresh drafts were made upon his life and his fortune, and, unhappily for him, both were at his heedless disposal.

Already all that he loved upon earth had ceased to exist: his son had fallen a victim to old age; alone Hassan pursued his way, sustained by the ambitious hope of being appointed vaivod, as his father-in-law had been. He obtained at length this enviable title; but with his nomination he received an order to levy troops, and to march in person, with the chief of Moldavia, against the Tartars of Boudziac, who had refused to pay the tribute to which they were subjected.

The new vaivod, forced, according to custom, to present the Grand Seignor with five hundred thousand Turkish piastres on his arriving at the regency of Wallachia, found himself ruined; it became necessary, in order to undertake this fatal war, at once to oppress his subjects with taxes, and to enrol them under his standards. These painful and novel occupations did not occupy his time so agreeably as to dispense with his abridging it. His prerogative came to his aid, and he saw himself immediately at the head of a superb army, one half of which deserted the next day. Relying upon his courage and the favour of Providence, he gave battle nevertheless, and was defeated; and being cited before the divan to justify his conduct, Hassan repaired to Constantinople, where he was cast into a dungeon, and forgotten.

The unfortunate man, surrounded with gloomy objects and savage guardians, had ample time to reflect upon his misery. 'I am approaching the terrible period when I must terminate my life,' said he; 'and yet how little have I lived after all! Perhaps I have sacrificed too thoughtlessly, to my desire of enjoyment, periods that would not have been without a charm; for even in the rapid visions which have passed before me, I have discerned objects worthy of regret. Let experience render me wise in future: time becomes precious to me. Once returned to my province, I will employ it for the good of my people and my own: every hour shall have its employment, its trials perhaps, but also its pleasures. I will do good; I will—— But alas!' added he, 'I am a prisoner, suffering under the weight of a false suspicion; it is folly to make such resolutions at the present moment: the few happy days that I hope to enjoy cannot be mine in this horrible dungeon! Ah! I will confound my vile accusers in the presence of the sultan! Let the hour arrive when justice shall be accorded me!'

He spoke, and found himself upon his deathbed. A shadowy form, veiled in the drapery of wo, and forehead wreathed with the fatal blossoms, appeared before him; in one hand he held a two-edged sword, with the other he proffered tablets to the dying man.

'Hassan Corati, thy two centuries are accomplished: thou didst complain of the brevity of life, and when two hundred years were granted thee, thou didst squander them madly in the pursuit of illusory pleasures, which vanished at thine approach. Double centenary, see upon these tablets the actual amount of thy existence. From thine encounter with the chief of the zingari, thou hast lived barely five years. Thine hour is come.'

'Already!' cried the miserably vaivod in a lamentable voice; 'already! when I was forming such noble projects for the glory and happiness of Wallachia. Vile Kaboul, it is thou who wert the cause of my disasters! What need had I of thine abominable philtres? Why did you not leave me to follow the common destiny of my race? I should have lived longer and happier—in spite of my wishes, it is true—but then I should have died in the arms of my Anna, and before my beloved son. Savage Kaboul! remorseless chief of——'

'Holla! my good host, wake up,' cried the zingaro, shaking him violently by the arm: 'is it a custom with you Wallachian Boyards to sleep over your meals? Awake, arouse, Hassan Corati! Your soup is exquisite, but it is growing cold.'

And Hassan opened his large eyes with an air of terror, and looking around him in utter astonishment, found himself in his palace of Bucharest, situated on the banks of the Dumbrowitz, tête-à-tête at a repast with the chief of the zingari, to whom he related at length the astounding visions of his brief repose.

'One thing,' said he, 'I regret—I am not vaivod.'

'No; but you may become so, if you are not afraid of the dungeons of Constantinople. But you have the consolations that are common to us all—you will not survive your offspring; and you may die in the arms of your Anna, though your marriage is yet deferred for a year. But tell me, what think you now of my asser-

tion, that thought and imagination can transform an hour into an age? Your dream has not lasted a quarter of an hour, and yet you have accomplished during its course an entire existence.'

'Ah,' said Hassan, 'but by what sorcery?'

'By none,' replied Kaboul. 'I know nothing of sorcery, and discredit its professors. The potion you drank was distilled simply from narcotic herbs, the property of which is to excite the imagination during the slumber of the body. I had but occasion to rouse those ideas to activity which already filled your brain, and of which I was informed by our previous conversation. The few words that escaped your lips at intervals convinced me of my success. You may learn from the lesson you have received, that it is sensation which constitutes and prolongs life. Noble occupations and wholesome pleasures amplify the existence—not the pretended powers of necromancy. Enjoy the present, of which alone you are certain, with wisdom, and in so doing, you provide honour and tranquillity for the future. Despise not the period of youth, nor cast the best gift of Heaven disdainfully from you: consider the end of all your designs: prize your time, and use it sparingly, for it is the stuff that life is made of. Never forget that the future is a gulf which the present is greedily devouring. Man complains of the brevity of life, and yet exercises all his powers to accelerate its rapidity. Well for him that his destiny is in better hands.'

The Egyptian rose and departed.

'Alas!' said Hassan, 'I must bear as I may the delay of this lingering year.'

GARDEN WHIMSIES.

THERE must be something, we are inclined to imagine, intoxicating in having much to do with flowers and gardens. Possibly a sort of hortifloral love may have to be reckoned by the psychologist among the passions of the human breast; if so, we would set down as one of its first general laws, that this sentiment has a great tendency to attain an extravagant height, and to pass all the common boundaries of common sense. Of the flower-love, we have the familiar instance of the Tulipomania as an illustration; and we may learn, in addition, that sober Dutchmen, head-over-ears in this passion, have been known to half starve themselves, that they might feed their anemones—to lose entire days in love-sick gazing upon a hyacinthine beauty—and to tremble for the consequences of a careless stranger breathing over a fair auricula. We happen to have known a person in the outskirts of London who carried his passion for tulips to such a pitch of frenzy that he ruined his family, and almost broke the heart of his wife. Finally, his household was reduced to a single bedstead; but this he one day took and placed over a group of tulips, tent-wise, to keep off the too ardent glare of the sun; having performed this droll feat, he sat down, pipe in hand, and for hours gazed with delight on the resplendent tints of his favourites. Cases of this nature supply us with a strong presumption that a love for flowers is liable to run into monomania. The extravagances of garden-makers are at all events curious, and worthy of notice.

It was according to rule that the excitable people of Italy would be among the greatest sufferers by the attacks of this disorder. A modern writer on Italy is lost in admiration of the garden doings of some of the cardinals of former days. Their riches, their taste, their learning, their leisure, their frugality, all conspired in this one object. 'The eminent founder would expend thousands upon his garden, but allot only a crown for his own dinner!' The garden of the Borgheese villa, of all others, was costly, luxurious, and whimsical. We read that from a distance this garden appeared like a great town, the wall being interrupted here and there with castles, turrets, and banqueting-houses. 'Within,' exclaims enthusiastic Evelyn, 'it was an elysium of delight.' It abounded with all kinds of delicious fruits:

exotic plants of the rarest description breathed out odours the most pleasing, and spent their vegetable lives amid the music of a thousand fountains and the murmur of countless rivulets. It contained a grotto of the most rare device, in which, at the visitor's pleasure, there fell down showers of artificial rain, which, we may add, often wetted him through against that will. Water in this place put on the character of Proteus: it was now jetting up in a full round bore, and, dashing against the roof of the grot, came tumbling down in millions of sparkles; now it was streaming out into an elegant vase, brilliant, liquid, inconstant; and now it flew into the form of a great convolvulus, or radiated away into an aster. If we may take the good gossip's word for it, and we are fully disposed to do so, 'nothing but what was magnificent was to be seen in that paradise.' The gardens of the Vatican, at the same period, were laid out and ornamented, and be-whimsied to an extent even surpassing their Borghese rival. They abounded in curious fountains, many of which tossed their water to the clouds. There were also wonderful grottoes of the 'most artificial' construction, and mimic lakes adorned the scene, on which floated diminutive men of war; and there also three bees poured from copper trunks three jets of water, under which was written some very witty Latin.

An estimate of the splendour of the Horti Matthæi may be obtained from the circumstance, that, on pain of forfeiture of the inheritance, an annual outlay of not less than six thousand crowns was necessary to be expended on them. The gardens of Frascati were of wide celebrity: in the centre rose a hill covered with wood, and naturally carved into such a fantastic outline, as if it had been a work of art. From its summit fell a cascade, which precipitated itself into a noble theatre of water, and as it fell, shone with an iridescence, when gleaming in the sunshine, which might vie even with the rainbow. Here was nature. But under the falling waters there was a grotto upon which vast sums must have been spent; and in it was a variety of instruments, played by the unwilling waters of the cascade. There were hydraulic organs; grumbling, uncomfortable, out-of-breath contrivances, now bellowing away might and main, then, as the air-chest got hydrothoracised, sighing out some indistinct notes of nobody knew what; while a spasmodic Cupid, as leader of the band, would twitch his arms and *baton* in a distressing irregularity of time; and three Titans at the farther end pound with wooden hammers a sham bit of iron on a sham anvil of deal; and a dance of skeletons enliven with their monotonous gyrations the background of the apparatus. Besides these, there was a monster to frighten ladies and little children, by roaring through a terrific horn; and finally, the representation of a storm, with such a fury of wind, rain, and tempest, as one would imagine the elements might themselves envy.

Every one has heard tell of the famous garden of Tivoli. It seems to have been an exquisite place, and it cost altogether nearly a million. It was crowded with innumerable statues, and abounded in stately fountains. One long and broad walk was full of *jets d'eau*, and each fountain represented one of Ovid's metamorphoses. Its principal *lion* was a large model of the imperial city, when 'she sat a queen' over the kingdoms of the earth. It represented all her amphitheatres, shows, temples, aqueducts, arches, and streets; and through it wandered a little rivulet, the representative of old Tiber, which gushed out of an urn held by a statue of the god. Farther on, a fountain of dragons roared out water; and a grotto, by a strange misnomer called the Grotto di Natura, resounded with the melodious wind and water strains of a large hydraulic organ. The great Cardinal Richelieu had also expended an enormous sum in embellishing the gardens attached to his palace at Ruelle. These splendid gardens contained a piece of real nature in the midst of them, consisting of a corn-field, vineyards, meadows, and groves, which bare corn, and yielded grapes, and

grew grass and leaves, the same as an ordinary farm. Here reaping, and harvesting, and every agricultural occupation were served up for the cardinal's amusement. But he was a great water wit also. In one of the walks was a basilisk of copper, near which some practical joker of a fountaineer was sure to be placed; and as the visitor was wondering at the metallic monster, he would be suddenly saluted with a powerful jet of water from its mouth; and if he fled, the wily basilisk would set to revolving rapidly, and shooting out its water to an immense distance, so that it was a certain thing for him to get drenched to the skin. At the end of another walk was an admirable view of Constantine's arch, painted in oil upon the wall, with the clear blue sky appearing so faithfully, that birds were frequently found dead at its foot, having dashed against the wall in the attempt to fly through it. Artificial cascades filled the air with glittering spray, and sheets of water like glass gleamed in the summer's sun. There was a grotto here too, and this was a grotto such as nature never beheld. In the midst of it was a marble table, all round which a sort of water banquet was displayed, various jets continually playing in the form of crystal goblets, glasses, crosses, flowers, and crowns. The roof showered down an everlasting rain; and in emerging from this place of wonders, two sharp-shooting musketeers took a generally successful aim at the visitor with their water-chases.

The Dutch gardens were mathematical whimsicalities. Triangles of orange-trees, ellipses of water, rhomboids of parterres, and parallel lines of groves, were the delight and glory of this taste. The very fountains partook of the same square-set character, and played with a sober steadiness altogether unlike the gambols in which that element generally waltzes. The garden of St Germain was famous for its subterraneous artificial caverns, where scenes of various kinds were performed by the force of water. Here were mills revolving, men fishing, birds chirruping, and sundry other devices of curious sort, especially an Orpheus, surrounded by dancing animals. The celebrated gardens of Versailles contained, besides numerous other remarkables, a series of fountains which represented *Æsop's fables*. The animals were all of brass, and painted in their proper colours, and cast forth water, in different forms, out of their mouths. The fox and the crane were thus personated: upon a rock stood a fox, lapping something from a flat gilded dish; while the unhappy crane, whose length of bill offered a serious obstacle to its joining in the feast, spouted water up into the air by way of complaint. There were altogether thirty-nine such follies, occupying different walks. These gardens cost two hundred millions of francs, and altogether cover two hundred acres of ground. M. Girardin, who expended a fortune on his gardens, added to their attractions that of a little patch, desolate and neglected, which he called his 'garden in ruins.' He was very vain of the 'points' about his grounds; and to call proper attention to them, used to employ a band of music to wander from spot to spot, so that the eyes of visitors might be drawn in succession to the different *lions* of the place. 'In the decal gardens at Gotha,' says the Quarterly, 'is a ruined castle, which was built complete, and then ruined *express* by a few rounds of artillery!'

At home, another sort of oddity disfigured our gardens. This was called the Topiary Art. Under the hands of London and Wise, our evergreens underwent metamorphoses more wonderful than Ovid's. It was said they left the marks of their scissors on every plant and bush. The ingenious Dr Plot, in his *Natural History of Oxfordshire*, expresses himself in warm terms of admiration upon these feats of the primary shears. At Hampton Court were some remarkable animals and castles cut in box, and a mighty wren's nest, which was sufficiently capacious to receive a man on a seat inside. Box-trees were often cut into sun-dials and coats-of-arms, and now and then some venerable mansion gloried in a couple of giant guards, 'clothed in living green.'

which kept up a perpetual watch near the gates, looking as natural as branches and leaves could well look. Listen to Horace Walpole. 'The venerable oak, the romantic beech, the useful elm, even the aspiring circuit of the lime, the regular round of the chestnut, and the almost perfectly-moulded orange-tree, were corrected by such fantastic admirers of symmetry. The compass and square were of more use in plantations than the nurseryman. Many French groves seem green chests set upon poles.' Giants, animals, and monsters of horrible grotesqueness, were the pride of the day; and the Gog and Magog, which may still be seen in some of our suburban citizens' gardens, are but faint and feeble outlines of the colossal stature and ferocious features of their boxen and yew-tree ancestors. We had our water-jokers in England too. At Euston, in Oxfordshire, in the gardens of a certain worshipful gentleman, were the most artistic water ingenuities it has been our lot to meet: a description of as existing in this country. They even drew down the marked approbation of royalty itself. On approaching the spot, a venerable hermit rose from the ground, and after entertaining one with a 'neat and appropriate' speech, sank down again like a Jack-in-a-box. There was a small rocky island in the midst of a lake, which was full of watery tricks. The visitor was politely requested to walk up and view this spot; and after satisfying his curiosity, and proceeding to walk down again, the fountainer would bob down, turn a cock, and send, we dare not say how many, *jets d'eau* flying on all sides of the victim, one stream having for its object his legs, another his loins, and another his head. After this funny reception, he was conducted to look at a spaniel hunting a duck, by the force of water—the automata diving and pursuing each other by turns. Beyond was the grotto; a hedge of sparkling jets of water rose from the ground to guard it, mimic cascades foamed down in tiny cataracts, and countless streams shot up, and appeared to lose themselves by being caught in their return, and not suffered to fall down again. Here, too, a nightingale discoursed very liquid music, and arched jets of water played with one another, and now and then with the visitor, all hope of egress being destroyed by the sudden pouring down of a heavy rain in the doorway. The sport which this caused was thought to be well worth the wetting. Probably the magnificent gardens at Chatsworth are the only places where anything at all similar to the above is now to be found. There are some practical wet jokes even here; and country bumpkins, in their native innocence, may be found willing to pay a visit to the weeping tree. The visit is never repeated.

After a while we are growing out of these whimsies, and a purer taste is diffusing itself over our pleasure-grounds; but to this hour the Chinese are even more full of them than were we, or any other nation, at our worst. Macartney says, 'it is the excellence of a Chinese gardener to conquer nature,' and it must be confessed it is an excellence which is pretty common in China, for by no stretch of the imagination can nature be recognised, excepting in her productions in their gardens. The Chinese emperor's pleasure-garden contained, it is said, two hundred palaces, and was on a scale of great magnificence. Artificial rocks rose up out of flat plains; canals and serpentine bridges enlivened the scene; and here the emperor played at agriculture and commerce. A small corn-field was reaped and carried home right under his celestial eyes; and as an amusement for him within doors, shops were erected, and business done as in the city, with all its minutiae, especially with the tricks of trade. Practical jokes are still in great vogue, and the walks are broken of purpose into holes and foot-traps, the fun being to get into them and get out again with limping, if not broken limbs. Nice, tempting, green, grassy little plots intersect some of them, on which, if the visitor plant his foot, he sinks to his middle in a bog. In these cases, however, the fun must not unfrequently become rather serious.

We might go on almost *ad infinitum* on this inexhaustible subject: we prefer to stop. Our object has been to expose the puerilities with which the childish taste of men has dishonoured what Lord Bacon declared to be 'the purest of all human pleasures.' At no time do the most exquisite works of man endure a comparison with those of his Maker—how much less so when it is a few childish toys, with their babbling and squinting absurdities, which are unnaturally united with the exquisite scenery and chaste creations which have proceeded from His hands!

MUSIC IN SWEDEN.

At a time when the sceptre of song is so gracefully swayed by a native of Sweden, it may not be uninteresting to our readers to receive a slight sketch of the early progress of that science in a country which has given birth to Jenny Lind—to her who possesses not only the rare and wondrous power of fascinating all ages and all classes in this unimaginative country, from the prince to the peasant—from the gray-haired man to the youthful stripling—but whose unobtrusive virtues have likewise commanded the respect and admiration of all those who know how to appreciate the difficulty of her position.

Apart from her glorious gift of song, and her great dramatic talent, Jenny Lind is a remarkable person, uniting, as she does, the naïve innocence of childhood and the gentle tenderness of woman, to that firmness and intelligence which are more peculiarly characteristic of another sex. But she is worthy of being praised by nobler and more gifted pens than ours; so having yielded our passing homage to the queen of song, we return to the proposed sketch of the early history of music in her native country, Sweden. And truly we have to tell of no lordly bower, wherein the bard was welcomed with reverence and love.—'High placed in hall, a welcome guest,' whose stirring strains impelled each listening knight to deeds of valour and renown; neither have we to speak of those lighter measures which wake up the joyous feelings of youth to the festive dance; for the ancient Swedes had, with regard to their amusements, some singular laws and customs peculiar to themselves. Amongst all the other nations of the earth—whether breathing the soft sunny air of the south, or living in the hardier atmosphere of our northern latitudes—dancing has ever been a favourite pastime; but the Swedes had no knowledge of this peaceful art, because their legislators had, from some mistaken conception, forbidden the indulgence of music, and had even branded musicians as infamous persons, and as being dangerous to the state. Even at so late a period as the beginning of the sixteenth century, a law was enacted banishing all musicians from the kingdom, and allowing of their being slain in what place soever they might be found. It is true that a nominal penalty was attached to this destruction of human life; but it was so slight a one, as to deserve the sarcastic observation of Archenholz, in his *Life of Gustavus Vasa* (vol. i. p. 113), wherein he says that the murder of a musician seemed to be regarded in Sweden rather as a joke than a crime. The only penalty imposed on the slayer was the obligation to bestow upon the heir of the murdered man a pair of new shoes, a pair of gloves, and a three-year-old calf. Even this poor indemnity, conceded oftentimes as the price of a father's or a brother's life, proved in general to be a mere mockery through the conditions attached to the gift; for the heir lost his right to it unless he submitted to a ceremony, which, in its absurd and humiliating accompaniments, was worthy of that barbarous period.

The calf's tail was anointed with grease, and the animal having been led to the top of a hill, its slippery tail was placed in the inheritor's hand. The murderer then seizing a heavy bludgeon, dealt some furious blows upon the creature's back, impelling it to flight; and if the injured person could retain his hold, the beast became his

property. If, on the contrary, the tail escaped out of his hands, he lost his right to it, and became the laughing-stock of the crowd who were wont to assemble on such occasions.

These barbarous customs continued until the middle of the sixteenth century, when Gustavus Vasa, resolving to abolish laws which would have been ludicrous but for their ferocity, summoned to his court several foreign musicians, and at the same time introduced into Sweden the art of dancing, hitherto unknown there.

By way of marking more effectually his royal approbation of the heretofore proscribed arts of music and dancing, Gustavus was wont, at the close of almost every evening, to lead the dance in his palace halls, being accompanied the while by the music of the royal orchestra.

The art of music is now regarded in Sweden as an important part of education, and especially amongst females; and its professors are held in such high estimation, that they are received with distinguished courtesy in the highest circles of society. Nor is this predilection for music confined only to the more educated classes of the people; for on every occasion of social festivity the voice of song is heard among the peasantry, and their national ballads, so long proscribed by an ill-conceived policy, still live in the hearts of the people, and are remarkable for their simple pathos and beauty.

Among the mountains of Sweden a peculiar kind of trumpet, made of the bark of boxwood, is used by the shepherds, who call it *mir*. This instrument is about four feet in length; and although its blast is so powerful as to scare away the wild beasts, yet its tones, as they echo across the mountain lochs of that singular region, are by no means unpleasant to the ear.

Hitherto the Swedes, in spite of their taste for music, have not (with one brilliant exception) evinced much genius for this fascinating science; and in the Stockholm theatre, French and Italian compositions are those which are most in vogue. This capital has, however, an academy of music, founded in 1772 by Gustavus III.

A MESSAGE FROM THE MISSISSIPPI.

AN emigrant is no sooner settled in his new quarters, than he becomes as anxious as Vanderdecken himself to send a message home. It is usually a message of invitation. He describes his promised land as it appeared to him *before* his arrival, and thus claims credit from his friends for the judgment and sagacity he has exhibited in his choice. No one likes to own himself in the wrong. He conceals the fact even from himself; and if the emigrant does not all at once find himself in smooth water, why, this was only to be expected. It is a fine country, anything grows in it; and if people will only bring means, industry, knowledge, and patience into the field, they will come in time to live like princes, and die patriarchs. His correspondent at home in the meantime does his part: he disseminates the Message far and near; and in his own circle at least it tells to purpose. One might reasonably doubt a newspaper, whose writers have no substance, shape, or name; but when the message in question comes from our own, or a neighbour's acquaintance—in fact, from that John Smith whom we all know, or have heard of, we should be infidels indeed to disbelieve.

Emigrants, generally speaking, have no intention to mislead; and yet it so happens that the worst fields have always had their eulogists as well as the best. For our part, who have watched with the utmost attention the progress of emigration, we confess frankly that we now dread giving an opinion upon the subject at all. Every post brings us letters requesting our advice as

to the choice of a new home; and to every letter our answer is the same, that, under existing circumstances, we cannot take the responsibility of influencing so fateful a step. We are glad, notwithstanding, to make public from time to time such matters of information as may come in our way; and in the present paper we lend our aid in disseminating a Message from the Mississippi, which contains some practical details, and enough, besides, to show that the writer is not entirely blinded by his preconceived notions.

Our emigrant found himself in the first place at New Orleans, and in some employment, which is not described, when he was attacked by dysentery, and in six or seven days reduced to the brink of the grave. This disease, it appears, is very prevalent in the whole valley of the Mississippi; in which, we may remark, is comprehended the valleys of the Ohio, Illinois, and other feeders, and generally the country called the West. In temperate latitudes it is rarely fatal; but in the burning climate of the south, it is as deadly as the yellow fever, and more painful to the victim. The sufferer in question could not walk without support; and finding the idea disagreeable of dying in a bed at New Orleans, the net curtains of which were surrounded day and night by a full band of mosquitoes, he suddenly determined upon 'going west.'

'Going west' at home, with reference to a journey, may mean going from Edinburgh to Glasgow, or from London to Bristol; but in America the expression appears to apply exclusively to that part of the country which lies to the west of the eastern coast, but *north* of New Orleans. The particular part of the West fixed upon by our invalid was Cincinnati—a distance of some sixteen hundred miles; the voyage to which occupies from six to fourteen days, according to the swiftness of the steamer, and costs from ten to fifteen dollars in the cabin, including an abundant table. This, however, is 'barring accidents,' as our traveller found to his cost.

The morning after they left New Orleans, being the 21st of June last, while bowling gaily along, about three hundred yards from the shore, they felt the vessel bump against something in the river. A party of volunteers from Mexico, who were on board, remarked that it was as hard a lick as they had given the enemy at Monterey; but while all were enjoying the joke, a heavy lurch stilled their laughter, and presently a voice shrieked that the ship was sinking. And so indeed it proved; for she had struck upon a snag, and our invalid, who had before been hardly able to crawl along the deck, starting up with the energy of mortal terror, had little more than time to buffet his way through the struggling crowd, and throw himself overboard, when she went down. He swam to the shore, leaving behind almost his whole baggage—and his dysentery. In fact, the hydropathic treatment (assisted, no doubt, by the fright) cured him of his disorder. From that moment he began to improve rapidly, and he pursued his way to Cincinnati a poorer and a healthier man than before his embarkation.

He made his way to Baton Rouge, a small town situated on the first rising ground up the river from New Orleans; and there waited two days, with the heat at 93 degrees in the shade, till the arrival of an upward-bound steamer, in which he embarked. Five dollars of his passage money were returned by the owners of the lost vessel, and ten dollars charged by the new conveyance; so that, upon the whole, his trip cost him twenty dollars instead of fifteen. But he wisely balanced this by his renovated health, and pursued his journey in good spirits.

The lower part of the Mississippi our emigrant found interesting only from the extreme beauty of the foliage, with which the country on either side of the river was covered. The soil appeared to be nearly a continued swamp, the pestilential vapours of which rendered the

clearings of comparatively rare occurrence. The tide of population was flowing past this abode of death; and at a distance of one thousand miles from New Orleans, turned up into the Ohio, to seek the wholesome breezes of the north. Our traveller is enthusiastic in his praise of the scenery of this great feeder of the Mississippi; which is thus characterised by a more eloquent pen than his:—'The shores of the Ohio do not anywhere present that savage grandeur which often characterises our larger streams. No tall cliffs, no bare peaks, nor sterile mountains, impress a sentiment of dreariness on the mind. The hills are high, but gracefully curved, and everywhere clothed with verdure. There is a loneliness arising from the absence of population, a wildness in the variegated hues of the forest, and in the notes of the feathered tribes; but the traveller feels none of that depression which results from a consciousness of entire insulation from his species, none of that awe which is inspired by those terrific outlines that display the convulsions of nature, or threaten the existence of the beholder. It is impossible to gaze on the fertile hills and rich bottoms that extend on either side, without fancying them peopled; and even where no signs of population appear, the imagination is continually reaching forward to the period when these luxurious spots shall maintain their millions.'

'Approaching towards Cincinnati, the scenery becomes more monotonous. The hills recede from the river, and are less elevated. The bottom lands begin to spread out from the margin of the water. Heavy forests cover the banks, and limit the prospect. But the woodland is arrayed in a splendour of beauty, which renders it the chief object of attraction. Nothing can be more beautiful than the first appearance of the vegetation in the spring, when the woods are seen rapidly discarding the dark and dusky habiliments of winter, and assuming their vernal robes. The gum-tree is clad in the richest green; the dogwood and red-bud are laden with flowers of the purest white and deepest scarlet; the buckeye bends under the weight of its exuberant blossoms. The oak, the elm, the walnut, the sycamore, the beech, the hickory, and the maple, which here tower to a great height, have yielded to the sunbeams, and display their bursting buds and expanding flowers. The tulip-tree waves its long branches, and its yellow flowers high in the air. The wild rose, the sweetbrier, and the vine, are shooting into verdure; and clinging to their sturdy neighbours, modestly prefer their claims to admiration, while they afford delightful promise of fruit and fragrance.'

The emigrant found Cincinnati a very healthy and thriving city, with some splendid buildings; but, like all other American cities he had seen, not to be compared with places of the same size in England. 'You will observe,' he says, 'alongside of as good a dwelling as can be put up, one made of timber in genuine backwood style, and occupied perhaps by one of O'Connell's peasantry, who thinks that all human felicity consists in filth and pigs.' Pigs and cattle, indeed, appear from his description to be the masters of the place, and must continue to be so, so long as the ruling passion of the citizens is the love of 'dollars and popularity.' A town-councillor may desire to introduce plans for clearing the streets, and bringing their four-footed promenaders under some control: but what effect would this have on his chances of re-election? That is the respect which gives him pause, and makes Cincinnati a filthy and pig-ridden town.

Another trifling inconvenience at Cincinnati is the custom of the sovereign people righting their wrongs with the gun and the knife. New Orleans and Galveston are reckoned the headquarters of the duellists: but the emigrant, while at the former place, did not hear of more than some half-dozen fatal rencounters; whereas during his nine weeks' sojourn at Cincinnati a score of such murders occurred.

'If Beasy was here,' says he—Who is Beasy? We cannot tell: but this would be the routine of her employment. She must get up at five o'clock in the morning, for by this time the whole population (with the exception, we presume, of some of the gentlefolks) is astir, and taking her basket on her arm, go out to cater for the day. In the market streets she will find country wagons ranged in interminable lines, with fruit and vegetables of all kinds, said by travellers to be among the finest in the world, displayed on their tail-boards; some of them having come to the town from a distance of one hundred and fifty miles. In three different market-houses she will have an opportunity of selecting meat, poultry, cheese, and other matters for the daily consumption, for the market is held here every day; for which she will have to expend but little money—the price of pork being only 2d., mutton 2d., and beef 4d. per lb.; and she may send home a barrel of flour of 220 lbs. for 18s. 9d., or about a penny a pound. Tea she will buy at 2s., coffee at 4½d., and the best sugar at 4d. a pound. But all this is not done without a struggle; for the crowd is great, and the shoving and pushing of men, women, dogs, pigs, and cattle far from polite. Beasy will think to herself what sort of figure Miss Wilhelmina Scroggins of her town would make in the medley; and as she lugs her now heavy basket through the thick of the press, she will smile at the idea her imagination conjures up. And this smile, we will venture to say, will do more for her than all her struggles; for the pale American will soften as he looks at the rosy cheeks she has imported from the other side of the ocean; the lean, lanky, lengthy down-easter will shuffle awkwardly out of her way; and the short, chubby Dutchwoman, reflecting the good-humour in her own round face, will draw in her breath to let her pass.

When at length she gets home, she must tuck up her sleeves and set to work with a will, in order to have breakfast ready for the household by half-past six o'clock exactly, as the men commence their work at seven. At this meal 'everything that man need desire' is placed upon the table; and the same exhibition is repeated at twelve o'clock for dinner, and at half-past six or seven o'clock for supper. The wages which furnish this abundant housekeeping are good, considering the cheapness of provisions; mechanics receiving from seven to twelve dollars, according to trade and proficiency; and some old hands as much as fifteen dollars. House rent, however, is comparatively high, and the business therefore of house-building is a good one.

With a little capital, however, it is our emigrant's opinion—and this, in fact, is the burden of his Message—that great profits may be made in many ways, and with but little exertion. Good land, he tells us, sells for twenty dollars an acre; and a 'splendid country' it is; where the grape grows well, and pays handsomely for its cultivation. It was his intention, however, to go by and by into the neighbouring state of Indiana, or else Illinois; where, he says, the purchase of a farm will not cost him more than a year's rent of one in England! He could buy a good horse for twenty dollars, a cow and calf for eight dollars, a sheep for three-fourths of a dollar, and a capital pig for 'almost nothing.'

In Indiana, the Indian reserve, it appears, is now in the market, of which the government price is only one and a quarter dollar per acre. But the drawback is, that the land is so heavily timbered, that a farmer could do nothing single-handed, and labour in that country is, as we have seen, very costly. Our emigrant, therefore, proposes that his brother shall join him, asserting that they could purchase one hundred and sixty acres of land for two hundred dollars, run up a log hut for twenty-five more, and be at once independent. While eulogising, however, the comfortable position of the farmers, he makes it clearly understood that its indispensable condition is ceaseless industry. Every man

* Judge Hall's Notes on the Western States.

of them must be his own weaver, tailor, cobbler, and joiner, and attend besides to the work of his farm. The following calculation he gives at more length :—

160 acres of land, at 1½ dollar,	-	-	200 dollars.
2 horses, at 20 dollars,	-	-	40 ...
2 cows, at 8 dollars,	-	-	16 ...
10 sheep, at 75 cents,	-	-	7½ ...
2 pigs,	-	-	1½ ...
Log house,	-	-	20 ...
Clearing 40 acres,	-	-	40 ...
Getting in seed, &c.,	-	-	10 ...
12 months' provisions,	-	-	50 ...
Wagon, &c.,	-	-	50 ...
Spades, pickaxes, &c.,	-	-	12 ...
			447 dollars.

To this many other items will be added even by the least reflecting; but, upon the whole, if our emigrant be not exceedingly sanguine, it would seem actually possible for a man to set up in a moderate way as an Indiana farmer with a capital of L.150. Such at least is the purport of the present Message from the celebrated American territory, known generally as the West, or otherwise as a portion of the Valley of the Mississippi.

TASTES OF THE GUARDSMEN IN LITERATURE.

A curious document has come into our hands, a manuscript list of the books forming a library for the use of the privates of one of the household regiments, with marks made at the particular works which are 'the most popular with the men.' The selection, we may remark, is much better in this case than it appeared to us to be in a regimental catalogue which we perused some time ago, and which, we were told, was of general application. In that case a vast number of the books appeared unsuitable to a singular degree. In this instance, where, we understand, a special care was exercised by one of the officers, the selection, though not incapable, we humbly think, of improvement, is on the whole good. With regard to the preferences shown by the men for particular books, it occurs to us that to learn what these are may serve not merely to gratify curiosity, but to guide others in making selections of books for persons of limited education. We therefore shall indicate them, as far as can conveniently be done in these columns.

Of books of history the catalogue contains *twenty-five*. Here we find the favourites are—Brenton's Naval History, The Wellington Despatches, Voltaire's Charles XII., The Siege of Gibraltar, Hume and Smollett's History of England, and Thiers's Revolution. On Gibbon, Plutarch, Josephus, Knight's London, Chambers's History of the Rebellion of 1745, The Pictorial History of England, &c. no remark is made. In biography, Scott's Napoleon, Clarke's Life of Wellington, The Buccaneers, Mackenzie's Naval Biography, Peter the Great, and Theobald Wolfe Tone, are marked with approbation; while Cromwell, Watt, Columbus, Exmouth, Hardy Vaux, Vidocq, Madame du Barri, Benvenuto Cellini, Kotzebue, &c. are to be understood as comparatively neglected. There are fifteen religious books, four of which are in esteem amongst the Guards—The Pilgrim's Progress (where is it not a favourite?), Hervey's Meditations, The Holy War, and Watt's Sermons. We are to suppose that less regard is paid to Williams's Missionary Enterprises, Paley's Evidences, Abbot's Young Christian, Richmond's Annals of the Poor, The Guide to Heaven, Religious Life, &c. The poetical department is very limited, only six books—Shakspeare, Dr Aikin's Selections, Milton, Southey, Scott, and Byron; whereof only Southey and

Scott are unmarked. Then follow the novels and romances, which may be said to form the bulk of the library, as was perhaps to be expected, however much it may be regretted. The marks of admiration are thick sown over this class: Scott, Bulwer, Dickens, are favourites, as a matter of course (Martin Chuzzlewit an exception, in the last instance); so are Mr Gleig and Captain Marryatt, as was also, in some degree, to be expected. But one is surprised a little to find James more in favour than Cooper. Galt has no marks; neither, as a general rule, have any of the older novelists, as Smollett and Sterne. The rollicking humours of Mr Lever are in good esteem; so are the exciting marvels of Eugene Sue; not so the quiet pleasantries of Washington Irving. We next come to voyages and travels, where, out of twelve books, but one is in favour—The Modern Traveller (a sort of essence of books of travels), in thirty-four volumes, by Josiah Condor. Then comes 'Philosophy,' limited to eleven books, whereof Combe's Phrenology and Constitution of Man, Lectures on Astronomy, Divine Dialogues, The Pursuit of Knowledge under Difficulties, and Bingley's Useful Knowledge, are distinguished as popular. Amongst a final class of 'Miscellaneous'—The Penny and Saturday Magazines, Chambers's Journal and Information for the People, The Tales of the Borders, The London Journal, and Bentley's and Ainsworth's Magazines, are in repute; while Hone's Year-Book, The Rambler, and even The Military Bijou, are undistinguished.

We cannot conclude without expressing the pleasure we feel in reflecting that the intellectual and moral condition of the poor soldier is now a matter of concern and regard to his superiors, and that even under arrangements which cannot be considered as complete, he has at his command a means of spending his spare time in what will advance him in intelligence and as a responsible being, instead of being condemned, as formerly, to the idle promenade, the corrupting street, or the debauching public-house. We would, however, strongly press upon the officers the necessity of seeing carefully after the selection of the books for the regimental libraries. Many in the catalogues we have seen might as well not have been there, while many acceptable and instructive books are wanting.*

THE BACHELOR OF THE ALBANY.

It can hardly be supposed that the popular works of fiction of the present day are destined to occupy a permanent place in our national literature. Romance, considered as an art, arose by slow degrees to the elevation it assumed under Scott; but no sooner had the grave closed over that great master, than his legitimate sway gave place to the wildest anarchy. It was no longer sufficient to be natural. Virtue and vice were no longer considered as conditions arising out of circumstances, but as independent qualities turned loose upon the world, like Harlequin and Pantaloon, to tumble their way through all sorts of impossibilities. Education, position, example, were of no consequence: the most sensitive delicacy, the most heroic goodness, were found flourishing in the very sinks of infamy. Poverty, nay, want itself, had lost its chilling influence. Its offspring under the new régime was generosity and high-mindedness; while, by the same rule of contrary, meanness and rascality were the sure concomitants of wealth and station.

Anything that promises to bring fiction back to a more healthy tone must be considered interesting, if not important; and, invested with this extrinsic dignity, a volume just now arrests our attention in a way which its own merits would hardly account for.† The 'Bachelor of the Albany,' by some miracle or other, has escaped the epidemic fever; and though not particu-

* A list of popular books, of which there are cheap editions, was given, with prices and names of publishers, No. 73, new series.
† Chapman and Hall.

larly strong, is at least healthy. Its characters, taking them generally, are natural as conceptions, though inadequately wrought out; and the idea is suggested throughout the whole book that the author has in him, to a respectable extent, the stuff of which a good novel writer is made. In the meantime he has merely sketched in his persons, but, with one exception, left them unfinished. Mr Spread, for instance, as the *beau idéal* of a wealthy British merchant, is admirable as a literary portrait, but quite useless as a character in the novel. The author describes what he is, but does not put him in action, to let him show his own paces and tell his own story. And this is generally characteristic of the book, which exhibits a remarkably clear conception, but as remarkable a poverty in execution. The exception we have alluded to is the 'Bachelor of the Albany.' 'Imagine a small, well-made man, with a smart, compact figure, excessively erect, his action somewhat martial, his eye gray, cold, peevish, critical, and contemptuous; a mouth small and sarcastic; a nose long and vulpine; complexion a pale dry red; hair stiff and silvery, and evidently under the severest discipline to which brush and comb could subject it, with a view to its impartial distribution on each side of a head which was carried so high, and with such an air, that it was clear the organs of firmness, combativeness, and self-esteem were superbly developed. With the exception of a plain, but rich *robe-de-chambre*, his morning toilette was complete: trousers of shepherd's plaid, seemingly made by a military tailor, and tightly strapped down over a pair of manifest Hoby's; a double-breasted cashmere waistcoat, of what mercers call the shawl pattern; the shirt-collar severely starched, and a little too exalted above a cravat of dark-blue silk, carefully folded, and tied with a simple, but an exact knot.'

The habitat of this fine animal is well described. His chambers in the Albany (as all London readers know, a secluded and covered-in street of apartments for wealthy bachelors and fugitive married men in the neighbourhood of Piccadilly); his rigid and peculiar habits; the awful care of his servant, and the man's anxious and frightened glance round the room, to see finally that everything is in its place before the appearance of his master to breakfast—all this is in a high style of art. The visitor is his old friend Mr Spread, the wealthy merchant, and in this conversation is brought out the germ of the story. The following little incident occurring in the midst, illustrates amusingly the feverish impatience of the bachelor's character. 'The bell of the outer door rang, and Reynolds came in to receive his master's pleasure as to the persons who were to be honoured with, or be refused, an audience.

"Should it be Mr Smith, sir?"

"I'll see Mr Smith. You know him—a tall man?"

"Yes, sir," said the valet.

"And it was Mr Smith. Barker proceeded to the antechamber to receive him, and presently Spread heard the bachelor speaking in his gruffest manner, obviously much exasperated by something that his visitor had either done or said. Then doors were opened abruptly and shut violently, after which succession of noises Barker returned in a sultry chafe, and it was some time before Spread could divine the cause of his agitation.

"Animals' friends—stupidity of servants—asses—rascals—animals' friends—vagabonds—vice-president—me—imagine!"

'Spread looked as if he would like some more lucid explanation of what had occurred.

"A scoundrel!—not the Mr Smith I wanted to see—agent to a confounded society called the Animals' Friends."

"Wanted you to subscribe?"

"Wanted me to accept the office of vice-president. Imagine, vice-president of the Animals' Friends!"

"A very responsible office!" said Spread with mock

solemnity. "They are going to send a deputation to the Pope, to interest his holiness to put down bull-baiting in Spain. You would be the second personage in the embassy."

The drift of the story, as the skilful novel reader will at once observe, is to break through the habits of the fierce bachelor, and to break down his system. 'It was the glory of Mr Barker that he had neither wife nor child, neither a house, an office, nor a vote; he was dependent on nobody, and nobody was dependent on him; it was impossible to be more unattached than he was—impossible to have fewer ties, without entirely forsaking the haunts of men.' And just so it is the glory of our author to fling the shackles of circumstance over this haughty freedom; to bind Mr Barker hand and foot in the sympathies and relationship of society; to drive him forth of his beloved Albany; to compel him into the business of life, which he abominates; into parliament, which enrages him; and finally, into matrimony itself.

Mr Barker sets out to visit his friend at Liverpool, and in the railway train he meets a youth who is destined to haunt the old bachelor like a spectre throughout the volume. The youth is as solitary in the world as a bachelor can be, and is going about trying to 'hunt up' an uncle, whom Mr Barker supposes, from his conversation, to be *himself*. The feelings with which he makes this discovery may be conjectured from the portrait of the young gentleman. 'His *vis-a-vis* was a raw youth, of eighteen or twenty, with a round rosy face, and a simple, good-humoured physiognomy; he was immersed in an immense rough coat, like a bear's skin, with enormous mother-of-pearl buttons, and a dozen pockets of all sizes and in all positions. In fact he looked something like a brown bear, or a great water-dog, sitting on its hind-legs; and he kept his neighbours in constant alarm, by sometimes pulling out a cigar-case, as if he meant to commence smoking; sometimes producing a three-barrelled pocket-pistol, and examining the priming; sometimes displaying a wonderful knife with a hundred blades; and every now and then giving a blast with a hunting-horn, which he had bought, he informed an elderly lady beside him, at a shop in High Holborn, adding that it was a great bargain, and that if she ever wanted a thing of the kind, he would recommend her to go to the same place. "Have a care, sir. I hope your pistol is not loaded," Mr Barker at length broke out in a surly tone, with a look still surlier, at the formidable simpleton in the enormous rough coat, who, in exhibiting the pistol to the plump maid, had repeatedly pointed it right at his head. The old lady had already, in her capacity of protectress-general, cautioned the youth twenty times against shooting *himself*, which was the least part of the danger to be apprehended. None of these remonstrances, however, proving successful, the cool man took a different course. He expressed a curiosity to examine the pistol; and the moment it was placed in his hands, he extended it out of the window, and a couple of sharp reports instantly proved that two of the barrels had been loaded. The innocent youth, far from taking offence, laughed loud, said it was funny, and called the cool man a famously sensible fellow—a compliment which that gentleman could not have returned with the slightest respect for truth. What a relief it was when, as the train approached the next station, the nephew in search of an uncle informed his companions that he was under the necessity of depriving them of his attractive society! He took leave in the most troublesome and obstreperous manner possible, elbowing everybody, then insisting on shaking their hands, then kicking their shins, then begging their pardons, then pressing his cigars on the gentlemen (Mr Barker particularly), and looking very much disposed to kiss the fat lady's maid, who looked equally well-inclined to submit to his impudence. At length, after nearly crushing the quiet little girl in the corner into a mummy, and poking out the old lady's eye with the mouthpiece of the hunting-horn, he jumped out of the carriage with a whoop like a Cherokee Indian; and

after committing twenty more outrages, while looking after his luggage, clambered, alternately shouting and winding his horn, on the top of an omnibus, which stood hard by waiting for passengers.'

In the same conveyance he meets with a solitary neglected little girl, who turns out at the end of the volume to be the daughter of an early friend; and much to his surprise and annoyance, he finds himself acting as the escort of this wandering damsel, and carrying a carpet-bag (imagining it to be his own) for a good old lady, a certain Mrs Briscoe, and her fat maid Letty. A mistake of the old lady, who is one of the guests at Mr Spread's, gives the first hint of his matrimonial fate. 'But Mab was not Barker's only female visitor that night. Mrs Briscoe having dosed her maid (who had no other fever than that which she might well have caught from the pile of blankets over her) with a bottle which was to be taken every third hour, had promised to return in due time to administer the second draught; and had arranged that, should Mistress Letty be asleep, she would leave a light in her room, and also her own watch, so as to enable the poor thing (whose only complaint was laziness) to help herself to the contents of the bottle during the rest of the night. Proceeding about two o'clock in the morning to carry this design into execution, she found her watch out of order, and it immediately occurred to her to borrow a watch from one of the Smyly girls. The old lady trotted off with the watch, and, mistaking doors, entered Mr Barker's room instead of Letty's. The rooms were similar in size and furniture; and by the dim light which the taper gave (only, in fact, making darkness visible), there was no very striking difference between the bachelor and the maid, buried as both were under huge mountains of bedclothes. The old lady accordingly, having listened to Barker's breathing, and carefully tucked him in, deposited the light (with a bottle and a spoon) on a small table which stood at the side of the bed, shrouded by the curtains; and having placed the watch in a convenient position (not observing Barker's watch, which was lying there too), retired noiselessly, highly satisfied with herself for all her benevolent arrangements. But several hours afterwards, growing fidgety again, and thinking that the watch would be of more use to herself than to Letty, she returned, tucked Barker in again with the utmost tenderness, and carried off his watch instead of Miss Smyly's, which it resembled extremely. The man-servant, who came to the bachelor's room at eight o'clock the next morning (and a thoroughly English winter's morning it was, not very distinguishable from night), removed the candlestick, with the bottle and spoon; and when Mr Barker rose, and had completed his toilette, he took up the watch which he found on the table, placed it in his waistcoat pocket, and went down to breakfast. Mrs Briscoe, on her part, before she went down, was very particular in returning Miss Laura Smyly her property, or what she believed to be such.' The result may be conceived, when an explanation takes place the next morning.

Mr Barker is exhibited in various adventures of this kind, to his no small irritation and discomfort, but always drawing on by degrees to the overthrow of his Albany peculiarities, and the consummation of his fate. The incidents, however, as might be expected from the author's want of artistical skill, are not well managed: it is in the conversations, and there alone, in which he shines; and for this reason it is hardly possible for the reviewer, when so much restricted in space as we are, to give a fair specimen of the book. Let us try, however, to present at least the anatomy of a scene at a wealthy miser's dinner-table.

Mrs Spread, drawing her shawl well about her, took the interest of a curious observer of social phenomena in reviewing the array upon the table; and she thought, upon the whole, that it looked surprisingly well: the cloth was whiter than she had anticipated, the glass brighter, and the argentine and albata did their best

to look silvery—what could albata and argentine do more? Then there was a splendid epergne, borrowed from the Prouts; it was stocked with evergreens—the ivy, the arbutus, and the holly; they looked wintry, certainly, but then they were fresh and healthy, and for Mr Barker they produced the very desirable effect of interposing between him and the polar Mrs Narrow-smith's hideous head-gear. Barker was very cold; and as he sat with his back to the fireplace, he turned round to see how it was that no heat reached him. There was a fire in the grate, but it had evidently been lighted not an hour before. It yielded a great deal of smoke, but no warmth whatever. While he was directing Mrs Spread's attention to these agreeable incidents of a house-warming, the page put a finishing touch to the piece, by running up and asking the bachelor—"Would he like to have a fire-screen?"

'The miser asked Barker to take wine—sherry. Mrs Spread could evidently see that Barker would have given the wine another appellation. In fact it was a mixture of the grapes of Cadiz and the Cape. Mr Narrowsmith was as roguish about wine, and as practised a garbler of the grape, as the most disingenuous vintner in Liverpool.

'Now the fish came—a magnificent turbot, to do the miser justice, but it was a little overdone, and the sauce was execrable.

'Mr Spread had been separated by some accident from the fair East Indian, and sat between Mrs Crackenthorpe and Mrs Marable. The one was a dissyllabic, the other a monosyllabic lady.

"You find this frosty weather agreeable, I hope?" to Mrs Marable.

"Very."

"I should think there must be skating in some places?"

"Do you?"

"I was very fond of skating in my young days."

"Were you?"

'Then he tried Mrs Crackenthorpe.

"Have you been lately in London?"

"No."

"Your sister lives in London, if I remember right?"

"Yes."

"You know my friend Upton, I think?"

"No."

"Don't you think this room a little cool?"

"Yes."

"You find your new house comfortable, I hope, Narrowsmith?" said Mr Spread, giving the ladies up, and making one of those remarks indispensable at house-warmings.

"Very," squealed the host in his wiry, gibbering voice; "warm and comfortable—very. Don't you think the atmosphere of this room agreeable? Well, I assure you, it's the coldest room in the house."

"Except the kitchen," muttered Barker to his fair neighbour.

"We found it not easy to warm the house we lived in before," said Mrs Narrowsmith.

"Did she ever try coals?" growled Barker again.

'Mrs Spread was wretched about her husband, and was continually saying to Mr Barker, "I fear he will get his death of cold. Do you think the window behind him can be open? How happy I am Augusta is not here."

'Barker made no reply; he was paying critical attention to something on his plate, which Mrs Narrowsmith had just recommended to him as "*one of Madame Maintenon's cutlets*." Having removed the envelope with his fork, he turned to Mrs Spread, and with the oddest conceivable mixture of disgust and enjoyment in his countenance directed her attention to the unfolded paper.

"What! I protest there is writing on it! In the name of all that is comical try to make out what it is!"

'Thus adjured, Mr Barker looked narrowly at the scrap of paper in which the cutlet had been dressed,

and had no great difficulty in reading nearly the whole of the Crackenthorpes's answer to the Narrowsmiths's invitation. The cutlets just at that moment taking their round again, Mrs Spread resolved to have one, to try her chance of a literary document, where nobody could have dreamed of meeting a thing of the kind. It was a very diverting occupation this for a dinner-table.

"Well, what have you got? Is it mine?"

"Ours," said Mrs Spread, recognising the hand of her daughter Elizabeth upon the wrapper of the exquisite *morceaux* before her. To this we may append a few lines containing a capital hit at the author himself—a complete illustration of the supposed necessity which exists in these last days for a joke, and the heavy straining that is often required to produce it. 'But it was a tedious, heavy, chilly affair altogether, and Mrs Spread thought that Mrs Narrowsmith would never give the signal for the rising of the ladies. The truth was, that Mrs Narrowsmith was uncertain whether she ought to look at Mrs Marable, or Mrs Spread, or even at Miss Guydickens. At length it was over: the ladies went, the gentlemen remained. A bottle of claret was produced—Mr Spread said it was corked: another—Mr Spread made the same remark: a third—it was a wonder it escaped the same criticism, for there was very little wine *uncorked*, in any sense of the word, in Mr Narrowsmith's establishment.'

NEWSPAPERS IN FRANCE.

THE activity which now prevails in all social affairs, commercial, political, literary, by creating a demand for prompt and trustworthy intelligence, has helped to give to newspapers their present great importance. They have become almost a necessity of existence, a species of daily food, of which we should be exceedingly unwilling to be deprived. It is so natural to refer to a newspaper for information, that it is scarcely possible to imagine a time when the broad sheets had no existence. Two centuries ago, however, the world contrived to transact its business without their aid, and by some means or other a nation managed to learn what was doing among the powerful few who claimed the privilege of making war and levying taxes.*

In common with many other valuable inventions, newspapers started in a very humble way: a little sheet of coarse gray paper, published at uncertain intervals. According to the historians, newspapers were first printed in England to announce the defeat of the Spanish Armada: in France they originated in the correspondence of the celebrated genealogist D'Hozier. In the exercise of his functions, he was obliged to keep up an active correspondence with different parts of the kingdom, and with foreign countries, which brought him many scraps of news. These he communicated to his friend Theophrastus Renaudot, physician to Louis XIII., who transcribed them for the amusement of his patients. The *hand news*, as they were called, grew, however, so much into vogue, that the physician was unable to supply the demand; when the idea of printing them occurred to him, and he petitioned Richelieu for the necessary authority. The minister at once foresaw the importance and utility of a sheet relating events under the dictation and in accordance with the supreme power, and unhesitatingly granted the privilege. The first number appeared on the 1st of April 1631, under the simple title of 'Gazette'; a word borrowed from Venice, in which city a journal had been published for several years, and sold for a *gazetta*—something less than a halfpenny. According to some authorities, the derivation is *gazza*, a magpie; as indicative of the chattering style of newspapers. Renaudot addressed a portion of his preface to the king. 'Sire,' he says, 'it is a remark worthy of history, that during the reigns of sixty-three kings, France, so curious in novelties, should not have

thought of publishing a gazette, or weekly collection of news, domestic as well as foreign. But the memory of man is too weak to be trusted with all the marvels with which your majesty is going to fill the north, and all the continent. Hereafter it must be assisted by writings which fly, as in an instant, from north to south; ay, marry, to all the corners of the earth. This is, sire, the journal of the kings and powers of the earth; all is here by them and for them; they are the capital; all other personages are only accessory to them.'

He gives besides a long preface, addressed to the public, in which he relates the vexations and slanders to which he is exposed in the discharge of his duties. On the one hand, he is accused of publishing false reports; and on the other, blamed for suppressing news which had been sent to him. He finds support, however, in his desire to content the one and the other; and intreats the 'princes of foreign states not to lose time uselessly in attempting to close the passage to his news, seeing that the traffic in this merchandise cannot be prevented, and which, after the nature of torrents, enlarges by resistance.' The 'Gazette,' however, under royal favour, was in a position, at the end of a year or two, to look down in calm dignity on its detractors. It appeared once a week, in the form of eight small quarto pages, with the addition of a supplementary number monthly. The contents were of the most commonplace description: no money articles, no political discussions, no advertisements; nothing but a dry, monotonous collection of details respecting war and courts, with a few lines, dated from Paris, as domestic news.

In 1650, a competitor appeared in 'The Burlesque Gazette,' of which all the matter was versified. The editor was a courtier named Loret, who 'pleased himself naturally in poesy;' but after a time found the demands on his inventive powers more than he could well supply, as he tells us—

'His pen would soon have been worn out,
His poor vein spent, there's ne'er a doubt;
Not knowing Latin, neither Greek,
Dried up he must have been, and weak—
Without some high celestial aid,
Without some angel's inspiration.'

Mazarin, the Fronde, or any other party obnoxious to the editor, were pilloried in his facile rhymes. Colbert was so irritated at his audacity, as to strike his name off the pension list. Illustrious births, deaths, and marriages, the thousand little events of the court and city, humorous and scandalous anecdotes, were all made to do duty in verse, and sometimes in language far from polite. For two years and a half 'The Burlesque Gazette' was issued in manuscript. Its popularity, however, became so great during the stirring period of the Fronde, as to induce the proprietor to print it. It lived fifteen years.

A second rival to Renaudot's 'Gazette' made its appearance in 1672, under the title of 'Mercure Galant,' by Danneau de Vize. In style and variety of intelligence, it partook somewhat of the character of modern newspapers. During the first six years it came out very irregularly; but afterwards, at stated monthly intervals, as a duodecimo volume of three or four hundred pages, which sold for three livres (france). It was conducted with great talent, and survived, as the 'Mercure de France,' until the year 1815, having numbered among its friends and contributors Marmontel, La Harpe, Lacretelle, Chateaubriand, and many others of literary celebrity. During this period, the 'Gazette' first published by Renaudot had undergone various changes. To chronicle the great exploits of the reign of Louis XIV., and the magnificence of Versailles, the number of pages was increased from eight to twelve. In 1762, it was published twice a week, four pages with double columns, and the price fixed at fifteen livres a year, post paid. Advertisements for the first time make their appearance, the earliest examples consisting of an announcement of a new book or a map. Gradually the number increased; and they were inserted altogether

* The substance of the above article is taken from a small work published last year at Paris.

in a *budget*, without any attempt at classification. An advertisement of six lines was charged thirty sous, and seven sous for each additional line. The fluctuations and transactions in the money market were first recorded in 1765. The 'Gazette' maintained its ground through the reigns of Louis XIV., XV., and XVI., meeting in the progress of events with numerous competitors. In 1792, it was published daily; and the same year became the 'Gazette Nationale de France,' headed with the words '*Liberty and equality*,' while the price rose to thirty-six livres. In this year, also, theatrical amusements were first advertised. In 1793, the 'Gazette,' which, at its origin, almost worshipped Louis XIII., announced of his descendant, 'The tyrant is no more.'

'The Journal de Paris,' the first daily paper in France, made its appearance in 1777. An article upon the Almanac of the Muses, a letter from Voltaire, a bookseller's advertisement, three or four facts relating to the government and the judiciary, two accidents, a bon-mot, and the announcement of the play, make up the contents of the first number, which concludes with a notice from the editor to the effect that, instead of four pages octavo, the 'Journal,' for the better service of the public, would consist of four pages quarto. Even with this addition, a whole number of 'The Journal de Paris' would find room, and to spare, in a single column of the 'Times.' The annual subscription for Paris was twenty-four francs, and thirty-one francs four sous for the provinces. So successful was the speculation, that the profits amounted to 100,000 francs yearly. With few exceptions, these papers constituted the whole periodical press of France down to the period of the Revolution: the existence of those which originated in the conflict of opinions was but short. Among these, 'The Spirit of the Gazettes' (monthly), 'The Ecclesiastical Journal,' 'The Sentinel of the People,' 'The Herald of the Nation,' were the principal. The severity of the censorship gave rise to several manuscript journals, chiefly of a scandalous character, issued whenever it suited the humour of the editors. The most redoubted of this class were those concocted by the writers who met at the house of Madame Doublet, including Piron, Sainte-Palaye, Mirabeau, Falconet, and others. Notwithstanding the non-political character of the sheets, they were often the cause of much uneasiness to the authorities.

The Revolution, which gave liberty and license to thought, speech, and action, no matter of what character, was not without its effect upon the press. The whole kingdom was inundated with newspapers representing every passion that agitated the popular mind. No sooner had the States-General assembled in 1789, than Mirabeau commenced the publication of his famous 'Letters to his Constituents;' and a host of others started up to record or discuss the acts of the legislators. Whole volumes would be required to give a faithful sketch of the revolutionary press: we give some of the more prominent titles. 'The Peep of Day, or Collection of what Passed the Night before in the National Assembly,' by Barrère: 'The Evangelists of the Day:' 'The Revolutions of Paris,' by the triumvirate Prudhomme, Loustalot, and Tournon, with its famous epigraph—'*The great only appear great to us because we are on our knees: let us rise.*' 'The Journal des Débats et Décrets:' 'The Parisian Publicist, Free and Impartial Journal,' by Marat, *the friend of the people*: 'The Acts of the Apostles,' a medley in verse and prose: 'The National Gazette, or Moniteur Universel,' date of the first number, November 24, 1789: in short, during the first year of liberty, more than 150 journals started into existence. The following year, 1790, the number was 140: among the latter we may quote—'The Iron Mouth,' by the Abbé Fauchet: 'The Friend of the King:' 'The Friend of the Citizens:' 'The Village Sheet.' A gradual diminution appears to have taken place: in 1791, the number of new journals was 95; then 60, 50, 40, 35, 35, until 1797, when it went up

again to 95; in 1798, it fell to 17; 26 in 1799; and in 1800, 7 only: making a total in the twelve years of 750 publications. The number was probably greater, as it is scarcely possible to determine it with accuracy. Every party had its organ—royalist, republican, or Jacobin. Robespierre brought out, 'The Defender of the Constitution:' 'The Old Cordelier' was edited by Camille-Desmoulins: 'The Journal of the Mountain' had numerous conductors. There were more than 100 with the prefix of 'Journal,' and as in an uproar such as the Revolution created it is difficult to gain a hearing, every one tried to cry louder than his neighbour; or, when this means failed, to sell cheaper, or to assume a more extraordinary title. There were 'The Journal of the Men of the 14th July, and of the Faubourg St Antoine:' 'The Journal of the Sans-Culottes,' inscribed—'*The souls of emperors and those of cobblers are cast in the same mould*:' 'The Journal of Louis XVI., and of his People:' 'Poor Richard's Journal:' 'The Devil's Journal:' 'The Journal of the Good and Bad:' 'The Journal of Idlers,' which *'told everything in few words*:' 'The Journal of Incurables:' and 'The Journal of Laughters.' The title of fifteen others commenced with Bulletin; seven were Gazettes; half-a-dozen each of Annals, Sheets, and Chronicles; eight Courriers, and as many Postilions; twenty Correspondence; from forty to fifty Friends and Defenders; besides an endless catalogue of Mirrors, Lanterns, and Enemies.

Among the more grotesque or pointed titles were—'The National Whip:' 'For and Against:' 'The Listener at the Door,' motto—'*Walls have ears*:' 'The Tocsin of Fearless Richard:' 'The French Democritus,' motto—'*At everything to laugh is folly: he laughs best who laughs the last*:' 'The Evangelists of the Day:' 'The Breakfast:' 'Mustard after Dinner:' 'To-morrow:' 'All the World's Cousin:' 'Hang Me, but Listen to Me:' 'Stop Thief—Stop Thief:' 'I Don't Care a Rap: Liberté, Libertas, the Deuce.' Many others might be enumerated. This short list will, however, suffice to convey an idea of the press in France during the Revolution; years of liberty, as Malouet observes, speedily degenerated into libertinage. It was, in fact, not only the national assemblies, the parties into which they were divided, and the thousand clubs opened in every quarter of Paris, that maintained their organs; every ragamuffin believed he had a right to express his opinion upon men and things, in virtue of the people's sovereignty principle, of which the immediate consequence was, that every individual, every fraction of society, had the right to interfere in the management of public affairs. With the exception of the 'Moniteur,' the form of which was from the first such as it retains at present, and of two or three other double-columned quarto journals, all the newspapers of the Revolution were published in octavo, sometimes duodecimo. Each number contained from eight to twelve pages; the price from nine to twelve francs a quarter.

The greater portion of these papers, however, produced in a moment of excitement, had but an ephemeral existence. Some died a natural death, others fell beneath the blows of the Commune or Directory. Even at the period when it seemed that everything could be dared, the license of the press was often forced to submit to authority; opinions were, in common with human lives, at the mercy of the dominators of the day. The Commune of Paris decreed, that the poisoners of public opinion should be arrested, and that their presses, types, and instruments should be distributed among the patriot printers; and appointed commissioners to seize papers at the post-office. On the 18th Fructidor of the year 5, the editors and printers of thirty journals were incarcerated in the prison of La Force, by orders of the Directory, for conspiracy against the safety of the republic. In January 1800, the consular government, by an edict, reduced the number of political journals to thirteen, among which were several yet in existence. In the words of the edict, 'The minister of police shall permit, during the whole of the war, the undermen-

tioned journals only to be printed, published, and distributed—"The *Moniteur Universel*," "*Journal des Débats*," "*Journal de Paris*," "*Gazette de France*," and nine others." Journals devoted exclusively to science, art, literature, commerce, &c. were exempted from this sweeping proscription; the press had, however, sunk into such a state of barbarism, that when the First Consul put his heel upon the hydra, scarcely a voice was raised in complaint.

Under the Consulate and the Empire, the press was remarkably tame: the politics of the day was a *tabooed* subject, not meant for public discussion, and the only writer of 'leaders' was Bonaparte. Journalists grew tired of echoing the '*Moniteur*;' and feeling the necessity of free speech on some topic, began to turn their attention to non-proscribed subjects—literature, and the theatres. From this arose the *feuilleton*, which remains to the present day an eminent characteristic of French newspapers; and liberty, banished from the top of the page, took refuge at the bottom. In the *feuilletons*, under the disguise of a bad tragedy or a literary ephe-meris, the highest political questions were discussed in spite of the authorities. '*The Journal des Débats*' changed its title to '*Journal de l'Empire*;' and such was the success of its *feuilleton*, that the paper at one time numbered 32,000 subscribers. This journal resumed its original title in 1814, gave it up again during the 'hundred days,' to take it once more at the second entry of Louis XVIII.

'*The Constitutionnel*' was commenced in the brief period following Napoleon's escape from Elba in 1815, under the name of '*The Independent*;' three other names were adopted before that by which it is now known was decided on. From 1815 to 1830, the censorship, the severity of the laws against the press, and the excessive rate at which securities were fixed, left the press but little more free than it had been under the imperial despotism. The number of newspapers, however, gradually increased. In 1824, a comparative statement was drawn up privately for the use of the ministry: the six government journals had a total of 14,344 subscribers, while the six opposition papers numbered 41,330. In the following year, the opposition had increased to 44,000, and the government diminished to 12,580. On the part of the opposition, '*The Constitutionnel*' counted the largest number of subscribers. Previously to 1830, their ranks were further strengthened by the appearance of '*Le Globe*,' '*La Revue Française*,' '*Le Temps*,' and '*Le National*.'

The revolution of July 1830 gave a new shock to the periodical press, and for a short time a whole *avalanche* of papers threatened to overwhelm Paris; but when order was again re-established, the greater portion perished. We give the titles of some of each of the parties into which society was divided. The democratic party was represented by '*La Tribune*,' '*Le Reformateur*,' '*Le Bon Sens*' and '*le Monde*.' The last was an unsuccessful speculation of the celebrated Lamennais, who had already failed to carry on '*L'Avenir*,' notwithstanding the assistance of two such writers as George Sand and Montalembert. The Bonapartists expressed their opinions in '*La Revolution de 1830*,' '*Le Capitole*,' and '*Le Commerce*;' the legitimists in '*Le Renouveau*,' '*Le Courrier de l'Europe*,' and '*La Nation*;' the opposition, now called Conservatives, in '*La Paix*,' '*La Charte de 1830*,' and '*Le Globe*;' and last, the *tiers-parti* in '*L'Impartial*,' '*La Renommée*,' and '*Le Temps*;' the latter was most ably conducted, but eventually failed, at a loss to the proprietors of more than a million of francs.

During the past ten years, a great reduction has been made in the price of newspapers in France, in many instances to half the original charge. '*The Journal des Débats*,' however, still maintains its high rate of subscription—eighty francs a-year. The effect of the reduction on the aggregate sale is seen in the stamp-office returns. In 1828, the number of stamped sheets issued was 28,000,000; in 1836, it was 42,000,000; in

1843, 61,000,000; and in 1845, more than 65,000,000. Paris alone supports 26 daily papers, besides 400 other periodicals on all sorts of subjects—science, art, literature, industry, &c. The provinces maintain about 300 political papers, of which 125 are ministerial, 70 opposition, 35 opposition dynastique, 25 legitimist, the remainder of no party. The 26 Parisian papers muster about 180,000 subscribers, distributed in the following proportions:—Four papers count from 500 to 2000 subscribers; eight from 2000 to 3000; nine, among which are the '*Charivari*,' '*Le Quotidien*,' '*Le National*,' 3000 to 5000; two, '*Les Débats*' and '*L'Epoque*' (since defunct), 10,000 to 15,000; two, '*La Presse*' and '*Le Constitutionnel*,' 20,000 to 25,000; and one, '*Le Siècle*,' more than 30,000. The '*Moniteur*' is distributed gratuitously to all the government functionaries, and has but very few paying subscribers.

The development of the *feuilleton* has kept pace with the increase in the number of newspapers, and French editors at the present day depend more perhaps on literary than on political readers. The *feuilleton* consists of about a fourth of each page, reserved for the publication of novels, romances, &c. by the first writers of the day. It is no longer 'a few timid lines stealing modestly along under the formidable political columns of which they are the futile accompaniment, the elegant embroidery;' on the contrary, it is the *feuilleton* which now bears the politics on its powerful shoulders.

This brief sketch of the history of French newspapers may be appropriately concluded by the opinion of a French writer on the claim which society has on literature. '*Society*,' he says, 'demands from treatises, science; from books, ideas; from reviews, profound study of the questions discussed, from special collections, to justify their title; from daily journals, the speediest publicity, the most impartial views on all debates, documents, and facts—the most rapid and dispassionate judgment on events, institutions, men, and things.'

SMALL FARMING.

The following paragraph in a newspaper lately came under our notice:—'*IMPROVEMENT*.—In the cornyard of the farm at Petty, Morayshire, there are 101 stacks of corn, each stack averaging 13 quarters of grain. Last year there were only 88 stacks in this yard, and of a much smaller size. About thirty years ago, the farm was tenanted by a number of small cotters, and their whole produce would scarcely average 10 small stacks. This piece of information should not be suffered to pass without comment. It furnishes, in a few words, a thorough explanation of the advantages of *large over small farming*. A piece of land which, thirty years ago, under the cotter system of farming, produced only ten small stacks, now when in one farm, conducted on improved principles, produces 101 large stacks. It is evident that there is a gain of at least 91 stacks by the change. Who is it that makes this gain? First, the landowner, who receives a larger rent; second, the farmer, who has a larger proportion of the return for his trouble and outlay of capital; third, the public, who have ten times the quantity of food brought to market. But probably six families have been expelled in order to make room for one great capitalist farmer. Quite true; yet it is to be observed that all the grain which the six families could furnish was ten stacks. Suppose, then, we go back to the former state of things, what are we to do for lack of the additional ninety-one stacks? If the subsistence of cotter families were alone concerned, we might be contented to see no more than ten stacks sent to market. But this meagre condition of things will, unfortunately, not answer the demands now made for food. Twenty-eight millions of people require to have daily bread, and they must be thought of as well as the tillers of the soil. Mechanics, tradesmen, merchants, and all other dwellers in towns, although not owning a scrap of land, have a right to see that the territory of our island is not abused, and brought back to that condition which would defraud them of the material of subsistence. Thus small farming, with its want of capital to improve and make the very most of the land, is adverse to the general well-being; and from all that we have heard of old times, is not even advantageous to the parties who conduct it.

TOBACCO SMOKING.

There is an article much used in various ways, though not as an aliment, the deleterious effects of which on the assimilating organs require to be briefly noticed—namely, tobacco. Although confessedly one of the most virulent poisons in nature, yet such is the fascinating influence of this noxious weed, that mankind resort to it in every mode they can devise to insure its stupifying and pernicious agency. Tobacco disorders the assimilating functions in general, but particularly, as I believe, the assimilation of the saccharine principle. I have never, indeed, been able to trace the development of oxalic acid to the use of tobacco; but that some analogous and equally poisonous principle (probably of an acid nature) is generated in certain individuals by its abuse, is evident from their cachectic looks, and from the dark and often greenish-yellow tint of the blood. The severe and peculiar dyspeptic symptoms sometimes produced by inveterate snuff-taking are well known; and I have more than once seen such cases terminate fatally with malignant disease of the stomach and liver. Great smokers also, especially those who employ short pipes, and cigars, are said to be liable to cancerous affections of the lips. But it happens with tobacco as with deleterious articles of diet—the strong and healthy suffer comparatively little, while the weak and predisposed to disease fall victims to its poisonous operation. Surely if the dictates of reason were allowed to prevail, an article so injurious to the health, and so offensive in all its forms and modes of employment, would speedily be banished from common use.—*Proud on Stomach Diseases.*

GOOD FOR A GOOSE.

The Rev. Cæsar Otway, in his recently-published paper on 'The Intellectuality of Domestic Animals,' gives the following anecdote, which is by far too good not to receive the benefit of a wider circulation:—At the flour mills of Tubberakeena, near Clonmel, while in the possession of the late Mr Newbold, there was a goose, which, by some accident, was left solitary, without mate or offspring, gander or goslings. Now it happened, as is common, that the miller's wife had set a number of duck-eggs under a hen, which in due time were incubated; and of course the ducklings, as soon as they came forth, ran with natural instinct to the water, and the hen was in a sad pucker—her maternity urging her to follow the brood, and her selfishness disposing her to keep on dry land. In the meanwhile up sailed the goose, and with a noisy gabble, which certainly (being interpreted) meant, leave them to my care, she swam up and down with the ducklings; and when they were tired with their aquatic excursion, she consigned them to the care of the hen. The next morning, down came again the ducklings to the pond, and there was the goose waiting for them, and there stood the hen in her great frustration. On this occasion we are not at all sure that the goose *invited* the hen—observing her maternal trouble—but it is a fact that she, being near the shore, the hen jumped on her back, and there sat, the ducklings swimming, and the goose and hen after them up and down the pond. And this was not a solitary event: day after day the hen was seen on board the goose, attending the ducklings up and down, in perfect contentedness and good-humour; numbers of people coming to witness the circumstance, which continued until the ducklings, coming to days of discretion, required no longer the joint guardianship of the goose and hen.

VALUE OF AN OLD COAL-PIT ROPE.

Among the numerous worn-out and often considered worthless materials which the ingenuity of man has discovered means of remanufacturing, and rendering of equal value with the original substance, are old tarred ropes, which have been long in use at coal-pits. Our readers will be surprised when we inform them that out of this dirty (and apparently unbleachable) substance is produced a tissue paper of the most beautiful fabric, evenness of surface, and delicacy of colour—a ream of which, with wrapper and string, weighs only two and a half pounds. It is principally used in the Potteries, for transferring the various patterns to the earthenware, and is found superior to any other substance yet known for that purpose. It is so tenacious, that a sheet of it, twisted by hand in the form of a rope, will, as we are informed by Mr Fourdrinier, the manufacturer, support upwards of a hundredweight. Truly we live in an age of invention.—*Mining Journal.*

SONG—THE SPRING.

I know where by Life's wayside
There is a crystal spring,
Where sometimes I sit down and sigh,
But oftener sit and sing;
None tarry there so long as I,
Or there so often be;
For it for none does outward flow
As it flows out for me.
In the dryest days of summer
Its current sweeps along:
The winter brings no ice to freeze
The measure of its song;
And like a good thought of the soul
That wanders out to bless,
It every day but deeper grows,
Instead of growing less.
Ask you where by Life's wayside,
On what enchanted ground,
This crystal spring, so sweet and rare,
Is ever to be found?—
Look down into your heart, my love,
As I into your eyes,
And while I trace the outward flow,
You may behold the rise!

—*New York Literary World.*

LOSS OF STRENGTH.

The loss of our strength is much oftener occasioned by the vices of our youth than by the ravages of age; it is early intemperance and licentiousness that consign to old age a worn-out constitution.—*Cicero.*

CHAMBERS'S
LIBRARY FOR YOUNG PEOPLE

A SERIES OF SMALL BOOKS, AT ONE SHILLING EACH.

EDITED BY WILLIAM CHAMBERS.

MY DEAR BOYS AND GIRLS,

My brother and I have often been asked to publish some small books for your special instruction and amusement; but for a number of years, we have had so many other things to do, that we have never yet been able to comply with the request. We now intend, however, to issue a few books of this kind. The subjects of some of the volumes will be of an instructive nature; one, at least, will be poetry; but the greater number will consist of moral and religious tales, written for your entertainment and benefit. The first which appears will be a story by Miss Edgeworth, a lady who has written many tales for youth, and who has kindly assisted in the present undertaking. Mrs Hall and some other ladies have also promised to write for these books; and from the French of MADAME GUIZOT, EUGENIE FOA, and others, will be procured some interesting new translations. It may be agreeable to your parents to know, that the subjects will be designed to influence the conduct and feelings, and that the general aim will be to make you better and happier.

You will probably be anxious to know what is to be the appearance of these books. It is to be something different from that of children's books generally. I remember, when a boy, being much pleased with a variety of little volumes published by 'the good Mr NEWBERRY, at the corner of St Paul's Churchyard.' I intend to revive Mr NEWBERRY's style of publication. His books were not thin soft covered things, but real volumes with hard boards, brilliantly ornamented with figures in colour and gold. These are the sort of books which I am going to prepare; only they will be much more beautiful; and each will be illustrated with a frontispiece. It is proposed to publish only a small number; one to come out every month till all are issued. The price of each will be a shilling. The first book will appear towards the end of December, so as to be adapted for a Christmas and New-Year's gift. Perhaps your papa or mamma may present you with a copy, and also order a volume to be afterwards sent home every month; by this means a row of elegant little books, at a small expense, will be procured for the nursery library.

W. C.

EDINBURGH, Nov. 10, 1847.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 98 Miller Street, Glasgow; W. & G. 147 Strand, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 206. NEW SERIES.

SATURDAY, DECEMBER 11, 1847.

PRICE 1½d.

A NIGHT ADVENTURE ON LAKE SIMCOE.

THE rigour of a Canadian winter is such as to enchain in icy bonds, for several consecutive months, the second-rate lakes of the continent. In the higher latitudes of the province, the ice acquires an almost incredible thickness, defying for a long time the influences of spring; and when it yields at length, about the month of May, choking up the rivers, by which it attempts to descend in crowded and fantastic masses, and causing inundations, at all times inconvenient, and sometimes fatal both to life and property.

As soon as these great bodies of fresh-water are frozen, an active intercourse immediately strikes up between the different points on the shores of such of them as have become either wholly or partially encircled with an industrious population. Districts of country which, in the summer season, are only accessible to each other by toilsome and circuitous journeys, thus experience, when winter sets in, all the advantages of a direct intercommunication. It is during the winter season that the traffic and intercourse between the rural districts and the towns reach their greatest height, the majority, particularly of the more distant farmers, reserving their visits to the different markets of the province until the smoother and more direct roads of winter can enable them to perform their journeys with greater speed and less toil.

Fearlessly as it is generally undertaken, a journey across one of the great frozen masses of the North American continent is not always unaccompanied with danger. The following incident will exhibit, to some extent, the nature and amount of the peril which is thus occasionally encountered.

Amongst the American lakes of the second class, Lake Simcoe ranks as one of the largest. Its extreme length is about forty miles; its width, at some points, being nearly thirty. It is situated in the midst of a beautiful and fertile district lying between Lakes Huron and Ontario; its distance from the latter, due north from the city of Toronto, being forty miles; whilst its northern extremity approaches to within five-and-twenty miles of the former, into which its superfluous waters are discharged by the river Severn, whose short course is frequently interrupted by successive cascades and brawling rapids. The shores of the lake are such as to strike every beholder with their beauty, being indented with numerous bays, some of which run far up into the land, and retreating at many points, in graceful undulations from the water, crowned with the beech and the maple, the birch, the hickory, and the live oak of Canada. It is approached from the capital of Canada West by a fine macadamised road, on either side of which the forest has been cleared away, the whole route being lined with elegant man-

sions, and comfortable and commodious farmhouses. In the social organisation of Canada, wealth has not as yet marked out a very numerous class for its own; but the shores of Lake Simcoe are destined to be the future retreat of the wealthy and refined class, to which the progress of the colony will give rise. In less than fifty years it will be encircled with the villas and country mansions of those whom circumstances will enable to retire from the bustle and activities of life. Already have many English families with limited means settled in its neighbourhood, and the axe of the husbandman is rapidly transforming the whole aspect of the circumjacent country. Like other lakes of its class in these latitudes, Lake Simcoe yields to the rigours of winter, and becomes perfectly ice-bound for several months in the year.

In the month of December 184-, in company with two friends, I undertook the passage of the lake upon the ice, which had then been formed for several weeks. We started without dreaming of danger, inasmuch as the roads, which had been marked off in various directions across its surface, had been traversed for some time with perfect safety. For two or three days previously, the thermometer had ranged at from 10 to 15 degrees below zero; but a marked change had suddenly taken place in the temperature, the mercury having risen several degrees. Our object was to cross from the Holland Landing, the nearest point of the lake to Toronto, to the town of Bonie, on Kempenfelt Bay on the opposite side, and lying in a north-westerly direction from us. Night was fast setting in when we started; but as the moon was then about full, and the sky clear, we set out with every anticipation of a pleasant sleigh-ride over the broad and glistening expanse of the fettered lake. With a good horse, a couple of buffalo robes, and with ample provision for man and beast—for we had a journey of about thirty miles before us, and there were no inns on the road—we wanted nothing that could minister to our comfort. No road of life, however, is smooth, even though it should be over ice; and we had scarcely emerged from the low and sedgy banks of the Holland River, which was quietly emptying itself into the lake under our feet, when we encountered one of those rents or chasms which so frequently permeate large masses of ice, and which sometimes serve effectually to interrupt the road, unless the traveller is provided with the means of overcoming them. These rents are formed by the inability of the ice to sustain its own weight; and when they occur in the winter covering of large masses of water like Lake Simcoe, they frequently extend from one end of the lake to the other. The water, with which they are immediately filled up, seldom freezes; and when the ice is covered with a thin sprinkling of snow, the eye can trace them for miles, like the blue veins which

underlie a clear and brilliant complexion. Although they are not always of sufficient width to offer any serious impediment to a journey, it is nevertheless a matter of prudence in the traveller to possess himself of adequate means of crossing them. This is generally done by attaching to the bottom of the sleigh two or three planks, which can be thrown over the chasm, should there be need, in the form of a temporary bridge, over which the vehicle can be easily pulled or pushed, the horse being in the meantime detached from it, and having to trust for his gaining the opposite side to the powers of leaping with which nature may have endowed him. The propriety of providing ourselves with the necessary materials for putting such a device into execution, was made manifest to us by this our first interruption, the rent which we encountered being sufficiently formidable to call into exercise all our pontoon accomplishments. We got safely across, without further cost than that of a little delay, and proceeded merrily on our journey, occasionally enlivening our way with a song, and satisfied that we could have but little to complain of if all our obstacles should be as easily overcome.

The shadows of evening had scarcely closed around us, ere the moon rose in her full-orbed splendour. Adequately to describe the scene which her silvery light displayed to us is next to impossible. The sky was without a cloud. As night advanced, the eastern horizon was bathed in that glorious flood of pearly lustre, which the moon, in the clear atmosphere of America, pours over earth and heaven. To the westward, the sky gradually darkened into the deepest blue; imbedded in which, the far-off stars twinkled with a brilliancy unknown in our murky climate. The loneliness and stillness of the scene were absolutely oppressive. Had I been alone, the conviction would easily have settled upon me that I was that unhappy wretch—the 'last man.' Not a sound stirred in the air, except that of our own voices, which we sometimes strained to the uttermost, to catch, if possible, an echo; but in vain—our appeals met with no response, and all around us was as still as death. As far as the eye could reach, a belt of spectral pines lined the shore, whose sombre and dusky forms contrasted strongly with the glistening ice. Their branches were heavily laden with snow, and gleamed in the moonlight with myriads of pendent icicles. The more distant shores of the lake looked ghastly and shadowy; whilst towards the north, in the direction of its greatest length, the vast plain of ice which we were traversing appeared to stretch to infinity, merging into the horizon, as if it led to heaven. A lovelier night never shone on earth—a more beautiful and impressive scene was never witnessed.

As we were in no hurry, we proceeded at a leisurely pace, guided in our course by a wide breach, which was observable in the broad shadow that lay under the high bank forming the eastern shore of the lake, and which we knew indicated the entrance to Kempenfelt Bay. It was but natural that our conversation, as we proceeded, should turn upon the prospects, social, political, and economical, of the magnificent country which spread around us, and which, with few exceptions, still rioted undisturbed in all the wild luxuriance of nature.

Engaged in this manner, we were insensible to the indications which were accumulating around us, that the repose of the elements was soon likely to be disturbed. The first that we observed was the momentary obscuration of the moon, caused by the passage

across its disk of a small cloud, dark and watery-looking in the centre, but fringed with lighter and fleecy vapours. It passed swiftly by, and its shadow sped over the frozen lake, as if it marked the flight of an eagle. In its lower strata, the air was motionless as before; but the winds were madly careering aloft, as was plainly indicated by the rapid and fitful motions of the clouds, which now mottled the eastern half of the sky, whilst the horizon beyond was shrouded in an impervious screen of dark stormy vapour. We were sufficiently acquainted with the climate to know what this sudden change in the aspect of things portended; and as we had still many miles before us, we became anxious for the termination of our journey. The road was but here and there slightly traced; and should the night become dark, our position would be very uncomfortable, to say the least of it. It is usual for those who traverse the lake, to stop about half way and bait their horses on the ice; but we had no longer time to spare for such a detention, and proceeded at an accelerated pace. We had already encountered several chasms, similar to that which had first obstructed our course; but owing to their no great width, and aided by the light of the moon, we easily passed them. To overcome them in the dark, however, would be quite another matter; and darkness was now fast stealing around us.

The angry horizon rapidly unfolded its vapours, and the moon was at length completely obscured. No sooner had the last gleam of light forsaken the sky, than the wind began to beat around us in fitful and eddying gusts. The snow, which lay lightly upon the ice, was lifted up and thrown rudely against our faces. Our position was every moment becoming more and more discouraging, and we at length began to give way to apprehensions for our safety. Land was, in every direction, many miles distant, and we were hemmed in by treacherous chasms on every side. This was no pleasant predicament in which to be overtaken by the howling tempests of a boisterous winter night. The darkness which had so suddenly succeeded to the brilliant moonlight, was now nearly complete, and to add to our discomfiture, the wind was almost directly in our teeth. Nothing was wanting to impart a climax to our perplexity but a blinding fall of snow; nor was this wanting long. A few large and ominous flakes spotting the buffalo robes in which we now wrapped ourselves, gave token of its approach; after which the storm rapidly progressed in its fury, when the gloom cast upon our spirits was only exceeded by the still deeper gloom which reigned around us. Faster and faster fell the drifting snow, and more dismally howled the wintry wind as we crawled along, feeling our steps, in momentary expectation of encountering another rent in the ice, which our present position would have rendered dangerous in the extreme. It seemed as if the elements had conspired to torment us; for the snow, which now beat against us in masses, when it fell, refused to lie, but mounted again on the wings of the tempest, to mingle with the falling flakes; and it was not until it had been whirled about for some time in furious eddies, that it was at length deposited in fantastic drifts upon the ice.

Every trace of the road was now blotted out; and as no distant landmarks were discernible for our guidance, we proceeded for some time in an uncertain course, with nothing to guide us but the direction of the wind, which we knew to be easterly. We had every now and then to encounter heavy snow drifts, that had rapidly

accumulated in our path, through which we penetrated with some difficulty; but consoling ourselves with the reflection that, if they were toilsome, they were not dangerous, like the yawning chasms, of which we stood in constant dread. We exerted ourselves to the utmost to proceed; but at length, weary and benumbed with cold, and unable any longer to face the pitiless storm, we came to a halt, without a tree or bush to shelter us from the tempest. Our first care was to do all in our power to protect both our horse and ourselves from its fury, which we did by turning our vehicle in the contrary direction to that of the wind. We had but two buffalo robes along with us, one of which we threw over the horse, huddling under the other in the sleigh for warmth and shelter. There we remained for some time, in the hope that the storm would ere long abate somewhat in its fury. Nor were we disappointed in this respect. After waiting for about twenty minutes, it sensibly relaxed. It was still almost pitchy dark, but the wind had fallen considerably, and the snow fell more sparingly than before. We resumed our journey—if crawling along, one leading the horse, the other moving cautiously a little in advance, to ascertain that the ice was safe, can be called a resumption. Thus we proceeded for some time, in utter uncertainty as to the point to which our weary footsteps were leading us; and almost sickened at the thought, that, on the most favourable calculation, fully four miles of treacherous ice yet intervened between us and land.

We had made but little progress in this way, when, to our dismay, the wind began once more to increase in violence, and we were compelled again to seek what shelter we could by coming to a dead halt. We had scarcely done so, however, when our alarm took a new direction. We were startled by a dull deep sound, resembling a heavy but smothered crack, which arose to our left, and apparently in the vicinity of the shore; and which, after a moment's cessation, was repeated, and, growing louder and louder, seemed to approach the spot where we stood, and to which we were now rivetted with terror. For a few moments we listened, unconscious of its cause, but recognised it, as it came nearer and nearer to us, bellowing like thunder. It seemed to pass swiftly about a hundred yards in advance of us; and although still in fear, we could not refrain from mutual congratulations on having escaped the danger. As it receded to our right, it became fainter and fainter, until at length it resembled the sound of musketry heard at a distance, and finally died away amongst the bays and promontories at the upper end of the lake. The whole proceeded from the occurrence of one of the physical phenomena of these wintry regions. The ice had, in fact, opened another seam; and in doing so, it roared as if it had been racked with pain. As it swept by, we clung instinctively to the sleigh, for the chasm might have opened beneath our feet.

As this might prove a crowning difficulty to us, we cautiously advanced to ascertain its extent. We had not proceeded far, when we heard the water beating in small ripples against the newly-rent ice. It was so distinct, that even the horse seemed to recognise it; and with unerring instinct, recoiled a step or two from the danger. There was now no alternative before us but to retrace our steps, or to remain where we were until morning. Between the two, however, there could be no hesitation, and we at once determined to remain. We could gain nothing by retreating; for, to say nothing of our having already crossed the greater portion of the lake, there were dangers behind us similar to those before. The width of the newly-opened seam we ascertained to be about four feet at the point where we stood. Dark and stormy as it was, half that width would have deterred us from attempting to cross it. We therefore prepared to bivouac for the night. Retreating some distance from the chasm, we unharnessed the horse, and turned the sleigh on its side, to protect us from the wind and the still drifting snow. The horse we tied by the reins to the sleigh, and left him to forget

the cold in an ample feed of oats, which we placed before him. We then sat down, enveloped in our buffalo skins, under the shelter of the sleigh, in which posture we determined to remain until returning light should enable us to pursue our journey.

We were obliged, however, frequently to spring to our feet, and move briskly about, in order to counteract the insidious and benumbing effects of the cold, to which one of my companions, despite of remonstrance, was fast giving way. Determined to rescue him from the dangerous lethargy which was stealing over him, and finding persuasion useless, I resorted to the device of provocation. By degrees I managed to rouse him into a towering passion, which restored his languid circulation; and saved him, by arousing him to a state of physical activity. The weary hours at length crawled by, and a dull, grayish light in the east betokened the approach of morning; but with it came no abatement of the tempest. The thick air was still oppressed with its heavy burden of snow, of which it seemed vainly endeavouring to rid itself. But the approach of light had deprived the scene of nine-tenths of its horrors, and we lost no time in preparing to resume our journey.

The cold had by this time, however, so enfeebled us, that it was with difficulty we succeeded, by our conjoint efforts, in restoring the sleigh to its right position. I held the horse, whilst my companions proceeded to reconnoitre the chasm, to select the most favourable point for crossing it. Whilst they were so engaged, I had to shout occasionally to them, with all the strength that remained to me, to enable them to rejoin me, for the light was still faint, and the heavy snow, mingled with the drift, soon hid us from each other. The noise thus occasioned, or something else, which it is not now necessary to ascertain, caused the horse to become restive. I tried to soothe him, but failed, and my hand was not strong enough long to retain the rein. Finding himself at liberty, he darted off, and ran past my companions, who made a vain effort to stop him. We followed him for a few seconds in the direction he had taken, until at length a heavy splash warned us that further pursuit might be as dangerous as it was useless. We cautiously approached the spot whence the sound proceeded, but on reaching the chasm, could find no trace of the poor animal, save a little blood, which the feeble light enabled us to discern staining the snow on the opposite side, and which showed that his head had come in violent contact with the ice in tumbling into the water.

We had now no alternative left but to prosecute our journey on foot. To cross the chasm, it was necessary to resort to our planks; but these were no longer at our command, being by this time buried under a heavy wreath of snow. We made several ineffectual efforts to recover them, and at last gave up the attempt in despair. Our situation was now more than ever hopeless. We had not sufficient strength left us to overcome the chasm by a leap, nor were we in a condition to undertake a journey of five-and-twenty miles, which an attempt to retrace our steps would have involved. Exhausted and benumbed, and in utter despair at our situation, we once more resorted to our buffalo skins, wrapped in which we again lay down under the shelter of the sleigh. The storm raged wildly as before, and although the sun had been now more than half an hour above the horizon, the thick atmosphere seemed to absorb its struggling beams, and nothing but a dull grayish twilight was the result. It was again with extreme difficulty that we prevented one another from yielding to that drowsy lethargy which, under such circumstances, is the sure prelude to dissolution. Our powers of resistance would have sustained us but little longer, when hope again shed its cheering light into our souls. A solitary gleam of wan and struggling sunlight suddenly passed over us, but was instantly swallowed up again by the drifting clouds. It was an omen of good, and we hailed it with a feeble shout. With renewed prospects of life and future happiness in store for us, our energies once

more revived, and we sprang instantly to our feet. The spell of the storm was broken; it had spent its fury, and torn itself to pieces in its wrath. The vapoury masses, which had shrouded the heavens and deluged earth with snow, were rent asunder on all sides; the sky gradually lightened of its burden; and in half an hour's time, over the vast surface of the lake—to which the myriad snow-wreaths now imparted as stormy an appearance as its unchained waters had ever worn when lashed into billows by the wind—the shadows of the broken and fast-drifting clouds were sporting themselves in the dazzling sunlight.

It is unnecessary to prolong the recital. After considerable search, we discovered a point at which we could safely cross the chasm which had so unseasonably yawned across our pathway during the night. We had not proceeded far on our way towards Bonie, when, to our inexpressible joy, we perceived a sleigh making directly towards us. It was driven by our warm-hearted friend Mr —, to visit whom was the object of our journey. Aware of our intention to make a night passage of the lake, our non-arrival, coupled with the storm which had occurred, gave rise to apprehensions in his mind which induced him to start off in search of us. The relief which his appearance gave us was more than reasonable. We jumped into his sleigh, and made for land at as rapid a pace as the loose deep snow, with which the ice was now covered, would permit us. On arriving at our journey's end, we inured ourselves gradually, as was but prudent, to the warmth of the house; and when, shortly afterwards, seated by the large, crackling, blazing log-fire, which leaped and roared in the ample chimney around which we were ranged, its comfortable heat, together with the happy faces and cordial welcomes of those around us, made us forget for a time the miseries of the night, and the painful apprehensions of the morning.

SKETCHES OF THE HISTORY OF EDUCATION.

ERASMUS—LUTHER—TROTZENDORF.

To give anything like a complete history of education, such as should be in anyway suitable to the importance of the subject, and the interest now attracted to it, would require a voluminous work. At present, nothing more is proposed than a brief outline of the progress of the science, and some account of the views of the more remarkable men who have thought and written on the subject.

The history of intellectual education in Europe may be said to commence with what is generally termed the revival of letters in the fourteenth century. Up to this time the nations of Europe were engrossed in warlike affairs. Few amongst the laity, and those only the most favoured by nature or position, attained even the rudiments of reading and writing, and the clergy were only less ignorant than the laity. Of vernacular literature, properly so called, with the exception of ballads and romances, there was none; and the huge tomes, written in the barbarous Latin of the period, which occasionally made their appearance, were occupied with the abstruse absurdities of the scholastic theology. The physical sciences, with the exception of such amount of empirical chemistry as was hoarded up in secret by the 'alchemists and magicians,' were unknown, and natural history and geography were a mass of fables. Many of the principal authors of Rome, we may almost say all those of Greece, were unknown even by name; and in fact the language of the latter had disappeared from western Europe. When, however, something like order had succeeded the anarchy of the middle ages, when cities arose and peace was occasionally enjoyed, men quickly turned their minds to intellectual pursuits. The revival of letters began in Italy, in the golden days of the republics. The cities of northern Italy were at that time both richer and more civilised than any other portion of Europe; intellectual pursuits were more con-

genial to the people of that classic land than to the ruder spirit of the Gothic nations; and the destruction of the Greek Empire, by scattering abroad the learning and the learned men of Greece, afforded facilities for acquiring a knowledge of the ancients which had before been unattainable. All the leading men of Italy were seized with the passion for letters. Manuscripts were collected, libraries formed, and schools instituted for the teaching of Latin and the study of the classics. The step thus made was of immense importance, for a literature worth reading was reintroduced into Europe, and it began to be thought necessary that men should be able to read it. Once awakened to the advantages of mental culture, the intellect of the age, elevated by the tuition of masters so superior to any previously known, expanded the more the more it was cultivated. So far the good done was unalloyed; but it did not long remain so.

In looking back on the history of education, as it is understood now, and as it was spoken of till within a comparatively recent period, we shall see that opinions have changed rather with regard to the theory than the practice of this science. Every propounder of a system of education, and every schoolmaster, however closely he may stick to the antiquated system in the method of teaching, will tell you that his ultimate object is the general training and expanding of the mind, the strengthening and cultivation of the faculties, and the fitting of the youth for the business and the duties of the man. As to the best means to this end, we have many questions, but all agree that school learning is only the means by which their object is to be attained, not the object itself, and in that object they agree. This distinction, merely verbal though it may at first appear, between the object and the mode of education, is not unimportant, since it is to the confounding of the two—in consequence of the overweening admiration of the ancients entertained by the revivalists—that we are to ascribe all the inconsistencies which have infected education down to the present day, rendering it a teaching of vocabularies instead of a training of the mind. It was not perhaps wonderful, especially of the Italians, that an undue admiration should have been aroused by those beauties of style and manner in which the classical authors so immensely surpassed the crabbed theologians of the middle ages. Carried away by this appreciation of mere external excellence, they exceeded the absurdities of later times, and not only imagined that the study of the classics comprised everything necessary for education, but actually thought that the attainment of a Latin style was all that was to be looked to. Selecting one or two favourite authors, Cicero in particular, they directed all their efforts to a slavish imitation of him; and the sole object of education, both in theory and practice, was held to be, not even the learning of Latin as the most valuable branch of knowledge, but absolutely the writing and speaking of Latin in the style of Cicero—using no words, no forms of speech, except those found in his works. The lengths to which this childish idea was carried are almost incredible; and the least evil attendant on it was, that it not only led to the neglect of all which was really valuable in the uncouth learning of the middle ages, but that the classics themselves, for which everything else was abandoned, were not studied to the best purpose.

The theory of Ciceronianism, as this perversion of classicism was called, reigned omnipotent for nearly two centuries; but it was too absurd to endure for ever; and as the learning of the Italians extended into other lands, the pupils began to laugh at the folly of their masters. It was in Germany that the first resistance was made to this education in shadows. It was maintained that the perfect imitation of the style of any author, how excellent soever, was not the only thing to be sought for in education; and that classical studies would be of little value until they were entered on in a very different spirit. The celebrated Erasmus was the hottest

enemy of the Ciceronians. He exhibited in the most ludicrous light the folly of placing the sum of literary excellence in the aping of the same words and turns of style as those used by Cicero, without any regard to the alterations necessitated by change of circumstances, or any consideration of the intrinsic merit of the work. But though Erasmus gave a fatal blow to Ciceronianism, and so far did good service to the cause of education, he did not touch the principle which was the root of all the evil—namely, the teaching of the classics for themselves alone. He only showed how to impart the best knowledge of the classics, not how best to educate the man. Thus the sum of his argument is contained in the question, Whether he is the better master who, in reading an author, only loads the memory with individual niceties of language, or he who, whilst he impresses his pupils with the full spirit of his author, at the same time instructs them in every point of history, physics, or literature *necessary to the complete understanding of that author?* His efforts were directed to the overthrow of the Ciceronian system, because it did not teach the classics aright, rather than to the establishment of the principle, that the teaching of the classics is not the object of education.

In fact Luther seems to have been the first and the only man of his time who understood this matter aright, who saw that education is not comprised in Latin and Greek, and that if the classics are to be studied at all, they should be studied not as the end, but as the means for attaining the end. He found education in Germany of the crudest and most useless kind. Instruction was chiefly in the hands of the monks, and little or nothing of real knowledge was imparted by them. The study of the classics was cramped by the Ciceronian folly, and what was taught as science was the fanciful absurdities of the ancients. In place of these vanities, Luther strove to introduce a sound system of practical instruction not only for the higher orders, but for the people in general; and it is to his efforts that we may trace the origin of that system of education which now renders German schools the models for those of Europe. His views on this subject were most extensive, and he strenuously enforced the necessity of education for every class. It will not do, he writes, to say that the children of the poor have no time for attending school (a common objection even in our days); my opinion is, that the boys should go to school for an hour or two every day, and bestow the rest of their time at home, in working or learning their future trade. Surely, too, a girl may give an hour a day to the school, and yet have time enough for her household business. And therefore it is, he argues, the duty of the state to provide instruction for all. For since these children, whether instructed or ignorant, must grow up amongst us—and the well-being of a state does not consist merely in riches and military strength, but in good and orderly citizens; yet besides those whose parents are too careless, there are many whose parents, though willing, are unable or unfitted to instruct—it is no less the interest than the duty of the government to care for those who otherwise must grow up without any instruction whatever. Thus Luther's idea of education was not that of arbitrary teaching without reference to utility, but the imparting of such instruction, and the carrying out of such a system of training, as would best fit the youth of both sexes to fulfil their respective duties as men and women. In fact the extension of sound education was essential to the great object of Luther's life. Founded as his reformation was on intellectual enlightenment, he saw the necessity, if his reformation was to be permanent, of extending and preserving that enlightenment. So he pressed the necessity of a real study of the classics, with a view to the thorough examination of his views on religion, whether correct or otherwise—declining against cramming a collection of words and phrases down the throats of the unlucky students, without any attempt to explicate the real worth of the authors read, or to make the learning

so acquired ultimately useful. But whilst so strenuous an advocate for classical learning, he did not by any means bound his views by it alone. It is of no use, he said, to teach words alone—we must teach things also; for if words alone are taught, without any understanding of the thing signified, nothing is taught at all. So he was altogether opposed to Erasmus, and insisted on the necessity of instruction in physics and science in general. This instruction, too, he wished to be of the best kind, and inveighed against the use of such works as those of Aristotle, which were even in those days known to give most incorrect views of nature, pointing out that all the improvements and advances then made in science should be brought to bear upon the system of instruction, so as, as far as possible, to give the scholar a real insight into the mysteries of nature. With the same view Luther added to his course of instruction mathematics, history, rhetoric (all at that time either not taught at all, or most miserably taught), as well as music, and exercises for the body as well as the mind. And nothing can more strongly show how completely he felt that education was not bounded by teaching, than the minuteness with which he descends into the particulars of the early training of children, exposing the evils of severity towards them, of introducing foolish or improper ideas into their minds, and the necessity of giving full play to the natural vivacity and activity of youth, in opposition to the system of seclusion and restraint pursued in the monkish seminaries. Such, generally, were Luther's views; and so great were the improvements effected by him, that he was scarcely more the reformer of religion than of education in Germany. His coadjutor in this, as in his other labours, was Melancthon, who reduced to practice the theory which Luther expounded; and having first qualified himself for the task, composed several books for the use of learners, and acted as teacher in many of the higher branches.

Of the many teachers who, incited by the exhortations of Luther, strove to supply an education suitable to the increasing enlightenment of the age, the most characteristic, both as regards the man and the time, was Trotzendorf. He was born in the year 1490, and was for thirty-five years rector of the school at Goldberg in Silesia. There was no point on which Luther was more decided than the inexpediency of severity in discipline, and the practicability, as well as advisableness, of leading aright by moral influence, instead of deterring from wrong by terror of punishment. Trotzendorf's system was founded on this principle. His ideal of a school was, that it should be a republic, in which the scholars should assist the master in the task of government. With this view he constituted himself perpetual dictator, and promulgated a code of laws which all were bound to obey. Officers were appointed from amongst the boys, with various duties; some to see that the proper hours for rising and going to bed were preserved, that the clothes were kept clean, &c.; others, that order was maintained at meal-times, and so forth. Besides these, there were monitors, chosen weekly or monthly, for assisting the teachers in their labours. The government of the school was quite constitutional. It consisted of a consul, chosen by the master every month, twelve senators, and two censors. Every scholar accused of a fault was cited before the senate, at the meetings of which Trotzendorf was always present in his character of dictator. The accused was given eight days to prepare his defence, and if he failed, was subjected to such punishment as was appointed in the laws for his offence. This system, of officers chosen from, and judicial functions exercised by, the scholars themselves, was in great measure the same as that practised in our own day at Hazlewood school; and Trotzendorf's method of teaching was in so far a foreshadowing of the Lancasterian, that he availed himself, in the instruction of the lower classes, of the aid of monitors chosen from the higher. Some of the rules laid down for the conduct of the scholars were singular enough—

as that they should not bathe during summer in cold water, nor go on the ice nor throw snowballs during winter, nor eat too much fruit in autumn. We have, however, introduced this sketch of a school of the sixteenth century, not so much from the coincidence of its system with some of those of the nineteenth, as because the system, however whimsical in some of its details, was founded on a principle which is still too much overlooked—the principle of self-rule and self-responsibility—the uniting of the scholars with the master in the task of government. Those who consider the whole duty of a schoolmaster to consist in the driving in of a certain amount of knowledge, may sneer at the idea of Trotzendorf as fantastic and useless—as certain to produce much embarrassment without any practical benefit; but if the real object of education be the formation of the mind, such a system is well deserving of consideration which, constituting the pupil himself the judge and the rephender of wrong, leads him to look to principle as the basis of action. In point of fact, the great difficulty in the moral regulation of a school, is the difficulty of producing the feeling of responsibility. If we are to have moral principle, we must have self-responsibility; and there can be no feeling of responsibility without self-government. If, then, as men, we are to be actuated by principle, the sooner we begin to look within ourselves for our motives of action the better. Under the ordinary management of our schools, the pupil does not feel himself bound to his master by any tie beyond that of unreasoning subjection—the school is divided by an impassable line into the governed and the governors and the scholars, as Trotzendorf said, and are bound together in an impenetrable phalanx in opposition to the master. If they do right, they escape punishment; if wrong, they suffer it; but as they have no share in judging what is right or wrong, the prospect of punishment constitutes their whole motive for acting one way or the other. It is a simple matter of calculation, somewhat like that of the smuggler, who knows that, if detected, he is liable to pay the penalty of his offence, but who attaches no moral guilt to the act for which he suffers. After all, a school is, as Trotzendorf said, but a collection of youthful men, and in the same circumstances the same results may be predicated with regard to both. Nothing is more trite than the observation, that the essential advantage of a constitutional over a despotic government does not consist so much in any direct superiority in the external wellbeing of the subjects of one over those of the other, as in the general elevation of mind and principle produced by the habit of self-reliance and self-control. The same may be said of a school. Under the despotic sway of a vigilant master, a boy may commit fewer acts deserving punishment than if under the control of his fellows; but the effect on his mind will be far inferior. In the one case, he acts aright from fear, not from conviction; in the other, he is elevated to the position of judging for himself; he feels that it is wrong to do wrong; and his moral principle is gradually strengthened under the influence of the same motives which are to guide him in manhood. Nor are the benefits arising from this union of the pupil with the master limited to indirect improvement. At present, the master is placed so completely in opposition to his scholars, he is so completely the common enemy, that every effort is made, even at the expense of the innocent, to screen the guilty. It is from this feeling, that the great object is to thwart the master, and that the whole school is banded together in a sacred compact against his authority, that so much obloquy attaches to the crime of the tell-tale. Who does not remember innumerable instances where the greatest amount of wrong and tyranny by one boy towards another was borne without complaint; and why was this? Because the appealing to the master was looked on as a species of treason, as a treachery far more to be detested than the crime of the greatest bully in the school. We do not complain of this feel-

ing; it is a natural and an honourable feeling; and so long as things continue on the present footing, the same feeling, and the evils resulting from it, must exist. But the case would be very different if the injustice to be complained of were about to come under the authority of the equals instead of the common master of the oppressor and oppressed. In that case the pupils would be engaged on the same side as the master; wrong and injustice could be checked without touching the sentiment of honour, or destroying the feeling of confidence amongst the pupils themselves; whilst at the same time, as the last appeal in the last resort would be to the master, his authority would be looked to for protection, and he would be regarded with confidence rather than aversion.

But whilst the enlisting of the moral feeling of the pupils in aid of the master's authority will produce these advantages—if the system is carried out on principles which secure a perfect confidence between all parties—the mere making of the pupils the tools of the master is not only detrimental to his authority, but must necessarily be destructive of all moral feeling amongst the pupils themselves. As a contrast to the system of Trotzendorf, we may take that of the Jesuits, whose schools at this period obtained the greatest celebrity, and who so far enlisted their scholars on the same side as the master, that they enrolled them as a sort of detective force against each other. The whole scholastic system of the Jesuits was founded on what they chose to call a 'beautiful emulation' amongst the pupils. Stringent rules were laid down for the regulation of the school, and the strictest and most slavish obedience to these rules was required. Any one transgressing them was subjected to a certain punishment, unless (and this was the beautiful emulation) he could in the meantime detect one of his fellows in the same fault; as, for instance, the speaking of anything but Latin was strictly forbidden. Any one, however, who, for the infringement of this rule, had been subjected to disgrace and punishment, transferred both to any schoolfellow 'whom he had likewise heard, either in or out of school, speak German, or at any rate whom he could convict of such a fault by a competent witness.' This system was, as we have said, so far founded on the same principle as that of Trotzendorf, that the pupils were united with the master in the repression of evil; but here the resemblance ceased. The plan of the Jesuits created no union of interest founded on morality, aroused no feeling of self-responsibility; for the pupils were the spies, and not the colleagues of their master. But the disadvantages of such a system were not merely negative. Every one must at once see the abominable evils which would necessarily be generated by the operation of this principle of beautiful emulation. It was, in fact, emulation turned the wrong way: all feeling of honour, all confidence, all affection amongst the scholars must have been destroyed. Each, instead of being the friend, was the enemy of his neighbour; and the great object of every one was not to incite his fellow to do right, but to lead him wrong. How different to Trotzendorf's plan, by which each boy, instead of being a spy on the other, and interested in his misdoing, was guarantee for his doing well; and wrong-doing was avoided, not because detection was inevitable, but because the feeling of the school was enlisted against it!

We have alluded at such great length to this subject, because we believe that many of the problems which now vex us in the practical details of school management, can only be solved by resorting to a system which, by identifying the interests of the master and the scholars, shall lead them to support, instead of thwarting his authority. But then, if such an attempt is to be productive of any advantage, it must be fully carried out. The pupils must feel that it is they themselves who act, and not their master through them; they must be the allies, not the servants of their governor. To say that such a system would be attended by many difficulties, and would require the most judicious and unremitting attention, is merely to say what is true

of every scheme of education which is to produce any good whatever. That such a plan is not impracticable, the writer has witnessed. In the case alluded to, the idea originated entirely with the scholars themselves. A code of laws was drawn up for the regulation of their conduct towards each other, and officers were appointed for the enforcing of them. Regular meetings were held at stated periods, at which the rules were altered according to the opinion of the majority. The matter went on for some time without even the knowledge of the master. On his being informed of it, he recognised the self-created authority, and ultimately referred to his pupils the investigation into many matters of dispute and of offence which would otherwise have come under his own cognisance, and which were adjudged on as much to his satisfaction as, and far more so to that of the pupils, than if they had been left to his own individual decision. The practical details of the system were but imperfectly concocted from the first, and its full operation was much impeded by extraneous circumstances; but the beneficial effects produced on the moral feeling of the school were such as to be remarked by all who had any opportunity of judging of it before and after the introduction of this principle of self-government.

'ROSE ALLEN.'

THIS is a little book professing to be the self-written memoirs of a servant-girl, but verging so much on the character of a tale, that, in the absence of authentication, great doubt of its genuineness is excited. Even if accepted as what it professes to be, it does not tell in the way we would expect; for Rose is no average specimen of her class, being the reduced daughter of a farmer, the acquaintance of a rector's daughter, and sister of a young clergyman, and altogether betraying a tone of mind and habits of feeling which speak much more of the middle than of the labouring classes. There is, nevertheless, an appearance of great truthfulness in the sketches of families and individuals whom Rose Allen met in the course of her life of service; and the incidents, with two or three exceptions, do not occur in the manner of fictitious events. However the fact may be in this respect, the book is one entirely readable, in some places touching; and we believe it may help to show how the relation of mistress and servant may be made more happy than it is.

Rose's history commences with the departure of her widowed mother, and a large family of young children, from their happy country-home, to dwell in a poor lodging in Liverpool, with only a pittance to depend upon for subsistence. 'We entered our new abode with heavy hearts: all was in sad contrast to the home we had left. A thick yellow fog hung over the town; carts and carriages rolled by incessantly; and quarrelsome children were crowded on the steps of the lodging-house. We silently made our way along the narrow passage, went up the steep creaking stairs, each slight causing my mother to breathe quicker and more painfully; and the people we met either staring us out of countenance, or pushing past with hasty indifference. The landlady, with a kind of dogged resolution, piloted us to the third floor, and noisily threw open the door of the sitting-room, closing it upon us the moment we entered. A single candle was on the table, and a tray ready for tea. I hastened to give my mother a cup, for she was too faint to speak. As she lay down on the miserable sofa, one of its legs broke, and we were obliged to prop it up with one of our boxes. The children were quiet with astonishment and fear at the dark room, the noisy voices in every part of the house, and the perpetual shaking of the room from footsteps above and below. My dear mother, when a little refreshed, drew me to her, and kissed me, saying, "Let us be thankful, love,

that we can be alone here together." I could not repress a few tears, though cheered by her affection, which made me feel, at the right moment, how richly we were blessed when she was still spared to us; but the tears proved infectious, and both little girls began to cry, partly from weariness. It was some time before they could be consoled; nor was it effected until Johnny and Willy discovered a poor little kitten, which seemed half starved, and engaged the attention of all. I took this opportunity to look at our sleeping apartments: they were very poor, and I did not know how my mother was to rest in such confusion. The children, fortunately, were so tired, that they dropped asleep as soon as they were in bed, and then I had a long talk with my mother as to our future proceedings. She wished me to go first to the corporation schools, and see if all the four little ones could be taken in at once, and then to call on the lady in Rodney Street, whom Mr Herbert had mentioned as likely to supply us with sewing. When we had decided upon this plan, we went to bed. In spite of sorrow and constant noise, I soon slept, but often awoke, and saw too plainly that my mother never rested. In the morning she was too ill to rise, and I went out with sad forebodings.

'I could not find out the schools from the directions impatiently given by our landlady; but a kind old Irish-woman, who was selling fruit in a basket, showed me the way, giving me a posy of southernwood and snowdrops from her scanty stock. I was greatly delighted, for all our trials had not prevented my fearing we should never see flowers again. After some trouble, I agreed with the schoolmistress that the children should come that afternoon at two o'clock, and then went back to my Irish friend to ask where I should obtain food for our dinner. She gave me various instructions; but it was twelve o'clock when I again found myself at home, having expended two shillings in what seemed but a scanty meal. My mother asked me what I had spent; and when I told her, I was sorry to see she looked grieved, though she immediately said, with a smile, "Never mind to-day: but we must try to live upon less, if we mean to have food at all." I took the children to school, and at three o'clock, cold and weary, rang the bell at Mrs Gray's house in Rodney Street. A footman opened the door, saying sharply, "Well, and what's your business?" "I wish to speak to Mrs Gray, to ask if she can give us some sewing." "Not she: she's plenty of folks to do her sewing." But seeing his lady passing, he told her my request. She replied, "Oh, I can't see her now: tell her to call again. What's her name?" I told the man "Rose Allen:" on hearing which, she said, "Yes, I must see her; it's the child Mr Herbert spoke about. How tiresome! I shall be late at Mrs Brown's." After asking many questions, some of which I thought very strange, she gave me two merino frocks of the children's to be turned, desiring me to bring them as soon as possible. I went back to my mother, who seemed pleased at the kind of work, and immediately began. It was late at night before she came to bed; but uneasy as I felt about her, the day's fatigues had been so great, I could not then speak to her. The next morning I got up in the dark, and going into the parlour, was astonished to see her at work, wrapped up in her cloak, without a fire, and pale with cold. "Oh, mother, you will be ill—I know you will; and you will die: and what shall we do without father or mother?" "My dear Rose, remember that when our rent is paid we have only six shillings a week to look to, and that will scarcely find us in bread; the schooling will be sixpence weekly; and the chief part of our food, fire, and clothing, where are they to come from? Strength will be given according to our need; and I really had some sleep last night. Besides, dear, you will find the lady expecting these things in a day or two; and we have a character to earn."

'I made a small fire according to her directions, and then warmed some rice and milk for breakfast. The children were really very good: the kitten had become

* The Autobiography of Rose Allen. Edited by a Lady. London: Longman and Co. 1847.

fond of them, and never failed to come in at meal-times. I remarked upon their quietness to my mother, and was surprised at her grave look; but she said nothing: a month later, I understood too well why she looked grave.

The above, it will be acknowledged, is equally true and touching. After many sufferings, the family is relieved by the kind intervention of a Miss Evelyn, the district visitor, and Rose is recommended to go to service. Her first place was in the house of a couple of Quaker sisters of the most primitive fashion of the sect, with a young nephew, unhappily possessed of a taste for music. The quiet, precise manners of the sisters, and the disturbance caused to them by their musical nephew, are amusingly sketched. Her next mistress was a Mrs Stanhope, the wife of a wealthy merchant—a good-natured, but confused and irregular family. 'There were three, four, or five breakfasts, as the occasion might be. The different ages of the family led to much of this perpetual eating and drinking; but it was increased by irregular hours. Miss Ellis and her young ladies breakfasted at eight, and it was the most regular of the morning meals: the younger children had the same hour fixed, but nine times out of ten they were gone with Mr Stanhope to look at something; or, when it was ready in the house, I was ordered to take it into the garden. The nine o'clock repast, for the older members, was generally prolonged till eleven—almost time for the little ones' luncheon; and Mr Crofts, the butler, would fret and fume, ring bells, and knock at doors, until his face was crimson. Then the numerous and contradictory directions which were often given—horses ordered for riding into town would be countermanded, because Miss Louisa must have the carriage to shop. Mr Somebody was coming unexpectedly that evening, so the pic-nic tea in the hay-field must be given up. Mr Stanhope would leave the house, ordering dinner at six or seven; come back at half-past five—the gentleman could not come; "So," he would perhaps exclaim, "never mind, but just cut some sandwiches to take with the tea in the field;" and while the butler was carrying it out, the young gentleman would remember an evening engagement of a fortnight's standing, and a car be ordered, the horses probably having already been out twice that day.'

This family being reduced by a change of fortune, Rose has to seek another place. 'In a couple of days I was well enough to walk to Mrs Bennet's, at Aigburth, a lady who I had heard wanted a young woman to wait upon her. When I knocked at the door, the servant said, "Mrs Bennet never saw any one if she did not feel in the humour, and she guessed that would be the case to-day." She left me waiting in the cold passage for at least ten minutes, and then came back to say Mrs Bennet wished me to call the next day. This was tiresome, as the walk was long, and consumed both time and strength; but I went, and was ushered in, after again waiting fully ten minutes. Mr Bennet was seated, with a newspaper, on one side of the fire, his left knee propped up, under an attack of gout. Mrs Bennet was on the other side, nursing a fat poodle dog. She asked a multitude of questions about my former places and the rest of my family, commenting upon my answers to Mr Bennet as if I had not been present. I asked what my duties with her would be. "Nothing heavy," she replied. "There's my old china in this room, in my bedroom, and in the closet, which must be dusted every day: there's breakfast for the dog, cat, and parrot: indeed all their meals you would have to prepare; and my dear poodle can't eat meat unless it is nicely minced. They must be washed every other day, and combed every day; and poodle must go a walk when it is sunshiny, only you must never let him wet his feet, but carry him across the streets. They must sleep in your room, as I should not feel easy for them to be left alone. Then there's my caps; you would wash and make them, and I always change them three times a week. Of course you would have to

attend my toilet; but that would not take long, as I am never more than an hour morning and evening, and two hours before dinner. You can write, I suppose?"

"Yes, ma'am."

"I should want you to write always to tradespeople, and invitation notes for my whist parties. Do you like reading?"

"Yes, ma'am, very much."

"I don't know, then, whether you'll suit me. The last maid liked reading, and she kept my poor Polly waiting for his supper twice in one month; and sometimes she forgot to wash the cat on Mondays, Wednesdays, and Fridays, and would do it on Tuesdays or Thursdays, which I never can permit; and I'm sure it all came from her love of books."

"Indeed, ma'am, I would never read unless you gave me leave; and I really would endeavour to keep to the hours and days you wish."

"What do you think, Mr Bennet; will the girl do?"

"I wish, my dear, you would not ask me; when I've the gout in my foot, you know I can't bear to be spoken to."

"That reminds me," said the lady, "your duties would include sitting with your work in the room when Mr Bennet has the gout. I hardly ever do, he's so violent; and he requires some one at such times whom he can scold and abuse as he likes: do you understand?"

"I think I should hardly be qualified for this part of your place, ma'am; and I am sorry that you did not mention it sooner, as it would have saved you further trouble."

"Oh, nonsense; what does it signify? You'd only have to sit quiet; and he never throws anything worse than his book or his slippers at any one, and you would not mind that."

'I told Mrs Bennet decidedly that I could not take the situation; and as I withdrew—inclined both to laugh and cry—I heard her say to Mr Bennet, "Really girls are so saucy in these days, there's no bearing it: they talk of difficulty in finding places, but it's my opinion the difficulty is to find servants."'

Rose settles with a family named Dacre, of whom a most painful picture is drawn. Of aristocratic birth and pretension, with narrow means, they maintain a show of state by shabby and even fraudulent expedients. 'I never saw a good fire the whole time that I was there; no one had sufficient bedding for winter; the bread was often so stale, that it had to be soaked in water before it could be used; the wages of the old servants who had served them so faithfully were seldom paid; and no one had more than was just enough to prevent their giving warning. The family, when alone, would often live upon heavy puddings, to satisfy the cravings of hunger. . . . My own troubles seemed almost light when compared with those of Miss Janson, the miserable, unhappy governess. I used to look upon her, and wonder why such things were permitted. Her face was deeply marked with care, want, and sorrow; it seemed as if her wretchedness was too deeply seated to find vent in words; and if it had, who would have listened to them? Her eyes were tearless, for she had no sympathy to bring the relief of tears. No friends came to see her, for her home was afar off; and that home was too poor to receive her again, or to permit her to think of leaving her present abode. She was highly accomplished, and her time was fully occupied in teaching and cramming two pale-faced girls of fifteen and sixteen, who were to come out, with all the array of music, singing, drawing, and languages, in the hope of securing some establishment, which should release them from further bondage under their home-system. I used to pity these girls, but not as I pitied Miss Janson. . . . I used to fill a bottle with hot water for her in the winter nights, but I dared not let Mrs Dacre know, for she would have forbidden it as extravagant, and I think this first made Miss Janson speak to me: she was so much with her pupils, that it was not very easy to do so in private; but at last she

became fond of me, and would weep when I expressed my compassion for her lonely state. Once she said, "Far better for me if I could be a respectable servant in some kind family; I should at least have some of the comforts of life, and there would be some one to speak to, some one who would love me, amongst the other servants; and no good mistress would allow any one to be so overworked or so treated as I am, and must be, while I remain here." I ventured to advise her leaving the place, and asked if she could not become an upper nurse. "I would willingly, Rose; but small as my salary is, it is more than I could earn as a servant, and I have a poor crippled sister, who looks to me for help. I am angry at myself for what I have said, but my heart seems so full, and your kindness has led me to speak more openly than was perhaps right. I almost hate the talents I possess for music and drawing. These pursuits, which were intended as relaxations for the mind, and to increase our appreciation of all that is good and beautiful in the creation—to me are associated with the sordid striving after vain distinction, with heartless indifference to the welfare of others, and with the years that I have dragged on in teaching them either to unwilling pupils, or to those who studied them for the low purpose of attracting notice by their exhibition."

'This was the outpouring of a crushed spirit; but it would be unfair not to state, that when she gradually acquired the habit of confiding in my affection, she seldom spoke in this bitter strain: her spirit was too meek: she more frequently adverted to the suffering which this unhappy family brought upon themselves, to remembrances of her own early and happy life, and to her strong conviction that all her trials were sent for a wise and good end. She liked me to repeat simple hymns and psalms. Her memory was singularly retentive, and stored with chapters and texts from the Bible; without which, she said, the isolation of her existence would have deprived her of her reason. I could not help fancying she looked a little better after giving vent to her pent-up repressed feelings, and it gave me renewed strength to go on a little longer in this unpleasant situation.'

As a contrast to this wretched home, we have Rose finally settled in the greatest happiness with the Evelyns, a wealthy mercantile family, given to every good and charitable work, and full of all right-mindedness. The greater part of Mr Evelyn's time was consumed in business of a philanthropic nature, and in attending to petitions for advice and help. The old housekeeper used to say, 'Her master's riches would never hinder his entering into the kingdom of heaven, but would rather smooth the way.' 'I was much struck,' says Rose, 'by the invariable consideration which was shown for our feelings; and I have heard the men say that he would check any one at his own table who was making remarks which might be unpleasant to those who were waiting. The manners, too, of the whole family were not only quite free from pride, but had no coldness. They seemed never to forget that their servants felt like themselves; and when asking them to perform any service, they always did it so gently, and with such evident belief and trust in their goodwill, that it produced the most hearty, loving service. Books were provided, and encouragement given to improve ourselves.'

Rose concludes her story with her marriage to Edward Grant, a young mercantile man of good prospects. 'To beguile,' she says, 'some of the long afternoons, while waiting for Edward, I have written these sketches of the different situations which I have filled, hoping that they may suggest to those who do not *always* pay due attention to the welfare of their households the duty of consulting their servants' feelings, which are so often the same as their own; hoping also that they will endeavour to bear in mind how easily they may wound, and how easily they may gratify, those who are dependent upon them for the daily comfort of their lives. *Very strong* are the mutual bonds of duty and obli-

tion between servants and their employers. And when they are properly felt and attended to, very valuable are the friendships which may be formed. At all events, very pleasant may their mutual intercourse be rendered, when servants give themselves up with heartiness and good-will to the performance of their various duties; and when their employers remember that kindness and consideration are as much due to their feelings, as is attention to their bodily comfort, or the punctual payment of their wages.'

DO ANIMALS FEEL PAIN?

THIS is a question about which one should think there could be little doubt. The grand distinction of animal being is sensation, or a power of receiving pleasure or pain from external objects. When we see one of the very lowest and simplest in the scale of animals—the polype, for example—stretching out its long slender arms, and eagerly seizing the food which is palatable to it, while it rejects substances which are unsuitable; or when we see this same polype shrinking and withdrawing its body from the rude touch of any object applied to it, we cannot but suppose that all this arises from the will of the animal, stimulated by its perceptions of either pleasure or pain. Yet doubts have been started by many whether the lower animals possess any degree of sensibility; while some go so far as to deny them all consciousness of either pleasure or pain. Shakspeare, in one of those grand and comprehensive generalisations so characteristic of his mighty intellect, makes the 'corporeal sufferance' of the beetle which we tread upon as great as the dying pangs of a giant. Now, though we are not prepared, physiologically speaking, to maintain that all grades of animals have the same intensity of nervous sensibility, yet we doubt not that within each one's particular sphere the pleasures of existence and the pangs of dissolution are both acutely perceptible. Indeed all facts and analogies are in favour of such an opinion. We cannot look, says Paley, on the myriad crowds of insects buzzing in the air of a summer eve, without having suggested to us an immense diffusion of actual enjoyment. Nor, on the other hand, can we view the quivering limb, the shrinking wounded muscle, or the anxious anguished look of any of the higher animals, without supposing that there are accompanying feelings of pain. Indeed we should not have thought it necessary to start this subject at all, had it not been suggested by a paper read lately before a learned society (The Ashmolean) in Oxford.* In this paper Mr Rowell endeavours to prove that even quadrupeds evince very little or no sensations of pain on being grievously maimed or mortally wounded. He gives instances of horses which, having fallen and fractured their legs, yet lay without any visible expressions of pain, and after a little while began to eat the grass growing around them. He also mentions that pigs, when their throats are cut, only squeal because they are held fast; and that, if they are allowed to run away, they make no noise, or give no indication of pain, till they fall down dead from the loss of blood. Now, it appears to us that such facts as these prove nothing. The pain of a fractured limb is acute only at first, and even then is by no means excessive. For several hours after the injury there is little or no uneasiness, if the limb be not rudely moved; so that a horse or other quadruped meeting with such an accident, and being freed from the mental anxieties of a man on such occasion, may readily be supposed to be inclined to resume its usual eating propensities. But if such animal be watched afterwards, when inflammation of the limb, with heat and swelling commences, all the usual manifestations of pain and irritability will undoubtedly be present. Indeed no one can look upon a horse or other animal labouring under a diseased limb, and watch the reluctance with which they put such a limb to the ground, and the writhing of the

* See 'Edinburgh Philosophical Journal,' October 1847.

body which even a partial pressure on it causes, and doubt for a moment that very acute pain accompanies all such motions. It is the same with the stuck pig: the mere act of opening the carotid arteries is accompanied with but a slight and momentary pain, not a great deal more than that attending the simple opening of a vein in the arm; and after the first incision, all pain subsides, and no wonder that the liberated pig runs silently along till it drops dead from mere exhaustion of blood. The fact is, that nature has most curiously and wisely contrived that almost all the sensitive nerves are situated on the inner skin, or external parts of the body, in order to constitute so many guards or sentinels against all external mischief; while the internal parts, including even the heart and the most important vital organs, are almost devoid of sensibility. Who that has seen, on a hot summer day, the horse or the ox, maddened by the sting of the gadfly, leave his favourite pastures, and rush furiously to the nearest pool of water or shady thicket, could for a moment subscribe to the idea that their sensations of pain were not acute? The effects of the spur and the whip, too, must surely be so many daily practical proofs of the sensibility of horses.

Mr Rowell adduces some curious and well-known instances of animals gnawing their own flesh and bones. 'It is curious,' says he, 'to observe the apparent indifference with which some animals will devour parts of their own bodies. I once kept tame dormice, and in shutting the cage door, accidentally caught the tail of one of them, when it squeaked out, and left the skin of about two-thirds of its tail sticking to the door. Whether the cry was caused by pain or fear I cannot decide, but it went about the cage for a few minutes apparently rather uneasy, and then took hold of its tail with its paws, and ate all the injured part, and then seemed as well as ever.

'Rats will often eat their tails when in confinement, if kept short of food; and the habit of eating their own tails is not uncommon among the monkey tribe. I know a person who used to dip the end of his monkey's tail in tobacco water, to keep it from being eaten; and some of the monkeys in the London Zoological Garden may at times be seen enjoying themselves in this way: but from whatever cause this propensity may arise, I believe it is never indulged in by the monkeys with prehensile tails; their tails seem to be too useful to be so wantonly disposed of, and I have no doubt are therefore possessed of a much greater share of the sense of pain.' It is recorded that an old hyena, kept in the Jardin des Plantes at Paris, had its leg broken, when one night it bit off the leg at the broken part and ate it.

We ourselves saw, some years ago, in Wombwell's menagerie, a leopard which had got its hind-legs lacerated by another leopard in a neighbouring cage. During the night subsequent to this accident, after being properly secured in its cell, the leopard actually gnawed off its two hind feet to the extent of several inches up the ankle, and crunched and ate its own flesh and bones. We have seen a horse, too, on whom a blister had been applied, furiously tear up and gnaw the flesh; but all these we consider as indications of suffering in the animals, not of apathy.

Mr Rowell also mentions the well-known fact, that crabs and similar animals frequently throw off one or two of their dead limbs, and apparently without suffering pain. But how do we know that such is a painless process? If, on the contrary, we touch the long and curiously-jointed antennæ of these crustacean animals, we immediately perceive that they shrink from and avoid us, with a feeling of fear for all such contact; and Mr Rowell allows that, thrown into boiling water, these animals show intense feelings of pain. It is the same with insects: the horny coverings of their bodies may not be endowed with sensibility, but in their antennæ the nicest feelings of touch, and perhaps some other of the senses, undoubtedly reside. If we watch a small beetle or other insect marching along the ground,

we shall find that its two antennæ are in continual motion; if they encounter a drop of moisture, the insect immediately pauses and turns out of its course; or if any other substance to be feared or avoided comes in the way, they prove the surest of monitors. These antennæ not only have acute sensibility of touch, but they also can distinguish the temperatures of bodies; and thus the insect avoids cold or too much heat. According to Huber, too, the antennæ of bees would seem to possess higher powers of sensation; for when a bee is deprived of its antennæ, it wanders about at random in the hive, and seems to be thus deprived of all its usual instincts. 'I have seen,' says Mr Rowell, 'a wasp eat a fly almost immediately after a portion of its own abdomen had been cut off. I have also seen a cockchafer crawling and eating on a hedge after its abdomen had been emptied of the viscera, probably by some bird. It is well known that a dragon-fly will eat freely for a considerable time while confined by a pin through its body; and every one who has collected entomological specimens must know the difficulty in killing some of the larger moths.' That insects may be stuck through with a pin, and yet live and eat, is no proof of their want of feeling, however much it may be of his who thus tortures them. The pin may pass through a part of their body not highly endowed with sensitive nerves, and thus apparently give them little uneasiness; at all events, not so disorder their frame as to destroy all the functions necessary for life. But even a human being may receive a wound through some part of his body, and survive; while in the process of cure, he also, amid his sufferings, may be able to take food. Sometimes we find the expressions of pain heroically suppressed by an animal as long as silence is for its safety. 'A hare never, or very seldom, cries out when shot, even if she receives her death wound, if she can run a few yards and hide herself; but if her legs are broken, or she is in anyway stopped from running, even if caught in a net, which can give her no real pain, she utters most piteous screams. When followed by dogs, her screams always begin before they have actually caught her; and it is worthy of remark, that she is much more readily despatched than perhaps any other animal of her size. Rabbits resemble hares in this respect, as they utter no cry when wounded, but will do so from fear. If run down by a stoat or weasel, they always cry out when the enemy gets within two or three yards of them, and are generally so terrified, that they lie down and are caught; therefore the cry, in this case, is evidently from fear.' 'When rabbits are caught in traps, if not taken out in a short time, they are almost sure to escape, either by breaking away by force from the trap and tearing off the leg, or by biting the leg off. I have seen them caught after having recently lost a leg, and to all appearance in as good health, and as fat, as if nothing had happened to them. A short time since, I saw a rabbit caught which had but one leg, having lost one hind-leg apparently some time, and the two fore-legs very recently.' How often do we find a 'jolly tar' with no legs at all, and yet apparently cheerful and happy!

Such reasoners as would make the lower animals mere automata, seem to overlook one great distinction of sensitive beings. Even the simplest of animals, those which possess only one or two of the senses, as touch and taste, have a power of choosing or rejecting of liking or disliking; in short, a will of their own, however circumscribed. Thus the polype selects food grateful to its appetite, and rejects what is unfit; and so does every animal, however simple. Not so a plant. The roots of plants imbibe whatever fluids are presented to them—even poisons which destroy them—and absorb gases by their leaves which are equally noxious.

That the nervous system of animals is of a compound nature, is now well ascertained. Thus there are certain nerves through whose agency the great vital functions of the body are performed, but which do not contribute either to motion or sensation: other nerves, again, which

are specially productive of motion: and a third set which impart sensations. That these divisions of the nervous system may be distributed in various proportions, and with various intensities of action, throughout the various gradations of animal life, suited to their different habits and necessities, there can be no manner of doubt; but that even in the lowest animals one or more of these divisions are wanting, seems to be at variance with all facts of their vital and instinctive manifestations. Thus it is possible to suppose an animal devoid of all sensations, even without the sense of taste; but then it would require to be fed, like plants, in a mechanical way, without any will of its own. Now we know of no such animal—it being a characteristic of all animals, as we have said, to possess the power of choosing or rejecting their food. We might suppose an animal, too, without any sense of touch—unfeeling all over; yet we know of none such. The great proportion of animals have a skin exquisitely endowed with sensibility, and all have some part of their bodies whence this property more or less resides.

That man and animals, under certain circumstances, do often display strong convulsive motions, and even all the manifestations of agonizing pain, without in reality feeling any pain, or being conscious of any irritation or impression whatever, is a circumstance well known; but this arises from the nerves of motion being excited, and that often violently, while the nerves of sensation are either unaffected, or suffering under some suspension of their natural powers. This is exemplified in the disease of epilepsy; and the convulsive motions of an amputated limb of an insect, or the quivering fibres of the muscles in an animal newly killed, arise from the same circumstances. The inhalation of ether, and the effects of mesmerism, afford also examples of the temporary suspension of one division of the nervous system—the sensitive—while the other functions of the body go on as usual. All these circumstances only prove the separate, and so far independent, functions of the nervous system—not the absence of the sensitive nerves in the lower animals.

Correct theory on this subject may be of some use in practice. We are naturally too apt to think lightly of the sufferings of the lower animals, and need no false philosophy to palliate our cruelties. The great heart of Shakespeare beat right after all: death is a pang to the meanest thing that lives; and pain is an exquisite evil, shrunk from and avoided by the lowest in the link of the chain of existence, as well as the highest. Let us then, on all occasions, avoid the infliction of torture on creatures endowed with similar, if not with as intense, sensations as we are ourselves. Let us reason ourselves out of all selfish exclusiveness—the young, especially, out of all heedless and unthinking cruelty; and knowing that our own frames are tremblingly alive to all outward impressions, bear always in mind that analogy and observation undoubtedly teach us that *animals do feel pain*.

BALLADS OF THE RHINE.

BY ANDREW B. PICKEN.

STALZENFELLS.

It is morning on the mountain, the green morn of bursting spring,
And the dew is on the violet, the skylark on the wing;
The kine are lowing from the fold, the owl winks at the light,
And the breezy fields are wafting by the lingering shades of night;
And the wakened echo murmurs to the chiming of holy bells—
For 'tis morning—merry morning—on the crested Stalzenfells.

Now boldly, like a Lansknecht, with a carol and a shout,
From the green glades of a mountain farm a young Gräf rideth out;
He turneth but to bless his home, that like a nestling lies
In the bosom of the vintage, hallowed o'er by tender skies;
Then shakes the rein so gaily twined with garlands and with bells—
And 'tis morning—dewy morning—on the crested Stalzenfells.

There's a sound within the village too, all tremblingly alive,
Like the hymn of the rejoicing bees around the teeming hive;
Now 'tis singing—now 'tis laughter—now the bird-like mountain
call,

That warns the herdsman on the hill at dewy even fall;

To the young Gräf wending downwards, what a pleasant tale it tells:
And 'tis morning—sunny morning—on the lofty Stalzenfells.

And a Fraulein through the jasmine leaves that cloud her casement
round,
Is gazing on the mountain path, and lists a welcome sound;
While, like a marmotte, leaps her heart at each new voice she
hears,
And a rosy smile is breaking through and mocking her sweet tears;
For well she knows the eager steed, the garland, and the bells—
And 'tis morning—happy morning—on the lofty Stalzenfells.

The young Franz, like the eaglet, hath his eyrie on the hill,
Doräthen, like the wood-dove, in the valley calm and still;
But low and gentle was his voice, serene his haughty brow,
When he wooed her 'mid the roses in the downy vale below.
So blessed be the bridal pledge, the banquet, and the dance;
For the young Franz loves Doräthen, and Doräthen loveth Franz!

And our dove will rest delighted in that stormy nest on high,
With the wildest blast unheeded for her lover's softest sigh;
She will gaze within his eagle eyes confidently and lone,
Until his look becometh soft and dove-like as her own.
And he will bless her as he lists the merry matin-bells,
That hailed his bridal morning 'neath the crested Stalzenfells.

OBERWESEL.

The chimes of Oberwesel—oh how pleasantly and clear!
Far floating down the sunset Rhine, they steal upon the ear!
And the reaper on the furrow turns, the bargeman from the oar,
As solemnly the Angelus sweeps down the river shore.
For the German heart's an honest heart, and faithful every one,
From the peasant by the Brunnen, to the Kaiser on the throne.

The chimes of Oberwesel—oh their spell may ne'er depart!
Like the sound of waves in ocean shells, they live within the heart!
For I pine for the old Rhineland slopes, where first I heard them
rise,
And trellises of gushing grapes, and beaming Rhineland skies.
For the German heart's, &c.

It is not that the golden palm a softer shadow flings;
It is not that the jungle stream a sweeter roundel rings;
That the orient hath a festal crown that blesteth the long day;
The old chimes are a Ranz-ore-bache that clouds them all away.
For the German heart's, &c.

Amboyne's soaring minarets, melodiously on high,
Like the lark's triumphant *jodis*, they fill the sunset sky;
But give to me, oh give to me the pleasant chimes that come,
Like the trilling of the hermit thrush in the lowly bush at home!
For the German heart's, &c.

Though gorgeous be the hues that clothe this sultry land and air,
They're strange with all their glorionsness, and dull with all their
glare.

'Tis not my young fresh heart I've brought to this far foreign strand;
No—Gott-sey-dank—*that* never leaves our own dear Fatherland.
For the German heart's, &c.

WIESBADEN.

She came amongst us with the spring, those moist delicious days,
When odours steal like fairies forth from all the woodland ways;
And Hope, the huntress, with her train, outruns the rising beam,
And danceth with the dancing leaves, and singeth with the stream.
She came amongst us with the flowers, so fragile, yet so fair,
With eyes like the blue twilight stars, and rings of golden hair.

REFRAIN.

We know our songs are very sad, for mirth is all too loud
For us to tell of 'neath the weight of Famine's closing shroud;
So wonder not our memory most lingers with the dead,
For we're but poor German childerkin, and beg 'our daily bread.'

Her voice, like winds through autumn leaves, had a low and
mournful fall,
But yet our bruised hearts leapt up as to a mother's call;
Her cheek, like Spring's first rose, so pure, so softly delicate,
Made us dream of those sweet seraphs that at Mercy's portals wait.
We could not think, 'midst youth's own hues, the ruthless worm
was there,
Or that dust would soon be strewed upon her rings of golden hair.

We know our songs are very sad, yet who of joy could sing,
Where Poverty keeps chilling watch and saddens all our spring;
Where memory's embers only shine, and heavy tears are shed,
For we're but poor German childerkin, and beg 'our daily bread.'

And he on whom she leant at last—her anchor of the heart—
How watched he for the closing surge that tore the chain apart!
Was it fear or pain that shook him, when in each long look she
gave,
He marked within its dreamy depths the shadows of the grave?
No—were the shrouded breast laid bare—no yearning thought is
there
For that gentle English lady with her rings of golden hair.

We know our songs are very sad, but life's unfolding scene
Still shows upon its sunniest spots some serpent's trail hath been;
O'er every flower that bloomed for us the blistering slime is
spread,
For we're but poor German childerkin, and beg 'our daily bread.'

Sleep sitteth down with dove-like wings in that dim shaded room,
The grudging mental watch alone, like phantoms 'mid the gloom;
And the lovely lady dreams away her last calm dying hours,
'Mid the grand old woods of England and her own sweet garden
flowers.

The thrush thrills with his gushing pipe the hedgerow low and fair,
And the winds of home come wandering through her rings of
golden hair.

We know our songs are very sad, but where we loved so well,
Our thoughts, like summer birds, fly back with memory to dwell;
So wonder not our strain is grave, we seem on graves to tread,
For we're but poor German childerkin, and beg 'our daily bread.'

Why rings that stunning pistol shot at midnight's silent hour?
Why streams the pool of bitter blood o'er that dull chamber floor?
The gamester's latest die is cast, and thrown his final main;
The doom of God is on his soul—the false dice in his brain!
Thanks, holy saints! *she* sank at once, nor lingered in despair,
And pillowed on his bloody breast her rings of golden hair.

We know our songs are very sad, our hearts are full of cares,
And that lovely foreign flower is blent still with our songs and
prayers;
We dare not wish her back again, she's happy with the dead,
And we're but poor German childerkin, and beg 'our daily bread.'

LONDON CRIES FOR SANITARY REFORM.

SANITARY! The very word has become insufferable; less, perhaps, from excess of repetition, than from the apparent hopelessness of the thing meant being carried vigorously into effect. Year after year the press teems with details the most odious, showing the absolute necessity for sanitary reform: associations of philanthropic individuals go on denouncing the present insalubrious condition of towns—the public have long since acceded to every proposition on the subject—yet nothing is done! Will there ever be anything done? Is not the whole thing a mere matter of talk—a delusion?

Having, first and last, said so much on sanitary reform, we are almost ashamed to mention the subject again to our readers. A pamphlet, however, which has just reached us, opens up such a picture of horrors in and about the Metropolis, that it is impossible to keep silence. There *must* be something done, in spite of every obstacle to the contrary. The brochure referred to is a 'Report of the Health of London Association on the Sanitary Condition of the Metropolis; being a Digest of Information contained in Replies to Three Thousand Queries, which were circulated amongst Clergymen, Medical Men, Solicitors, Surveyors, Architects, Engineers, Parochial Officers, and the Public.' We propose to give only a few snatches of this condensed information, beginning with the following general statement as to fever:—

'It is everywhere stated that a low form of fever, and typhus fever itself, is generated and maintained by the filthy state of the dwellings of the poor, and of the immediate neighbourhood, and by the inefficiency, as well as the utter want, of sewage; and that in some of the courts and alleys in the Whitechapel Union, and in other parts of the Metropolis, *fever is never absent*. Instances are given of existing cases of typhus fever caused by exhalations from open sewers and gully-holes. These fevers are generally severe. This frightful scourge and fell destroyer of manhood in its prime, the fertile source of widowhood and orphanage, of pauperism and crime, is ever in active operation in this city.

'The fatal results of fever alone produced by these agencies may be estimated at from 20,000 to 30,000 annually. The absolute amount of wretchedness arising from such a frightful and unnecessary waste of human life can scarcely be calculated.

'Malignant fever, typhus, or low fever, and many infectious diseases, as well as the malignancy of our epidemics, and a large majority of cases of erysipelas, measles, small-pox, hooping-cough, scarlet fever, and

cholera, as well as the spring and summer diarrhoea, owe their severity, if not their origin, to atmospheric poisons produced by a combination of the evils enumerated in this question.

'Besides the unnecessary waste of human life by fever and febrile diseases in the Metropolis, it is calculated that of those who annually die of consumption, 2500 might be saved by proper sanitary measures; and one-sixth of that mortality is attributed to the deficient ventilation of workshops, while five-sixths are attributed to the condition of the dwellings of the poor.'

But why do not the poor keep their dwellings in a cleanly state? Many do what they can in this respect, but the bulk of the humble classes 'are compelled to live in the vicinity of their employments, in such houses as they find vacant; but such is the demand for houses among the poor, that but little choice is afforded to them; for, to use their own words, "if one will not take the house, another will." Three-fourths of the poor, moreover, are lodgers, living in single rooms, and still less able than tenants of small houses to effect improvements. Their houses are constructed without either sewers or drains; they can therefore only remove the filth from their dwellings to a neighbouring heap, there to putrefy and contaminate the air. They often attempt to keep the fronts of their houses clean, but generally, after a short perseverance in an unsuccessful labour, abandon it in despair; and while they deplore the filthy state of their streets, courts, and alleys, they know that complaint is useless, and their efforts to improve it futile, and therefore sullenly submit to what they cannot change.'

Very shocking effects are caused by the carrying on of unwholesome manufactories. An inhabitant of Stratford states 'that noxious fumes of nitrous acid gas from a neighbouring chemical work are frequently so extremely offensive, that persons passing along the main road are obliged to run, and hold handkerchiefs to their mouths; the eyes are much irritated by the gas, more particularly in the night time, during which the works are in full play. All metal utensils are discoloured or tarnished in the houses in the vicinity. The smell can be perceived half a mile off, which will enable a correct judgment to be formed as to its intensity. This is described in strong language as being one only of a collection of nuisances. Amongst others, there is a work for evaporating "gas liquor," the stench of which is so fetid, that even when the poor poisoned victims living near are confined to their rooms by typhus fever, consumption, &c. they *dare not, and cannot*, open a window, as it almost suffocates the inmates, particularly when the wind blows the fumes in that direction. The poor creatures have even been driven out by the intolerable stench into the main road, where they have asked, *What were they to do?* To which it was replied, that if they could become *pigs or asses*, and were killed, the law would punish the proprietors of these nuisances by making them pay *their value*; but as they were only *women and children*, the law did not trouble itself about them. It is to be regretted that so little legislation has been exerted on the subject of noxious or offensive manufactories; but perhaps there is not more ground for complaint with regard to these noxious agencies, than with regard to nearly all others, which do not include the taking away of our neighbours' lives by violence; for while, in the present day, one man is certainly hanged for taking away the life of his fellow-creature, another man is at liberty to destroy the health and lives of multitudes by *poisonous emanations* from any source of profitable employment—the profit being on his side, the loss on that of the public.'

Keeping pigs and slaughtering cattle are also among the active agencies of disease. 'The slaughtering of cattle takes place to a great extent in London, and the putrefying refuse is allowed either imperfectly to drain away, or to remain and infect and contaminate the air. Sometimes the blood is allowed to run down the middle of the main streets. There is scarcely a *reply* which

does not insist on the slaughtering of cattle in London being strictly prohibited. The effluvia arising therefrom in and about Fitzroy Market is stated to be horribly offensive. The Smithfield nuisance is too great and too notorious to require much reference. It is asserted to be the *greatest nuisance* ever inflicted on a civilised community, and to be a prolific source of moral and physical evil, perhaps unparalleled in the history of any people—where life and limb are constantly endangered, and the ear offended by the profane language of drovers scarcely less brutal than the objects of their unmeasured rage. The slaughter-houses in Aldgate High Street are most disgusting nuisances. In hot weather, the stench arising from the accumulation of the ordure of the cattle, the entrails, and the blood, is most offensive. There is also a slaughter-house near Newport Market, which is stated to be a shameful nuisance in that crowded neighbourhood.

The want of underground sewage is one of the chief causes of discomfort and disease of various kinds. The only outlet for refuse water from many of the more respectable houses in London is by tubes communicating with cess-pools. These pools are hollow spaces, sometimes underneath the cellars, sometimes below the small back-yards. And yet every inhabitant must pay for sewage, whether he have access to public drains or not. 'There are many open drains and open sewers which constantly emit deleterious gases from the decomposition of animal and vegetable matter, and are certainly prolific sources of cholera, scarlet and typhus fevers, and other diseases. Persons residing in the vicinity of open drains and open sewers suffer seriously in their health and property. At Greenwich there are open gutters and open ditches, which at times give out most offensive effluvia, and in the neighbourhood of which illness of some kind or another, especially fever, is always prevalent. In Westminster there are several open and stagnant drains, from which, in many instances, malignant typhus and puerperal fever have arisen. At Rotherhithe there is an open ditch which has given rise to typhus fever to a great extent; and there are also uncovered drains which receive the sewage of thickly-populated neighbourhoods. At Poplar the main sewer is partly uncovered, and is called the "Black Ditch." It emits a most offensive stench, and frequently produces fever, headache, debility, and disorders of the digestive organs. In the district of the Tower Hamlets Commission of Sewers there were, within the last few months, upwards of 10,000 feet of open sewers, many of which were in the crowded neighbourhoods of Mile-End New Town and Bethnal-Green.'

The supply of water is greatly defective, and what is supplied is at a dear rate. 'In the Metropolis there are about 270,000 houses, and 70,000 of them are without a supply of water being carried into them. Mr Liddle states that the poor incur great expense, from the want of wholesome water, by being obliged to resort to public-houses or coffee-shops for their breakfast, instead of having it at home with their families, which they would otherwise be enabled to do.'

On the general defectiveness of ventilation in dwellings there is much painful evidence. Burial below churches—still carried on to the shame of the Metropolis—is also a potent auxiliary of disease and death. From the impurity of the air in many places of public worship, individuals are often attacked with faintness and vertigo during service.

The annual waste of life by these united causes is very considerable. 'It is estimated that, *under due sanitary regulations*, the lives of 10,278 persons in the Metropolis might annually be saved, and 287,784 cases of sickness avoided. These deaths and illnesses are over and above what are due to natural causes; they are unnecessary deaths and unnecessary illnesses. Verily, twice the loss of life occurs to the inhabitants of this metropolis annually, which occurred to the gallant soldiers who were massacred and perished in the

retreat from Cabool; yet while a cry of lamentation was sent up by the whole country for their disastrous fate, no sound is raised for the victims of a cruel negligence and a disgraceful apathy. One-sixth of the total waste of life and health which takes place in the United Kingdom occurs in the Metropolis. Now, waste of life includes unnecessary sickness, widowhood, orphanage, funeral expenses, inability to labour, medical charges: it also includes the cost of the increased relative proportion of births, which is found to result from a high rate of mortality, and likewise increase of poor-rates, additional calls on public and private charity for the support of hospitals, dispensaries, and asylums for the sick and infirm. If an estimate is made of the money value of the losses from a neglect of sanitary measures in London, and if a detailed estimate of Dr Lyon Playfair, for Manchester, is proceeded upon, it is found that L.3,204,531 are wasted every year.

'It is estimated that the annual value of the sewage of London which is suffered to run to waste and pollute the Thames is L.433,879.

'Who shall estimate the amount of wretchedness and suffering, and of abandonment to despair and demoralisation, which is produced by the want of sanitary regulations? Who shall tell how many of the 112,000 orphans, and 43,000 widows on the poor-roll, have been thereby made fatherless and lonely? Who shall tell the number of convicts and criminals in our jails who have been sent thither by the negligence of sanitary measures?'

Need anything be added to prove that *something must be done*?

If any one answers in the affirmative, one word in reply will surely suffice—**CHOLERA**. This plague is once more on its progress from India towards Western Europe. Shall we be caught by it prepared or not?

Column for Young People.

LADY LUCY'S PETITION.

A TALE FOUNDED ON FACTS.

[Our attention has been drawn to this little piece by an obliging correspondent, who considers it, and with reason, as worth preservation. It appeared some years ago in a magazine—we think the 'Pocket Magazine'—now out of print.]

'AND is my dear papa shut up in this dismal place to which you are taking me, nurse?' asked the Lady Lucy Preston, raising her eyes fearfully to the Tower of London, as the coach in which she was seated with Amy Gradwell, her nurse, drove under the gateway. She trembled, and hid her face in Amy's cloak, when they alighted, and she saw the soldiers on guard, and the sentinels with their crossed partisans before the portals of that part of the fortress where the prisoners of state were confined, and where her own father, Lord Preston, of whom she was come to take her last farewell, was then confined under sentence of death.

'Yes, my dear child,' returned Amy sorrowfully, 'my lord your father is indeed within these sad walls. You are now going to visit him; shall you be afraid of entering this place, my dear?'

'No,' replied Lady Lucy resolutely; 'I am not afraid of going to any place where my dear papa is.'

Yet she clung closer to the arms of her attendant as they were admitted into the gloomy precincts of the buildings, and her little heart fluttered fearfully as she glanced around her, and she whispered to her nurse, 'Was it not here that the two young princes, Edward V. and his brother Richard Duke of York were murdered by their cruel uncle, Richard Duke of Gloucester?'

'Yes, my love, it was; but do not be alarmed on that account, for no one will harm you,' said old Amy in an encouraging tone.

'And was not good King Henry VI. murdered here also by that same wicked Richard?' continued the little girl, whose imagination was full of the records of the deeds of blood that had been perpetrated in this fatally-celebrated place, many of which had been related to her by Bridget

Holdworth, the housekeeper, since her father had been imprisoned in the Tower on a charge of high treason.

'But do you think they will murder papa, nurse?' pursued the child, as they began to ascend the stairs leading to the apartment in which the unfortunate nobleman was confined.

'Hush—hush! dear child, you must not talk of these things here,' said Amy, 'or they will shut us both up in a room with bolts and bars, instead of admitting us to see my lord your father.'

Lady Lucy pressed closer to her nurse's side, and was silent till they were ushered into the room where her father was confined, when, forgetting everything else in her joy at seeing him again, she sprang into his arms, and almost stifled him with her kisses.

Lord Preston was greatly affected at the sight of his little daughter; and overcome by her passionate demonstrations of fondness, his own anguish at the thought of his approaching separation from her, and the idea of leaving her an orphan at her tender age (for she had only just completed her ninth year, and had lost her mother), he clasped her to his bosom, and bedewed her innocent face with his tears.

'Why do you cry, dear papa?' asked the innocent child, who was herself weeping at the sight of his distress. 'And why will you not leave this gloomy place, and come home to your own hall again?'

'Attend to me, Lucy, and I will tell you the cause of my grief,' said her father, seating the little girl on his knee. 'I shall never come home again, for I have been condemned to die for high treason, which means an offence against the king, and I shall not leave this place till they bring me forth on Tower Hill, where they will cut off my head with a sharp axe, and set it up afterwards over Temple-Bar or London Bridge.'

At this terrible intelligence Lady Lucy screamed aloud, and hid her face in her father's bosom, which she wetted with her tears.

'Be composed, my dear child,' said Lord Preston, 'for I have much to say to you, and we may never meet again on this side the grave.'

'No, no! dear papa,' cried she; 'they shall not kill you, for I will cling so fast about your neck, that they shall not be able to cut your head off; and I will tell them all how good and kind you are, and then they will not want to kill you.'

'My dearest love, this is all simple talking,' said Lord Preston. 'I have offended against the law as it is at present established, by trying to have my old master, King James, restored to the throne, and therefore I must die. Do not you remember, Lucy, I took you once to Whitehall to see King James, and how kindly he spoke to you?'

'Oh yes, papa; and I recollect he laid his hand on my head, and said I was like what his daughter the Princess of Orange was at my age,' replied Lady Lucy with great animation.

'Well, my child, very shortly after you saw King James at Whitehall, the Prince of Orange, who married his daughter, came over to England, and drove King James out of his palace and kingdom, and the people made him and the Princess of Orange king and queen in his stead.'

'But was it not very wicked of the Princess of Orange to join with her husband to take her father's kingdom from him? I am very sorry King James thought me like her,' said Lady Lucy earnestly.

'Hush—hush! my love, you must not talk so of the Princess of Orange, for perhaps she considered she was doing right in depriving her father of his dominions, because he had embraced the Catholic religion, and it is against the law for a king of England to be a Catholic. Yet I confess I did not believe she would have consented to sign the death-warrants of so many of her father's old servants, only on account of their faithful attachment to him,' said Lord Preston with a sigh.

'I have heard that the Princess of Orange is of a merciful disposition,' said old Amy Gradwell, advancing towards her master; 'and perhaps she might be induced to spare your life, my lord, if your pardon were very earnestly intreated of her by some of your friends.'

'Alas! my good Amy, I have no one who will undertake the perilous office of soliciting the royal grace for an attainted traitor, lest they should be suspected of favouring the cause of King James.'

'Dear papa! let me go to the queen and beg for your pardon,' cried Lady Lucy with a crimsoned cheek and a

sparkling eye. 'I will so beg and pray her to spare your life, dear papa, that she will not have the heart to deny me.'

'Simple child!' exclaimed her father, 'what should you be able to say to the queen that would be of any avail?'

'God would teach me what to say, and He has power also to touch her heart with pity for a child's distress, and to open her ear to my earnest petition.'

Her father clasped her to his bosom, but said, 'Thou wouldst be afraid of speaking to the queen, even if thou shouldst be admitted to her presence, my child.'

'Why should I be afraid of speaking to the queen, papa?—for even if she would be angry with me, and answer harshly, I should be thinking too much of you, father, to mind it: or if she were to send me to the Tower, and cut off my head, she could only kill my body, but would have no power at all to hurt my soul, which is under the protection of One who is greater than any king or queen upon earth.'

'You are right, my child, to fear God, and to have no other fear,' said her father. 'It is He who hath perhaps put it into your heart to plead with the queen for my life; which, if it be His pleasure to grant, I shall feel it indeed a happiness for my child to be made the instrument of my deliverance from the perils of death, which now encompass me; but if it should be otherwise, His will be done! He hath promised to be a father to the fatherless, and He will not forsake my good and dutiful child when I am low in the dust.'

'But how will Lady Lucy gain admittance to the queen's presence, my lord?' asked old Amy, who had been a weeping spectator of the scene between the father and the child.

'I will write a letter to her godmother, the Lady Clarendon, requesting her to accomplish the matter.'

He then wrote a few hasty lines to that lady, which he gave to his daughter, telling her she was to go the next day to Hampton Court, properly attended, and to obtain a sight of Lady Clarendon, who was there in waiting upon the queen, and deliver that letter to her with her own hand. He then kissed his child tenderly, and bade her farewell. Though the little girl wept at parting with her father, yet she left the Tower with a far more composed mind than she entered it; for she had formed her resolution, and her young heart was full of hope. She had silently committed her cause to God, and she trusted that He would dispose the event prosperously for her.

The next morning, before the lark had sung her matin, Lady Lucy was up, and dressed in a suit of deep mourning, which Amy had provided as the most suitable garb for a daughter whose only surviving parent was under the sentence of death. The servants, who had been informed of their young lady's intention to solicit the queen for her father's pardon, were all assembled in the entrance hall to see her depart; and as she passed through them, leaning on her nurse's arm, and attended by her father's confidential secretary and the old butler, they shed tears, and bade God bless her, and prosper her in her design.

Lady Lucy, arrived at Hampton Court, was introduced into the Countess of Clarendon's apartments before her ladyship was out of bed, and having told her artless tale with great earnestness, delivered her father's letter. Lady Clarendon, who was wife to the queen's uncle, was very kind to her young god-daughter, but plainly told her she must not reckon on her influence with the queen, because the Earl of Clarendon was in disgrace, on account of being suspected of carrying on a correspondence with King James, his brother-in-law; therefore she dared not to solicit the queen on behalf of her friend Lord Preston, against whom her majesty was so deeply exasperated, that she had declared she would not show him any mercy.

'Oh!' said the little girl, 'if I could only see the queen myself, I would not wish any one to speak for me, for I should plead so earnestly to her for my dear papa's life, that she could not refuse me, I'm sure.'

'Poor child! what could you say to the queen?' asked the countess compassionately.

'Only let me see her and you shall hear,' rejoined Lady Lucy.

'Well, my love, it were a pity but what thou shouldst have the opportunity,' said Lady Clarendon; 'but much I fear thy little heart will fail thee; and when thou standest the queen face to face, thou wilt not be able to utter a syllable.'

'God will direct the words of my lips,' said the little girl, with tears in her eyes.

The countess was impressed with the piety and filial tenderness of her little god-daughter, and she hastened to rise and dress, that she might conduct the child into the palace-gallery, where the queen usually passed an hour in walking, after her return from chapel, which she attended every morning. Her majesty had not left the chapel when Lady Clarendon and Lady Lucy entered the gallery; and her ladyship endeavoured to divert the anxious impatience of her little friend by pointing out to her the portraits with which it was adorned.

'I know that gentleman well,' said the child, pointing to a noble whole-length portrait of James II.

'That is the portrait of the deposed King James, Queen Mary's father,' observed the countess, sighing; 'and a very striking likeness it is of that unfortunate monarch. But hark! here comes the queen, with her chamberlain and ladies, from chapel; now, Lucy, is the time. I will step into the recess yonder, but you must remain alone, standing where you are; and when her majesty approaches near enough, kneel down on one knee before her, and present your father's petition. She who walks a little in advance of the other ladies is the queen. Be of good courage, and address yourself to her.'

Lady Clarendon then made a hasty retreat. Lucy's heart fluttered violently when she found herself alone, but her resolution did not fail her; and while her lips moved silently in fervent prayer to the Almighty for his assistance in this trying moment, she stood with folded hands, pale, but composed, and motionless as a statue, awaiting the queen's approach: and when her majesty drew near the spot, she advanced a step forward, knelt, and presented the petition.

The extreme beauty of the child, her deep mourning, the touching sadness of her look and manner, and, above all, the streaming tears which bedewed her face, excited the queen's attention and interest: she paused, spoke kindly to her, and took the offered paper: but when she saw the name of Lord Preston, her colour rose. She frowned, cast the petition from her, and would have passed on; but Lucy, who had watched her countenance with a degree of anxious interest that amounted to agony, losing all awe for royalty in her fears for her father, put forth her hand, and grasping the queen's robe, cried in an imploring tone, 'Spare my father—my dear, dear father, royal lady!' Lucy had meant to say many persuasive things, but she forgot them all in her sore distress, and could only repeat the words, 'Mercy, mercy for my father, gracious queen!' till her vehement emotion choked her voice, and throwing her arms round the queen's knees, she leaned her head against her majesty's person for support, and sobbed aloud.

The intense sorrow of a child is always peculiarly touching; but the circumstances under which Lucy appeared were more than commonly affecting. It was a daughter, not beyond the season of infancy, overmastering the timidity of that tender age, to become a suppliant to an offended sovereign for the life of a father. Queen Mary pitied the distress of her young petitioner; but she considered the death of Lord Preston as a measure of political necessity; she therefore told Lucy mildly, but firmly, that she could not grant her request.

'But he is good and kind to every one,' said Lucy, raising her blue eyes, which were swimming in tears, to the face of the queen.

'He may be so to you, child,' returned her majesty; 'but he has broken the laws of his country, and therefore he must die.'

'But you can pardon him if you choose to do so, madam,' replied Lucy; 'and I have read that God is well pleased with those who forgive; for he has said, "Blessed are the merciful, for they shall obtain mercy."'

'It does not become a little girl like you to attempt to instruct me,' replied the queen gravely. 'I am acquainted with my duty; and as it is my place to administer justice impartially, it is not possible for me to pardon your father, however painful it may be for me to deny the request of so dutiful a child.'

Lucy did not reply; she only raised her eyes with an appealing look to the queen, and then turned them expressively on the portrait of King James, opposite to which her majesty was standing. There was something in that look that bore no common meaning; and the queen, whose curiosity was excited by the peculiarly emphatic manner

of the child, could not refrain from asking wherefore she gazed so earnestly upon that picture?

'I was thinking,' replied Lady Lucy, 'how strange it was that you should wish to kill my father, only because he loved yours so faithfully!'

This wise but artless reproof, from the lips of infant innocence, went to the heart of the queen; she raised her eyes to the once dear and honoured countenance of a parent, who, whatever were his political errors as a king, or his offences against others, had ever been the tenderest of parents to her; and the remembrance that he was an exile in a foreign land, relying on the bounty of strangers for his daily bread, while she and her husband were invested with the regal inheritance of which he had been deprived, pressed upon her the thought of the contrast of her conduct as a daughter when compared with the filial piety of the child before her, whom a sentence of hers was about to render an orphan. It smote upon her heart, and she burst into tears.

'Rise, dear child,' said she; 'thou hast prevailed—thy father shall not die. I grant his pardon at thy intreaty—thy filial love has saved him.'

THE ART OF LIVING WITH OTHERS.

In the first place, if people are to live happily together, they must not fancy, because they are thrown together now, that all their lives have been exactly similar up to the present time, that they started exactly alike, and that they are to be for the future of the same mind. A thorough conviction of the difference of men is the great thing to be assured of in social knowledge: it is to live what Newton's law is to astronomy. Sometimes men have a knowledge of it with regard to the world in general: they do not expect the outer world to agree with them in all points, but are vexed at not being able to drive their own tastes and opinions into those they live with. Diversities distress them. They will not see that there are many forms of virtue and wisdom. Yet we might as well say, 'Why all these stars; why this difference; why not all one star?'

Many of the rules for people living together in peace follow from the above. For instance, not to interfere unreasonably with others, not to ridicule their tastes, not to question and re-question their resolves, not to indulge in perpetual comment on their proceedings, and to delight in their having other pursuits than ours, are all based upon a thorough perception of the simple fact, that they are not we.

Another rule for living happily with others is, to avoid having stock subjects of disputation. It mostly happens, when people live much together, that they come to have certain set topics, around which, from frequent dispute, there is such a growth of angry words, mortified vanity, and the like, that the original subject of difference becomes a standing subject for quarrel; and there is a tendency in all minor disputes to drift down to it.

Again, if people wish to live well together, they must not hold too much to logic, and suppose that everything is to be settled by sufficient reason. Dr Johnson saw this clearly with regard to married people, when he said, 'Wretched would be the pair above all names of wretchedness, who should be doomed to adjust by reason, every morning, all the minute detail of a domestic day.' But the application should be much more general than he made it. There is no time for such reasonings, and nothing that is worth them. And when we recollect how two lawyers, or two politicians, can go on contending, and that there is no end of one-sided reasoning on any subject, we shall not be sure that such contention is the best mode for arriving at truth: but certainly it is not the way to arrive at good temper.

If you would be loved as a companion, avoid unnecessary criticism upon those with whom you live. The number of people who have taken out judges' patents for themselves is very large in any society. Now, it would be hard for a man to live with another who was always criticising his actions, even if it were kindly and just criticism. It would be like living between the glasses of a microscope. But these self-elected judges, like their prototypes, are very apt to have the persons they judge brought before them in the guise of culprits.

One of the most provoking forms of the criticism above alluded to, is that which may be called criticism over the shoulder. 'Had I been consulted'—'Had you listened

to me '—But you always will'—and such short scraps of sentences, may remind many of us of dissertations which we have suffered and inflicted, and of which we cannot call to mind any soothing effect.

Another rule is, not to let familiarity swallow up all courtesy. Many of us have a habit of saying to those with whom we live such things as we say about strangers behind their backs. There is no place, however, where real politeness is of more value than where we mostly think it would be superfluous. You may say more truth, or rather speak out more plainly, to your associates, but not less courteously than you do to strangers.

Again, we must not expect more from the society of our friends and companions than it can give; and especially must not expect contrary things. It is somewhat arrogant to talk of travelling over other minds (mind being, for what we know, infinite): but still we become familiar with the upper views, tastes, and tempers of our associates; and it is hardly in man to estimate justly what is familiar to him. In travelling along at night, as Hazlitt says, we catch a glimpse into cheerful-looking rooms, with light blazing in them, and we conclude, involuntarily, how happy the inmates must be. Yet there is heaven and hell in those rooms, the same heaven and hell that we have known in others.—*Friends in Council.*

THE DONSIDE FACTORIES.

A plan has been recently adopted at the large factories on the Don, near Aberdeen, employing from 2000 to 3000 people, of supplying them with breakfast and dinner on the premises, and is found to answer remarkably well, both as regards the workpeople and their employers. The plan, as carried out at Messrs Leys, Masson, and Co.'s, at Grandholm, is as follows, and the arrangements at the other factories are almost precisely similar:—In the cooking department, to which a supply of spring water is led in by pipes, there is for soup a boiler of 120 gallons, and for coffee one of 70 gallons, and hot table: and attached to the kitchen are six rooms fitted up with benches and fireplaces in each, affording accommodation for above 400 persons when taking their meals. The breakfast consists of a roll of bread, of 6½ ounces in weight, of mixed or whole flour of the best quality, and a measure of coffee, of one-tenth part of an imperial gallon. For one gallon of coffee there is appropriated 3½ oz. of coffee, 3 gills of milk, 10 oz. of golden syrup; and to every 30 gallons of coffee one-half ounce of ground cassia is added, which gives the coffee an agreeable flavour. Dinner consists of barley broth and bread, or pease soup and bread; either one-sixth of an imperial gallon of barley broth, with a roll of bread weighing six ounces and three quarters, or one-sixth of an imperial gallon of pease soup, and a roll of bread weighing 6 and one-fourth ounce. For 50 gallons of barley broth there is appropriated 43 lb. good butcher meat, 28 lb. barley, 5 lb. pease; vegetables—turnips, carrots, leeks, to the value of 2s. or 2s. 6d. For fifty gallons of pease soup, 22 lb. pease, 12 lb. butcher meat, with the reserved bones from the barley broth, together with vegetables—say carrots, turnips, celery, thyme, and an ounce of ground cassia. After the soup is boiled, there is added, to improve its consistency, two or three quarter loaves, cut up into slices, and browned. Breakfast and dinner, including bread, charged 1½d. each. The meals are served in exchange for printed tickets, of which there are two sets—one for breakfast, and the other for dinner. Each department in the work has a number of these tickets appropriated, having the number of the department on each. Returns of the number of persons in each department who order breakfast and dinner for the following day are given in to the superintendent of the kitchen every day at twelve o'clock, in order to the preparation of the quantity necessary to supply them. Any surplus there may be is inquired after, and bought for domestic use by any persons who may wish it. The overseers of the respective departments, having a list of the names of those who have been supplied with meals during the week, render accounts at the end thereof to the superintendent of the kitchen. The cooking part of the kitchen is raised off, leaving a passage for those receiving meals, who enter at one door, and, on being served, pass out at another door, or go into the sitting-rooms. There are two cooks, a man and a woman, in constant attendance; and besides these, there are two of the overseers of the works who assist by rotation during the time of serving out the meals. Four hundred

people can be served in twenty minutes. The provisions are all of good quality, bought at wholesale prices. The institution is a self-supporting one. Messrs Leys, Masson, and Co., much to their credit, supply the fuel gratis, as well as the house, furniture, and cooking apparatus. The above plan, which has been found to answer so admirably in practice, originated in the hardships which were experienced by workers who had to travel to the factories from a distance of one or more miles, and who of course had to bring their provisions with them, consisting very often of nothing else than a piece of dry oat cake. Having no house to go to, and no means of getting a more nourishing diet, the poor people subjected to this state of matters suffered much in bodily health and strength, being often quite exhausted before the labours of the day were over. These consequences, so injurious alike to the employer and employed, have been to a great extent obviated by the plan which has thus been happily fallen upon.—*Christian News*, July 29, 1847.

THE BEAR AND THE TEA-KETTLE.

The bears of Kamtschatka live chiefly on fish, which they procure for themselves from the rivers. A few years ago the fish became very scarce. Emboldened by the famine and consequent hunger, the bears, instead of retreating to their dens, wandered about, and sometimes entered the villages. On a certain occasion one of them found the outer door of a house open, and entered it; the gate accidentally closed after him. The woman of the house had just placed a kettle of boiling water in the court. Bruin smelt it, but burnt his nose. Provoked at the pain, he vented all his fury on the tea-kettle. He folded his arms around it, pressed it with his whole strength against his breast to crush it; but this of course only burnt him the more. The horrible growling which the rage and pain forced upon the poor animal now brought the neighbours to the spot, and Bruin, by a few shots, was put out of his misery. To this day, however, whenever anybody injures himself by his own violence, the people of the village call him the 'bear and the tea-kettle.'—*Gall Reporter*.

VALUE OF NOTORIETY IN LONDON.

After all, a little literary reputation is of use here. I suppose Solomon, when he compared a good name to a pot of ointment, meant that it oiled the hinges of the hall doors into which the possessors of that inestimable treasure wished to penetrate. What a good name was in Jerusalem, a known name seems to be in London. If you are celebrated for writing verses, or for slicing cucumbers, for being two feet taller or two feet less than any other biped, for acting plays when you should be whipped at school, or for attending schools and institutions when you should be preparing for your grave—your notoriety becomes a talisman—an 'open Sesame,' before which everything gives way—till you are voted a bore, and discarded for a new plaything.—*Letter of Sir Walter Scott from London.*

TO YOUNG MEN.

How, after the duties of the day are over, do you employ your evenings? This a question of importance. If you have no regular employment, no fixed pursuits to engross your attention and operate as a stimulus to the mind when unemployed, you must, of necessity, have many leisure and unoccupied hours—intervals when time will hang heavily on your hands, and suggest the necessity of some means to relieve it of its weight. The very time which is dissipated in idleness would, if devoted to study, enable many a young man to obtain eminence and distinction in some useful art.—*Christian News*.

MARVELLOUS RECITALS.

The history of all countries and of all ages is loaded with marvellous recitals, which we should be wrong in rejecting with an unphilosophical contempt; all the facts can be explained by a very few causes, more or less difficult to discern, and the research into these causes throws open to us the archives of a mysterious policy, of which the learned have in all ages availed themselves to rule the human race, and to lead it either to grandeur or to humiliation, to slavery or to liberty.—*Printing Machine.*

MEN AND CIRCUMSTANCES.

WE have had accurate treatises on the effects which various occupations have upon health, but never any systematic view of the effects which they have upon the characters and moral bearing of men. Yet the one class of effects is as certain in point of fact as the other. All who have anything practically to do with men in the way of preaching to them, or in anyway seeking to modify their conduct, come to know this well, and are obliged to act accordingly, using very different means and persuasives with one from what are required for another. It is indeed an immense difficulty in the way of all practical moralists and reformers; one which they will only overcome in the degree in which they can adapt themselves to a great variety of circumstances.

One of the broadest propositions connected with the subject is, that great and constant physical toil renders the mental faculties dull. Let any one try to walk thirty miles in (say) eight hours, and he will find that, during the latter part of his task, his intellect and feelings have become stupified to a surprising degree, and it is not till he has sat down, and begun to recover from his fatigue, that he can either think or feel according to his wont. Let a gentleman, after these experiences, consider what it must be to spend ten hours every day in this torpor of the mental system, and he will be able to understand how the lumberers of America, the *navies* of our own country, and workers at coarse labour everywhere, are rough, inconsiderate, and thriftless. It readily accounts for that low state in which fishermen are everywhere found. Their work is so full of hardship and toil, that every noble faculty is benumbed. The roughnesses of their daily life bring out all the roughnesses of their own nature, as if in self-defence. In the intervals of labour, they are only fit for sensual enjoyments and entire vacuity; from which, once more plunging into their coarse labours, they have no time left for the cultivation of their better nature. No wonder that this at length tells in the course of generations, so as to produce an inferior type of brain; which it is said to do. Nor is it surprising that this class of men, and all others who labour in the like manner, live more from hand to mouth than many savage tribes. The life of the North American Indian is one which, in comparison, may be said to allow fair-play to human intelligence. He has some leisure to gather his thoughts about him, and to attend to his social duties; which the other has not. His very occupations are of a kind which exercise no small amount of intellect. The Indian is therefore found making such provision for his life, that he never knows what we call destitution. The *navie*, on the other hand, reduced to spend nearly his whole time in labours which only employ

the brute part of him, drops, as it were, reflection and foresight from his calendar of qualities, and only can use unusual gains in unusual debauchery, till pennylessness sets him once more a-working.

We trust that no one will be alarmed at these acknowledgments, as supposing them to supply an excuse for the conduct of the coarser class of workers. Their more legitimate effect is to prompt inventions which shall supersede degrading labours. Preaching in direct contravention of evils which human nature, in connection with circumstances, must irresistibly bring forth, is preaching in vain. But when we see how things actually work, we may make some effort for their remedy. Not many years ago, the men who worked printing-presses were noted as a less steady class than their associates who composed the types. The explanation was, that they had a comparatively severe kind of labour, which tempted them to indulgence in liquor. All the stern preaching in the world would never have done so much to correct this evil as the application of steam power to the working of the press. So as to fishermen: let fishing be done in steam vessels, which can quickly go to and return from the fishing-grounds, and which will save the men from too much of both toil and exposure, and fishermen will become like other people. As to excavators, we must profess our surprise that they have as yet got so little aid from machinery. To see five hundred men labouring with spades in cutting through a gravel mound or a mass of blue clay, impresses us more forcibly with an idea of primitiveness of means, and the essential prevalence of middle-age systems in our nineteenth century, than anything we ever come in contact with. Why is there not a steam digger and blaster? Where is the American excavator? The value of such a machine as a moral reformer is not to be estimated.

When Adam Smith described the economic effects of the division of labour, he did not advert to the moral results of the system. These were not a part of his subject, but they are even more important than anything that was. If a man spends the working portion of every day of his life in making the heads of pins, it is quite impossible that he can preserve himself as a full and complete man. The making of pin heads is an extreme case; but the same is true in a degree of every kind of labour which keeps the attention absorbed for hour after hour, and day after day, in the doing of a particular class of minute and monotonous duties. Here, again, the Indian contrasts favourably, as far as the intellect is concerned. He must be a subtle warrior, a dexterous huntsman, an architect to a certain extent, and able to work at many handicrafts of a rude kind which are required in the economy of his life. Thus far more mind is necessarily brought out in him than in the executor of a department in an

English factory. The combination in the factory is a more wonderful thing, and speaks more of intellect, than any combination of doings in the savage tribe; but with the individual it is different. He loses integrality, and with that undoubtedly loses one of the most essential distinctions of a human being. This is a loss which may be said to be suffered by society in general, whenever combinations are made for economic purposes of any kind. It is experienced alike in the soldier as a little part of an army, in the clerk as a mere fragment of the unity of a counting-room or bank, in men of business generally, as only having knowledge of their particular walk or field. All such reductions of individuality have a fatal effect on mind. The better powers are unexercised, and consequently dwindle. Men, in such circumstances, are apt to become oddities or petty humorists, or simply to sink into a half-mindless state, in which they are content to perform their duties for the means of an existence rather vegetable than animal. A nation so composed must be a different thing from one in which individual men stand firmer each in his own footing. It may be a stronger nation: indeed this it probably will be, for it will be altogether a higher organic fabric, while the resulting wealth becomes in itself a mighty power. But the great mass of the component elements must be inferior. This, it must be confessed, puts society into a startling light; for if there is anything that the moralist insists upon more than another, it is, that men shall be considered as individuals. It is a problem of vast import, and of which no one can foretell the working out.

There is one form in the social arrangement which modern times have seen carried amongst us to a pitch never before known, and from which, in this excess, there cannot fail to be remarkable effects. Master and servant, employer and employed, there have always been; but there never were so many servants and employed to so few masters and employers as now. A company of three, which contracts for the making of railways, lately paid off ten thousand men in the course of a week or two. Their expenditure, mostly in wages, has occasionally reached fifteen thousand pounds a day! What was Warwick the king-maker to a grandeeship like this? Industry now has her captains of hundreds, and her captains of thousands and tens of thousands, not with so absolute a rule of the one over the other as existed amongst commanders and commanded in the old days, but with moral effects and influences not less potent. We take it to be an unavoidable consequence of the assumption of a place below another man, that we cease to feel the same independence, the same self-reliance, as in the contrary circumstances. Having now another to take care of us, we cease to take the same care of ourselves. Not allowed to act according to our own sense of the exigencies of each particular moment, we lose that vigilance, activity, and resource which we once possessed, or might have attained to possessing. On the other hand, the acquiring of mastership or patronage over a multitude as necessarily engenders feelings of pride and (not to use it in an offensive sense) self-sufficiency. If to these contrary-pulling influences we add that of money—the one kept at definite, and generally moderate incomes, the other put in the way of acquiring large capital, with all the dignity and power that thereto effeirs—we shall be inclined to regard society as in a state of polarity and divarication altogether unexampled in degree, and almost unknown in kind. Helotism we know: feudal

vassalage has been entered on the chronicles: but what may be the effects of the new nobility created by employment and capital, it has not entered into the mind of man to conceive. Obviously enough, however, it is this which is the basis of that aristocratic character remarked of our nation by foreigners, as a thing apart from, though co-existent with, an apparent tendency to democratic institutions. It is the wealth of Englishmen which makes them proud. It is the inexperience of any necessity of exertion throughout all their lives—the lot of a large class living upon paternally-acquired means—which dignifies the physiognomy of John Bull wherever he goes over the world. A power is thus erected far harder to deal with than any which rest in the constitution, or are protected by statute. It is one which no kind of Jacobinism hitherto known can touch.

That very zeal with which business is now conducted amongst us is a new element in the world, immensely modifying its inhabitants in moral respects. Nothing is now more common than to hear a man alluded to as too busy to attend to this; too much occupied to have any time for that; things which used to appear as the simplest duties of life. Many children see their father only once a week, and hardly become tolerably acquainted with him before they have to enter the world themselves. With thousands upon thousands, the idea of reading a book, or acquiring any new accomplishment of mind, is as much out of the range of possibility as a voyage to the moon. They are, morning, noon, and night, engaged in their affairs—that is, in the mere pursuit of money—with barely time for needful meals and rest. 'Why toil so hard?' 'We cannot help it. We must do as we do, if we would wish to keep our place, our rank, preserve our credit, or save our families from penury.' Terrible consideration! We wonder it does not occur to the many of them who are professedly religious men, that to give the whole mind to the behests of one desire of their nature, and that one of the meanest, is to degrade the divinity within them, and to be practically heathens. The necessity is of course merely an assumption imposed by the appetite. There is nothing to hinder men from working less, if they will be content with less. No one can doubt that this fanaticism of business must be rapidly modifying the externals of human nature in our country. A people so disposed must be something wholly different from, we shall say, such a people as lived in England in 1642. Query—Could they stand up to the same things?

Meditating on such matters, the spirit loving of its kind, and wishful of all that can increase human happiness, may well feel somewhat troubled; for though the evil may be seen, it is not so easy to see a remedy. It occurs to us that, in any efforts to this purpose, it would be well to keep chiefly in mind, as a resting-place for the foot of the moral mediciner, that inner state of man in which all of us have, as it were, a separate life. The merest slave may be free here. Salary may purchase all but this. The pin-head-maker, while his fingers and a small portion of mind are given to duty, may have a whole academy of thought, a whole temple of silent worship, going on in his spiritual self, beyond the ken of bystanders and the control of taskmasters. Here, even for him who 'has no time for anything,' there may occasionally be a moment for a regenerating reflection. Whatever can cultivate and invigorate this internal life, we would encourage—not to make men dreamers, but that they may continue to be men. It is a line of policy needful and good at all times, but now particularly needful and

good, when the tendencies of our external life are so dead-set towards mere wealth and all kinds of materialities, as well as to a sort of dismemberment of man himself. Everything, then, that can foster man's sense of his indivisible, unpurchasable mind—everything that can project him from the present into the future, from the seen into the unseen—everything that can help to make him pause now and then on the bustling highways of the world, and bethink him, 'I have come—from whence? I go—whither? I hang not self-sustained—from what far system of things am I depending, and to which shall I reascend?—And how shall I trim my life, or at least my inner thinking life, that it shall stand being glassed in the eternity which it must meet?'—All these things we would prompt into activity, and sustain with our whole power. To this let preacher, writer, politician, and educationist conspire, and there may still be hope for England.

THE NESTS OF FISHES.

ALMOST all the higher classes of animals assiduously perform the duties of parents to their young. They nurse, and feed, and protect them till they are able to provide for themselves. But many of the inferior animals, on the other hand, never know or care for their offspring. Not a few of them, indeed, as the insect tribe, bestow great pains in constructing nests for the eggs of their future young, and even provide and store up the food necessary for them; but here all their solicitude ends; and in many instances the parents are dead before their young come into existence. Aquatic animals exhibit what, on a casual view, would appear great carelessness in this respect. Fish deposit their spawn almost at random, and leave their ova to be hatched by the elements, and their young to provide for themselves. They form no nest, or a very rude one—the sand of the sea-shore, the small pebbles of the river or lake, or leaves of plants, or sea-weeds, receive their minute eggs. These are hurriedly and rudely covered up, if deposited in furrows of the sand, or they adhere to stones or weeds by means of a gluey mucilage by which they are enveloped. When the young fry are developed, they associate together in shoals, and roam about amid the shallow waters untended and unprotected by the larger fish, nay, sometimes even preyed upon by their own progenitors. This we might be apt to think extreme indifference, and an outrage on the great law of paternal endearment; but a little reflection will show that it is a wise adjustment of nature. In such an unstable element as water, continually agitated by currents, and incessantly changing its place, it would have been impossible for a parent fish to have kept its young family around it, or even, if it so could, to have afforded them any protection. Think, too, of a codfish surrounded by several millions of its young—the offspring of one single season! Or of an immense shoal of herrings, with each parent taking charge of its two or three millions of young, and distinguishing each among the surrounding myriads! The salmon comes into fresh-water rivers to deposit its spawn high up the stream; but its nature requires that it should return to the ocean again long before its young are able to travel: and the same remark applies to many migratory fishes, which leave the deep waters—their usual haunt—and come for a short space to the shallows to spawn.

Yet fishes, obedient to the great law of nature, show much solicitude about selecting the proper place for their spawn and future young. Every year the herring

in countless shoals makes a long journey, it is supposed, from the deep seas of the north to our shallow bays and firths; and the salmon leaves the sea, toils up the current of the river with incredible perseverance and force, overleaping the falls and rapids till it gains the smooth and shallow source where, amid the sand, the spawn is deposited, and where the future young may sport in safety amid the sunny rills, till they gain sufficient strength to swim down the stream. Some fishes, however, really make a kind of nest in the water, and assiduously tend their ova till they are hatched. This is the case with the stickleback, which constructs a nest made of pieces of grass and straw fixed among the pebbles of the stream which they inhabit. M. Coste procured some of these fishes, and putting them into basins filled with water, and the proper materials of their nests, watched their progress. A minute and very curious detail of which he lately submitted to the Academy of Sciences of Paris. The sticklebacks having selected a proper spot, set about constructing their nests. 'I saw,' says he, 'each of the males that was engaged in this work heap up in the place the selected pieces of grass of every kind, which he often brought from a great distance, seizing them with his mouth; and of these he began to form a kind of carpet. But as the materials which form the first part of his edifice might be carried away by the movements or oscillation of the water, he had the precaution to bring some sand, with which he filled his mouth, and deposited it on the nest, in order to keep it in its place. Then, in order to make all the substances thus brought together adhere to each other, he pressed his body against them, sliding slowly as if by a kind of vibratory creeping, and in this way glued them together by means of the mucus which exudes from his skin. By this operation the first collected materials form a kind of foundation or solid floor, on which the rest of the edifice is to be reared. The execution of this he continues with a feverish perseverance and agitation. In order to satisfy himself that all the parts are sufficiently united, he agitates his pectoral fins with great rapidity, in such a manner as to produce currents directed against the nest; and if he notice that the pieces of grass are moved, he presses them down with his snout, heaps sand upon them, flattens them, and glues them together again. When the process has reached this point, he chooses more solid materials—he seizes small pieces of wood or straws in his mouth, and presses them into the thick places, or on the surface of the first construction. If he finds, when attempting to introduce them, that the position does not sufficiently answer the purpose, he draws them out again, seizes them at another part, again inserts them, and pushes them forwards, until he ascertains that he has made the best possible use of them. Occasionally, however, in spite of all his care, there are portions which, owing to their shape, will not conform to the general plan. These he draws out, carries to a distance, and abandons, and proceeds to select others. When he has succeeded in building the floor and side walls, he then undertakes the roof, which is constructed of the same materials, carefully glued and compacted together by the same vibratory pressure of his body. Meanwhile he takes care to secure an opening in the centre of the nest, by repeatedly thrusting in his head and the greater part of his body.' The nest being thus finished, the male, which is distinguished by his vivid colouring, darts out and invites a female to deposit her eggs in the place which he has just prepared for their reception. The female enters, and having deposited her ova in the cavity, darts out at the opposite side at which she entered, and thus makes an open passage through both sides of the nest. Several females in succession are thus invited to deposit their spawn; and thus the nest becomes a rich magazine of ova. The male now becomes the sole guardian of this deposit; for not only do the females take no care of it, but they become its formidable enemies—forming part of those numerous coalitions

which attempt to plunder it, and satisfy their voracious appetite by devouring the ova. In his defensive exertions, no obstacle can divert him, or daunt his courage during the whole month requisite for the development of the ova. In order to strengthen the nest, he now covers it with stones, the size of which is sometimes equal to half his body, and which he moves along with great labour. In this process he always reserves one or more openings, through which he often drives currents of water by the rapid motion of his fins—these currents seem to be necessary in clearing away objects from the eggs, for if not thus cleansed, they are found all to perish. It is wonderful to see with what courage he beats away successive numbers of his foes, striking them with his snout, and erecting his long sharp spines. Sometimes, when about to be overpowered with numbers, he resorts to stratagem, and darts suddenly out of his nest, as if in pursuit of some prey. This frequently deceives the attacking sticklebacks, and they rush after him, in hopes of sharing the prey; and thus they are decoyed from the nest. As the period of hatching draws to a close, his assiduity increases: he removes the stones to give more easy access to the water, enlarges the openings, increases the frequency of the currents, and moves the eggs nearer the surface, or carries them deeper, according as circumstances require. Finally, when the eggs are hatched, he still continues to watch over the young in his nest, and does not allow them to go at liberty till they have become sufficiently active to provide the means of their own preservation.

THE VALUE OF LIFE.

AN EPISODE IN THE MEMOIRS OF A BRETON GENTLEMAN.

FROM THE FRENCH.

At the moment Joseph opened the door, and announced that the carriage was ready. My mother and sister threw themselves into my arms. 'It is not yet too late,' said they; 'give up your journey—stay with us.'

'Mother, I am now a man—I am twenty. I must not waste my life in obscurity; I must make my way either in the army or at court.'

'But what is to become of me, Bernard, when you are gone?'

'You will be happy in the success of your son, and proud of him.'

'And if you should be killed in battle?'

'What matter? What is life? Who thinks about it at twenty, when fame is to be won? I will come back to you, mother, in a few years, colonel or field-marshal, or with some fine situation at Versailles.'

'Well, and what then?'

'Why, then, I shall be treated with respect and consideration, and every hat off as I pass along.'

'And what then?'

'Why, then, I will marry my cousin Henrietta, get good husbands for my sisters, and we will all live with you in our fair domains of Brittany, as tranquil and happy as the days are long.'

'And what prevents your beginning from this very moment? Has not your father bequeathed to you one of the finest properties in the country? Is there within ten miles of us a richer domain, a more lovely residence, than that of Roche-Bernard? Are you not respected, honoured by your vassals? Have you any lack of salutations as you pass through the village? Be intreated, my son; stay among your friends, with your sisters, with your aged mother, whom, it may be, you would not find here on your return. Waste not in vainglory, or shorten by care and disquiet of every kind, those days which even now pass swiftly on. Life is sweet, my son, and sunny are the skies of Brittany.'

As she spoke, she drew me to the window, and pointed to the broad glades of the park; to the old chestnut trees now in full foliage; the lilacs; the honeysuckles embalming the air and glistening in the sun.

In the anteroom were waiting some of my dependants, whose sorrowful silence seemed also to say, 'Do not go, master; do not go.' Hortense, my elder sister, embraced me in an agony of tears, and my little sister Amelia clung to me with convulsive sobs. I tore myself from them: 'I am twenty—I must seek fame, glory—I must go!' and I darted into the hall. A female form stood on the staircase; it was Henrietta. She spoke not a word, shed not a tear, but she was as pale as death, and trembled till she could scarcely stand, while with her handkerchief she waved a last adieu, and then fell back senseless. I ran to her, I raised her, pressed her to my bosom, swore to her eternal love; but as soon as I was assured she had revived, I left her to the care of my mother and sister, and ran to the carriage without venturing a second look. One glance more at Henrietta, and I could not have gone. A few moments, and the carriage was rapidly pursuing its way along the high road.

For a long time I thought only of Henrietta, of my sisters, of my mother, and of all the happiness I was leaving behind me; but as the turrets of Roche-Bernard were lost to my sight, these ideas began gradually to fade away before the brilliant visions of glory and ambition that now presented themselves to my mind. How many plans did I form!—how many castles in the air did I build!—how many exploits did I perform in that one day's journey! Riches, honours, dignities, success of every kind—nothing was too high for me: I deserved everything, and I granted myself everything; and gradually rising in rank as I proceeded on my way, by the time I arrived at the inn where I was to stop that night, I was duke and peer, governor of the province, and Marshal of France. The voice of my servant, addressing me by the more humble title of 'sir,' roused me from my dream, and compelled me to abdicate my newly-acquired dignities.

The next day, and many following days, the same dreams, the same intoxication. I was going to Sedan, to the Duke de C—, an old friend of my father, and a patron of the family. He was to take me with him to Paris about the end of the month, to introduce me at Versailles, and by his interest obtain for me a company of dragoons. It was dark when I arrived at Sedan, and knowing that at that hour I could not intrude upon my patron, I deferred my visit till the next day, and took up my abode in the smallest hotel of the town, but that which was the usual resort of the military; for Sedan is a garrison town—a fortified place: the streets have a warlike aspect, and the very citizens a martial air, that seems intended to give strangers to understand, 'We are the countrymen of the great Turenne.'

I supped at the table-d'hôte, and in the course of conversation inquired the distance of the residence of the Duke de C— from the town. 'Three leagues' was the answer, 'and any one will show you the way; it is well known in the country. It was there the great general, the illustrious Fabert, drew his last breath.' And then the conversation turned upon Marshal Fabert. This was quite natural among a set of young officers. His battles, his achievements, were discussed, and honourable mention was made of the modesty which induced him to decline the patent of nobility and the collars of the several orders offered him by Louis XIV. But more especially did they dwell upon the marvellous good fortune which had raised him from the private soldier to the rank of Marshal of France. Being at that time the only instance of such a wondrous elevation, popular report attributed it to supernatural agency. It was whispered, even during the lifetime of Fabert, that from his childhood he had dealt in magic, and had made a compact with the demon. And our landlord, who possessed no small share of Breton credulity, attested in the gravest and most solemn way, that at the château of the Duke de C—, where Fabert had died, a black man, whom no one knew, had been seen to enter the room of the

dying man, and then disappear, carrying with him the soul of the marshal, which he had formerly bought: nay, more, that in the month of May, the very time of Fabert's death, the aforesaid black man appeared every night bearing a light. The time passed in laughing over this story till we separated for the night.

Early the next day I repaired to the abode of the Duke de C—, a large Gothic manor-house, that at any other time I should not have particularly remarked, but which I now looked at, I confess, with some little interest, as I remembered our landlord's story of the preceding evening.

The servant, in answer to my inquiry for the duke, said he would go see if his lordship were at home, and left me in a kind of armoury filled with crosses, hunting implements, and family portraits. I waited some time: no one came. I grew somewhat impatient, and asked myself, 'Was my career of glory to begin by dancing attendance in an antechamber?' I had already reckoned three times over the family portraits, and every joist in the ceiling, when I heard a slight noise in the wainscoting. It was a door which the wind had half-opened, and which now gave to my view a very handsome boudoir, with two large windows and a glass door looking out upon a noble park. I was advancing into the apartment, when my steps were suddenly arrested by an object hitherto unperceived. It was a man lying on a couch, with his back to the door by which I had entered. He suddenly started up, and without perceiving me, ran towards the window. Tears coursed each other down his cheeks, and dark despair seemed stamped on every feature. He remained motionless for some time, with his head buried in his hands; then with hasty strides began to traverse the apartment, till he came close to me. He started as he perceived me; and shocked and confused at my intrusion, I stammered out a few words of apology.

'Who are you, and what do you want?' cried he in a loud tone, and seizing me by the arm.

'I am the Chevalier Bernard of Roche-Bernard, and I am just arrived from Brittany.'

'I know, I know,' said he, throwing himself into my arms; then making me sit down beside him, spoke to me so warmly of my father, and my whole family, with whom he appeared to be so intimately acquainted, that I had no doubt I was speaking to the master of the house.

'You are Monsieur de C—, I presume,' said I.

He arose, and with a look of great agitation and excitement, he said, 'I was once; I am no longer—I am no longer.' Then seeing my astonishment, he exclaimed, 'Not another word, young man; I must not be questioned.'

'I have been the involuntary witness, my lord, of your emotion, your sorrow; and if attachment, if friendship could be any solace to you, gladly would I offer it.'

'Yes, yes, you are right; not that you can in any way avert my fate, but at least you can be the depository of my last wishes: it is the only service I can ask at your hands.'

He carefully closed the door, then returned to sit beside me. Almost trembling with emotion, I waited for him to speak. When words came, they were grave and solemn. His countenance had an expression which I had never before seen in any human face. He was pale, ghastly pale, while his black eyes glared upon me at times with an unearthly fire, and his lips contracted into a bitter, I had almost said an infernal smile.

'What I am about to tell you,' said he, 'will bewilder, amaze you. You will doubt; you will disbelieve. Little marvel that you should, when there are moments when I, too, doubt. Oh how gladly would I always doubt! But the proofs are too strong, the facts too stubborn; and is there not in everything that surrounds us, in our very organisation, many other mysteries which we are obliged to acknowledge, even though, to our darkened minds, they are inexplicable?'

He stopped a moment, as if to collect his thoughts;

then passing his hand over his forehead, went on. 'I was born in this château. I had two brothers, both elder than I, to whom would devolve the family estate, the family honours. I had nothing to expect but the gown and band of an abbé; and yet thoughts of glory, of renown, of ambition, fired my brain, and swelled my throbbing heart. Unhappy in my obscurity, panting for celebrity, I thought only of the means of acquiring it, and this one idea engrossed me, to the exclusion of every pleasure, every other object in life. The present was nothing to me; I existed only in the future, and that future presented itself to me under the darkest colours. I was nearly thirty, and was yet nobody. At that time many were the brilliant literary reputations attained in the capital, and reaching us even in the provinces. How often did I say to myself, "If I could even make a name in the republic of letters, it would still be fame, and in it only is happiness." As the confidant of my cares, of my aspirations, I had an old negro servant, who had been in the château long before my birth: he certainly was the oldest person in the house, for no one could remember his having come into it. The people of the country went so far as to say he had known Marshal Fabert, and attended him on his deathbed.'

At this instant he paused on seeing my involuntary gesture of surprise, and asked what was the matter. 'Nothing; a sudden start,' I replied; but I could not help thinking of the black man of our landlord's tale.

M. de C— continued: 'One day I was abandoning myself, in the presence of Yago—such was the negro's name—to paroxysms of despair, to lamentations over the inglorious obscurity in which I was condemned to waste existence, and I at length exclaimed, "I would cheerfully forfeit ten years of my life to be placed in the first rank of celebrity as an author." "Ten years," said Yago coolly; "that is a great deal, and a dear purchase for a trifle of so little value. No matter; I accept your ten years. I take them. You must remember your promise; I will keep mine." I need not tell my surprise at his words; but taking for granted that age had disordered his faculties, I only shrugged my shoulders, and thought no more of his folly. A few days after, I left the château for Paris. There I obtained admission into literary society; and incited by example, and encouraged by my first success, I gave to the world several works, which soon placed me on the pinnacle of fame. The journals lauded me till all Paris re-echoed with my name; nay, it was but yesterday, young man, that you paid to it the tribute of your admiration.'

Another gesture of surprise on my part interrupted this strange recital.

'You are not, then, the Duke de C—?' I exclaimed.

'I am not,' answered he coldly.

'It must be,' said I to myself, 'some celebrated author. Can he be Marmontel, D'Alembert, or Voltaire?'

The stranger sighed; a smile of mingled disdain and regret just played upon his lips, and he resumed his recital.

'The literary reputation I had so coveted soon became insufficient for so ardent a disposition as mine. I aspired to noble triumphs, and I said to Yago, who had followed me to Paris, and was my constant attendant, "There is no real glory, no true fame, to be acquired save in the career of arms. What, after all, is the man of letters—the poet? A mere nothing. Give me the great captain, the great general; this is the destiny I covet; and for a high military renown I would be content to part with ten of the years that yet remain to me." "I accept them," answered Yago. "I take them: they belong to me. Do not forget that they are mine."'

The unknown again paused, seeing the uneasy surprise, the hesitating doubts, which my every feature expressed.

'Did I not say it would be so, young man? You cannot believe me; it seems to you a dream, a wild illusion. So it does to me; and yet the rank, the honours

I obtained, were no illusion. The soldiers I have led on to the fight, the citadels I have stormed, the victories with which France has resounded, all this was my work, all this glory was mine."

While he paced the apartment with hasty step, and spoke with a vehemence, a passionate excitement, that seemed to shake his whole frame, I stood petrified with astonishment. "Who, then, was this man? Coligny?—Richelieu?—Marshal Saxe?"

Deep depression now succeeded the excitement; and the unknown, again approaching me, said gloomily, "Yago had dealt truly—he kept his promise; and when, later still, I turned in disgust from that vain shadow, military glory—tired of grasping at smoke, at a vapour—and asked of him to give me the only thing real and positive in the world—when I offered to barter for wealth, for gold, five or six years more of my life, he acceded to my wish. Yes, young man, yes; I have seen fortune second surpass all my desires: lands, forests, castles; this very morning all these were mine; and if you doubt me, if you doubt Yago, only wait; he will soon be here, and you shall see for yourself, with your own eyes, that what is so bewildering to you and to me is unhappily but too sad a reality."

The unknown went to the mantelpiece, and looking at the clock upon it, he started back in terror, and said in a faint whisper, "This morning, at break of day, I felt so much exhausted, so weak, that I could scarcely get out of bed. I rang for my valet; Yago answered the bell. "What can be the matter with me?" I said. "Master, nothing but what is quite natural. The hour is come, the moment is at hand." "What hour?" I asked. "Cannot you guess? Heaven had destined for you sixty years of life; you were thirty when I first began to obey you." "Yago, you do but jest," I exclaimed in terror. "I jest not, master; in five years you had expended in fame twenty-five years of existence. You gave them to me; they belong to me; and that portion of your life which you bartered away is now to be added to mine." "What! is this the price of your services?" "Others have paid still dearer for them; you may be satisfied." "Silence—silence! I command you. It is not possible, it is not real." "Be it so. But prepare: you have but half an hour to live." "You are deceiving—mocking me!" "Not at all. You need only calculate yourself. Thirty-five years that you have actually lived, and twenty-five that you lost, makes a total of sixty. That was your number; every one has his own." And he was about to leave me. I felt my strength diminishing, my life escaping from me. "Yago, Yago!" I cried in agony, "give me but four hours—four little hours!" "No, no," answered he; "it would be to take them from myself, and I know better than you do the value of life. I would not give two hours of it for all that tempted you. Gold would not buy them." "Give me four hours, and I resign to you the wealth for which I have sacrificed so much. Only four hours, and I renounce my gold, my riches, my broad lands." "Well, you have been a good master, and I care not if I do something to please you. I consent." I felt my strength returning, and I cried, "Four hours! but four hours! After all, what are they? Yago, Yago! give me but four more, and I renounce my literary fame—those works which placed me on so high a pinnacle of glory." "Four hours for a puff of smoke!" said the negro contemptuously. "It is too much to give you; but no matter, I will not refuse your last request." "Not the last! Oh no, not the last, good Yago!" cried I, clasping my hands imploringly. "I conjure thee, give me till night—twelve hours—the whole day, and let my achievements, my victories, my military renown, pass for ever into oblivion—be for ever obliterated from the memory of man! This one day, Yago, this one whole day, and I shall deem myself too happy!" "You abuse my compassion," said he, "and I am making a fool's bargain. No matter, I will give you till sunset. Then you must ask no more. To-night I come for thee!"

"And he left me," pursued the unknown in a tone of agonized despair; "and this is the last day of my life!" Then approaching the glass door, which opened on the park, he exclaimed, "No more shall I behold that beautiful sky, the murmuring rivulet—no more breathe the balmy air of spring! Fool that I was! For twenty years longer I might have enjoyed those common blessings that God gives to all, those blessings to which I was insensible, and which now, when too late, I estimate at their full value. Look there, look there!" and he pointed to a group of peasantry who were crossing the park, and singing on their way to their work, "What would I not give now to share their toils and their poverty! What would I not give, that the motive which impelled me to action had been the desire to be useful to others, not to gain vainglory for myself! But I have now nothing more to give, nothing more to expect here below: nothing—not even misfortune!"

At this instant a sunbeam, a ray from the bright May sun, fell upon his wild and haggard countenance. He seized my arm in a kind of delirium, and said, "Do you see yon bright sun? And I must leave it all! Then let me enjoy it at least a while: let me taste the full beauty of this cool, calm day, which for me has no to-morrow!" Then darting from the room into the park, he rushed down one of the avenues, and disappeared from my view before I had time to detain him, which, to say the truth, I should not have had the power to do. I had fallen upon the couch bewildered, overwhelmed, by what I had just seen and heard. I now arose; I shook myself; I walked about the room, to convince myself that I was awake, and not under the influence of a dream. At that moment the door of the boudoir was thrown open, and a servant announced the Duke de C—.

A man about sixty, with a striking expression of countenance, advanced towards me with extended hand, and apologised for having kept me waiting so long. "I was not at home," he said. "I have but just returned from the next town, where I went to consult a physician about the state of my youngest brother, the Comte de C—."

"I trust there is nothing serious the matter with him, that you have no fears for his life?"

"Thank Heaven his life is not in danger," answered the duke; "but in early youth ambitious hopes, aspirations after fame, after the bubble reputation, excited him to a degree that amounted to disease; and lately a severe fit of illness, which had nearly proved fatal, has left a kind of delirium and alienation of mind, the effect of which is to persuade him that he has but one day to live. This is his mania."

Here was a full explanation.

"And now," continued the duke, "we must think of your affair, and see what can be done to promote your object. We will go at the end of this month to Versailles; I will present you."

"I am not the less grateful for your kindness, my lord, though I am under the necessity of declining to avail myself of it."

"What! have you given up the court, and all the advantages awaiting you there?"

"Yes, my lord."

"But bear in mind that, with the interest I can command, you would make rapid way; and with a little assiduity and a little patience, you might, in about ten years—"

"Ten years lost!" cried I.

"Well," he resumed in some surprise, "is not this a cheap purchase for fortune, honours, fame? Come, come, my dear young friend, we will start for Versailles."

"Pardon me, my lord, I will start for Brittany; and I beg again to offer you warm thanks for myself and my family."

"This is absolute folly!" exclaimed the duke.

But for my part, I recollected what I had just seen and heard, and I said to myself, "It is true wisdom."

The next day saw me on my way home. With what delight did I see once more my fair domain of Roche-Bernard, the old trees of the park, the sunny skies of Brittany. I greeted once more my vassals, my sisters, my mother; and once again did I find happiness, never more to part with it, for the next week I was married to Henrietta.

THE LEARNED HERDSMAN OF COSSE DAUDE.

'IDLENESS is the parent of every vice,' is a saying that every one has heard, and it is as true as it is trite. How often do we see it exemplified as we pass through life! Many a sad catalogue of genius wasted, of talents mispent, and of opportunities thrown away, might be furnished to show its justice; and many a dismal tale might be told within the prison, and at the gallows, in proof of its truth. But we gladly turn from the melancholy picture it presents, to the contemplation of the success which almost invariably attends industry. The benefits which industry confers on the world at large are incalculable. There is not a necessary that we possess, nor a luxury that we enjoy, which is not the fruit of industry; and while we are reaping the rich harvest it has spread before us, the patient zeal of the labourer should often be called to mind. How many have devoted themselves, with unwearied perseverance, to studies as difficult as they are important: to what privations have they cheerfully submitted—how have they watched by the midnight lamp while others slept—how have they abstained from the social intercourse in which others freely indulge—how have they endured fatigue and cold while others enjoyed all the comforts of warmth and of repose! But let it not be supposed that they are without their compensations. The snatches of repose and social intercourse which the labourer and the mechanic enjoy, are peculiarly exhilarating and renovating; the severest stretch of intellectual exertion is accompanied by the elevating hope that it may lead to the elucidation of some contested point, or the discovery of some latent principle, which lightens all the toil, and compensates for every privation.

When we turn to the biography of the learned, we are struck by the unremitting industry with which many have sought the fountains at which to slake their thirst for knowledge, and by the difficulties which they have overcome in attaining their object. A slight sketch of what was acquired in this way by an extraordinary man may not be unacceptable. Excluded from every advantage, and with difficulty obtaining the most scanty means of information, John Ludwig arrived at attainments that would have done honour to the professor of a university. He was born in the year 1715, in the village of Cosse Daudé, and was sent to school at six years of age. The Bible was the book in which he was taught to read, and the delight which he took in it was intense; he soon felt an ardent longing to read other books, but none were within his reach. In about a year he began to learn to write, and when he had made some progress, he was given books from which to copy certain sentences. He read these books again and again with the greatest delight, and devoted himself almost entirely day and night to copying out the passages which pleased him most, and patiently collecting into a regular series such paragraphs as bore upon any subject or event which excited his interest. When he was ten years of age he was put into arithmetic; but he found it difficult, and could not understand it without explanation. As his master was not willing to take any trouble which he could avoid, he told him to refer to the rules. Poor Ludwig found himself at such a loss to comprehend the bearing of these rules, that he became thoroughly disgusted with the pursuit, which scolding and beating had not rendered more fascinating, and left the school without having learned anything but reading, writing, and his catechism.

He then went to tend cows, and spent his days in the fields, where all he had learned was after a time forgotten. He became clownish and listless, and gradually gave into the habits of the idle and vicious with whom he was associated; but still, in the midst of his dissipated career, he preserved the wish to surpass others, and often recalled to memory the praise bestowed by his master when he had excelled his schoolfellows in reading and writing. He sighed for the same gratification again, but thought it was now beyond his reach. When he was about twenty, he purchased a small Bible, to which was added a catechism with references to a great number of texts, upon which the answers were founded. Ludwig was continually looking through his Bible for the passages; but finding it tedious, he resolved to have the whole together, and transcribed the catechism, with all the texts at full length, in those passages in which they had been merely referred to: this manuscript filled two quires of paper. Though the writing was scarcely legible when he began, it was quite plain long before it was finished; so faithfully did this exercise revive the art which, from neglect, was almost lost. No doubt the task produced the most salutary effect upon his mind and conduct. This indeed may be inferred, when we find that in the following year he was appointed to receive the Excise of the little district in which he lived. The situation, though one always held by a peasant, was of some trust, which would not have been conferred on one who was ill-conducted and reckless.

Ludwig found that it was now absolutely necessary that he should understand the two first rules of arithmetic—addition and subtraction—as, without being conversant with them, he could not keep his accounts. To do this in a masterly manner, he determined, at whatever loss of time or exercise of patience, to conquer his distaste for the pursuit, and by diligent application, to arrive at a thorough knowledge of arithmetic. He now deeply regretted that he had not availed himself of the advantages once within his reach, and lamented bitterly that he should now be without an instructor. His mind was continually on the rack to devise some way of supplying the want. At last he suddenly recollected having seen a book with one of his schoolfellows, from which his master was in the habit of giving examples of the rules to the scholars. He hastened to seek out his schoolfellow, and was fortunate enough to find him, and to learn that he still possessed the precious volume. This was readily lent to him. His impatience to study its contents was so great, that he earnestly read it as he went along. A commencement undertaken with such energy, was followed up by the most unremitting application; and in six months he was master of the rule of three with fractions. He became intensely anxious to know more, and to meet with a more difficult book. Having at length procured one, in which he was able to exercise himself in the most intricate and complicated calculations, he soon made himself master of it. Shortly after, a treatise on geometry by Pachek fell into his hands. This study he was obliged to lay aside after a time, the season requiring that his constant attention should be given to his fields and vines. The great severity of the winter of 1740 obliged him to keep within doors; and wishing for employment, he resumed the work on geometry. He at length understood some of the leading principles, and then procured a little box ruler, and an old pair of compasses, on one point of which he mounted the end of a quill, cut into a pen. 'With these instruments,' as we find from Doddsley's Annual Register, 'he employed himself incessantly in making various geometrical figures on paper, to illustrate the theory by a solution of the problems.' He thus busied himself during the winter months; and when early spring came, he was in an ecstasy at the knowledge which he had gained during the season of his confinement.

His appetite for learning increased by what it fed upon; every acquisition of knowledge but excited the

thirst for more. But he was recalled to the fields, by the necessity which he was under of procuring the means of subsistence. He was unable to purchase the books and instruments necessary for the pursuit of the science in which he had so ardently engaged. In this emergency an artificer kindly supplied him with the figures which were represented by the diagrams in his book, made of wood.* With these, whenever he had a spare moment, Ludwig went to work. He had contrived to scrape together a little money for the purchase of a book at the fair. He then procured three small volumes, by which he obtained a complete knowledge of trigonometry. He then succeeded in getting an introduction to astronomy, having resolved to pursue that science. He immediately devoted himself to it with the greatest energy, his invention and ingenuity supplying him with substitutes for the proper instruments. The word 'philosophy,' which had often struck him as he studied geometry and astronomy, became the constant subject of his thoughts. Was it the name of some science of paramount importance? was a question which he frequently put to himself. Being impatient to discover what it was, he was continually on the watch, hoping that some means of explanation might offer. One day he procured a book called 'An Introduction to the Knowledge of God, of Man, and the Universe;' but though he met with much that was highly interesting to him, the book did not go far enough, and he went to Dreden, to inquire among the booksellers which was the most celebrated writer on philosophy. The works of Wolfius were recommended, and as soon as he could, he bought his 'Logic.' He laboured for a year at this, still keeping up his other acquirements. He next bought an abridgment of 'Wolfius's Mathematical Principles,' as his finances did not permit his purchase of the work in its extended form. From this book he derived the greatest advantage, and considerable pleasure. It engaged him from October 1743 to February 1745. He then studied physics and metaphysics. To his great delight, he procured from a dealer in old books 'Wolfius's Mathematical Principles' at full length, a work after which his heart had so long panted. The study of this book cost him intense labour, and occupied him for a year every moment that he could spare from his business, or steal from the hours of rest. He then took up the study of Kaheel's 'Law of Nature,' and of a work on the terrestrial and celestial globes. These were the books from which he gained a stock of information seldom to be met with, even among those who have had the advantage of the best university education, and free access to the finest public libraries.

Mr Hoffman, who was chief commissary of Excise in Dreden and its neighbouring villages, while examining the accounts of the peasants who were employed under him, was told that there was one among them, called John Ludwig, who was a very extraordinary person; 'who, though poor, and with a large family, was continually reading in books, and very often stood the greater part of the night at his door gazing at the stars.' From what he heard, Mr Hoffman felt the greatest curiosity to see Ludwig, and therefore sent for him. He had pictured him to himself as a man of most prepossessing appearance, with an air greatly superior to his station, and a countenance which would at once impress others with a consciousness of his intellectual powers. When Ludwig entered the room, Hoffman's feelings underwent a complete revulsion, and it was with deep disappointment he looked on the uncouth boor who presented himself. His hair, all neglected, hung down over his eyes; his aspect bespoke all that was sordid and stupid; and his manner was as dogged and unprepossessing as his appearance. Mr Hoffman, after looking at him for a moment in silence, and the first shock over, hoped that, notwithstanding his unpromising appearance, his mental superiority would discover itself when he spoke, and he asked him if what his neighbours had said of his read-

ing and studying was true? He received the following blunt and surly answer, 'What neighbour has told you that I read and studied? If I have studied, I have studied for myself. I don't desire that you or anybody else should know anything of the matter.' Though so much discouraged and disappointed, Mr Hoffman determined to ask some questions connected with arithmetic and the rudiments of astronomy. The answers he received filled him with still greater surprise. They were such as to inspire the highest respect and admiration, and would have done honour to those most renowned for their proficiency in the sciences.

Mr Hoffman was so much delighted, that he prevailed on him to spend some time at his house; and in their subsequent conversations, his surprise and admiration increased. To the most difficult and abstract questions which he put to him, Ludwig replied with the most perfect ease and precision. During his stay, Mr Hoffman dressed him in his own gown and other habiliments, which seemed to produce a magical effect; his very accent and dialect assumed something of refinement, and Hoffman acknowledged, with great simplicity, that he felt himself inclined to treat him with more deference than he had done before he had made the change from his coarse dress, although that change had been made in his presence, and with the clothes supplied from his own wardrobe. During Ludwig's stay there was an eclipse of the sun, and Mr Hoffman proposed that he should make his observations as an astronomer, and furnished him with such instruments as were requisite. The restless impatience with which the herdsman waited for the eclipse cannot be described. He had never seen a telescope; and to look through it and view the heavens, which he had never before contemplated but with the naked eye, filled him with such rapturous anticipations, that for several days he could scarcely eat or sleep. The day at length arrived, but unfortunately, just before the eclipse, the sky became overcast by clouds, which did not pass away till it was over. What Ludwig suffered cannot be told; as the clouds gathered, he fixed his eyes upon them in unspeakable agony, and watched in breathless impatience, in hopes they might disperse; but as they advanced towards the sun, and then rested on it, he stood transfixed. When the eclipse was over, he became nearly frantic with grief and disappointment.

Mr Hoffman went to visit Ludwig in his own dwelling, feeling great curiosity to see it, with its library, study, and the instruments which he used. He found it a most wretched cottage. Its smoke-stained walls were nearly black, yet ornamented with diagrams and figures traced in chalk. In one corner there was a bed, and a cradle in another. Three pieces of wood laid side by side over two tressels served for a writing-table; it was covered with fragments of writing paper, on which were written extracts from books, and various calculations and geometrical figures. The library and museum were in one, and occupied a shelf. The part which formed the library contained the books already mentioned as having been purchased by Ludwig; the remainder was appropriated to the museum, which consisted of the compass and the ruler before described, and a wooden square, and a pair of six-inch globes. In this miserable cabin Ludwig dwelt till the year 1754; and while so ardent in his scientific pursuits, he was at the same time as indefatigable in his exertions to earn his morsel of bread. Sometimes he might be seen carrying a basket at his back; at other times wheeling a barrow along through the village, and crying such vegetables as he could offer for sale. By those who would have struck a hard bargain with him, he was often abused and called names; but Ludwig showed on these occasions that he was not a philosopher in theory alone, for he bore these insults with imperturbable indifference, never condescending to make any reply. The kindness of Mr Hoffman enabled him to add considerably to his comforts. He presented him with one hundred crowns, so that he was able to build himself a dwelling in the

* Gentleman's Magazine.

midst of his vineyard, and to furnish it with various articles. But what made him more happy than all, was the considerable addition which it was now in his power to make to his library. He declared to Mr Hoffman that he would not accept the whole province in which he lived, upon condition that he should renounce his studies; and that he would rather subsist upon bread and water, than give up what constituted his chief happiness.

We rejoice that, like the writer of a fairy tale, we have been able to bring our hero to this consummation of all his wishes; and in our gleanings, we were much gratified in finding such an example of what can be achieved with the aid of a very few well-selected books by one ardent in the pursuit of knowledge.

THE NATIONAL CLOCK.

THE publication of certain parliamentary papers furnishes us with several particulars respecting the great clock which it is proposed to construct in the tower of the new Houses of Parliament. It will be, when completed, the most powerful clock of the kind in the kingdom. According to the specification, it is to 'strike the hours on a bell of from eight to ten tons, and, if practicable, chime the quarters upon eight bells, and show the time upon four dials about thirty feet in diameter.' With the exception of a skeleton dial at Malines, the above dimensions surpass those of any other clock face in Europe. The dial of St Paul's is as yet the largest in this country with a minute hand: it is eighteen feet in diameter. Most of the clocks in Belgium which strike on large bells have to be wound up every day; but the new one is to be an eight-day clock: and, as we are informed, every resource of modern art and science will be made use of to render it a perfect standard.

No better guarantee for accuracy can be had than the fact, that the whole of the work, from first to last, will be under the direction and approval of Mr Airy the astronomer-royal, who has been consulted throughout by the government. Among the conditions for the construction of the clock drawn up by this gentleman, we find—the frame to be of cast-iron, wheels of hard bell-metal, with steel spindles, working in bell-metal bearings, and to be so arranged, that any one may be taken out to be cleaned without disturbing the others. Accuracy of movement to be insured by a dead-beat escapement, compensating pendulum, and going fusee. The first blow of the hammer when striking the hour to be within a second of the true time. We are glad to see that it is in contemplation to take advantage of one of the most interesting inventions of the day for a galvanic communication between the clock and the Royal Observatory at Greenwich. In Mr Airy's words, 'The striking detent is to have such parts, that whenever need shall arise, one of the two following plans may be adopted (as, after consultation with Mr Wheatstone or other competent authorities, shall be judged best), either that the warning movement may make contact, and the striking movement break contact, for a battery, or that the striking movement may produce a magneto-electric current. Apparatus shall be provided which will enable the attendant to shift the connection, by means of the clock action, successively to different wires of different hours, in case it shall hereafter be thought desirable to convey the indications of the clock to several different places.' Should this plan be carried out, a signal may be conveyed to Greenwich with every stroke of the hammer, and thus insure an accuracy never before attempted.

The Royal Exchange clock is said to be at present the best in the kingdom, and so true, that a person standing in the street may take correct time from the face; the first stroke of each hour is accurate to a second. The papers before us contain the names of three candidates for the honour of making the national clock—

Mr Vulliamy, who states his grandfather to have been clockmaker to George II.; Mr Dent, the maker of the Exchange clock; and Mr Whitehurst of Derby. Two estimates have been sent in, one for L.1600, the other, L.3373; but owing to some differences of opinion, and the withdrawal of one or two of the names, the maker does not yet appear to have been decided on.

The explanations to the plans drawn up by the competitors contain remarks, among other matters, as to the relative merits of cable-laid, catgut, or wire rope, for lines to the new clock. Wire rope is used for the Exchange clock; and, according to the manufacturer, a wire rope half an inch in diameter will bear eighteen hundredweight without breaking. The four sets of hands, with the motion wheels, it has been calculated, will weigh twelve hundredweight; the head of the hammer, two hundred pounds; the weights, from one hundred and fifty to three hundred pounds; and the pendulum bob, three hundredweight. One of the candidates proposes to jewel the escapement pallet with sapphires, as preferable to the stones generally made use of. The hands are to keep going while the clock is being wound up; but the motion of the minute hand is not to be constant; it will move once every twenty seconds, when it will go over a space of nearly four inches.

In many of the public clocks on the continent the whole of the works are highly polished—a 'luxury' which, it has been suggested, had better be dispensed with in the present instance, as it creates trouble from the rusting of the wheels, without adding in the least to the value or accuracy of the mechanism. Whatever be the final decision of the Board of Works, we trust that the astronomer-royal's recommendation, with regard to facilities for the admission of visitors, will be adopted to the letter. 'As it is intended,' he says, 'that this clock should be one of which the nation may be proud, and in which the maker ought to feel that his credit is deeply concerned, I would propose that the access to it should be made good, and even slightly ornamented, and that facility should be given to the inspection of the clock by mechanics and by foreigners.'

CHLOROFORM—A NEW MEANS OF PRODUCING INSENSIBILITY TO PAIN.

THE use of ether as a means of producing insensibility during surgical operations was the great novelty and wonder of the beginning of this year. Just as it is closing, a new and much more effective, as well as convenient means of producing this effect, is brought before the world. The discoverer in this case is Professor Simpson of the Edinburgh university, who has all along been a conspicuous advocate for ether inhalation, using it in his own eminent obstetric practice with distinguished success. Regretting certain difficulties attending this medicament, Dr Simpson has been for months engaged in experimenting with new agents, and at length he has found an unusual degree of efficiency in *chloroform*, or perchloride of formyle—a pure colourless liquid of recent discovery, which it is perhaps unnecessary in this place to describe more particularly. A teaspoonful of this fluid sprinkled on a handkerchief, and held to the nose or mouth while breathing, will throw most persons into a kind of swoon or sleep in from one to three minutes. Being rather pleasant to the feelings, as well as cleanly, and of neat and ready application, it is obviously a great improvement upon ether.

A pamphlet published by Dr Simpson* makes us aware of several cases in which the new agent has been used with success. A poor lady, who, in a previous confinement, had been three days in her critical state, and only delivered at the expense of the life of her child, was, a few days before we write, relieved without her own consciousness. To all appearance, a very dangerous crisis was thus eluded. Professor Miller had an

* Sutherland and Knox, Princes Street, Edinburgh. 1847.

operation to perform upon a Highland boy of four or five years old, who could speak nothing but Gaelic, and with whom it was of course the more difficult to deal, as he could not be made to understand what was desired of him. After a few inhalations administered by compulsion, he ceased to cry or move, and fell into a sound sleep. 'A deep incision was now made down to the diseased bone; and by the use of the forceps, nearly the whole of the radius, in the state of sequestrum, was extracted. During this operation, and the subsequent examination of the wound by the finger, not the slightest evidence of the suffering of pain was given. He still slept on soundly, and was carried back to his ward in that state. Half an hour afterwards, he was found in bed, like a child newly awakened from a refreshing sleep, with a clear merry eye and placid expression of countenance, wholly unlike what is found to obtain after ordinary etherisation. On being questioned by a Gaelic interpreter, who was found among the students, he stated that he had never felt any pain, and that he felt none now. On being shown his wounded arm, he looked much surprised, but neither cried nor otherwise expressed the slightest alarm.' A young lady had a tumour removed from the jaw with equal unconsciousness of pain. On the contrary, she had experienced pleasing sensations, 'and her manageableness during the operation was as perfect as if she had been a wax doll or a lay figure.'

We have had an opportunity of seeing some experiments performed with chloroform, but not for a surgical purpose. We saw it inhaled by at least twenty persons, men and women, all of whom became insensible to pain. Some had a short, pleasing slumber, during which the mind was the theatre of strange but not distressing dreams. Others were exhilarated in a greater or less degree, and made demonstrations which might fairly be presumed to depend in some measure on the excitement attending company. One, for instance, spoke of his love secrets; another shouted as at an exciting toast at a public dinner. It appears, however, that the exhilaration is much less likely to take place when the inhalation is given in quiet circumstances. No one felt the slightest consequent uneasiness from the experiment. Indeed the whole matter looked much like a brief intoxication, very suddenly induced, and as suddenly recovered from.

The means now undoubtedly exist in perfection of extinguishing pain in all circumstances. Such is the announcement, and no less, which we must make to our readers! A soldier may now take a phial of chloroform to the field with him, and if it be his fate to be wounded, and to lie a night without relief, he may inhale the vapour and be at ease. A delicate patient, about to submit to an operation feared to be too great for the nervous energy to sustain, may take this inhalation, and his life is safe from at least the shock of the pain. A peculiar class of female sufferings may be said to be abolished from the earth by this simple fluid. How the heart throbs responsive to the expression used by Dr Simpson in his pamphlet!—'I most conscientiously believe that the proud mission of the physician is distinctly twofold—namely, to alleviate human suffering, as well as preserve human life.' We conclude with another remark of our learned physician, which seems to us possessed of much interest. 'It is perhaps,' says he, 'not unworthy of remark, that when Soubiran, Liebig, and Dumas engaged, a few years back, in those inquiries and experiments by which the formation and composition of chloroform was first discovered, their sole and only object was the investigation of a point in philosophical chemistry. They laboured for the pure love and extension of knowledge. They had no idea that the substance to which they called the attention of their chemical brethren could or would be turned to any *practical* purpose, or that it possessed any physiological or therapeutic effects upon the animal economy. I mention this to show that the *cui bono* argument against philosophical investigations,

on the ground that there may be at first no apparent practical benefit to be derived from them, has been amply refuted in this, as it has been in many other instances. For I feel assured that the use of chloroform will soon entirely supersede the use of ether; and from the facility and rapidity of its exhibition, it will be employed as an anæsthetic agent in many cases, and under many circumstances, in which ether would never have been had recourse to. Here, then, we have a substance which, in the first instance, was merely interesting as a matter of scientific curiosity and research, becoming rapidly an object of intense importance, as an agent by which human suffering and agony may be annulled and abolished under some of the most trying circumstances in which human nature is ever placed.'

OMNIBUS SKETCHES.

BEING only what the denizens of London call, for reasons best known to themselves, 'a country cousin,' I cannot presume to give any sketch of matters connected with the numerous omnibuses that roll, with noise enough, through the great realm of Cockaigne. My experience of London 'buses,' though extensive, is full of sameness and monotony; for when in that delectable city, unfettered for the time by the cares or the hours of business, my practice is, when tired with walking, to hail the first 'bus' that comes in sight, and ride, as an outside passenger, until the terminus is reached. In this way I have made myself familiar with the characteristic features of the leading London thoroughfares, and have enjoyed many a delightful journey of discovery, until I was safely 'set down' at the Elephant and Castle, the Bank, Sloane Street, Mile End, or some other of the pleasant terminuses with which the outskirts of London abound. I can honestly assure all 'country cousins' that the most pleasant way of viewing the streets of London is from the top of an omnibus, travelling you know not whither. A certain admiral was in the habit of riding through London streets at an early hour in the morning, when very few people were out of their beds, for the purpose of getting better views of the public buildings, and the geography of the city, than were attainable during the day; but who would wish to see to the best advantage buildings, streets, and citizens together, should view them in the manner just described.

It is the boast of Englishmen, that though Paris is France, London is not England. True, indeed, London is great; but so also are Liverpool, Manchester, Birmingham, and Leeds. London has its hosts of omnibuses; but we too, 'country cousins' though we are, can ride in our 'buses' for sixpence all the way, 'as well as the citizens of the great Babylon.' And as metropolitan wit is the fittest for sketching metropolitan things, so a 'country cousin' may use what scanty modicum of wit he has in sketching country 'buses.'

London is like an ellipse—it has two centres: provincial towns are like circles—they have only one centre from which all their 'buses' start. This centre, in the town we have in our eye, is the Great Exchange, from whence radiate to every point of the compass great thoroughfares, traversed every half hour by omnibuses. You wish in the afternoon to visit a pleasant village two or three miles distant, and you walk down a crowded street to meet the 'bus' that will convey you thither. But you have forgotten that it is near the time when business closes and merchants dine; and when the vehicle comes slowly up, and you hail the driver by elevating your arm, stick, or umbrella, a shake of the head, or a gruff exclamation of 'full,' compels you to choose whether you shall walk, or go and secure a seat in the next 'bus.' You choose the latter alternative, and arrive at the Exchange a quarter of an hour before the time of starting. The 'bus' is there, horses yoked,

and driver and boy in waiting. You are almost ashamed to waste so much time in sitting idly in the vehicle; nevertheless, you enter, and find several passengers there already, so that you have some consolation in having companions in idleness. Opposite to you, in the most comfortable seat, is a remarkable elderly gentleman, a beautiful specimen of a British trader, whose character was formed long before the days of railway or telegraphic speed. You will find him in the same 'bus' every day at the same hour. He is punctual in everything; and though he values time highly, he will rather lose half an hour than lose his seat. His dress is really substantial, and at the same time neat, and without a single speck of dust. You will never see him without that clean silk umbrella, be the weather fair or foul. His linen is spotlessly white, and his face wears no trace of a beard. He is, in short,

'An honest man close-buttoned to the chin,
Broad cloth without, and a warm heart within.'

Another passenger is perhaps a lady, who has come to town to make a few purchases, and is now returning home. In one corner you will see a young man with a pale face and spectacles. A few books on his knee give him a student look; but you find the books are novels, and that their possessor is a bank clerk in delicate health, who lives in country lodgings. The door opens, and another merchant enters: a younger man than your first acquaintance, and at the same time stouter, less neatly dressed, and more jolly-looking. He commences talking immediately; he cracks his jokes, and laughs loudly at them; converses freely with his brother merchant on the state of business, and the talk on 'Change; and goes on making many acute sensible remarks in the most off-hand business way, and putting everybody but the novel-reading clerk into good-humour. The door opens, and enters another merchant like the former, and joins in the talk. Then comes a servant-girl, who has been on some particular mission, and is now, in her best clothes, quite proud of riding home in 'the bus.' She comes in in a great hurry, and shouts to the attending imp of a boy the name of the place where she wishes to be 'let off,' and strictly enjoins him not to forget. The next passenger is a sharp vivacious man, with a quick eye and thin lips. That is a lawyer, and with his usual acuteness in scenting out infractions of the law, he exclaims, as he sits down, 'Surely somebody has been smoking here?' Of course nobody has; but everybody immediately perceives the smell, and tries to find out where it comes from. Your second merchant friend soon discovers the secret, and laughingly directs attention to the glass pane in the front of the vehicle, through which you can see several young gents—cash-keepers, and book-keepers, and corresponding clerks—sitting outside smoking mild Havanas, or Manilla cheroots, a portion of whose smoke has made its way inside. Then enters a physician, about to visit a country patient, and he knows every passenger, and has something to say to each. The 'bus' begins to fill, and the quarter of an hour is nearly expired. Just as the driver is about to mount the box, another merchant passenger enters. This is a specimen of the new school. He is a young man, rather a dandy in his dress, with a jaunty air, a profusion of whisker, and a quick, roving eye that never rests. He is 'a fast man,' a speculator in shares: he thinks himself very clever and knowing, and will talk with a very fair share of sound sense so long as you talk only of 'cash.' But when his neighbours, the old merchants, talk with easy familiarity about higher topics, our fast friend is dumb, and plays with his gold watch-guard, or looks through his eyeglass at the servant-girl, who sits with wondrous ears listening to talk which she cannot comprehend. But the lawyer and the physician can talk, and sensibly too, about everything; while the bank clerk sits deeply absorbed in the pages of his novel.

Tempus fugit, and the omnibus starts. It has not proceeded far, when there is a stop. An elderly lady,

very stout, and bearing several brown paper parcels, wants to get in. There is just room for another 'inside;' and the vacant seat is, as vacant omnibus seats always are, at the extreme end of the vehicle. The door opens, and the lady enters. As soon as she is clear of the door, the boy closes it with a bang, and shouts 'All right!'—the little rogue well knowing that all is wrong. The lady has to push her way on to her seat; the sudden starting of the 'bus' sends her plump down on the jolly merchant's knee, who, with a passing joke, pushes her gently to his next neighbour; and after great exertion, the stout lady settles in her seat, out of breath, and wiping the perspiration from her brow, as she half audibly mutters something about 'them bothering 'buses.' The inside is now full, and the 'bus' rolls with great noise over the rough pavement. A stoppage now and then occurs to let out and in a passenger. The talk is kept up at intervals: sometimes the fun is 'fast and furious;' at others 'silence reigns supreme.' And so wheels onward the vehicle, with its strange and varied freight of human beings, many of them brought together for the first and the last time in this world. Passengers gradually get out; and by the time the terminus is reached, all your companions are perhaps gone: the merchants to spend the evening in their own happy homes; the bank clerk to luxuriate over his novel; the physician to attend the sick-bed of his patient; and the 'smoking outsiders' to enjoy their 'dinner, and drink, and one cheer more.'

At every hour of the day the omnibus has its different set of passengers. Return by it from the country in the evening, and you find it occupied principally by tradesmen or their foremen, who have been inspecting their workpeople at some country job; strangers returning from a saunter round the town, or townspeople returning from visits to their country friends. On Saturdays you will meet ladies going to market to buy, and country people going to sell; and occasionally some washerwomen, accompanied by large baskets of clean linen, washed and dried, and made up in the sweet fresh air of the country—a perfect luxury to the denizens of the smoky, sooty, cloud-covered town.

To the rider in omnibuses, every passenger is a study suggestive of many thoughts. That noble German writer, Richter, once finely said that 'either the future or the past is written in every face, and makes us, if not melancholy, at least mild and gentle.' And when, sitting in your own corner of the 'bus,' without inclination to join in the talk, and unable to think of more serious things, you quietly examine every countenance, there will arise in the mind certain vague and dreamy conceptions, out of which you feel assured that you could weave the story of every passenger's life. But these thoughts are very evanescent: they usually depart along with the passenger who gave rise to them; and as soon as you hear the sound of your own voice again, they all, like visions of the night, fly away.

But a deeper study is presented to your notice in the 'omnibus boy.' Each vehicle has a driver and a boy: the former comes very little into contact with the passengers, except the outsiders, with whom he talks about the last Derby and St Leger, and the merits of his own cattle; but 'the boy' has to enter into certain relations with each passenger, in consequence of his duty of obtaining the fare, and stopping the 'bus' when the passenger requires to get out. The boys on this line of road are six in number. They are all about the same age; that is, from fourteen to sixteen, a period in life when a great change takes place, and the tricks of the boy partake somewhat of the dignity of the man. To a looker-on, these boys would appear to lead an unpleasant life; but they seem to enjoy it. They are full of life and activity; they never whine or complain. Their hours of duty are long—too long: never less than from eight o'clock in the morning till nine o'clock at night all the week through, and on Sundays till even a later hour occasionally; the only break in the whole week being a few hours during divine service. They

are not, however, closely occupied all this time, and their work is in a great measure a recreation. They learn a great deal regarding the ways of the world, and become most acute in their habits of thought and action; but they learn no trade. Arrived at a certain age, they cannot be retained; you may find many 'post-boys' verging on threescore and upwards, but every omnibus boy is in deed and in truth a boy. He has plenty of spare time, which he spends near the Exchange in gossip with his equals, in lording it over younger boys, in annoying his elders, or listening gravely to the sage discourse of cabmen and porters. When at the country terminus, he will be seen lounging about the stables, prying occasionally into the bar of the inn, or romping on the road and in the grass with some of his estimable country friends, among whom he is petted as much for his superior acuteness, as for the occasional 'lifts' that he has the power of giving his juvenile friends when they go to town. On his journey he must be ready at the call of every one, to stop the 'bus' when required, or to deliver messages and parcels at poultries and other shops, which throw him far behind the vehicle, and cause him to run at furious speed to overtake it, and regain his old seat at the back-door. On that seat he oftener stands than sits; and when he is not 'poking fun' from it at juveniles in the street, he is either dancing a miniature polka, whistling the same tune, or singing 'Happy land.'

Each boy is different from another. There is Bill, for example, the oldest, most forward, and tyrannical of the six. He is the conductor of the largest 'bus,' one that holds fifteen inside and nine out. The others usually hold only thirteen inside; and often when that number are seated in Bill's 'bus,' he will be informed by some ease-loving passenger that now it is full, to which Bill's answer is, 'No, it isn't; hold two more yet;' and when his statement is called in question, he triumphantly answers, 'This is a fifteen 'bus,' which settles all further dispute. Bill enjoys these triumphs, and he has many of them over merchants, lawyers, and elderly ladies. Again, he is a musician, and keeps a French horn, on which he attempts occasional overtures and voluntaries; and on being asked the name of the tune played, he will answer you with abrupt conciseness, 'Mary Blane, to be sure!' Bill is the most 'wide-awake' of all the boys. He looks most sharply after the fares, and his memory is wonderful. Tell him when you get in where you want to be put down, and he stops the 'bus' exactly at the place, though he may have to remember the instructions of half-a-dozen other passengers besides yourself. He has many friends on the road who stand in awe of him. He will entice little boys to ride for a few minutes on the steps of the 'bus,' and suddenly seize their caps and drop them on the road, thus most effectually getting rid of the urchins. He makes faces to navigators as he passes, and winks to many a servant-girl, who peeps out to see the passing vehicle. Bill also is ambitious. He will occasionally disappear from his station at the door; and you will see, on looking out at the side-windows on the shady side of the road, the shadow of Bill plying the whip, and handling the ribbons, which the good-natured coachman has given up to him for a time.

Again, there is Jack, a little thin-visaged restless boy, who is always poking his head in at the door to count the passengers, and to ask—'Next place to stop at please?' Jack is never still; he is up and down from the steps to his perch, and from his perch to the roof over and over again. But he is always within hail, and his little head comes poking in at the door as his shrill voice squeaks out his inquiry, until he is declared by the ladies to be a 'tiresome boy.' On Sundays Jack is quite a little man; with a top-coat and a black beaver, and a clean shirt, all carefully prepared by his poor widowed mother at home, whom you will occasionally see waiting at the corner of a lane to hand him his dinner as he passes. Again, there is Bob, a very quiet boy, who plays upon a cracked flute, and who seldom moves except when

he is obliged. Bob and his driver do not agree, for Bob loves his flute rather too much, and forgets the driver's instructions occasionally, of which he is sometimes sharply reminded by a cut of the whip. Again, there is Jim the singer, whom you will often see with strange ballads in his hand, which he is learning by heart, and of which he will occasionally come out with a few stanzas, to the admiration of the audience of three boys whom he has collected on the 'bus' steps. Then there is Tom, the most stupid boy of the whole lot; a careless, trifling little fellow, whose head is often punched by walking-sticks and umbrellas, and who gets more hard words, on account of his neglect of orders, than all the other boys put together. Lastly, there is George, the melancholy boy, who is the most careful and attentive of all; the boy who seems prematurely grave, and whose quiet, thoughtful countenance makes you regret that he is not better employed.

And so, from day to day, all the year through, in wet weather and in dry, these omnibuses roll on with their boyish conductors; all forming a portion of the great scheme of world guidance, and each boy doing his indispensable share of the work allotted to man here below.

ESCAPES.

In these piping times of peace, one is startled to hear the sound of 'the ear-piercing fife.' But on listening, we find it to be but a very little fife—not much more formidable than a whistle; and its notes come mellowed to the ear as if from afar off, and were it not for their warlike associations, would mingle without much notice with the ordinary music of the time. This allegorical fife is 'The British Army at Washington and New Orleans,' a small volume, whose purpose it is to relate modestly, not to say meekly, to the present peaceful generation, the details of battles which passed into history thirty years ago.* Its theme is the brief and inglorious campaign of the British army in America in the years 1814-15; and the author, in the midst of his details of blood and burning, canvasses earnestly, and no doubt judiciously, the mistakes of departed generals, and of double or treble ex-ministries. This author, however, is Mr Gleig, a well-known and equable writer; and even the sweepings and refuse of his memory, though certainly in the present instance not imperatively called for, will be welcomed by many of his old readers, since they come at all.

Throughout the volume there are various scenic sketches given in good style; but the narrative, with the exception of a few passages here and there, is dull and quiet, as if feeling that it belongs to a bygone generation, or at least to the youth of the present, when the echoes of war were yet in the ear of Europe. Mr Gleig further identifies himself with the past, by the sort of defence of negro slavery familiar to the wisdom of our ancestors. It is a grievous evil, no doubt, in the abstract—but it is of long standing—authorised in the Bible, &c. &c.; and he proceeds to argue gravely about the expediency of our doing, or letting alone—what has been done long ago.

Among the anecdotes of war, there are none which exercise a more lively influence over the sympathies of the reader than narratives of personal escapes; and Mr Gleig, as a practised military writer, makes use of course of this source of interest. His story, for instance, of Admiral Cockburn, given in a few lines, is capital, and we hope new. 'It is said,' says he, 'that when Admiral Cockburn, who accompanied the army, and attended General Ross with the fidelity of an aid-de-camp, was in the wood where the latter fell, he observed an American rifleman taking deliberate aim at him from behind a tree. Instead of turning aside, or discharging a pistol at the fellow, as any other man would have done, the brave admiral, doubling his fist,

* Murray's Home and Colonial Library, No. 21.

shook it at his enemy, and cried aloud, "Oh, you—Yankee, I'll give it you!" upon which the man dropped his musket in the greatest alarm, and took to his heels.' This resembles another story we remember of the effect of habitual authoritativeness. A gentleman, for many years an invalid, and always apprehensive of cold, had acquired an inveterate habit of crying out 'Shut the door!' One day his carriage was stopped by a highwayman, who, after robbing him of his watch and money, was about to withdraw, when the victim cried out as usual, 'Shut the door!' The startled robber obeyed, and then made off.

Another very gallant escape is related at more length. 'Having waited till it was considered imprudent to wait longer, without knowing whether he was to be supported, Colonel Brook determined, if possible, to open a communication with the fleet. That the river could not be far off, we knew; but how to get to it without falling in with wandering parties of the enemy, was the difficulty. The thing, however, must be done; and as secrecy, and not force, was the main object, it was resolved to despatch for the purpose a single officer without an escort. On this service a particular friend of mine chanced to be employed. Mounting his horse, he proceeded to the right of the army, where, having delayed a few minutes till the moon rising gave light enough through the clouds to distinguish objects, he pushed forward at a venture, in as straight a line as he could guess at. It was not long before his progress was stopped by a high hedge. Like knight-errants of old, he then gave himself up to the guidance of his horse, which, taking him towards the rear, soon brought him into a narrow lane, that appeared to wind in the direction of the enemy's fort. This lane he determined to follow; and holding a cocked pistol in his hand, pushed on, not perhaps entirely comfortable, but desirous at all hazards of executing his commission. He had not ridden far when the sound of voices through the splashing of the rain arrested his attention. Pulling up, he listened in silence, and soon discovered that they came from two American soldiers, whether stragglers or sentinels it was impossible to divine; but whoever they were, they seemed to be approaching. It now struck him that his safest course would be to commence the attack; and having therefore waited till he saw them stop short, as if they had perceived him, he rode forward, and called out to them to surrender. The fellows turned and fled; but galloping after them, he overtook one, at whose head he presented a pistol, and who instantly threw down his rifle, and yielded himself prisoner; whilst the other, dashing into a thicket, escaped, probably to tell that he had been attacked by a whole regiment of British cavalry. Having thus taken a prisoner, my friend resolved to make him of some use: with this view, he commanded him to lay hold of his thigh, and to guide him directly to the river, threatening, if he attempted to mislead or betray him into the hands of the Americans, that he would instantly blow out his brains. Finding himself completely in my friend's power, the fellow could not refuse to obey; and accordingly, the man resting his hand upon the left thigh of the officer, they proceeded along the lane for some time, till they came to a part where it branched off in two directions. My friend here stopped for a moment, and again repeated his threat, swearing that the instant his conduct became suspicious should be the last of his life. The soldier assured him that he would keep his word, and moreover informed him that some of our ships were almost within gun-shot of the fort—a piece of information which was quickly confirmed by the sound of firing, and the appearance of shells in the air. They now struck to the right, and in half an hour gained the brink of the river; where my friend found a party just landed from the squadron, and preparing to seek their way towards the camp. By them he was conducted to the admiral, from whom he learnt that no effectual support could be given to the land force; for such was the shallowness of the river, that none except

the very lightest craft could make their way within six miles of the town; and even these were stopped by vessels sunk in the channel, and other artificial bars, barely within a shell's longest range of the fort. With this unwelcome news he was accordingly forced to return; and taking his unwilling guide along with him, he made his way, without any adventure, to our advanced posts, where, having thanked the fellow for his fidelity, he rewarded it more effectually by setting him at liberty.'

A third hair's-breadth 'escape, and we have done. 'Whilst things were in this state, whilst the banks of the rivers continued in our possession, and the interior was left unmolested to the Americans, a rash confidence sprang up in the minds of all, insomuch that parties of pleasure would frequently land without arms, and spend many hours on shore. On one of these occasions, several officers from the 85th regiment agreed to pass a day together at a farmhouse about a quarter of a mile from the stream; and taking with them ten soldiers, unarmed, to row the boat, a few sailors, and a young midshipman, not more than twelve years of age, they proceeded to put their determination into practice. Leaving the men, under the command of their youthful pilot, to take care of the boat, the officers went on to the house; but they had not remained there above an hour, when they were alarmed by a shout, which sounded as if it came from the river. Looking out, they beheld their party surrounded by seventy or eighty mounted riflemen; the boat dragged upon the beach, and set on fire. Giving themselves up for lost, they continued for an instant in a sort of stupor; but the master of the house, to whom some kindness had been shown by our people, proved himself grateful, and letting them out by a back-door, directed them to hide themselves in the wood, whilst he should endeavour to turn their pursuers on a wrong scent. As they had nothing to trust to except the honour of this American, it cannot be supposed that they felt much at ease; but, seeing no better course before them, they resigned themselves to his guidance, and plunging into the thicket, concealed themselves as well as they could among the underwood. In the meantime the American soldiers, having secured all that were left behind, except the young midshipman, who fled into the wood in spite of their fire, divided into two bodies, one of which approached the house, whilst the other endeavoured to overtake the brave boy. It so chanced that the party in pursuit passed close to the officers in concealment, but by the greatest good fortune failed to observe them. They succeeded, however, in catching a glimpse of the midshipman, just as he had gained the water's edge, and was pushing off a light canoe which he had loosened from the stump of a tree. The barbarians immediately gave chase, firing at the brave lad, and calling out to surrender; but the gallant youth paid no attention either to their voices or their bullets. Launching his little bark, he put to sea with a single paddle, and regardless of the showers of balls which fell about him, returned alone and unhurt to the ship.'

THE GAME AT DEFINITIONS.

Four friends were accustomed to meet. They resorted to *bouts rimés*, in order to while away an idle hour, but did not find the amusement they expected. They then tried a new exercise for their wits. A word being appointed, each set himself to give a definition of it; and, when done, all the four were brought together. Thus were formed the materials of a very small book, called 'The Council of Four,'* which has just made its appearance. It contains exactly a hundred subjects—as Language, Mirror, Death, Paper, Luxury, Politics, &c. There is an interest in seeing how four clever men are to make out something pointed on each of these themes

* The Council of Four; a Game at Definitions. Edited by Arthur Wallbridge, author of 'Torrington Hall,' &c. London: Ollivier. 1848.

in a single sentence, and often the definition given is one of no inconsiderable force. As an example of one subject—

CHILD.

The ever-renewed hope of the world.
A conscript for the wars.
The future in the present.
God's problem waiting man's solution.

Of single definitions, some have a pungency which throws the rest of their several groups much into shade, as—

IGNORANCE—A dark place, where poor people are allowed to grope about till they hurt themselves or somebody else.

FAMILY—An item in a poor nation's wealth and a rich nation's poverty.

IRON—The bones of the giant Civilisation.

EXPERIENCE—The scars of our wounds.

DEBT—A slice out of another man's loaf.

Others are too much of the character of conceits or rebuses, though these are fewer in proportion than might be expected from the present strain of light literature in the metropolis. Our object, however, is less to criticise this clever little work than to introduce it as a *vade-mecum* for a very rational, and, as far as we know, novel plan of fireside amusement, which may be followed with pleasure and advantage by our readers, especially those of tender age. The definition assignable to Wallbridge's 'Game at Definitions' is—

The Hoyle of its subject.

THE MANCHESTER ATHENÆUM SOIRÉE— MR COBDEN'S SPEECH.

ALTHOUGH we have no room for a report of this meeting, even if it were our province to give one, there are various points in Mr Cobden's speech which we are anxious to garner up for the quiet perusal and home meditation of our readers. It was his first appearance in public since his return from abroad, and he very naturally launched upon the subject of his foreign travels, expatiating upon the proof exhibited by his cordial reception, of the fact, that 'we are enlarging the circle of our sympathies; that the sphere in which politics is working has widened in our day; that instead of viewing each other in the narrow, jealous spirit which formerly distinguished the different nations of Europe, we are prepared to take a wider and more generous view of the interests of ourselves and neighbours; and that we are approaching that time when we shall think our interests identical.' He found the Oriental type at the two opposite extremities of Europe—in the remains of the Moors in Andalusia, and of the Tartars at Moscow; but even there, and in all intermediate places, he was constantly struck with the moral identity of men, and made to wonder what it could possibly be which stirred up nations and races against each other. The whole thing was a blunder, and nothing else. We had misunderstood each other, like the characters in a comedy, who, at the *denouement*, find out that it was altogether a mistake. But this comedy was a sad tragedy sometimes; and if we could only find the means by which we could show to the different nations of Europe that their interests are identical, that their objects are the same, we should be conferring the greatest blessing upon humanity that has ever been devised since the creation of the world.

In Italy, Mr Cobden went on to say, he had found a new life springing up. 'And when I inquired how it was that Italy began to make itself heard and felt in the rest of Europe, I came to the conclusion, from all I could observe, that it arose from the quiet progress of thought and of intelligence arising out of the education of the people. There have been in Italy great efforts made for the education of the people. I found, to my astonishment, in almost every town, several Infant Schools, supported by voluntary contributions, superintended by Italian nobles; and I saw a school at Turin,

which a marquis attends daily, and rides upon a hobby-horse with the children, and joins with them in their play. It is an honour to him, and I will mention his name; for I am sure he would not be ashamed to be known to you all: his name is Dazalio, and he is the brother of that Dazalio whose writings you have lately seen upon the present state of Italy. Then you have in Italy now, as you have always had, leading minds, great and powerful individualities, in every town; men who have been engaged in writing and treating upon every question of social importance. You have in every town in Italy men who are not only taking a deep interest in schools, but in prison discipline, and in every question relating to the moral condition of the people. As regards political economy, I was amazed at the number of people I found in Italy who sympathised with our practical efforts and controversies upon the subject of political economy. Every lawyer, every councillor in Italy, studies political economy as part of his education; and hence arises the great interest that was taken upon that subject, upon which we have been so long and so arduously engaged in England. It has not been from violent outbreaks in Italy that the present state of things is coming round. Violence and revolution retarded the present progress; but I trace to institutions kindred to this, though not the same as this—I trace to those institutions all the progress that has been made in Italy; and I join with the worthy chairman in saying, that it is by the progress of the human mind alone that governments can make progress, or that good governments can be maintained at all. I join with him in saying, that at this time public opinion will control governments. I go further, and I say, from my experience in Europe, that there is no such thing as despotism existing, in the old sense of the word: public opinion rules more or less everywhere, the better, of course, in proportion as it is the wiser; but give me the compound ratio of the intelligence and the morality of any people, and I will give you the character of their government, no matter what its formation. If you ask me, after my long tour on the continent, what it is that recurs to my memory with the greatest pleasure, I am bound to say it is Italy and the Italians. It is not merely their monumental remains: it is not merely that we have there the proofs that they have twice given civilisation to Europe and to mankind; but it is the character of the minds of their most distinguished men of this day. I like intercourse with living minds, and I will pass by the aqueducts, the columns, and the ruins, and I say that, amongst the Italians, at the present time, you will find, not in the mass of the people—I would not pretend to say so—but you will find in the Italians some of the most amiable, accomplished, and interesting men that are to be found in Europe; and it is those men, and the intercourse I had with them whilst in Italy, which, to tell you frankly, comes back upon my memory with greater pleasure than anything I experienced abroad. I argue that, in the present effort which is being made in Italy, you will see it progress just as the people become more and more enlightened. You have there, as you always had, a first-rate quality in the race; and if they are but left to themselves, if they have that privilege which we claim for ourselves, if Italians are left to work out their own regeneration, I do not doubt that the people who have twice given civilisation to the world, have the power within themselves again to work out their own redemption.'

It may be proper to keep strictly in view that Mr Cobden chiefly saw men of rank and education in Italy, and that his remarks apply strictly to that class. A friend of his and ours, who has been much in Italy, deplors that the mass of the people are of very different character. How far Mr Cobden may have overlooked the state of the masses in forming the agreeable prospects here presented to view, we are unable to say; but we feel only too sure that, till the bulk of the people are improved, all efforts at political regeneration must be greatly liable to disappointment.

On the subject of languages, Mr Cobden seems to be

of the opinion which all men who have travelled must entertain—that French is the leading language of communication in Europe. To learn French, he said, was indispensable, more especially since 'we are coming to a time when it will be not merely the select few who will travel to the continent, but when the operatives of this part of the world shall go in cheap trains to Paris. Within twelve months of this time, the railway communication from Boulogne to Paris will be completed, and we shall go regularly from the capital of England to the capital of France in ten hours. There will be opened up by that means a most desirable intercourse; and we shall see the different people of the world married, instead of these marriages of princes that create such a noise and tumult among the public.

'Gentlemen,' concluded Mr Cobden, 'I exhort you to maintain this and kindred institutions on every ground, public and private. I have had many changes, and have seen many phases of society, probably as many as most people. I do not speak egotistically, because I am now merely going to elucidate a thought. I have seen many phases of society; I have had many exciting and gratifying scenes; yet I tell you honestly and conscientiously, that if I want to look back to that which has given me the purest satisfaction of mind, it is in those pursuits which are accessible to every member of the Athenæum. I have not found the greatest enjoyment in the exciting plaudits of a public meeting; I have not found the greatest pleasure or interest in intercourse sometimes with men of an elevated sphere abroad, whom others might probably think it was a pleasure to meet; but I come back to you conscientiously to declare, that the purest pleasures I have known are those accessible to all—those that exist in the calm intercourse with intelligent minds, and the communion with the departed great, through books, by our own fireside.*'

THE GIN-PALACE.

THE gin-palace is generally at the corner of two intersecting streets in a gin-drinking neighbourhood: it towers, in all the majesty of stucco pilasters, in genuine Cockney splendour, over the dingy mansions that support it, like a rapacious tyrant over his impoverished subjects.

The doors are large, swinging easily upon patent hinges, and ever half-and-half—half-open, half-shut, so that the most undecided touch of the dram-drinker admits him. The windows are of plate-glass, set in brass sashes, and are filled with flaming announcements in large letters—'The Cheapest House in London!'—'Cream of the Valley!'—'Creaming Stout!'—'Brilliant Ales!'—'Old Tom, fourpence a quartern!'—'Hodge's Best for mixing!'—and a variety of other entertainments for the men and beasts who make the gin-palace their home. At night, splendid lights irradiate the surrounding gloom, and an illuminated clock serves to remind the toper of the time he throws away in throwing away his reason.

Within, the splendour is in keeping with the splendour without—counters fitted with zinc, and a long array of brass taps; fittings of the finest Spanish mahogany, beautifully polished; bottles, containing cordials, and other drugs, gilded and labelled, as in the apothecaries' shops. At one side is the bar-parlour, an apartment fitted up with congenial taste, and usually occupied by the family of the publican; in the distance are *casas*, and sometimes galleries, formed altogether of huge vats of the various sorts of liquor dispensed in the establishment. Behind the counter, which is usually raised to a level with the breasts of the toppers, stand men in their shirt-sleeves, well-dressed females, or both, dispensers of the 'short' and 'heavy'; the under-sized tipplers, raising themselves on tiptoes, deposit the three-halfpence for the 'drop' of gin, or whatever else they require, and receive their *quantum* of the poison in return; ragged women, with starving children, match and ballad-vendors, fill up the foreground of the picture. There are no seats, nor any accommodation for the customers, in the regular gin-palace; every exertion is used to make the

place as uncomfortable to the consumers as possible, so that they shall only step in to drink, and pay; step out, and return to drink and pay again. No food of any kind is provided at the gin-palace, save a few biscuits, which are exhibited in a wire-cage for protection against the furtive hand; drink, eternal, poisonous drink, is the sole provision of this whited sepulchre.

There is not in all London a more melancholy and spirit-depressing sight than the area of one of the larger gin-palaces on a wet night. There the homeless, houseless miseries of both sexes, whether they have money or not, resort in numbers for a temporary shelter; aged women selling ballads and matches, cripples, little beggar-boys and girls, slaving idiots, piemen, sandwich-men, apple and orange women, shell-fishmongers, huddled pell-mell, in draggle-tailed confusion. Never can human nature, one would imagine, take a more abject posture than is exhibited here; there is a character, an individuality, a family likeness common to the whole race of sots: the pale, clayey, flaccid, clammy face, pinched in every feature—the weeping, ferret-like, lack-lustre eye, the unkempt hair, the slattern shawl, the untidy dress, the slipshod gait, too well betray the confirmed drunkard.

The noises, too, of the assembled toppers are hideous; appalling even when heard in an atmosphere of gin. Imprecations, execrations, oburgations, applications, until at length the patience of the publican, and the last copper of his customers, are exhausted, when, rushing from behind his counter, assisted by his shopmen, he expels, *vi et armis*, the dilatory mob, dragging out by the heels or collars the dead drunkards, to nestle, as best they may, outside the unhospitable door.

Here, unobserved, may you contemplate the infinite varieties of men self-metamorphosed into beasts; soaker, tippler, toper, muddler, dram-drinker, beer-swiller, cordial-tippler, sot.

Here you may behold the barefoot child, hungry, naked, clay-faced, handing up on tiptoe that infernal bottle, which made it, and keeps it what it is, and with which, when filled, it creeps home to its brutal father, or infamous mother, the messenger of its own misery.

Here the steady respectable sot, the good customer, slides in, and flings down his throat the frequent dram; then, with an emphatic 'ha' of gratification, drops his money, nods to his friend the landlord, and for a short interval disappears.

Here you may behold a row of miseries seated by the wall, whose voices are husky, while they implore you to treat them with a glass of ale, or supplicate for the coppers they see you receive in change from the barman; and who are only permitted that wretched place of rest that they may beg for the benefit of the publican, and for his profit poison themselves with the aims of others.—*Physiology of London Life.*

[We take this opportunity, as the only one readily available, of commending to universal reception and regard the series of sketches which George Cruikshank has brought out under the title of *THE BOTTLE*. As a mirror for showing this vice its own image, it seems to us unrivalled. We believe we must only be expressing a general feeling, when we say that we have always delighted in the clever comic sketches of this artist, and allowed him the great praise due to them, but that we never felt one half the esteem or respect for him which we feel now that he has given the productions of his pencil the respectability of a moral and philanthropic aim.]

EFFECTS ON KNOWLEDGE OF ITS DIFFUSION.

It is highly significant, both of future results and of present duty, that in our stage of social culture, knowledge can only advance by being diffused. That which some writers carp at as a flaw and a foible in our modern state, may be boldly claimed as one great point of superiority. We are a mechanical age, it is said; everything is done by combination and organisation. We need philosophical and literary societies, royal institutions, British associations, academies, colleges, universities, in order that knowledge may flourish. How different from the sage of antiquity, who, by solitary musings, courted truth; who found a higher inspiration in the depth of the wilderness, where his meditations fructified into power that moved heaven and earth! Such statements are adapted to delude the religious heart,

* We are indebted to the 'Manchester Examiner' for the materials of the above abridgment.

which knows, and will ever know, the value of lonely musings. Nevertheless, the facts are herein utterly misrepresented. Isolated man is very weak, in intellect as in body. It is the play of mind upon mind which originally develops every faculty in the infant and in the growing boy; and only by joint effort, by mutual enlightenment, by learning from predecessors, by alternate inspection, by each verifying what another has suggested, can we make sure and sound advances.—*Professor Newman's Lecture on the Relations of Free Knowledge to Moral Sentiment.*

TESTS.

However some good men may cheat their own understanding, it is certain that a readiness to sign articles is no test of moral or spiritual sentiment; and is utterly ridiculous as a guarantee for any sort of goodness, present or future. The system is not even venerable for its antiquity, but is an inheritance transmitted from times when each man was eager to use the power of the state in enforcing his private opinions, and when church property was a scramble for selfishness. Nor can any arguments for continuing such exclusiveness be devised which do not amount to this—that young men's minds must be *managed* so as to push certain opinions upon them which, without peculiar external appliances, could not recommend and support themselves; and that knowledge (as far as possible) is to be confined to a special class, who are (as long as possible) bound over to maintain a fixed code of doctrine. I will not insist that this is glaringly absurd in a system which does not profess infallibility. What may here more especially be noted is, that an exclusive corporation is thus generated, having peculiar interests of its own. . . . Every restrictive trade is liable to a moral disease of its own. There have been kingcraft and priestcraft, lawyercraft, doctorcraft, and many other crafts beside, each virulent in proportion to the completeness of the mystery and of the monopoly. But break down the walls of exclusiveness; let the wind of heaven play through the dark chambers of pretension; pour the natural light into the desks and drawers of official technicality; and a healthier, sweeter breath soon comes forth from professional halls, when scholastic and traditional lore is forced to endure the gaze of strong native intelligence. All this is notorious. Are we very unreasonable then, if we go so far as to think that an ecclesiastical corporation is liable to the same defects as all similar bodies? For myself, I must confess, that wherever there is artificial appropriation, I am irresistibly impelled to suspect something amiss; while the great manifesto of simple-minded purpose is seen in the hearty desire of diffusing knowledge as unshackled by conditions as the natural light of heaven.—*Ibid.*—[Tests seem to us a perfectly fair means, as far as they are a means, by which a private body may prevent the admission of members of sentiments discordant with those hitherto entertained in the body. In this respect they are nothing more than a certificate of a certain kind of fitness. In as far, however, as they seek to exclude particular classes of individuals from benefits which flow essentially from the nation at large, or which could not exist without the national sanction, they obviously appear liable to such a strong challenge of reason and justice, as nothing in our age can long resist. All such exclusive arrangements have their dooms written on their foreheads; while the date of execution depends solely on some external accident which may any day take place.]

FEMALE EDUCATION.

The system of female education, as it now stands, aims only at embellishing a few years of life, which are in themselves so full of pleasure and happiness that they hardly need it, and then leaves the rest of existence a miserable prey to vacancy and idle insignificance. The real object of education is to give children resources that will endure as long as life endures, habits that time will ameliorate, not destroy, occupations that will render sickness tolerable, solitude pleasant, age venerable, life more dignified and useful, and death less terrible.—*Rev. Sidney Smith.*

NEVER GIVE UP.

What if you fail in business? You still have life and health. Don't sit down and cry about mishaps, for that will never get you out of debt, nor buy your children frocks. Go to work at something, eat sparingly, dress moderately, drink nothing exciting, and, above all, keep a merry heart, and you'll be up in the world.—*Franklin.*

OUR AIN FOLK.

I wish we were hame to our ain folk,
Our kind and our true-hearted ain folk,
Where the gentle are leal, and the ample are weal,
And the hames are the hames o' our ain folk.
We've met wi' the gay and the guid where we've come,
We're courtly wi' mony, and couthy wi' some,
But something's still wanting we never can find,
Sin' the day that we left our auld neighbors behind.

Oh I wish we were hame to our ain folk,
Our kind and our true-hearted ain folk,
Where daffin and gies, wi' the friendly and free,
Made our hearts aye sae fond o' our ain folk.
Some tauld us in gowpens we'd gather the gear,
Sae soon as we cam' to the rich mailens here,
But what is in mailens, and what is in mirth,
If 'tis not enjoyed in the glen o' our birth? * * *

Then I wish we were hame to our ain folk,
Our kind and our true-hearted ain folk,
Where the wild thistles wave o'er the beds o' the brave,
And the graves are the graves o' our ain folk.
But happy gae lucky, we'll trudge on our way,
Till the arm waxes weak, and the haffet grows gray,
And though in this world our ain still we miss,
We'll meet them at last in a world o' bliss,
And then we'll be hame to our ain folk,
Our kind and our true-hearted ain folk,
Where far 'yond the moon, in the heavens aboon,
The hames are the hames o' our ain folk.

—*Riddell's Poems.*

IMPERISHABLE FEATURES OF THE JEWS.

If a man like Newton or Locke were to cast his eye upon a Jewish face, and immediately after read the following passage in a book written some thousands of years ago (Isaiah, lxi. 9), 'And their seed shall be known among the Gentiles, and their offspring among the people: all that see them shall recognise them, for they are the seed which the Lord hath blessed,' it is impossible to say, or even to conjecture, what his reflections would be on such an occasion, but it is possible to say what they would *not* be: certainly they would *not* approximate to anything ridiculous; they would *not* have the remotest connection with anything contemptuous, nor would they in the least verge on anything satirical. If, on the contrary, a Trollope of American renown were to cast her eye upon a Jewish face, what would her reflections be?—She shall speak for herself: 'One reason why I do not always, and altogether, like some of the largest and most splendid parties of the monied aristocracy is, that I am so very sure to find myself unexpectedly, at some moment or other, entirely surrounded by a black-eyed, high-nosed group of . . . unmistakable Jews. I know and I reverence that improved principle of religion which teaches us to condemn no man's faith with any presumptuous feeling of personal superiority derived from our own; yet I have still enough of the old-time leaven about me to doubt if a strong affection for the society of the children of Israel be a duty positively imperative upon Christianity!'—*Jewish Chronicle.*

HATCHING FISH.

Hatching eggs by artificial heat is well known and extensively practised in China, as is also the hatching of fish. The sale of spawn for this purpose forms an important branch of trade in China. The fishermen collect with care, on the margin and surface of water, all the gelatinous matters that contain spawn of fish, which is then placed in an eggshell which has been fresh emptied, through a small hole, which is then stopped, and the shell is placed under a sitting fowl. In a few days, the Chinese break the shell in warm water (warmed by the sun). The young fish are then kept in water until they are large enough to be placed in a pond. This plan in some measure counteracts the great destruction of spawn by troll-nets, which have caused the extinction of many fisheries.—*Martin's China.*

A LOOK INTO LIDDESDALE.

'OFF again for the south I see—why, you were scarcely well home from Yarrow,' said an acquaintance, as he recognised us one morning perched on the top of the Jedburgh coach, as it stood taking in its complement of passengers at the foot of Princes Street.

'Cannot resist this glimpse of fine weather—must get out of town once more before winter sets in upon us.'

'And where is now to be your beat? Do you cross the Border?'

'No; but go close upon it. My friend here and I, with the reinforcement of an acquaintance at Jedburgh, intend to take a look into Liddesdale—a thing I have long wished for.'

'Ah, I see—the land of Jock o' the Syde and Dandie Dinmont. My compliments to Dandie.'

'Certainly; and that you will be glad to see him the next Parliament House job he has on hand, and that'—Here the clock struck eight, and away went the coach, and away went we on our many-a-day-wished-for excursion.

It was rather a daring thing, as we were told, to venture at this time of the year into the hilly region on the Border; but the weather, as is sometimes the case in October, had settled into a kind of 'farewell summer,' and was particularly tempting. The air was clear and bracing during the day; and the stars at night shining from an unclouded expanse of blue, with the flickering streams of the aurora borealis, imparted no inconsiderable degree of light and cheerfulness. A visit to the country during this brief interval, while the trees are not yet altogether deprived of their variegated tints, is a pleasure which few fail to relish.

Liddesdale, which was to be our ultimate object, may best be reached by way of Hawick, and so on to the Esk, into which the Liddel falls near Canobie; but I had particular reasons for entering the valley at its upper extremity from Teviotdale, and on this account took the road to Jedburgh, the chief town, as it used to be called, on the 'middle marches.' In this direction, a ride of three to four hours from Edinburgh brings us to Melrose; and in half an hour more, we find ourselves entering the richly-cultivated and finely-wooded valley of the Teviot. Passing down the slope which conducts us to the banks of the river, we are reminded that we are crossing the plain formerly known as Ancrum Moor, where, in 1545, there took place one of those savage battles between the English and Scotch which disfigure Border history. The encounter is traditionally remarkable, in consequence of a native female of uncommon strength and resolution having taken part in the fray, and fought till her limbs were severed from her body. This heroine, who was named Lilliard, was buried on

the spot, her grave being marked by a stone, on which at one time a few lines of rhyme were visible.

From Lilliard's Edge, as the place is now called, we enjoy a pleasant ride to Jedburgh, which is situated on the banks of the small river Jed, in a sheltered spot overhung with finely-wooded heights. Jedburgh—anciently Jedward, now corrupted in popular phraseology into Jethart—was in old times a walled town of considerable importance, protected by a massive castle, and adorned with one of the wealthiest abbeys in the south of Scotland. With its castle transformed into a modern jail, and its abbey in ruins, there is little in the town to interest the tourist; but that little is worth examining. In a back lane on the south still stands the old house in which Queen Mary lodged when on her judicial visit to the Borders in October 1565. It is of three storeys, thatched; the ground-floor is vaulted; and from a heraldic entablature in the wall, it appears to have been a residence of distinction; probably a bastle house, capable of defence, of which there were several in the town. Ascending by a narrow turret stair behind, we reach Queen Mary's room on the third floor. It is like all the rooms in which that unfortunate princess seems to have lived—very small and confined, with a little window commanding a view of a garden behind. Formerly, it was hung with tapestry, which has been transferred to a garret above, and it is now neatly papered and fitted up as a bedchamber. And in this limited apartment did Mary remain for several weeks during an illness brought on by her fatiguing journey to Hermitage, and which caused her physicians to despair of her life! The neglect she experienced from Darnley on this occasion, it will be recollected, led to the fatal estrangement which terminated in the conspiracy for his destruction. The house is now inhabited by a lady, who, before our departure, showed us a curious relic of past times and manners. This was a small *quaich*, or drinking-cup, formed of party-coloured wood, and mounted with silver, which had been used by the celebrated Rob Gibb, court fool or jester to James V., the father of Queen Mary. Rob's name is inscribed on silver within it; and by another inscription, we learn by whom it was gifted to a predecessor of its present owner.

A short way above the town, on a bank inclining to the Jed, is seen all that remains of the castle of Ferniehirst, the original seat of that branch of the family of Kerr or Car, which has become ennobled under the title of Marquis of Lothian, and which comes frequently into notice in Scottish history. From a point near Ferniehirst, in the midst of an Eden of woodland scenery, we strike westward for Liddesdale; and by an excellent road in this direction, we set off on our proposed journey. The route was that taken by Scott, when on his journeys to the Liddel with his friend Mr

Shortreed of Jedburgh; and with one of Mr Shortreed's sons, who is well acquainted with the country, and kindly agreed to accompany us, our excursion promised to be more agreeable than it could otherwise have been. There was, however, one great difference between Sir Walter's raid into Liddesdale and ours. Fifty years ago, when he visited the country, the only roads were mere tracks across hills and wastes, and travelling could be performed only on horseback, and with some degree of skill in selecting pathways. Now, roads of the best construction permitted our droosky to wheel along at a good pace, without any further interruption than what is incidental to the usual proportion of toll-bars. Many other changes, however, as will be immediately noticed, show that we are no longer in a land of adventure and romance. Scott was fortunate in making his visits when he did. The modern traveller is left nothing to pick up. All that awaits him is a land memorable for what it has given to literature.

Before reaching the higher dividing ridge of the country, we proceed up the small but pretty vale of Rule Water, that conducts us into a scene wild and altogether pastoral. Mountains lie before us, as if to intercept further progress; but these are gradually and slowly ascended, and for a time we are immersed in a sea of bare hills, beyond the sight of any human habitation. At length the summit is gained; and turning the flank of a huge knoll, known as the 'Knot i' the Gait,' we proceed by an easy and long descent towards Liddesdale. In these higher solitudes, a view occasionally opens on our left, in the direction of the Border, where, within the English side, and at a spot inaccessible to wheeled carriages, stands the famed castle of Keeldar, now a hunting-seat of the Duke of Northumberland.

'The heath-bell blows where Keeldar flows,
By Tyne the primrose pale;
But now we ride on the Scottish side,
To hunt in Liddesdale.'

As the dark recesses of these southern hills disappear, the prospect opens in front. At first our road skirts a rivulet, called the Dawston Burn, which for a mile or two dances and murmurs over a rugged rocky bottom, till it falls into the Liddel, at a spot where the narrow defile expands into a valley of wider dimensions.

We are now in Liddesdale, the scene of Border foray and ballad, but nowhere does any object of antiquity present itself. We are environed by the same mountains, cleughs, and glens, with which long-past generations were familiar; but of the castles or peels that once were scattered over the district, not a vestige meets the eye of the tourist. Few houses of any kind are visible; here and there a thatched cottage, weather-worn, and reduced to inferior purposes, remains to indicate the kind of dwelling which had been used in former times; while in the substantial and handsome edifices inhabited by the modern farmers, we see a striking evidence of the great advance latterly made in the condition and habits of the people. Changed in many things, Liddesdale, however, retains its character for hospitality. At the house of an acquaintance of Mr Shortreed we received a hearty welcome, besides information which was useful for next day's excursion.

From the windows of the mansion a beautiful view was commanded of the Vale of the Liddel, through which the river pursued its way amidst green fertile haughs, here and there dotted with trees, and on which coveys of blackcock, almost 'as thick as doos in a docket,' were leisurely pecking their way. The Liddel is one of the best trouting streams in Scotland, the more so from not being poached by any vile engines of piscatory destruction. In the beginning of June, the angler would here find a field of superlative enjoyment; but even now the sight of the water was too much for S., who had cannily brought his rod with him in the droosky; and we had scarcely landed ere he set to work with all the ardour of an ancient Borderer.

Next day, it was a question whether we should go

straight down the dale, and return by Hermitage, or go first to Hermitage, and return up the valley of the Liddel. Votes for the latter course carried, and so we set out for Hermitage. Our road took us in the first place down the valley a little way, past several places mentioned in Border story, and among others, Lariston, occupying a pleasant situation on the south side of the river. Lariston was at one time the seat of a chief of the Elliots, whose fame has been commemorated in Hogg's spirited ballad—

'Lock the door, Lariston, Mon of Liddesdale;
Lock the door, Lariston, Lowther comes on;
The Armstrongs are flying,
The widows are crying,
The Castletown's burning, and Oliver's gone!
* * * * *
Scowled the broad sun o'er the links of green Liddesdale,
Red as the beacon-light tipped he the wold!
Many a bold martial eye,
Mirrored that morning sky,
Never more oped on his orbit of gold!
* * * * *
See how they wave—the proud files of the Windermere!
Howard! ah, wo to thy hopes of the day!
Hear the wide welkin rend,
While the Scots' shout ascend—
Elliot of Lariston, Elliot for aye!'

Shortly after passing Lariston, we crossed by a good road over a low hill in a northerly direction. This brought us in an hour into the Valley of Hermitage Water, a tributary of the Liddel, and to all appearance as large, and much more picturesque. The geological formation is thin layers of red sandstone, which shelve out in the bed of the river, so as to cause numerous cascades, gurgling rapids, and deep-wheeling pools, the residence of bull-trouts rivalling the famed denizens of Tarras. To add to the beauty of the banks, there is much natural coppice-wood, the remains of the great forests which in former ages spread over the country. Although less extensive than that of the Liddel, the Vale of Hermitage is therefore superior in some points of attractive beauty, and is more pleasingly pastoral.

By a bend to the left, in proceeding up the banks of the stream, we are brought suddenly into view of Hermitage Castle. Rising like an apparition out of the ground, the huge gray mass starts into sight at the bottom of an extensive waste, declining all round from the hills; and the Hermitage Burn, with its shining and noisy waters, is the only object of a lively nature in the whole of its bare and desolate vicinity. The fortress has been one of the largest castles within the Scottish Border, very different in size and means of defence from such inferior peels as that of Gilnockie. It consists of a union of four towers rising to a height of sixty feet, with a projecting parapet or bartisan all round, whence missiles could be poured down on an attacking party. The walls, which, at the ground, are seven or eight feet in thickness, have been repaired and rendered quite entire by the Duke of Buccleuch, but the edifice is roofless, and the interior is a green and empty ruin. The remains of fortifications are seen around, and at a little distance is a deserted burial-ground, adding, if possible, a deeper melancholy to the whole aspect and circumstance of the ruin.

Since its erection in the twelfth century, Hermitage Castle has passed through many hands, and its present form is the work of different eras. Coming latterly into the hands of the Earls of Bothwell, it was temporarily the residence of the infamous bearer of that title who has been associated so dismally with the story of Mary. Bothwell had been commissioned to reduce Liddesdale to obedience, but in an attempt to apprehend Elliot of Park, a notorious marauder, he was grievously wounded. Hearing of this accident while she was at Jedburgh, Mary visited Hermitage, when, in the presence of Murray and other officers, she conferred with Bothwell for two hours on the distressed state of the district; she afterwards returned to Jedburgh on the same day—a ride of at least fifty miles going and coming, and of great difficulty.

Like all feudal strongholds, it bears the repute of having been the scene of numerous deeds of oppression and wickedness. One of its early owners, Ranulph de Soulis, from a cause not explained by history, was put to death by his own domestics in his castle of Hermitage in 1207; and a successor, William de Soulis, who joined in a treasonous plot against Bruce, with a view to usurp the crown, was seized and confined in Dumbarton Castle (1320), where he died. These circumstances are not unworthy of notice, as tradition—on the principle of a tale never losing by the telling—has given to a Lord Soulis of Hermitage all the attributes and diabolical propensities of a necromancer. A redoubted adversary of Soulis was the chief—or, as he was called, from his gigantic size, the *Cout* (colt)—of Keeldar, who, being foully set upon by Soulis's orders, while hunting near Hermitage, was killed in attempting to cross the water. It is stated that he was held down by lances till he was drowned; and the eddy in which he perished is still called 'Keeldar's Pool.' Outside the ancient burying-ground of the castle, a grave of huge dimensions is pointed out as that of the unfortunate Cout of Keeldar—

'Where weeps the birch with branches green,
Without the holy ground,
Between two old gray stones is seen
The warrior's ridgy mound.'

And, as a consequence of Soulis's enchantments—

'The hunters bold of Keeldar's train,
Within yon castle wall,
In a deadly sleep must aye remain,
Till the ruined towers down fall.
Each in his hunter's garb arrayed,
Each holds his bugle horn;
Their keen hounds at their feet are laid,
That ne'er shall wake the morn.'

The murder of Keeldar and other atrocities having at length roused general indignation, Soulis is seized by persons whom he had wronged, and they resolve on putting him to death. But the great difficulty is to know what will kill him. Thomas the Rhymer being consulted on the subject—

'The black spae-book from his breast he took,
And turned the leaves with curious hand;
No ropes did he find, the wizard could bind,
But threefold ropes of sifted sand.'

Ropes of sand, however, would not bind Soulis, even with the addition of 'nine handfuls of barley-chaff'—

'And still beside the Nine-stane Burn,
Elbbed liked the sand at mark of see,
The ropes that would not twist nor turn,
Shaped of the sifted sand you see.'

Thomas again consults the 'black spae-book,' and he now finds that the wizard must be boiled in lead—

'On a circle of stones they placed the pot,
On a circle of stones but barely nine;
They heated it red and fiery hot,
Till the burnished brass did glimmer and shine.

They rolled him up in a sheet of lead,
A sheet of lead for a funeral pall;
They plunged him in the caldron red,
And melted him, lead, bones, and all.

At the Skelf Hill, the caldron still
The men of Liddesdale can show;
And on the spot where they boiled the pot,
The spreat and the deer-hair ne'er shall grow.'

And such is said to have been the end of Lord Soulis. The whole story is of course a *myth*; that is, a legend fabricated by an ignorant and simple people, to account for certain existing circumstances. 'The ropes of sand' are merely marks in the gravelly debris, caused by the reflux of the burn. The 'stones but barely nine,' are the stones of a Druidic circle, on the summit of a low hill two miles from the castle. The old metal pot, shown as that in which Soulis was boiled, could not have possibly held a man wrapped in lead. It is also unfortunate for the credit of the story, that while the pot is comparatively small, the circle of stones on which

it is alleged to have been placed is eighteen feet in diameter. This cruel fact I ascertained by a long tramp to the spot; but the disappointment in finding so many vulnerable points in the tradition, was more than compensated by the view of so interesting a relic of antiquity as this tolerably well preserved memorial of Druidic worship.

We have not yet done with Hermitage Castle. When in the possession of William Lord Douglas, that warrior, though distinguished by the proud title of the 'Flower of Chivalry,' showed that his heart was accessible to the baser passions. A desire to obtain the office of Sir Alexander Ramsay, sheriff of Teviotdale, urged him to seduce that knight into his power, after which he caused him to be thrown, along with his horse furniture, into a dungeon in Hermitage Castle, and there left him to perish by the most fearful of all deaths—that of hunger. This occurred in 1342. The wretched captive is said to have prolonged his existence for seventeen days by eating particles of corn which fell from a granary above his dungeon. As if to verify this dismal tradition, some bones, a sword, and the bit of a bridle, were found a number of years ago in the cell in which Sir Alexander is said to have been confined. In the present day, the dungeon is reached only by climbing with a ladder to the height of what had been the first storey in one of the towers. Here, on looking down, is seen a species of oubliette, reaching to a level with the ground, without any window, and entered only by a square hole in the vaulted roof. Any one thrown into this horrid receptacle could not possibly have got out without assistance from above.*

From Hermitage we proceeded down the vale, taking in our way the old farmstead of Millburn, situated about a mile below the castle. The house is interesting from having been that which Scott first visited when on his raids into Liddesdale, and from being in the present day what it was half a century ago. It is an old thatched dwelling, of plain appearance, inhabited by servants of the neighbouring farmer, who obligingly permitted us to look into the only room or ben-end, a small apartment with a stone floor, and rafters overhead supporting a kind of upper room. Little is changed in aspect within, and the only alteration without is the removal of the stables, which were huddled together in front. In 1793, advocates from Edinburgh were of rare appearance in Liddesdale, and the arrival of Scott with Mr Shortreed did not fail to create a certain bustle, mingled with alarm. On Willie Elliot, the guidman of Millburn, being informed of the quality of his guest, he received him with great ceremony, and insisted upon leading his horse to the stable. Shortreed accompanied Willie, however, and the latter, after taking a deliberate peep at Scott, 'out by the edge of the door-cheek,' whispered, 'Weel, Robin, I say, I'm ne'er a bit feared for him, after a'; he is just a chield like ourselves.' Half a dozen dogs of all degrees had already gathered round 'the advocate,' and his way of returning their compliments set Willie Elliot completely at his ease.

At the sunny end of the humble rural dwelling overlooking the burn, which goes brattling past a slip of garden, still remains the stone bench or dais on which Willie Elliot in his latter days used to sit: the confined interior rendering an outside lounge of this kind in good weather as much a necessary as a luxury in the olden time. According to Sir Walter's acknowledgment, the character of Dandie Dimmont was drawn from no individual—a dozen of the stout Liddesdale yeomen with whom he was acquainted being entitled to lay claim to be the prototype of the rough, but faithful, hospitable, and generous farmer. Mr Shortreed, however, was of belief that much of the portraiture of Dandie was drawn from Willie Elliot of Millburn, and that Mrs Elliot was

* 'The bridle-bit [found in the dungeon] was given to grandpapa, who presented it to the present [now late] gallant Earl of Dalhousie, a brave soldier, like his ancestor Sir Alexander Ramsay, from whom he is lineally descended.'—*Scott's Tales of a Grandfather*.

still more truthfully represented in the fine character of 'Allie.' In one point, namely, Dandie's dogs, the Peppers and Mustards, Sir Walter mentions that he had in his eye a generation of terriers belonging to Mr James Davidson, the farmer of Hindlee, at the head of Rule Water. For the name Charlieshope, we have Thorlieshope, a place in the higher part of the Liddel.

Two or three miles below Millburn, at the junction of the Liddel and the Hermitage Burn, once stood the old peel of Westburnflat, mentioned in the tale of the Black Dwarf as the scene of an exploit not unusual in Border history. It must ever be deemed fortunate that Scott visited a district abounding in so many scenes and circumstances adapted to the purposes of a novelist, and that at a time when there was still a degree of freshness in traditional recollection, along with the strong features of but a partially-advanced age. By visiting the firesides of farmers and cottagers, he here picked up, just as they were about to vanish from the stage—

'The songs to savage virtue dear,
That won of yore the public ear,
Ere polity, sedate and sage,
Had quenched the fire of feudal rage'—

And which, under his hands, formed so large a portion of the 'Minstrelsy of the Scottish Border.' To acquire these ballads, he visited Liddesdale seven successive years, nor did he leave a single rivulet or spot of interest unexplored. It was this species of out-door industry in storing his mind with subjects from nature, along with extraordinary powers of observation and memory, that formed a leading feature in Scott's character, and distinguished him from those novelists whose structures are drawn almost exclusively from imagination.

Passing the junction of the Hermitage and Liddel, near which is the parish church of Castleton, we shortly after arrived at New Castleton, a large and neatly-arranged village, which was erected about fifty years since by Henry, Duke of Buccleuch, on the principle of giving feus, or long leases of small pieces of ground, to its inhabitants. The project was doubtless a benevolent one; but as in all similar schemes of patch-farming, it has proved a failure, so far as insuring a prosperous population is concerned. The best thing that could happen to the village, would be the absorption of the feus into a limited number of hands, with the corresponding establishment of some kind of manufactory, at which the inhabitants could receive remunerative employment. We found here a capital country inn—a hint for those who think of making a trip into Liddesdale.

Below New Castleton the scenery of the dale improves, as if softening into the richer valley of the Esk, to which the Liddel hurries in its course. At the distance of a mile from the village, there may be said to be a concentration of interest on points noted in Border tradition. Near the side of the highway, at the foot of an ascent leading to the solitary burying-ground of Ettleton, stands Milholm Cross. Almost opposite, within a meadow on the left bank of the Liddel, is seen a tumulus—all that remains of Mangerton House, the seat of a chief of the Armstrongs. And on the remote edge of the hill, on the right bank, is pointed out the spot where stood the formidable peel of 'Jock o' the Syde.' On every hand is the scene of a ballad.

Jock o' the Syde, it seems, was an Armstrong—nephew to the Laird of Mangerton, and cousin to the Laird's Jock; that is, Mangerton's eldest son. This precious pair of cousins, along with John o' the Park, were the terror of the Border. The last named hero is commemorated in the ballad which narrates his capture by the English, beginning—

'Now Liddesdale has ridden a raid,
But I wat they had better hae stayed at hame;
For Michael o' Wingfield he is dead,
And Jock o' the Syde is prisoner taen.'

By the activity of the Laird's Jock, the Laird's Wat, and Hobbie Noble, he is fortunately released from dur-

ance, and with the irons on his legs, is carried home to his fortress in Liddesdale—

'Now Jock, my billie, quo' a' the three,
The day is comed thou was to dee;
But thou's as weel at thy ain ingle-side,
Now sitting, I think, 'twixt thee and me.'

I must, however, tear myself from this old-world gossip; for I am desirous of saying something as to the social history of the dale before closing my paper. Suffice it to say, that after examining Milholm Cross, a curious relic of ancient piety, in good preservation, we turned our horse's head up the valley, and next day crossed the hills into Teviotdale.

During the old Scottish monarchy, Liddesdale was inhabited principally by two clans, the Elliots and Armstrongs, whose chief occupation appears to have been making predatory incursions into the adjoining domains of Northumberland and Cumberland. Owning little or no allegiance to the crown, they were a kind of outcasts, who carried on war on their own account, and held it no act of theft to make free with the flocks and herds of their neighbours across the fells. Usually mounted on horseback, and armed with lances, they sallied at nightfall from their petty castles or peels, and by unfrequented and crooked paths reached the scene of aggression. In these excursions, they did not by any means confine themselves to attacks within the English frontier, but sought a booty wherever it could be found on the lands of persons with whom they or their nominal heads were at feud. Although holding the convenient doctrine, that property was common to all who stood in want of it, they are not to be ranked with the mean thieves of modern days; and it was a favourable point in their character, that they abhorred and avoided the crime of unnecessary homicide. An ancient Borderer, with all his lawlessness, would have scorned to take the mean advantage of killing a defenceless enemy. To allay Border feuds, and suppress cattle-lifting forays, the Scottish and English sovereigns had recourse to various severities inconsistent with humanity and justice. Enraged at the frequent complaints respecting the Border freebooters, James V., in the summer of 1529, made his celebrated expedition through the south of Scotland, in which, with an executioner in his train, he remorselessly put to death a number of chiefs who fell into his power. It was on this occasion that, having invited Johnie Armstrong of Gilnockie to meet him, he mercilessly hanged that unfortunate hero, with thirty-six attendants whom he had brought with him, 'arrayed in all the pomp of Border chivalry.' One cannot but feel that Johnie was seized in a treacherous, and murdered in a cruel manner—jealousy of his authority and gallant bearing, as is represented by tradition, having influenced the king as much as considerations of justice. Struck with his appearance, James asks where Johnie had got the golden tassels or targats that hung at his hat—

'Oh whair got thou those targats, Johnie,
That blink see bravly abune thy bree?
'I got them in the field fechtin',
Where, cruel king, thou durst not be.'

For a time James's severity produced the desired effect; but during the difficult times which followed, disorders commenced with renewed activity. All the efforts of the lords wardens could not prevent forays. In 1581, at a justiciary meeting held within the English Border, 'Sir Simon Musgrave, with Thom of the Todhill and his neighbours, complains upon Robin Elliot of the Park, Sim Elliot, Clemie Crosier, Gawen's Jock, and their complices, for 60 kine and oxen, a horse, and the taking of Thom Routledge prisoner.' And in November 1582, 'Sir Simon Musgrave complains of the Laird of Mangerton, Laird's Jock, Sim's Thom, and their complices, for burning of his barns, wheat, rye, oats, big, and peas, worth L.1000 sterling.' There were, however, complaints per contra. The west of England claimed L.3230 damages against Liddesdale; but Liddesdale had more than a set-off against the English, in

losses amounting to L8000. Again the Border spirit seems to have been allayed, and it is to this period of comparative tranquillity (1590) that we have to refer the incidents noticed in the ballad of 'Dick of the Cow':—

'Now Liddesdale has lain lang in,
There is nae riding now at a';
The horses are grown sae lither fat,
They downa stir out o' the sta'.'

And so, to give them a little work, a raid is planned and executed—

'Then they are come to Hutton Ha';
They rade that proper place about;
But the laird he was the wiser man,
For he had left nae gear without.'

However, a booty is brought to Liddesdale, and so the business of marauding was recommenced. As late as the union of the crowns, and later, there were forays on the western marches. Not until Buccleuch ingeniously drew away the more daring spirits to the wars in Germany, many had been banished to Ireland, and a vast number executed without form of trial, were Liddesdale and the adjoining districts reduced to social order. It is curious, by the way, that a whole colony of these exiled Elliots, Armstrongs, Kers, &c. exists to this day in one of the northern counties of Ireland (we think Fermanagh), all of them stout Protestant Episcopalians, as we have been assured by a peer on whose land some of them are seated.

Like the rest of Scotland, this interesting valley has partaken of the progress of manners; but in no place is the change, step by step, more distinctly or pleasingly marked. First, we have the 'old riding times,' above alluded to, when the population consisted of petty chiefs living in castles, and served by retainers who dwelt in mean hovels containing nothing of any value. There was perhaps a degree of fun and frolic during this period, which is not to be found in these sober days; but certainly there was also much misery. Second, came a time, it is believed, of still greater privation. Robbery on a great scale was no longer tolerated; retainers were dismissed as useless; there was little regular employment; and nothing had been accumulated wherewith to pursue profitable enterprise. The distress of this transition period was aggravated by seasons of pestilence, which carried off man and beast. An attempt at farming was made, but the Duke of Buccleuch, who was owner of the greater part of the dale, had a poor return of rental. On the occasion of a term day, his Grace was waited on by a tenant of the name of Elliot, who came to resign his lands as wholly profitless, his stock of sheep and cattle having mostly died.

'No, no, Elliot,' said the duke; 'I beg you to keep your farm: surely it is worth something?'

'I cannot do so,' was the reply; 'I am a ruined man, and can pay you nothing.'

'Make one more trial, my old friend,' answered the duke: 'you shall have the farm for another year; all I shall ask as rent is that pair of woollen mittens on your hands.'

Elliot took off his mittens, and handed them across the table to the duke. His descendant is still tenant of the farm, which now supports large flocks of sheep, and the annual rent is several hundreds of pounds. A continuation of this dismal period may be pictured as embracing efforts at improvement, along with attempts to educate and religiously instruct; but everything remained on a meagre and rude scale. Fighting at fairs and trysts was common; the country was overrun with beggars and gipsies; and, to crown all, intemperance was universal. In this state was Liddesdale about the middle of last century.

Some of the stories told of these drinking times are exceedingly droll. A farmer having gone to a fair at Hexham with a quantity of cattle, and taken up his quarters at a public-house, one day observed to the landlady that he had that morning received a hint it was time to depart.

'What hint do you mean?' she asked.

'This morning,' said he, 'I noticed that the hen which began to sit on her eggs on the day of my arrival has now got chickens.' And so, after a carouse of three weeks, he set out for Liddesdale.

Another farmer, who dwelt in the higher part of the district, was one day, in the year 1745, surprised and chagrined to find that his house was made a place of refuge for a number of his neighbours, on the occasion of a detachment of the rebel forces passing down the dale. Unprepared for so large a company, he suggested the propriety 'of all immediately going to bed, as they did not know on what service of danger they might soon be called.' The advice having been taken, though not without some murmurs of dissent, the host had no sooner seen all safely lodged in bed, than he despatched two shepherds on horseback for a stock of brandy. The kegs in due time arrived, and were arranged with spigots; and the kettle being boiled, the sleepers were joyfully roused from their lairs, and told 'that all was now ready for a regular set-to.'

Drinking with little intermission for days together was so common on all occasions of festive meeting, that a refusal to participate in the orgies consigned the recusant to contempt and exclusion from society. In the house in which we lodged during our stay in Liddesdale, is shown a curious memorial of these excesses. It is a bell-shaped glass on a tall stalk, capable of holding an English pint, and known by the name of 'The Constable.' This capacious goblet was put on the table at the commencement of a bouze, and all the glasses which a guest refused to take off, at the frequent rounds from the punch bowl, were poured into it. When 'The Constable' became full, it was the duty of the recusant guest either to drink it at a draught, or leave the room—a consequence which entailed no small share of local disgrace. When a great national collection shall be made of engines of bygone intemperance, 'The Constable' must receive a conspicuous place.

During this drinking era, which, with some modification, may be said to have extended till within the last forty years, there was little substantial improvement. The houses were almost all mean thatched dwellings, one storey high, with stone or clay floors, exhibiting the usual sluttish appearance in external matters. The only beds were in the kitchen and sitting-room, or in some indescribable dark closet or garret, half filled with wool and miscellaneous rubbish. Toilette apparatus was scarcely known. Nearly all washed themselves in the morning at the pump, or the rivulet which ran past the end of the house. Communication with towns and markets was carried on entirely by means of carriers with pack-horses, who pursued their dreary way by dangerous paths across hills and moorlands. At certain appointed hamlets among the mountains, these men used to meet and make an exchange of goods suitable to their different points of destination; and among them, of course, contraband traffic was a staple branch of trade. No wheeled carriages could at this time enter Liddesdale, for there were no roads worthy of the name. In order to find hard patches of ground, in proceeding up or down the valley on horseback, it was necessary to go pretty much in the bed of the river, which then wound in many a mazy curve through the adjoining haughs. The first regular road for a few miles along the bank of the stream, appears to have been in course of construction in 1795. On the occasion of Scott's last visit, in August 1800, his gig was the first wheeled vehicle which entered Liddesdale.

Our next period refers to the beginning of the present century, when roads were partially formed; carts drawn by horses now assumed the place of sleds and pack-saddles; green crops for winter feeding were introduced; drinking bouts were diminished in length and intensity; the people were better dressed; the wages of labour had considerably advanced; and, among other meliorations, houses covered with slates were substituted for the old thatched dwellings. Yet what a poor

architectural taste seems to have prevailed, even in this late era, here as elsewhere in the rural districts of Scotland: farm-houses were constructed on but one model—two storeys, with three small windows above, and two below, one on each side of the door. The very look of these houses imparts a feeling of cold and semi-starvation. Builders had not yet dared to think of the ornamental; and to be too comfortable was almost a sort of heresy.

From this time all has gone on improving until the present day, when the following condition of things is seen in Liddesdale. Roads (and bridges) as good as any in the kingdom connect the whole district with Jedburgh, Langholm, Hawick, and Carlisle; and consequently regular carriers, and also the general post, reach all quarters. Husbandry is on the most advanced scale of operations, and abundant crops are produced in the lower grounds. The extensive hill pastures feed large flocks of the finest sheep, which find a market in certain fairs lately instituted at New Castleton. Five years ago, when these markets were instituted, the number of sheep offered for sale was fourteen hundred; on the last occasion the number was fifteen thousand; and in all probability these will become the largest sheep and cattle fairs in the southern counties. Among the general improvements on the surface of the country, a conspicuous place is due to the straightening of the water-courses, and drainage of their banks, by which much good land has been added to the productive enclosures, and the climate considerably meliorated; while well-made fences and considerable plantations impart shelter, along with the appearance, if not the reality, of warmth. But the most agreeable changes are those which have taken place in habits of living. Drinking among the farmers is now out—an exploded thing. The old Border spirit which once took the direction of freebooting, fighting, and rollicking intemperance, now finds vent in emulation of a different kind. All are possessed with a keen spirit of competition in store farming. It is not now who will drink the greatest number of 'cheerers,' but who can show the best breeds of sheep, as well as the best general management of stock. Books and newspapers occupy the place formerly devoted to glasses and decanters. The young of both sexes receive an education equal to that common among the respectable classes in towns. One farmer told me that his nephew had been for some time studying chemistry in Germany under Liebig. As may be guessed from these circumstances, the farmers are no longer lodged in the small, tasteless houses to which we have referred. Their dwellings are generally of a superior order, with every internal elegance and accommodation, and are environed with neat gardens and shrubberies. Substantial and commodious offices for horses and cattle adjoin them. Here and there herdsmen and labourers are left to occupy the relinquished abodes of the farmers; but in various places good slated dwellings have also been erected for the farm assistants, who may be said to live better, and enjoy a greater variety of comforts, than masters did half a century ago.

It is a pleasing social feature throughout the very extensive domains belonging to the House of Buccleuch—and you may go almost fifty miles at a stretch on their lands in the south of Scotland—that the same family, from father to son, for many successive generations, is found renting the same tract of ground. The family with whom we stayed had been three hundred years on the same farm. The devotion to the duke—pronounced in the soft speech of Liddesdale like *duc* in French—is unbounded, partaking a good deal of the old feudal attachment, yet fully warranted by the nobleman's considerate attention to the interests of his tenantry. All have leases of the usual duration, not at scourging, but fair rents; and the best proof of the system working well, is the number of intelligent and substantial tenants in the district. If the same families, however, remain, what becomes of the increase of the population? That is answered in one word—emi-

gration. The overplus, young and middle-aged, do not remain to incumber the soil, and draw out a half-starving existence. Great numbers have gone to America, and others have pushed off in quest of fortune elsewhere.

Such is a glance at Liddesdale, ancient and modern. The remarkable thing about this secluded valley is its total change of character, without any change of race. The whole are still Elliots and Armstrongs, as in the days of yore. The improvement has been a self-improvement, affected by no other influences than those which have operated in all other parts of Scotland. Government has not been appealed to, nor has it had anything to do with the change. The district may indeed be said to have advanced in the face of obstacles of a legal kind; for the maintenance of differential duties in England and Scotland (here the two opposite sides of a hill or a rivulet) has always tended to demoralisation, by holding out an inducement to smuggling. The game laws have also formed a too frequent source of disturbance. Fortunately the spirit of the people themselves, and the temptations of regular industry, enabled them to resist the tendency of bad institutions. The Scottish Borderers, in their worst days, possessed the Anglo-Saxon sagacity and love of independence. They were never slothful, or given to a reckless commission of crimes against the person: above all, they possessed common sense; without which indispensable quality, along with self-reliance and self-respect, it is unnecessary to say that no people, though governed by the perfection of human wisdom, can hope to rise above the mean level of a half-savage existence.

W. C.

EXTRAVAGANCES ABOUT THE MOON.

WE suppose that great astronomer who pronounced the moon to be an egg laid by the earth, and no doubt proved the fact to his own heart's content, has a claim to an eminent position among the extravagancists of whom we are about to speak. But unfortunately, before and since the age which was made conspicuous by this remarkable discovery, the moon has been the subject of speculations more wild and outrageous than have fallen to the lot of any other heavenly body. In a previous article in this Journal,* an amusing account of the 'Popular Fallacies about the Moon' appeared. These 'fallacies' had principally reference to lunar influence on the weather. It has been thought that the subject deserved, and would admit, of treatment under another aspect, and that some amusement might be derivable from a sketch of a few of the extravagant notions which have had their sway with reference to other attributes and circumstances connected with this beautiful satellite. Some selection, however, is requisite out of such a heap of absurdities. We shall therefore study to make our notice of this subject as short as will suffice to give it a general interest.

That was a bold belief which united the moon with haircutting. It was a daring stroke of genius which attributed a 'Balm of Columbian' influence to the queen of the night. It was in this wise. If it were desirable to strengthen and give a shagginess naturally wanting to hair growing too lank and weak, the remedy was, that a man should go to his barber's when the moon was in the constellation *Leo*. Ladies, likewise, who were obliged to produce curls by paper, irons, or *pillottes*, if those days knew of such inventions, might enjoy a strength of curl that all Burlington Arcade might envy, by getting their hair clipped under the lunar influence when in *Aries*, the spirals having then all the graceful curve of the horns of that animal. But the moon served a higher purpose still. It was both a dietetist and a monthly doctor. The rules which were laid down for the regulation of these important subjects are too good

* No. 360, old series.

to be consigned to oblivion. From them we learn that it is good to use cathartic electuaries when the 'moon was in *Cancer*;' although at first sight one would rather dread the gripping energies of such a constellation. Potions were best when she was in *Virgo*. Emetics were expedient in *Taurus*, from the ruminating faculty of that animal. Catarrhs were soonest cured under his influence, and it was best to bathe of course when she was in *Pisces*. Husbandry was equally obliged to her. She ruled the plough, guided the sower, and appointed the harvest. Timber was cut, peat was dug, and sundry other operations were performed, or at any rate were only rightly performed, at their appointed periods of her dynasty. She also guided the 'faculty,' and surgical operations were amenable to her laws. She was of necessity the oracle of monthly nurses; and Dr Jamieson states that it is a common belief in Angus, that if a child is weaned during the waning of the moon, it will waste away all the time that the moon continues to wane. The Spanish ladies blame her for spoiling their complexions; and if they are abroad on a fine moonlight night, hold their fans so as to hide their faces from its blackening influence. Finally, physicians blamed her for causing and aggravating many kinds of fevers; very disinterested no doubt of them, but equally unjust.

As the moon swayed the affairs of living men, so, and more especially, was her power exerted upon them in determining the period of their decease. A physician of some celebrity, in a work upon tropical diseases, has composed an essay upon this subject, in which he lays down for a well-ascertained fact (?), that persons in extreme age generally die at the new or full moon. The evidence he adduces is curious; and as it is in the power of most persons to investigate it, we will shortly state it. It is an appeal to the churchyard. The evidence is that of the tombstone. This is coming nearer the point than most of the lunatic—the lunar, we should say—philosophers have a mind to. A correspondent of the 'Gentleman's Magazine,' possessing a long list of ephemerides, was bent on determining the question. For this purpose he resorted to the churchyard of St Giles's, London; and here he found one stone which rested over the remains of five people who died at the respective ages of 60, 63, 80, 89, and 90. The first died at the first quarter, the second on the day of the full moon, the third at the first quarter, the fourth two days before the new moon, and the fifth at the first quarter. Not satisfied with these results, he repaired to Westminster Abbey, and out of the vast multitude there, he was so successful as to pick out three stones which confirmed his newly-adopted views. He also went to many other churchyards, and was able to select similar corroborations. Upon these he builds up his implicit faith in the doctrine, expressing his astonishment that it should have suggested itself to no one but the author of that work before. The work itself contains a formidable list of instances in point, some of which we may quote. Old Parr died at the age of 152, two days after the full moon. Henry Jenkins on the day of the new moon, at the age of 169. The poet Chaucer on the day of the first quarter; Copernicus on the day of the last quarter; Henry VIII. on the day of the first quarter; Calvin two days after the full moon; Queen Elizabeth on the day of the last quarter; Shakespeare the day after the full moon; Lord Bacon on the day after the last quarter; Milton two days before the new moon; Locke and Newton also two days before the new moon; Earl Chatham, Dr Samuel Johnson, Linnæus, Dr Franklin, Sir Joshua Reynolds, Burke, Wilkes, General Washington, in common with many other of the illustrious men of our own country and of others, all succumbed, according to our author, to the lunar influence of these two periods. We have to regret that the requisite ephemerides to verify these cases are not within our reach. As this statement appears in a work of some circulation, published so recently as 1802, it deserves confuting; and in the absence of positive evidence upon the subject, we may

state our belief that the churchyards would furnish as many arguments *con*, probably more, than they have supplied *pro*; and nothing but severe statistical evidence would satisfy us that the idea is anything more than a long-lived relic of lunar fallacies.

Having thus spent some little time upon this class of lunar absurdities, let us turn to others even more ludicrous; and of these we shall select, as the oddest of all, the chimera of the learned and ingenious mathematician Bishop Wilkins. A journey to the moon has long been a favourite idea among philosophical dreamers; something so tempting appears in it, while it is not so far removed from the bounds of possibility as in the case of the more distant heavenly bodies. Bishop Wilkins's way to the moon is one of the most laborious and serious essays which have appeared, to our belief, upon this enchanting topic; and there seems no reason to doubt that it occupied his mind not only as a romantic subject for contemplation, but as one which he viewed as a sober possibility, though not acquainted with the means of accomplishing it. His work is oddly enough entitled the 'Discovery of a *New World*,' which one would suppose, considering the long period during which the moon and mankind have preserved a peaceful acquaintance, was something of a misnomer. The object is to demonstrate that there is another habitable world in the moon; and, wonder of wonders, that a passage thither is possible! An anecdote is related which shows that the learned bishop was neither to be laughed out of his conceit nor lacked wit to defend it. The famous Duchess of Newcastle objected to Dr Wilkins the want of bating places in his way to the new world, when the doctor expressed his surprise that such an objection should be made by a lady who had been all her life employed in *building castles in the air*. Several propositions are laid down in this curious treatise, of which we may extract the following—that there is an atmosphere encompassing it; that it is a solid opaque body; that it is probable there may be inhabitants there—but he prudently adds, of what kind is uncertain; and lastly, that it is possible that posterity might discover a conveyance to this other world; and if there were inhabitants there, to *establish commerce with them*. This was the true spirit of British enterprise indeed! In the ingenious manner peculiar to him, he proceeds to show the possibility of the passage. He conceived it possible that a man might be able to fly, by the application of wings to his body, as angels are pictured, and as has been attempted by divers, particularly by a Turk in Constantinople, who, if we mistake not, either broke his leg or lost his life for his pains. Another way of reaching the moon suggested itself still. If there be such a great *ruck* in Madagascar as Marco Polo mentions, the feathers in whose wings are twelve feet long! which can swoop up a horse and his rider, or an elephant, as easily as our kites do a mouse—why, then, it is but catching and teaching one of these to carry a man, and he may ride up thither, as Ganymede upon his eagle! Or if neither of these methods would answer—and for ourselves we should be uncommonly afraid of a high-spirited *ruck*, and should beg for a reversal of the laws of the attraction of gravitation before we set out—yet 'I do seriously affirm, and upon good grounds,' saith the doctor, 'that it is possible to make a flying chariot in which a man may sit, and give such motion to it as shall convey him through the air.' The chariot was to be large enough to contain food for the journey. And here, again, the commercial interests were duly considered, also 'the commodities for traffic' with the lunars, or moon-men and moon-women. 'A great ship,' he adds, 'swims as well as a little cork; and an eagle flies as well as a tiny gnat.' The perfecting of such an invention would be of such excellent use, that it were enough not only to make the inventor, but the age in which he should live, for ever famous. One would almost believe that the philosopher had a perspective view of some of the absurdities of our own time; and, taken satirically, his

work would be the severest critique upon the preposterously ridiculous attempts of some modern Dædali. It was in a kindred spirit, and with dreams which no doubt partook much of the character of sober conceptions, that another learned prelate composed, under a *nom de guerre*, the adventures known as the journey of Domingo Gonzales to the moon. This very curious and amusing fable is preserved among the Harleian manuscripts, and deserves perusal by those who have the opportunity for the ingenuity of its composition, and for the singular correspondence of its detail in some respects with what reasoning from analogy would lead us to anticipate about the lunar world. His plan of getting thither was a simple one. He harnessed five-and-twenty wild swans to a car, and all taking wing, made directly for the moon, where he arrived after twelve days' journey, passing through regions of meteors, spirits, &c. and meeting with clouds of migratory birds and insects. Getting out on *luna firma*, he beheld divers marvellous things—great houses, palaces, beasts, birds, and great and little lunites, who travelled by leaping up sixty feet into the air, and being then out of the influence of lunar attraction, swept by means of fans along the liquid plains. He descended in China, after a happy sojourn among his lunar friends. There we may end our subject. Had but Dr Wilkins, and all who have followed his footsteps, lived in our balloon times, what a world of labour, and argument, and time, and pen, paper, ink, and printing would have been saved! Or had they been told of the limits of the earth's atmosphere, how it would have blighted their bright commercial advantages in the bud! Perhaps this attempt to sketch, in a playful manner, a few of these follies, may not be without its advantage; and if it will show us the invariably erratic tendency of hasty generalisations, unsupported by a single fact, it will do some good, and may prevent some errors, if not as extravagant, possibly quite as ludicrous. It may be more romantic to behold our fair moon with the eyes of superstition, and to attribute to her influences whose secret causes lie elsewhere; but it is more sobering, more pride-subduing, more awe-exciting to look at her with those of philosophy, and to behold in her, despite her now calm and silvery lustre, a rugged, scorched, sealess, airless world.

ANATOMY OF LAUGHTER.

THE variety of publications now circulating in England, with the common aim of making the readers laugh, is not the least remarkable feature of this age of steam and iron. But it is odd that among the multitude of our literary jokers, there is not one who has thought of considering what laughter is—who has inquired into the philosophy of his art. Surely this would be the best jest of all. If the right theory were hit upon, fun would always tell; and we should no longer have to wander, as we do now, through page after page, in quest of an actual bona-fide joke. It is cruel to disappoint a man who, on the faith of a title-page, sits down for the express purpose of laughing. It is, in fact, a kind of fraud; and the abused reader is led to think bitterly of the Johnsonian connection between punning and pocket-picking.

In other countries we meet with sundry attempts at an anatomy of mirth. In 1662, an Italian astrologer published an essay at Orleans, tracing the temperaments of men by their mode of laughing. The melancholic class, according to this philosopher, laugh hee—hee—hee! the bilious, hae—hae—hae! the phlegmatic, ha—ha—ha! and the sanguine, ho—ho—ho! But the treatise of a French author, supposed to be Poinsinet des Sivry, given to the world a hundred years later, goes much deeper into the subject. It is entitled, '*Traité des Causes Physiques et Morales du Rire*, relativement

à l'Art de l'Exciter,' and contains an 'imaginary conversation,' among some eminent men, on the nature of laughter. According to Destouches, one of the colloquists, laughter is derived from a principle of reason, and is the effect of joy; while Fontenelle, on the contrary, considers it to be, like anger, a brief madness.

If it had any necessary connection with joy, argues the latter, we should never be joyful without laughing; and the more joyful we were, the louder and longer would be our guffaws. Whether Fontenelle be right or not, Destouches undoubtedly is wrong. According to his theory, a lover accepted by his mistress would giggle wildly in her face, and when they came to be married, laugh out his responses at the altar like an evil spirit; a wife, on receiving a cheque from her husband for a new dress, would go off forthwith into cachinnatory hysterics; and a man hearing suddenly of a fat legacy, would disturb the whole neighbourhood with his roars.

'You pretend,' says Fontenelle, 'that this convulsion arises from joy: let us see what connection there is between them;' and he gives the following anatomy of laughter, compiled apparently from different sources.

The forehead is enlarged, the eyebrows lowered, the eyelids drawn in at the corners, and the surrounding skin covered with wrinkles. The eye, constrained and half shut, is only lustrous by the humidity which darkens it; for even those who were never melted to tears by grief, must weep when they laugh. The nose is puckered and pointed, the lips drawn back and lengthened, the teeth uncovered, and the cheeks raised and stretched forcibly upon their muscles, so as to leave agreeable dimples in some, and ugly holes in others. The mouth, forced open, exhibits the convulsed tongue suspended in the midst. The voice is broken, sometimes quick and piercing, sometimes weak and plaintive. The neck swells and shortens; its veins are stretched and puffed; and the blood, which rushes tumultuously into the slenderest vessels of the epidermis, dyes the face with a deep red, symptomatic of approaching suffocation. The breast in the meantime is agitated so wildly, that speech, or even respiration, is out of the question. The sides ache; the entrails feel as if they were torn; the ribs as if they were dislocated; and the hands are pressed upon the seat of pain, while the whole body is bent, twisted, and convulsed. The face of the victim is bathed in perspiration, his voice broken into sobs, and his breath extinguished in sighs. The result is sometimes displaced joints, syncope, and death. A man, continues Fontenelle, seldom laughs when he is alone, or when he is collected enough to consult the oracle of reason. He is betrayed into the misfortune by surprise, when the intelligence of his nature has no time to come to the rescue; and the trumpet of folly, as Count Oxenstiern calls it, goes ha—ha—ha! before he is aware.

This elaborate paradox is strengthened by Montesquieu, who asserts that laughter can have no necessary connection with joy, inasmuch as it precedes, follows, or accompanies that feeling indifferently. But neither, he thinks, can it be the result of folly, since wise men laugh as well as fools; or, at anyrate, the folly must be of a peculiar and specific nature. It is his notion, however, that the cachinnation in question originates in pride. The men or actions we laugh at are only ridiculous when they appear to us in the light of inferiority. In laughing at others, we applaud ourselves. When a sudden squall has eloped with a man's hat, it is intensely amusing to see the owner panting after it, while

the runaway appears to be endowed for the nonce with the legs of its parent beaver, and with all the sagacity of that animal too, in dodging its pursuer. Our amusement, however, proceeds from a sense of self-security—of superior prudence: our own hat is on our head; we should like to see the squall that could catch us in a nap like that; the man deserves what he has got for not being wide awake like us; serve him right—ha—ha—ha! At a play, in like manner, we receive a vivid impression of the ridiculous when the vice or folly satirised belongs to other people: but only let us recognise the trait exhibited as something of our own—only let us suspect that we are ourselves, in our inner nature, paraded upon the stage to make our neighbours laugh—and the joke at once loses its point.

We may add to these illustrations with which we have fortified the supposititious Montesquieu, that a man's occasionally laughing at himself is not to be considered as militating against the theory in question. In such cases the action or suffering is a rare departure from our ordinary course of existence: it is a sudden and temporary folly which establishes the general state of wisdom; it is an exception that proves the rule; and even in the act of laughing at our own folly, we appeal to Philip sober.

Laughter is divided by this author into various kinds: the laugh *à gorge déployée*, or vulgar laugh; the graceful laugh or smile; the laugh of dignity or protection; the painful or disdainful laugh; the frank, sincere, or serene laugh, diffusing itself over the whole physiognomy; the hypocritical laugh; the malignant laugh; the smothered laugh; the forced laugh; the bitter laugh; the sardonic laugh; in fine, the inextinguishable laugh of Homer, being a convulsion which usurps our whole faculties, and only subsides when it is its own pleasure to do so. All these laughs are connected, by a greater or less exercise of ingenuity, with pride.

This theory is probably based upon the definition given by Hobbes—'The passion of laughter is nothing else but sudden glory, arising from some sudden conception of some eminency in ourselves by comparison with the infirmity of others, or with our own formerly;' of which Beattie says, that it would be altogether undeserving of notice if Addison had not spoken of it with approbation in the 'Spectator.' Addison, in fact, after praising the theory, says that, according to it, instead of telling a man whom we find laughing that he is very merry, we should tell him he is very proud. Thus our great men should all have been great laughers. James Watt should have laughed with a million horse-power; Thomas Gray should at this moment perambulate our railways, through the length and breadth of the land, ready to burst his boiler with merriment at the sight of the trains rushing past him, and at the thought of the honours and emoluments with which the gratitude of his country has overwhelmed the originator of the system; and the Duke of Wellington, after giving peace to the world by decimating the turbulent portion of its denizens, should have put his hands to his sides on the field of Waterloo, and roared the cannon out of countenance.

Beattie's theory is, 'that laughter arises from the view of two or more inconsistent, unsuitable, or incongruous parts or circumstances, considered as united in one complex object or assemblage, or as acquiring a sort of natural relation from the peculiar manner in which the mind takes notice of them;' and he explains himself further by saying, that it is 'an opposition of suitability or unsuitableness, or of relation or the want of relation, united, or supposed to be united, in the same assemblage.' Thus joy—pride—and a union of incongruities—have all in turn been blamed by theorists for the betrayal of mankind into that disorder of the fifth pair of nerves which some think an agreeable interruption of the calmness of sober health.

Each theorist thinks the others wrong; but the truth may perhaps be, that they are all right. Joy, pride, and incongruous unions, may all have something to do

with the result. For instance, Aristotle considers an error to be ridiculous when it is neither painful nor pernicious. And thus, if we see a man swallow by mistake a bumper of salt and water instead of a bumper of wine, there is no end to our rejoicing; whereas, if the substituted potion were something dangerous to health or life, we should be as serious as the fifth act. In the case of the salt and water, we have all the three theories in play at once; and the idea presents itself that all three are necessarily so. Mere joy will not make us laugh, or an accepted lover would laugh in his mistress's face; mere pride, or the feeling of triumph, will not make us laugh, or the Duke of Wellington would have split his sides on Waterloo; and mere incongruity will not make us laugh, or we should laugh as heartily at our health being drunk in arsenic and water as in salt and water instead of wine.

If this hint should not be relished by the laughing philosophers of the day, perhaps they would like as an alternative the opinion of Quintilian, *Anceps ejus rei ratio est*—which means, that we know nothing at all about the matter.

THE EDUCATIONAL INSTITUTE OF SCOTLAND.

It has often been matter of complaint with teachers themselves, and a subject of wonder with other people, that they are so disunited, and apparently estranged. Those who follow even the more common handicrafts seem to have known, as if by instinct, that 'union is strength,' and to have acted accordingly. But teachers have never yet combined, so as to present a united front to society. Perhaps this was not really to be wondered at, so long as teachers were regarded as beings of a subordinate character (which was the case in Scotland), and while their function was one held in little respect (which was the case everywhere). Now, however, things have somewhat changed. The highest wants of society demand the employment of talent, not merely in our universities, but in our common schools; and many men of good abilities and attainments are beginning to enter the profession, as one by which they may gratify an honourable ambition. It is time, therefore, that the privileges of a distinct profession were assigned them. Of these the most important is self-government and entire independence. Long accustomed to submit to be snubbed and looked down upon, they will not perhaps at first conduct their common affairs with the firmness and prudence which are desirable. There may be a transition period of anarchy, more or less extended, before they shall settle into a right state; for effects will not immediately disappear with their causes; and if dependence and penury have deteriorated the whole class, it will take some time for independence, and more generous remunerations, to raise them. Accustomed, too, as society has long been to look down on schoolmasters, it will not readily come to respect them. Yet the time is favourable to establish a character; for even with the general public there is now a sense of the propriety of raising the teacher to a superior position.

A dim perception of the advantages of union has long haunted the minds of many members of the profession, and various local attempts have been made to realise them. These cannot be said to have entirely failed, for it is by their means that the desire for combination has been kept alive; but they have been productive of so little good, that we are forced to despair of anything less than a united effort of all the teachers in the country. We rejoice to think that there is some prospect of this effort being now made, and under such auspices as almost to secure success.

The history of the movement to which we refer is interesting, in a general point of view, as indicating the measures by which a depressed class may seek to elevate themselves. Upwards of eighteen months ago, a number of gentlemen engaged in the occupation of

teaching, in and about London, determined to form themselves into a united body, which they eventually resolved to call 'The College of Preceptors.' The great object of 'the College' is to guarantee to the public the efficiency of its members, and to discriminate the worthy from the unworthy—the Pestalozzis from the Squeerses—those who follow teaching as a liberal profession, not inconsistent with the character of a gentleman, and those who, in the spirit of hodmen, drive it as a trade. So far as we have been able to learn, the College has acted with much vigour as well as much prudence; and it promises, in no long time, to regenerate the teachers of the middle classes of society in England. It is the misfortune and not the fault of 'The College of Preceptors' to be confined to one class. In the south, the great schools—such as Westminster, Harrow, Eton, &c.—are mostly in the hands of the clergy; and rather in spite of, than in accordance with, the wills of many of their founders, are likely to remain so. These masters of course take their standing in society as clergymen, and not as teachers. Having nothing to gain by associating with their brethren of the middle class, they refrain from joining the College, and in this way greatly lessen its influence. In Scotland, things are quite different: the teachers of our burgh and parochial schools are neither socially nor in point of education raised above the unendowed teachers of the country, and here all can readily unite for the accomplishment of a common purpose, without the sacrifice of any principle or prejudice. Accordingly, the movement which originated in England among a class, when extended to Scotland, assumed an appearance that deserved the name of national.

About twelve months ago, an educational association in Glasgow addressed a circular to the principal teachers of Edinburgh, with a view to persuade them 'to lend their authority and example in urging the formation of local associations throughout the country, for the purpose of considering the best means by which the standard of education and the status of the educator might be elevated.' This appeal was most favourably responded to by the individuals addressed, and they immediately set themselves to the task of organising the teachers of Scotland. They opened a correspondence with schoolmasters in all parts of the country, and the desire for union was found to be all but universal. After many private meetings, they agreed upon certain fundamental points, on which it was resolved to found 'The Educational Institute of Scotland.' Accordingly, in September last, a very large and influential meeting of teachers was convened in the High School of Edinburgh, and the code of laws, which had been prepared with much care by the teachers of the capital, was adopted as the 'tentative constitution' of the Institute. The preliminary statement attached to this code very briefly indicates the objects aimed at; and the laws are taken up with detailing the means by which, and the persons by whom, these objects are to be effected. 'As the office of a public teacher is one of great responsibility, and of much importance to the welfare of the community; as it requires for its right discharge a considerable amount of professional acquirements and skill; and as there is no organised body in Scotland whose duty it is to ascertain and certify the qualifications of those intending to enter upon this office, and whose attestation shall be a sufficient recommendation to the individual and guarantee to his employers, it is expedient that the teachers of Scotland, agreeably to the practice of other liberal professions, should unite for the purpose of supplying this defect in the educational arrangements of the country, and thereby of increasing their efficiency, improving their condition, and raising the standard of education in general.'

Few who have taken any interest in the subject of education will call in question any part of this statement. Some, indeed, might have wished, and we willingly confess ourselves to be among the number, that

government had stepped in and appointed a board of examiners, with power to certify the qualifications of every teacher in the kingdom. The appointment of such a board, possessing the full confidence of the public, would have rendered it, if not illegal, at least disreputable, to teach without a license, and would at once have cleared the profession of *quacks*. Government, however, has done nothing, or next to nothing, in the matter; and it is therefore all the more necessary that well-qualified teachers should take the whole subject into their own hands, and adopt such measures as may be necessary to discriminate between themselves and those who, without any of the necessary qualifications, have insinuated themselves into the office of educators. For a profession to reform itself, and cast out its unworthy members, is no doubt a work of great delicacy and difficulty; but it may be done 'in some approximate degree.' As is hinted in the extract which we have just submitted, the principle is not new. Surgeons have long been allowed to pronounce on the qualifications of surgeons, and to exclude mere *barbers* from the profession; lawyers are allowed to decide on the claims of those who wish to practise the profession of the law; and there is no valid reason why teachers should not exercise a similar privilege. The difficulty at the commencement will be great, but this ought not to discourage the really earnest. It will be constantly growing less, and in the course of a few years it will entirely disappear. The existing race of teachers, who cannot be subjected to any systematic trial, will soon die off, and regular examinations may be instituted in the case of the young men who are to be their successors. In this way, in the short space of ten years, the profession would be almost entirely renovated; and, from being a disjointed, ill-assisted mass, held together by no common idea, it would become a compact and respected corporation. Much will depend on the teachers themselves. They can only, as a body, hope to attain additional regard by superior attainments, and by improvements in school procedure. The lesson cannot be too strongly urged on the Institute, that it has a character entirely to make for itself. At first, it is sure to be neglected; and when its enemies begin to feel that it is 'a great fact,' if ever it should arrive at the state indicated by that laconic description, it will be vigorously opposed. Those hitherto affecting rule and patronage over teachers, will not willingly leave them to their own mastership; and corporate influence will not be obtained till the Institute has acted, for some considerable time, in such a way as to impress the public with a sense of its activity, intelligence, judgment, and good faith. In one word, the Institute will not attain influence until it shows that it deserves it; and we will not pay the teachers of Scotland so poor a compliment, or rather we will not lay on them so unmerited a reproach, as to suppose that they want influence on easier terms.

The object they have in view is worth struggling for; it is an honourable ambition that they are actuated by; and hundreds not in the profession will lend their influence in enabling them to become a self-ruled body. They ask only liberty to manage their own affairs; and we hope they will be content with nothing less.

On the specific measures that the Institute seems resolved to adopt for regenerating the profession, we would be tender in pronouncing opinion. Further reflection will perhaps convince them of the necessity of being more sparing of their honorary degrees. If they are of very easy attainment, they will be valueless. If a mere teacher of writing, for instance, can become a 'Fellow' by paying his two guineas, what value can attach to the degree in the eye of the classical and mathematical scholar? We would have the Institute open wide its arms to all as members, but be very jealous in the distribution of its honours.

The last item of the constitution is not the least important:—'In further prosecuting,' it says, 'the objects of the Institute, it seems expedient that a knowledge

of the theory and practice of education be more widely disseminated among the profession by means of public lectures, the institution of libraries, and such other means as may afterwards seem advisable.' Here two subjects are touched on, both of great consequence. The theory of education has been profoundly studied, and several great principles are agreed upon, and yet every teacher begins his vocation as if he were the first that ever taught. Mere blind imitation should not be the guide of the young teacher. He ought, by the study of philosophy, to be grounded in the principles of teaching. Wherever a well-qualified lecturer on education can be found, let him be employed by the local associations; but, in his absence, the members of the association may do much for themselves. A simple statement of the mode of teaching any particular subject will be of great use.

As to the second point, fortunately there is much less difficulty about it. To establish a schoolmasters' library, will not be found beyond the means of even the poorest locality. They certainly need access to works which shall enable them to explain to their classes the various subjects that occupy their attention, and they require good books to keep up their own mental activity. No teacher should enter his school-room without preparation; and it is a principle too much lost sight of among them, that they are no longer fit to teach than they are willing to learn. When the teacher's education is finished, the pupil's is almost done too. The late Dr Arnold, in addressing a teacher, has well said—'Every improvement of your own powers and knowledge tells immediately upon them [the boys]; and indeed I hold that a man is only fit to teach as long as he is himself learning daily. If the mind once become stagnant, it can give no fresh draft to another mind; it is drinking out of a pond instead of a spring; and whatever you read tends generally to your own increase of power, and will be felt by you in a hundred ways hereafter.' If these words be carefully reflected on, it will be seen why we attach so much importance to the formation of good libraries for the use of teachers. They would be a perennial fountain, sending out streams to fertilise the land, and they would serve both to unite teachers and to keep them united.

BALLADS OF THE RHINE.

BY ANDREW B. PICKEN.

LAHNTHAL.

A DREAM came o'er me once, one sunny Sabbath afternoon,
In a winding glade of England, 'neath the leafy arch of June.
A hush of heat stilled everything, and sweet, sweet was the sleep
That made old Memory's honeyed tears rise from an urn so deep.
'Midst slumber's vista'd reach I saw a lone Bavarian maid
Come wandering with sad homeless smile up through the emerald
shade.

She still looked back, as there was something that her young breast
pined to leave;

And wept above the wildflowers, as 'twere sweet with them to
grieve;

And with a garish fitfulness, like the last song of the swan,
She murmured of 'Green willows leaning o'er the peaceful Lahn.

'Oh! buy my brooms, my merry maids, they are not half so fair
As the flaxen tendrils that the wind flings from your clouded hair;
But they were cut from willow-trees where home's sweet blessings
twine,

And imaged with a loving truth from ringlets of the vine.
They will tell a pleasant tale, as none but fairy willows can,
For they breathed above my childhood—those old dwellers of the
Lahn!

'How often hath the vesper hymn their drooping garlands thrilled,
When young and old beneath their shade the day's last tasks ful-
filled;

And the river seemed to listen, as it gently stole away,
To the praise of Him who seepeth mysterious night and day!
How often have we sat and sang till the low moon, faint and wan,
Streamed o'er the dreaming willows—the old willows of the Lahn!

'How often hath their silvery sweep waved childish cares away—
Their hushing whisper fallen like a nurse's roundelay;
And when at midnight's anxious watch we heard the old trunks
crack,

Have we looked around us to behold the reverend dead come back!

For our fathers, and the men of old with whom our names began,
Reared their altars 'neath the willows—the gray willows of the
Lahn!

'I hear the rustling welcome that at morning round us swept,
And the ever-sounding blessing that the noontide slumber kept;
I see the soft and gem-like tears that dewy evening brought,
Hang glistening on the goosamer the pilgrim spider wrought.
My heart is wandering round them still—at night, at noon, at dawn,
The patriarchal willows—the old willows of the Lahn!

'Two names were carved one summer eve on a dark half-hidden
bough,

And a compact made—I can but weep, and wonder at it now;
For 'twas of shrined hearts, which now, alas! are far astray,
Where every embered spark of hope is wildly wept away:
And another symbol of the faith of thoughtless, thankless man,
Are our old ancestral willows—the dark willows of the Lahn!

'No love was left me to brood o'er in those sweet trailing glooms,
So with heart within my knapsack I have come to sell my brooms;
To sing ye the old German songs that float above the Rhine,
To remind ye that the Saxon was our father—thine and mine;
To think in every corner, till my wearied breath is drawn,
How I best may love, when far away, our willows by the Lahn!

COLOGNE.

To the shrine of old St Cunibert, that structure gaunt and lone,
The ancient 'midst the aged of the sainted walls of Köln,
The pilgrim tribes of olden days oft hied to bend the knee
For those who fought the holy fight by Paynim Galliee.
Some swelled the hymn of lofty pride, some pleaded tender fears;
And some brought bright and golden gifts, some only prayers and
tears.

A lonely pilgrim cometh still to that dark altar-stone;
A weary one, that only there doth make her wonted moan;
And many a rugged league hath known her parched and bleeding
feet,

And many a kindly heart hath blessed her greeting mild and sweet.
For still she murmured mournfully, 'To Köln I come to pray
For my father and my brethren, who are fighting far away.'

She struggles on, through storm and shine, though wearisome and
faint;

None know how the shorn lamb hath fared—to none she makes
complaint.

Their aims she smilingly rejects, and shows, with placid look,
The acorns and the cresses she hath gathered by the brook.
And still she murmurs mournfully, 'To Köln I come to pray
For my father and my brethren, who are fighting far away.'

There's not a child in all the town but knoweth her sweet face;
The gleeful quell their merriment, the sullen yield her place;
The churchman foldeth his broad stole, and bends with stately
smile,

As drooping, like the Magdalen, she totters down the aisle;
For she bears her burthen of the Cross, and comes 'To Köln to pray
For her father and her brethren, who are fighting far away.'

She knows not that the mountain cross is reared above their bones,
On a lone barrance of Biscay—those dear lamented ones;
That the clarion of triumphant fields hath perished from the ear;
That the old familiar sounds of home they never more may hear;
For still she says, the simple one, 'To Köln I come to pray
For my father and my brethren, who are fighting far away.'

A noble vessel is the heart that floats amidst its tears,
And braves the chill of pale suspense, and cold besieging fears.
The intellect, with all its towers, may crumble and decay;
The mind, with all its mysteries, may darkly fade away;
But still the poor heart meekly comes to holy Köln to pray
For the faithful sons of Germany low sleeping far away.

MANHEIM.

AN ANECDOTE OF CHARLES SANDT.

A FEEBLE thread of light shot down, a pale imprisoned beam,
That faltered into darkness, like an ocean-merging stream;
The weary grates that crossed its way, and caught its earliest kiss,
Seemed to mourn its fleeting lifetime in the dungeon's dank abyss.
The walls gave back no answering smile; the cold and clammy floor,
With its tenantry of prowling rats, rejoiced in gloom the more.

Yet there was one sad form that caught the dim bewildered rays,
Like a lonely turbaned pillar in a Moslem burial-place:
A prisoner—at doomed morn, whose moments ne'er relax,
Condemned to yield his life beneath the ignominious axe.
He stands within their halo with a swimming, wistful eye,
And bulleth up a hopeless dream of blessed liberty.

The tonsured monk, that at his feet with trembling ardour prays,
Charms not away from that strayed beam the captive's yearning
gaze.

Like a fevered child, whom even Love's soft sympathy annoys,
He chideth back the holy man with fierce and husky voice.

'Hush, dreamer! He hath sought me here, in crime's accused
abode;

He hath pierced the triple-walled gloom—Behold the eye of God!

He hath sought me—He hath found me with the blood upon my hands;

The slayer of his brother 'neath *His* accusation stands!
The craftiest lore cannot avert that Sinai-thundered glare,
Nor still the soul-re-echoing voice, "Where is thy brother—where?"

Hush, dreamer! Leave the guilty heart to wrestle with its load;
A mightier far than thou is here—Behold the eye of God!

He bringeth back the blessed years of childhood's sinless way,
When the world's glad garden to mine eyes in summer's radiance lay,

And a fountain of sweet waters, welling upwards from the heart,
Made the hopes of life's young innocence, like starry flowers, start.
Hush, dreamer! Let me weep; the rock is smitten, and the rod
Hath made the hidden treasure flow—Behold the eye of God!

My father's honoured age, alas! is bowed unto the dust;
My mother's loving pride is quelled, and broke her heart of trust;
The holiest bonds of earth for me are burst and sundered all,
And for the hoary head I smote mine own is doomed to fall!
Hush, dreamer! There's no refuge in thy dark and subtle code
From *that* which searcheth everywhere—Behold the eye of God!

When the bourne is gained the abhorred axe must lead me to at
morn,

Amidst upheaving curses, and a relentless shout of scorn;
When the gates of life shall close upon my errors and my crimes,
Let my motives stand recorded till the birth of other times.
Hush, dreamer! Preach to-morrow to the valley's senseless clod;
The rest hath its interpreter—Behold the eye of God!

PERSONAL NARRATIVE OF THE ESCAPE OF W. L. MACKENZIE FROM TORONTO TO THE UNITED STATES.

THE rash and ill-planned rebellion of Upper Canada was speedily checked by the discomfiture of the insurgents at Montgomery's Tavern, near Toronto, on the 7th December 1837. Though Mackenzie, the chief leader of the insurrection, did not certainly display much of the warrior on that occasion, yet he showed considerable tact and presence of mind in his subsequent escape from his pursuers; and there is something in the successful escape of any one from imminent peril, the detail of which has a tendency to raise the individual into a sort of hero.

The first few volleys of the government militia cooled the ardour of the insurgents; the rifle balls fell thick amongst them; and a friend of Mackenzie's falling dead at his side, he deemed it necessary to quit the field, and warn his comrades to disperse. After an unsuccessful attempt to snatch his cloak from the hotel, he set off on foot, and after running a short distance, met a friendly farmer, who readily gave him his horse, a trusty, sure-footed creature, which that day did him good service. On he rode, while volumes of smoke rolled after him, and behind was seen the vivid glare of the flames of the fated tavern and outhouses which had been the scene of the encounter. He met several friends; one handed him an over-coat; and the general resolution was to make for the States by the head of Lake Ontario.

Meantime government rewards were offered for their apprehension—one thousand pounds for Mackenzie, and five hundred pounds per man for several others. Couriers were sent off in every direction with tidings to the like effect, and a gazette was circulated minutely describing those persons whose apprehension was especially desired.

Finding himself now closely pursued and repeatedly fired at, Mackenzie left the high road with one friend, and made for Shepherd's Mills. 'The fleetest horsemen of the official party were so close upon us,' says he in his narrative,* 'that I had only time to jump off my

horse and ask the miller of the place whether a large body of men, then on the heights, were friends or foes, before our pursuers were climbing up the steep ascent almost beside me.' He eluded them, and soon after overtook Colonel Lout with about ninety of his friends. After taking some refreshment at a farmer's, the party separated, sixteen only accompanying Mackenzie. They were all on foot, many unarmed. Mackenzie had no other arms than a single-barrelled pistol. They made for the Humber Bridge through Vaughan, but found it strongly guarded. They then went up the river a long way, got some supper at the house of a farmer, crossed the stream on a foot bridge, and by two o'clock next morning reached the house of a friendly settler, completely exhausted with cold and fatigue.

Here blankets were hung over the windows to avoid suspicion; food and beds were prepared; and while the government troops were keenly searching for them, the fugitives were sleeping soundly. Next morning, those who had arms buried them: they agreed to separate, and make for the frontier two and two together. A young lad of twenty was the companion of Mackenzie. They set out together undisguised, and on foot, and met and conversed with several people, but found none disposed to betray them. About three o'clock in the afternoon they reached Comfort's Mills near Streetsville; there they were told that Colonel Chisholm, with three hundred men, were divided into parties in search of them. Mr Comfort, an American by birth, but a citizen of Canada, treated them kindly, and lent them his wagon, with a young Irish driver. They drove through the village in broad daylight; 'yet,' says the fugitive, 'though known to everybody, we proceeded a long way west before danger approached. At length, however, we were hotly pursued by a party of mounted troops; our driver became alarmed, and with reason, and I took the reins, and pushed onwards at full speed over a rough, hard-frozen road without snow. Our pursuers, nevertheless, gained on us; and when near the Sixteen-Mile Creek, we ascertained that my countryman, Colonel Chalmers, had a party guarding the bridge. The creek swells up at times into a rapid river—it was now swollen by the November rains. What was to be done? My companion and I jumped from the wagon, made towards the forest, asked a labourer the way to Esqueving, to put our pursuers off our track, and were soon in the thickest of the patch of woods near the deep ravine in which flows the creek numbered Sixteen. Those in pursuit came up with our driver almost immediately after we left, and took him prisoner. The frequent reports of rifles, and the barking of dogs, near the place where we were concealed, annoyed us not a little. There was now but one chance of escape, surrounded as we were—for the young man had refused to leave me—and that was to stem the stream and cross the swollen creek. We accordingly stripped ourselves naked, and with the surface ice beating against us, and holding our garments over our heads, in a bitter cold December night, buffeted the current, and were soon up to our necks. I hit my foot against a stone, let fall some of my clothes, which my companion caught, and cried aloud with pain. The cold in that stream caused me the most cruel and intense sensation of pain I ever endured; but we got through, though with a better chance for drowning; and the frozen sand on the banks seemed warm to our feet when we once more trod on it. In an hour and a half we were under the hospitable roof of a kind farmer; and a supply of dry flannels and food, and an hour's rest, were kindly furnished us, while the sons and daughter of our host kept a silent watch outside in the cold, while I and my companion slept.' They started again; travelled all night; and by four o'clock on Satur-

* In 'The Tribune,' New York, September 1847, is a long narrative by Mackenzie of his escape. The present paper contains the substance of his narrative, condensed and much modified, all

the political allusions and digressions with which it is interspersed being omitted, and only the most interesting parts of the personal adventures given in a connected form.

day morning they reached Wellington Square by the middle road. 'The farmers' dogs began to bark loudly; the heavy tramp of a party of horsemen was heard behind us; we retired a little way into the woods; I saw that the men were armed; entered the road again; and half an hour before twilight reached the door of an upright magistrate, which an English boy at once opened to us. I sent up my name; was requested to walk up stairs (in the dark), and was told that the house, barns, and every part of their premises had been twice searched for me that morning, and that M'Nab's men from Hamilton were scouring the country in all directions in the hope of taking me. I asked if I had the least chance to pass downward by the way of Burlington Beach, but was answered that both roads were guarded, and that Dr Rolph was by that time safe in Lewiston.' They immediately retired to a thicket behind the house, deeming it the safest place; and as the young man was chilled with cold and fatigue, I was deemed best for him to separate from Mackenzie, as, not being known, he would be safe from apprehension. He did so, and reached the frontier, but was laid up for four months afterwards by indisposition. 'At dawn of day,' continues Mackenzie, 'it began to snow and show footmarks. A pease-rick, which the pigs had undermined all round, stood on a high knoll, and I chose it for a hiding-place. For ten or twelve days I had slept, when I could get any sleep, in my clothes; and my limbs had swelled so, that I had to leave my boots, and wear a pair of slippers. My feet were wet, I was very weary, and the cold and drift annoyed me much. Breakfast I had had none; and in due time Colonel M'Dowall, the high-sheriff, and his posse, stood before me. House, barns, cellars, and garret were searched, and I the while quietly looking on. The colonel was afterwards second in command to Sir Allan M'Nab, opposite Navy Island, and when I lived in William Street. Some years ago he called on me, and we had a hearty laugh over his ineffectual exertions to catch a rebel in 1837. When the coast seemed clear, my terrified host, a wealthy Canadian, came up the hill as if to find his pigs, brought me two bottles of hot water for my feet, a bottle of tea, and several slices of bread and butter; told me that the neighbourhood was literally harassed with bodies of armed men in search of me, and advised that I should leave that place at dark, but where to go he could not tell me. After I left his premises, he was arrested; but had powerful friends, gave bail, and the matter ended there. When night set in, I knocked at the next farmer's door; they were strong government men, and as the house had been searched often for me already, they refused to see me; but their boy conducted me by a by-path to Mr King's, the next farm. Here I had supper; rested for an hour; and then walked with my host to my early residence, Dundas Village, at the head of Lake Ontario. We saw a small party of armed men on the road, near the mills of an Englishman; but they did not perceive us. We went to the dwelling of an old friend, to whom I stated that I thought I should now make a more speedy, yet equally sure progress on horseback. He risked at once, and that too most willingly, his horse. Mr King returned home, and I entered the village alone in the night, and was hailed by some person, who speedily passed on. I wanted to take a friend with me, but durst not go to wake him up. There was a guard on duty at the hotel, and I had to cross the creek close by a house which I had built in the public square. I then made for the mountain country above Hamilton, and in the way called upon some old Dutch friends, who told me that all the passes were guarded. Near Ancaster I got a fresh horse from an old friend, and pursued my journey; but coming upon a house well lighted up, and where a guard was evidently posted, I turned aside, and tried to find my way through the Biasbrook and Glassford woods. For several weary hours did I toil through the primeval forest, leading my horse, and unable to get out or find a path. The barking of a

dog brought me, when near daylight, to a solitary cottage; and its inhabitant—a negro—pointed out to me the Twenty-Mile Creek where it was fordable. Before I had ridden a mile, I came to a small hamlet, which I had not known before: entered a house, and oh my surprise—was instantly called by name! At the inn, I did not at all like the manner of him who addressed me, though I now know that all was well intended. Quite carelessly to appearance, I remounted my horse, and rode off very leisurely, but turned the first angle, and then galloped on, turned again, and galloped still faster. At some ten miles' distance, a farm, newly cleared, and situated in a by-place, seemed a safer haven. I entered the house, called for breakfast, and found in the owner a stout Hibernian farmer, an Orangeman from the north of Ireland, with a wife and five fine children. I took breakfast very much at my leisure; saw my horse watered and fed with oats in the sheaf; and then asked Mr Waters to be so kind as put me in the way to the mountain road; which he consented to do, but evidently with much reluctance. After we had travelled about a quarter of a mile in the woods, he turned round at a right angle, and said that that was the way.

"Not to the road?" said I.

"No; but to Mr M'Intyre the magistrate!"

'Here we came to a full stop. He was stout and burly, I small and slight made. I soon found that he had not dreamt of me as a rebel; his leading idea was, that I had a habit of borrowing other men's horses without their express leave—in other words, that I was a horse thief. Horses had been stolen, and he only did his duty by carrying a doubtful case before the nearest justice. This was a real puzzle. Should I tell Waters who I was, it was ten to one but he would seize me for the heavy reward. If I went before the justice, he would doubtless know and detain me. I asked Mr Waters to explain. He said that I had come in great haste to his house on a December Sunday morning; that it was on no public road, with my clothes torn, my face badly scratched, and my horse all in a foam; that I had refused to say who I was, or where I came from; had paid him a dollar for a very humble breakfast, been in no haste to leave, and was riding one of the finest horses in Canada—making, at the same time, for the frontier by the most unfrequented paths; and that many horses had been recently borrowed. My manner, he admitted, did not indicate anything wrong; but why did I studiously conceal my name and business? There was some truth in all this. My *bonnet rouge*; my torn, homespun, sorry slippers; weary gait, and unshaven beard, were assuredly not much in keeping with the charger I was riding; and I had unfortunately given no reply whatever to several of his and his goodwife's home questions. My chance to be tried and condemned in the hall where I had often sat in judgment on others was seemingly now very near, but I did not quite despair. To escape from Waters in that dense forest was entirely hopeless; to blow out his brains while he was acting quite conscientiously, while his five pretty children at home waited his early return, could have easily been done as far as opportunity went, for he was unsuspecting of anything of the kind, and my pistol was now loaded, and sure to fire. But I could not do it. So I held a parley with my detainer, touched on various subjects, and at last found, to my great surprise and real delight, that though averse to the object of the revolt, he spoke of myself in terms of good-will. His next neighbour had lived near me in 1823 at Queenstown, and had spoken so well of myself and family to him, as to have interested him, though he had never met me before. "I am an old magistrate," said I, "but at present in a situation of some difficulty. If I can satisfy you as to who I am, and why I am here, would you desire to gain the price of any man's blood?" He seemed to shudder at the very idea of such a thing. I then, before revealing myself, made him take a solemn oath of secrecy. When he had ascertained my name,

which I showed him on my watch, seals, and pocket-book, he expressed real sorrow on account of the dangerous situation in which I stood, and pledged himself to keep silence for twenty-four hours, directed me how to get into the main road, and feelingly urged me to accept his personal guidance to the frontier. He kept his word; but when I was fairly out of danger, he told the whole story to his neighbours, which caused his apprehension, though he was afterwards released.'

Our hero now gained the open country, recrossed the Twenty-Mile Creek, and at length re-entered the mountain path a little below where a military guard was then stationed. While in sight of this guard, he moved on very slowly. The country people were going to church, and he made as if going there too. As soon as he was out of sight, however, he used his spurs to some advantage. It appears that two men whom he had spoken to in the road gave the alarm to an armed party, who immediately gave pursuit. 'I perceived them,' says he, 'when a third of a mile off. I thought it safer to endeavour to put my pursuers off the track, and on a false scent, than to keep on a-head of them; so I turned short towards St Catherine's when I got to Smithville, and seemed to take that road down hill full speed. Instead of doing so, however, I turned a corner, put up my horse very quickly in the stable of a friendly Canadian, entered his house, he being at church, beheld my pursuers stop to interrogate a woman who had seen me pass, and then ride furiously onward by the St Catherine's road. I then went quietly to bed, and rested for some four hours; had a comfortable supper with the family, and what clothes I required. A trusty companion was also ready to mount his horse, and accompany me the last forty miles to Buffalo. We accordingly started about eight o'clock on Sunday night, and keeping clear of the armed guards, we got safe into Crowland before daylight. We awoke a friend here, turned our horses into his pasture, and he immediately accompanied us to the Niagara river on foot. On inquiry, it was found that all the boats on the river, except those at the ferries, which were well guarded, had been seized and taken care of by the officers of government. A gentleman, however, who lived opposite the head of Grand Island, was believed to have kept one of his boats locked up beside his carriages. This gentleman was applied to; and though no favourer of the late movement, and at considerable risk, immediately consented to give his boat. As well as I can now remember,' continues the narrator, 'it was about nine on Monday morning when I reached this gentleman's house, an excellent breakfast was prepared, and I was fatigued and hungry. But there was a military patrol on the river, and before sitting down to a repast, I thought it safe to step out and see if the coast was clear. Well for me it was that I did so! The custom-house officer, opposite Black Rock, and his troop of mounted dragoons, were so close upon us, riding up by the bank of the river, that had I not then observed their approach, they would have caught me at breakfast. Nine men out of ten, in such an emergency, would have hesitated to assist me, and to escape by land was at that time evidently impossible. My host lost not a moment; his boat was hauled across the road, and launched in the stream with all possible speed; and he, I, and my guide were scarcely afloat in it, and out a little way below the bank, when the officer with his troop of horse were parading in front of the house. How we escaped here is to me almost a miracle. I had resided long in the district, and was known by everybody: a boat was in the river against official orders: it was near the shore, and the carbines of the military could have compelled us to return, or have killed us if disobedient. The commanding officer did not see us, that was evident; he turned round at the moment to talk to the lady of the house and her daughters, who were standing in the parterre in front of the house full of anxiety on our account: but of the troop, not a few must have seen the movement; and yet we were allowed to

steer for the head of Grand Island with all the expedition in our power without interruption; nor was there a whisper said about the matter for many months thereafter. In an hour we were safe on the American shore, and that night I slept in tranquillity and safety.'

Column for Young People.

THE TWO BEES; OR THE HEATH AND THE HIVE.

UNDER the stump of an old willow-tree, that once grew and now withered upon the bank of a very narrow, shallow, and clear little brook, which wound its fretful course through a solitary tract of heath and moor, a little colony of wild bees had fixed their residence. They were few in number compared with the vast armies that avail themselves of the protection of man, and through the convenient residences he has provided for their accommodation and his own. But they were a prosperous and happy little community, and strong enough for their own defence, though they numbered scarcely half a thousand; and their neighbours, the water-rat and the weasel, knowing by experience that they managed their weapons valorously, never dared to show their marauding muzzles at the entrance of the cosy little cavern for fear of the sentinels, who would have taught them manners at the sting's point with very little parley. Of human visitants they seldom caught a glimpse, and knew but little, and cared less, for these lords of the creation. Their nest was situated a full mile from the public road over the heath, which was too deeply overgrown with furze and fern, and too full of unshapely stones and miniature crags, to tempt any but a geologist to wander from the way. So they were left pretty much to themselves, and enjoyed the world in their own mode, making the most of it in summer, when the whole plain was yellow with the golden furze-blossom; and revelling, like jolly fellows as they were, in the winter, when nothing better than a cold nose was to be got by going out of doors.

They had formed a bad opinion of mankind, whom they were not disposed to look upon in the light of benefactors, although traditions were not wanting among them concerning the commodious palaces which man had constructed for the convenience of their race. These traditions, however, which sometimes formed the theme of their long winter soirées, had a bad effect on the minds of some of the junior members of the colony, who, being sceptically inclined, longed in secret to explore the forbidden precincts, and judge of human intentions on their own account; and were not at all disposed to cherish the admonitions of Gray Fuzbuz, their 'oldest inhabitant,' who never failed to close his accounts of these fine palaces with a dismal expansion of his feelers, and a shuddering surmise as to the probable fate of those of their own tribe who, tempted by the splendours of the hive, had deserted their queen-mother, and after a brief period of enjoyment and vain-boasting, had disappeared for ever.

But these dolorous preesages had not always their due result, as we shall see in the case of young Petalby. This juvenile hero was a fine stalwart bee, standing a good three-eighths of an inch without his feelers, who felt it beneath the dignity of a prince and a warrior (and he considered himself both, being royally descended, and wearing a weapon) to take for gospel the croakings of old Fuzbuz. So he resolved manfully to investigate matters for himself, and only waited for a fair opportunity, when he could have a fine day and a side-wind for going and returning, to track the course of the brook, which, he knew, before he had flown a dozen miles, would bring him to the distant town, on the outskirts of which he had heard that the hives were situated. He resolved, however, that he would wait till the queen had returned from her airing, which she regularly took every fine morning for half an hour, as he had no wish to encounter her majesty in his rebellious flight.

The long-desired opportunity came at length; and one fine morning early in July, when the wind was due south, and the sun shining brightly, having first seen the queen safely housed after her short trip, he stretched his wings, and rose silently into the upper air, out of the track of his comrades, who were all busily occupied in honey-hunting in the near neighbourhood of the nest. Following the course of the stream in a westerly direction, he kept up aloft, out of sight and sound of brother bee for a full mile before he ventured down to his usual altitude; and then he flew another mile or so between the banks of the brook within a few inches of the water, not keeping too near,

however, for fear of being snapped up by some hungry trout in search of a breakfast—these finny gentry having no fear of stings before their eyes, and gobbling up bee, wasp, or hornet with great relish. Feeling at length that he was in no danger of meeting with any of his fellows at such a distance from home, he rose boldly to the bank, and perched for a few moments upon a honeysuckle to repose himself, and sip a little dew, of which enough yet remained in the curly horn to serve for his refreshment. He was just about to resume his flight, when he heard a noise that occasioned him at once curiosity and alarm. 'That is certainly a bee,' said he to himself; 'and yet it is not one of our troop, for we all buzz B flat, every wing of us, and this fellow's noise is a full semitone lower: he must be in sad case too, or he would not thrash away at that rate. I'll try and get a sight of him.' So saying, Sir Petalby rose a few yards into the air, and soon saw the true cause of his disquietude. On the opposite side of the stream, kneeling on the sandy bank, and stooping over a stone upon which he had pinned down an unfortunate 'worker' in the fork of a split straw, was a vagabond village urchin, bent upon sucking the honey from 'the bag o' the bee,' and even then preparing for the preliminary process of cautiously squeezing out the sting with a sharpened slip of black thorn. Our wandering adventurer was too much of a true knight to behold such a spectacle with composure; his indignation and valour fired at the sight; and darting swiftly downwards, he alighted on the ragged rim of the monster's dilapidated 'felt,' and stuck his weapon into the soft part of Master Mangleum's left cheek with such vigour and effect, that my gentleman commenced an impromptu *pas seul* to music of his own composition, which would have been irresistibly comic to a 'fit audience,' though it was unfortunately all thrown away, there being not a soul within a mile of him. During his performance, the proposed victim contrived to escape the fork, and, like a bee of breeding, as he was, hastened to tender his acknowledgments to Sir Petalby for his timely aid. We need not dwell upon the compliments that were exchanged between the parties in the hollow of a dock-leaf, whither they both repaired, that the rescued prisoner might repose after his struggles, and refit his soiled surcoat. Suffice it to say, that mutual confidence and friendship soon ensued. Sir Petalby informed his new friend, who rejoiced in the name of Shinyshanks, of the object of the journey in prosecution of which he had arrived so opportunely to his assistance; and the other proposed with eagerness to be his guide to the hives, among which was his own home, and from which he had set out that morning for the enjoyment of a solitary flight; but whither he now felt compelled to return, being yet considerably indisposed from the effects of the ill-treatment he had undergone. So soon, therefore, as the sufferer had in some degree recruited his strength, the pair set forward on their journey, Shinyshanks leading the way, and arrived, ere the sun had yet reached the meridian, at the suburbs of the town, and the scenes which our truant knight had so long desired to behold.

'This,' said his companion, as they alighted on the top of a high wall which enclosed a spacious and well-filled garden, 'is our domain, where we find plenty of everything, and where everything belongs to us. That old fellow yonder, with a spade in his hand, and a paper cap on his head, is old Stifle the gardener, who looks after our comfort, and keeps the garden full of flowers all through the season for our especial ransacking. That low thatched cottage, the walls of which you cannot see through the blooming roses that cover them, is his residence; and early and late he and his wife and daughter are at work in the garden, which is kept in perpetual order for our advantage. No sooner are the flowers of May withered or overblown, than those of June are open to our operations; and so it goes on through the whole summer. Then, when our population increases too fast for our convenience, forth comes a new hive for the reception of a new swarm. You see that one opposite to us, the last in the upper row, it was but last month it was first taken possession of by a colony of some thousands from the society of which I have the honour to be a member; and proud enough they are of their new quarters. But come, let me know what you think of our fare. Just dip your palpi into the calyx of that campanula, and tell me how you like the flavour you find there.' Sir Petalby did as he was bid; and forgetting the rules of etiquette in the gratification of his palate, kept his head so long out of sight, that his friend

was fain to remind him of his manners by buzzing round the flower. The visitor declared, on emerging from the calyx, that he had enjoyed a prodigious luxury, and showed an evident desire to renew his acquaintance with the viands; but his host observed that much better things were to be had, and conjured him by the shade of Epicurus not to squander so fine an appetite as he possessed on a paltry campanula. 'Come with me,' said he, 'I can show you good quarters, where we can take a snack together. I think I can pick a bit, though I seldom eat much in working hours.' With that he led the way to a retired spot in the garden, where grew some magnificent specimens of the white lily; and choosing a large unoccupied flower, affording ample room for both, he invited the visitor to enter and regale himself. Here the parties dined with perfect pleasure, and afterwards held a conversation upon the respective laws and governments of their different tribes. Sir Petalby was too much overcome with wonder and admiration at all he saw around him to find anything comparable with it in his own shabby tenement and desolate heath, so he had nothing to do but to assent to the encomiums of his friend, and lavish his praise upon all he saw. Having expressed a wish to view the interior of a hive, his friend arose and led the way to his residence, where the vanity of the one and the curiosity of the other were equally gratified, in explaining and admiring the wonders and treasures of the edifice. They afterwards made the tour of the garden together, and even entered the gardener's cottage, and perched upon old Stifle's paper-cap, where they watched the operation of filling his pipe, but decamped like shot at the first cloud he blew forth.

The afternoon was now far advanced, and the sun beginning to approach the horizon, when Sir Petalby signified to his friend the necessity of his return. The grateful Shinyshanks insisted that he should not go away empty-handed, and the other consented to accept of a cargo of honey, lest, by returning without any, he might arouse the suspicions of his fellows. Bidding farewell to his friend, after making an appointment for a subsequent meeting, the wanderer set out for his humble home with feelings very different from those of joyful excitement which had rendered that morning the happiest of his life. Never before had the vast plain appeared so solitary and joyless; he could not help contrasting its barren surface with the paradise he had just quitted, and deprecating his shabby fate which had consigned him to so humble a career. He reached his home in safety, but said nothing to his companions concerning his adventure. He was resolved to keep his own counsel; but he waited with impatience for the hour when he was again to meet his more fortunate friend.

They met again on the appointed day; and again Sir Petalby revelled in the enjoyment of luxury, and returned at eventide loaded by the liberality of his friend. The month of August was now fast approaching, and another meeting was agreed upon early in that month. By this time our discontented traveller had almost made up his mind to cast off his allegiance to his sovereign, to quit the snug retreat where he had first seen the light, and which was now grown but a beggarly hole in his estimation, to bid adieu to his old companions, and join the wealthy and populous community of which his friend Shinyshanks was a member. There wanted but another iteration of the oft-repeated invitation, and farewell for ever to the old willow stump, and the home in the brook side.

On the morn of the appointed day he sallied forth with the dawn, ere yet a bee had quitted the nest, and rising high into the air, struck across the country in a straight line towards the town (he was too well acquainted with the route by this time to need the guidance of the brook). Once he turned round to look again upon the silver thread of water winding through the dark furze, now without a flower, and black in the shadow of the gray morning, and almost wished he had not ceased to think it a beautiful sight; but the sunshine and flowers of the garden recurred to his recollection, and flushed with the delights of anticipation, he turned again, and soared onwards to the embrace of his paradise. As he approached the town, the sun rose fair in the heavens, and he saw his level beams reflected in the cottage windows. At the same moment an unwelcome odour assailed his breathing, and retarded, nay, almost stopped his flight. While revolving what this could possibly be, he was struck with the unusual silence, the almost total absence of all insect sounds, that pervaded the place. Strange apprehensions came over him, he knew

not why. Fears for his friend, not unmingled with alarms for his personal safety, began to intrude upon his insect mind. Still determined to proceed, and not without a hope that all might yet be well, he made a detour to avoid the current of the wind, which blew the intolerable odours in his face, and coming round in the rear of the blast, alighted on the garden wall, immediately over the ranges of hives. Here a horrible spectacle met his view. Amidst a number of the oldest hives, now lying overthrown and plundered of their contents, stood the monster Stifle and his daughter. The beautiful architecture of the industrious nations had been wrenched from its foundations, with all its treasured stores, and cast into earthen vessels—dish, pot, and pan, of every shape and size—where from the delicate hexagonal chambers the liquid luxury drained away. And, worst of all, in large holes dug in the ground, there lay the carcasses of the slaughtered proprietors, crushed together, and reeking amid the fumes of burning brimstone. Poor Sir Petalby stood bewildered and aghaast at such a concentration of horrors; his limbs refused their office, and for some minutes he had not power to stir from the spot. While gazing around him in all the excitement of terror, he saw the lifeless remains of his poor friend Shinyshanks lying on the edge of a dish; he knew him by his glittering thighs, and grew sick at heart at the recognition. At length, sighing a 'farewell, a sad farewell to all his greatness,' he summoned his frightened energies, and urged his way once more back to the scene of his former safety and contentment. When he got again among his old companions, the sun was high in the sky, the smell of the wild thyme was abroad in the air, and the cheery hum of his busy brethren made the wilderness vocal with joy. 'Ah!' said he to himself, 'welcome peace, safety, and humble home! Gray Fuzbuz was right after all: a little, with security, is better than all the wealth of the world enjoyed at the peril of existence.'

BIDE YOUR TIME.

Every man must patiently bide his time. He must wait. More particularly in lands like my native land (United States), where the pulse of life beats with feverish and impatient throbs, is the lesson needful. Our national character wants the dignity of repose. We seem to live in the midst of a battle, there is such a din—such a hurrying to and fro. In the streets of a crowded city it is difficult to walk slowly; you feel the rushing of the crowd, and rush with it onward. In the press of our life it is difficult to be calm. In this stress of wind and tide all professions seem to drag their anchors, and are swept out into the main. The voices of the present say—Come! But the voices of the past say—Wait! With calm and solemn footsteps the rising tide bears against the rushing torrent up stream, and pushes back the hurrying waters. With no less calm and solemn footsteps, nor less certainty, does a great mind bear up against public opinion, and push back the hurrying stream. Therefore, should every man wait—should bide his time. Not in listless idleness—not in useless pastime—not in querulous dejection; but in constant, steady, cheerful endeavours, always willing and fulfilling, and accomplishing his task, that, when the occasion comes, he may be equal to the occasion. And if it never come, what matters it to the world whether I or you, or another man, did such a deed, or wrote such a book, so be it the deed and the book were well done! It is the part of an indiscreet and troublesome ambition to care too much about fame—about what the world says of us; to be always looking into the face of others for approval; to be always anxious for the effect of what we do and say; to be always shouting to hear the echo of our own voices! If you look about you, you will see men who are wearing life away in feverish anxiety of fame; and the last we shall hear of them will be the funeral bell that tolls them to their

early graves! Unhappy men, and unsuccessful; because their purpose is, not to accomplish well their task, but to clutch the 'trick and fantasy of fame;' and they go to their graves with purposes unaccomplished and wishes unfulfilled. Better for them, and for the world in their example, had they known how to wait! Believe me, the talent of success is nothing more than doing what you can do well; and doing well whatever you do—without a thought of fame. If it come at all, it will come because it is deserved, not because it is sought after. And, moreover, there will be no misgivings—no disappointment—no hasty, feverish, exhausting excitement.—*Professor Longfellow's Hyperion.*

RISE OF A MANUFACTURING TOWN.

Sixty years ago, Huddersfield, now the centre of the fancy manufacture of England, was a miserable village. The houses were poor and scattered; the streets narrow, crooked, and dirty; the people ignorant, and wild in their manners almost to savagery. Around them stretched the black moorland, unreclaimed by the plough or the spade; and the sides of the noble hills were covered with shaggy moss, brambles, and wiry creepers, or coloured in the appointed season with the golden gorse and the purple heather. And how short was to be the intervening period! Already in this wild people were deposited the seeds of a glorious manufacturing and historical unfolding. Sixty years have changed the face of this vast district. For during that time heads and hands have been at work, conquering the wild dominion of nature, and making all her elements serve them. Thus the river has been converted into artificial beds, and the waters arrested in their course by weirs, and compelled to turn the wheels of the hundreds of factories which are built upon the river's banks. The savage moorland has been cultivated and parcelled into corn-fields and pastures. The hills in many cases wave, even to their stony summits, with rich herbage; and from the wildest glens and ravines rise the chimneys of noble factories, sending their black smoke through the green foliage of the trees; every one of them the centre of a little working community. Thus Huddersfield has grown into an important town; and what is more, she has fostered other towns and villages in her immediate neighbourhood, and made them also important; so that within six miles of her there are some hundred and thirty thousand souls engaged in manufactures, and in the commerce to which those manufactures gave birth.—*Bradford Observer.*

SUCCESS IN LIFE.

In no department of life do men rise to eminence who have not undergone a long and diligent preparation; for whatever be the difference in the mental powers of individuals, it is the cultivation of the mind alone that leads to distinction. John Hunter was as remarkable for his industry as for his talents, of which his museum alone forms a most extraordinary proof. If we look around and contemplate the history of those men whose talents and acquisitions we most esteem, we find that their superiority of knowledge has been the result of great labour and diligence. It is an ill-founded notion to say that merit in the long-run is neglected. It is sometimes joined to circumstances that may have a little influence in counteracting it, as an unfortunate manner and temper; but it generally meets with its due reward. The world are not fools—every person of merit has the best chance of success; and who would be ambitious of public approbation, if it had not the power of discriminating?—*Physic and Physicians.*

The present number of the Journal completes the eighth volume (new series), for which a title-page and index have been prepared, and may be had of the publishers and their agents.
